Guide to the FH9 Fang File

[The Fang file consists of eight sources, seven of which are translations from the French and the German. The major sources in the file are 1: Tessmann, 2: Tessmann, 6: Alexandre and Binet, and 7: Trilles. 1: Tessmann and 2: Tessmann are the first and second volumes of a two-part monograph by a German ethnologist, who covers the material culture very thoroughly. 3: Trézenem is a summary article on a group of aberrant Fang "tribes" by a French ethnologist. 4: Dugast is a demographic survey of the Fang groups by a French social scientist. 5: Balandier is a discussion of contemporary Fang sociology by a French social anthropologist. 6: Alexandre and Binet is an ethnographic survey by two French government officials. 7: Trilles is a descriptive and theoretical study of Fang totemism and its functioning, while 8: Bennett is a descriptive study of various aspects of Fang culture by a British doctor.

In general this is a well-rounded file with good material on all major aspects of the culture. It is particularly strong in the ethnosciences, material culture, and current sociology. Its weakest area is in the domain of religion. There were no special marking decisions made for this file. --Analyst]

Processed in 1960.

Village and Household

000 Place names (their derivation and explanation). -- Names of fields. -- Plan of the villages. -- Settlement; development of a settlement into a village; village; significance of the name; growth of the village. -- Provisional meeting houses: plan, form -- Permanent meeting houses: scaffolding; roofing (procedure, material used for rafters and covering); side walls (material, erection, appearance); veranda. -- Interior of the meeting houses: posts; benches; fireplaces; furnishings (gun racks, trophies, and the like). -- Life in the meeting house. -- Dwellings: forms; appearance; door part; door; condition. -- Interior of the dwellings: sleeping benches; lofts and larder; frames with drying boards and baskets; hooks; stools; brooms. -- Raffia palm: kinds; names; uses. -- Storage houses; guest houses; field huts; houses for the sick. -- Houses on piles. -- Illumination: hearth fire; torches; lamp; mushroom torches; fire making. -- Village square (appearance, cleanliness). -- Toilet. -- Ornamental plants. -- Trade routes. -- Trade by water. -- Bridges.

● 101 361 In the large, jungle-covered Pangwe region /Ed., the author uses Pangwe /Fang/ as the name for a group of tribes in which the Fang are one tribe; the others are the Eton, Mwele /Mvele/, Jaunde /Yaunde/, Bene /Bane/, Bulu, Ntum, Mwai /Mvae/, and Mokuk (Oschüeba)/ the settled areas are scattered like oases in the desert. They are unevenly distributed, and their greatest concentration is along the line of the main trade routes which cross the region for the most part in an east-west direction. [487]

133 full of fish, hold water during the worst of the dry season.

137 In going up the Ogooué one meets, a little before the island of Talagouga, the first spurs of the north-south oriented African plateau, still low (N'Djolé has an altitude of 63 meters), the élevation of which increases rapidly as one goes towards the interior. Upstream from N'Djolé, the Ogooué ceases to be navigable. Broken by rapids, it is no longer passable except for specially equipped dugout canoes. About a dozen kilometers beyond the influx of the Okano, the aspect of the country changes: the large forest gives way to great stretches of prairie dotted with wooded groves, on the hillsides formations of quartz blocks are seen and oil palms, which were not present downstream, begin to appear. Mt. Otoumbi dominates the landscape from its 700 meters, and the rounded hillsides of the ranges bordering the river recall some features of the Vosges.

133 In the N'Djolé region, the Ogooué receives as its chief tributaries: to the right, the Bingola, Okano, and Abanga; to the left, shorter rivers of less volume, the Leledi, Lebe, and Mbumi. Only Abanga is navigable, and this for only about 70 kilometers.

132 The climate is hot and humid, with alternating dry and rainy seasons: from October to January, the rainy season; from January to March, a
133 very hot, dry season, the ripening time of almost all the forest fruits; from March to June, again violent rains, great tornadoes, and severe heat; and from June to October, a comparatively cool, dry season, with cessation of growth for some varieties of forest vegetation. At this time the waters are very low; sand banks can be seen everywhere in the Ogooué some of whose tributaries, like the Misanga, have only a trickle of water. The seasons are obviously not as strictly demarcated as this, and one season often encroaches on the other.

101 Today this whole region is almost entirely inhabited by the Fan who, since their arrival, probably at the beginning of the nineteenth century,
563 have either driven out or decimated the [other] inhabitants, the Okata and Bapinji [Bapindji] up the N'Djolé (of the Okata there is now only one village left, and the Bapinji have completely disappeared) and the Bakele [Bakale, Bakelle (?)] downstream. The latter still have some villages in the interior on the left bank, but only one on the edge of the river.

101 Fan is the name they give themselves. Pahouin [Pahuin] is the one by which they are commonly known and which, according to Haug (1)

1. Ernest Haug, "Notice géographique et ethnographique sur le Bas-Ogooué"

101 [Geographic and Ethnographic Comment on the Lower Ogooué], Ann. de Géogr., No. 62, March 15, 1903.

" is a [67] corruption of the word mpanwe by which the tribes of the coast refer to the Fan." Among them are found the tribes of three great parent branches, the Betsi and the Nzaman of the Madzouna dialect, and the Make of the Maekina dialect. Their number has a [161] strong tendency to decrease due to continuous migration towards the sea, and above all due to lack of births and to stillbirths. There are 361 actually no villages except on the banks of the Ogooué and the Abanga, and in the valley of the Okano along the route that joins the river at Oyem; and a few hamlets of the Make in the interior near small Bakele settlements on the left bank. The whole region of the right bank is depopulated, and one finds no more than frequent patches of short, thick brush without trees, except for some banana trees which are traces of vanished former villages.

Beliefs

173 I. Concerning the origin of man, the elements. Whenever a [867] Pahouin recites his genealogy (every child is used to this from his early years, a survival of the need while traveling to make oneself known as a member of a tribe), he ends the list of his ancestors with: "X... son of Nzame," and adds a formula meaning "and the rooster crowed and I was not there." All the Pahouin now living thus claim a common ancestor, Nzame, to whom they attribute supernatural powers but whom they do not worship. This Nzame himself has four known ancestors: Meboere, Nkwa, Sokuma, and Mba Angwe. We have not been able to obtain any information about these, nor about the formula in which the rooster is mentioned [sic]. It seems that this is due to the ignorance of the natives rather than their ill will (many traditions were lost through contact with peoples met in the westward migration and especially through contact with Europeans), since the natives questioned quite voluntarily gave accounts of the life of Nzame as their fathers had described it to them.

Beti

101
131

[Map 1]

101 This group of Beti, or Bati, north of the Sanaga, whom the Germans—being good linguists—recognized easily by their language, were
131 all those whom the French administration later called by the general name "Sanaga." They included the Tsinga, the Mvele /Mvelle/ (contrary to Nekes' opinion), the Bavek, the Mangisa, the Ngoro, and the Kombe.

114 What is the origin of these Bati? G. Tessmann thinks that they may
174 be related to the peoples he has named "Mittelkamerun Bantu /Middle Cameroons Bantu/" (Bafia, Banen /Banend/, Yambasa, etc.). But he does not confuse the two groups. He believes that the Bati came from the north, where they first lived on the left bank of the M'Bam. Then, pushed by the Babute, some of them moved to the right bank. He notes that from that point on two tendencies are apparent: Some of the Bati were attracted by the civilization of the northeast (Babute), others by that of the southeast (Pahouin). Thus the Bavek and the Yangafuk (the Fök and the Fuk) migrated and scattered in a direction that differed from the one taken by groups such as the Betsinga and the Mangisa, who were moving toward the Pahouin. The latter two let themselves be assimilated quite rapidly.

According to G. Tessmann, the Bati are not Pahouin but rather a population encountered by the latter in their migrations. These people were attracted or influenced by the Pahouin and, in turn, influenced the invaders, just as they influenced, or were influenced by, the central Bantu. In the course of influences and counter influences, the intermingling of Pahouin and Bati, as much in culture as in language, has been so great that it is now difficult to untangle the threads of their various ramifications. Some threads have been lost, others broken, and those that remain have taken on a variety of hues.

THE PAHOUIN

101 It has seemed necessary to us to employ the term "Pahouin," 131 generally used by the French to designate a group of peoples who,

101 barely a century and a half ago, invaded and took over more than
131 176, 000 square kilometers of land in the western part of Equatorial Africa. For a century these peoples have occupied the huge forest area which stretches from 1° south of the equator to 4° 30 in the north, and from 9° 30 to 14° meridian in longitude.

101 Poutrin uses the term "Fan" to designate these peoples. Tessmann
114 uses the term "Pangwe /Mpangwe/."

We have rejected Poutrin's term "Fan" for the same reason that Tessmann did. There exists in the Cameroons a subgroup of Pahouin known as Fang, and it seems to us that using the same term to designate two different entities—on the one hand, a large group occupying a vast territory, and on the other, a very small unit comprising 12, 583 persons within this group—could lead to confusion and misunderstanding.

114 The penetration of the area by the Germans, which brought them into contact with the Pahouin of the southern part of the territory, had to be carried out slowly. The first expeditions started from Grand-Batanga near Kribi. It was possible to explore quite rapidly the lower part of the Sanaga River as far as Edea Falls. At that time the river was called "Grand (Big) Nyong," and the present-day Nyong was "Petit (Little) Nyong." The natives on the coast said at that time that in the interior there flowed a great river whose waters moved from west to east. This detail posed a great problem for the Germans: Did the separation of the waters reaching the Congo and Grand-Nyong basins occur so near the coast? The first expedition was led by Lieutenant R. Kund, who was accompanied by Lieutenant Tappenbeck, the zoologist Weissenborn, and the botanist Braun. On October 15, 1887, they left Grand-Batanga, traveled through the Ngumba country and the valley of the Nyong, and, going northeast, reached the Sanaga on January 19, 1888. According to the reports they were "at least 300 kilometers from the coast," but it is not possible to locate the exact spot.

Within a few years from that date nearly the whole forest region had been explored, opened up to commerce, and studied both from ethnographic and economic viewpoints.

114 The first observations were based on linguistic notations, and the
174 extension of the Pahouin invasion above the second parallel was easily perceived when it was investigated also from the south through Gabon.

Pahouin

114 The great explorer Schweinfurth was the first to present the theory
174 that the invasion must have begun far to the east among the Azande, south of Bahr el Ghazal (approximately 23° long., and 5° north lat.). Dr. Poutrin, R. P. Trilles, Largeau, and Avelot accepted his conclusions, but Baumann and Westermann rejected them as greatly exaggerated. According to them, the Pahouin came only from the high Sanaga and had reached the western part of Equatorial Africa through a series of successive westward migrations, avoiding the great equatorial forest by going around it in the north and going through the valleys of the Lom and the Adamawa. "The advance of the subgroups," write Baumann and Westermann, "was made in successive leaps, as each group pushed the other ahead or passed them by. The migration was made by kin groups, about thirty to a tribe, which constituted the only political and social unit. These kin groups (agon) moved continuously westward, often passing one another; the last comers settled beyond their predecessors for a generation or two and then departed again."

The last push was made quite recently, /60/ in the southern part of the plateau of the Adamawa, by the Mbum and the Baya, who subsequently had to yield to the Fulbe /Fulani/. This last move from the right bank of the Sanaga to the forest dates back no more than about a hundred years. When the Europeans came, they in turn stabilized the positions of all these peoples.

114 In spite of the linguistic investigations quickly undertaken by the Germans, whose great specialist was Father Nekes, and the study of
●101 oral traditions carried out to a greater extent by the French, the con-
197 clusions arrived at concerning the distribution of the Pahouin in the Cameroons are not entirely in agreement with one another. They are as follows:

Father Nekes is the authority on the subject, but his classification is chiefly linguistic. According to him there are two major groups, the Beti and the Mvele. In the first he includes the Ewondo, the Bane /Bene?/, the Yetenga, the Yetudi, the Eton, and the Betsenga; in the second, the Mvele, the Yebekolo, the Yebekanga, the Bulu, the Ntumu /Ntum?/, the Okak, the Omvang, and the Fang. Tessmann connects the Yesum with the Bulu.

According to Dr. Schnee, the "Fang" are divided into two large
114 groups, the Betschi /Betsi/ (established in the northwest) and the
101 Makei /Mekei/ (settled in the southwest). His division is based on whether they pronounce the phrase, "I say that," as Mekima or Matsina. The groups are divided into an infinite number of tribes,

114 with names beginning either with Eb (Makei) or with Es (Betschi).

101 The Governor General, Cournarie, after carefully surveying the peoples in the vicinity of Yaoundé, where he was administrator, prepared the following table:

- NANGA ....
  - Beti ....
    - Kolo ....
      - Ewondo
      - Bane
      - Mangisa
      - Kombe
      - Tsinga
      - Etudi
      - Emfek
    - Eton
    - Mvele
    - Badzu
    - Omvang
    - Ntumu
  - Yesum

And he concluded: "It appears that among the Beti one can also include the Badjia, the Bavek, the Bamvele, the Djanti, the Ngoro, and the Yangafuk."

It is impossible to say whether or not this problem will ever be solved, for it becomes more and more complex from decade to decade because of the changes which are taking place, with perhaps increasing speed. We would like future researchers to be aware of its complexity; they should not believe that we have thought to present solutions here.

THE BUNDJU AND THE KOMBE

131 Location: 11°25 to 11°50 long.
101 4°30 to 4°35 north lat.

We cannot silently skip over these minute groups whose names are known only to administrators working in the region of M'Bam, east of Bafia. As a matter of fact, they are essentially a part of the Beti group.

Physical and Human Geography

161 Population: Bundju—about 550 inhabitants
Kombe—about 1, 126 inhabitants

361 The Kombe are settled in three villages in the valley of the
131 M'Bam, on the right bank of that river and on the highway from Bafia to Yaoundé, from the 16th kilometer to the 22nd kilometer southeast of Bafia. /Map 2/

The Bundju occupy two villages, also on the vehicular road, southeast of the Kombe but between the M'Bam and the Sanaga rivers. The two villages are separated by a Ngoro village which is wedged in between them. /62/

131 According to the Moisel map of April, 1913 (G2, Jaunde), these
101 two peoples occupied far greater territories at that time. The Kombe (then known as the Nkombe) were found all the way to the borders of

Ngoro

101 present-day Bafia, in numerous villages all along the right bank of
131 the M'Bam, meeting the Tsinga at the Owama or Afama River and reaching as far as the vicinity of the Yambasa. Others, known as Kombe, were located much farther east on the Maloko River and are probably under the jurisdiction of the Kombe villages, now claimed to be Mvele and Bavek villages (on the vehicular road in the north).

On this Moisel map, the Bundju occupied the whole vast territory, triangular in shape, which lies between the M'Bam and the Sanaga rivers.

173 According to the reports of the administrator Cournarie, resumed by the administrator Relly, these peoples lost all cohesion after the Babute invasion in the middle of the last century. According to their traditions, the Kombe were enslaved and consequently dispersed. The Bundju, said to be related to the Mangisa, first crossed the Sanaga. Later, when the Germans pushed the Babute back towards the north, the Bundju, greatly reduced in numbers, recrossed the Sanaga and returned to their former lands.

000 It would be interesting to investigate these former Beti from the linguistic viewpoint and to find out how much of their former language remains with them. The study should not be made on the basis of entire zones; rather it should be carried out almost village by village throughout a whole area where these peoples may be found juxtaposed and overlapping one another all along a vehicular road. No doubt the study will /sic/ shed but little light on the problem of origins, but it will clearly show what G. Tessmann calls the "Bati-Mbam" languages.

THE NGORO

131 Location: 11°15 to 11°30 long.
101 4°30 to 4°55 north lat.

Physical and Human Geography. The Ngoro are widely dispersed on the left bank of the M'Bam, in the valley of its tributary, the
133 Ngoro. This little river has a minimal water supply during the dry season, but during the rainy months, on the contrary, it swells beyond the river bed and floods the banks, sometimes for a considerable distance. This is a prairie region adorned with thin shrubs. Near branches of the river, a few clumps of raffia palms can be seen.

Ngoro
Bafok-Yangafuk

361 The several Ngoro villages are stretched over 70 kilometers of trails. A single one may be found on the right bank of the M'Bam, in the immediate vicinity of Bafia, on the vehicular road. Another is located about 30 kilometers to the southeast, also on the vehicular road but on the left bank of the M'Bam; it is Goura, inhabited by the Ngoro who moved down toward fertile land.

173 The Ngoro say that they descended from the Mangisa a long time ago—perhaps during the time when the latter still lived north of the Sanaga. The traditions of the Ngoro also say that their original ancestor was the same as that of the Betsinga, the Kombe, and the Bundju. Is this myth or history? This extended kinship brings together all the Beti.

The folk history of the Ngoro begins only with the war against the Babute in the last century. At that time they were dispersed, and most of them clustered around the Ngoro River. When attacked by the Babute, those nearest the M'Bam crossed the river and settled among the Bafia, whom they pushed back. /63/ Others, the Yasakunu, were driven all the way back to the Yambasa. The people of the village of Ngoro submitted and were enslaved. They were deported north to Linte and Tibati and south to Goura. /Map 3/

175 At Goura the young slave Ndenge was born of a Ngoro father and a
167 Djanti mother, both deported there. As an adult, Ndenge enlisted in the native army of the Germans and attracted the attention of his superiors by his intelligence and zeal. They assigned him the task of reuniting all the exiles, and little by little turned over to him all those who were freed through their wars—first the exiles found among the Yambasa, then those among the Bafia. These migrations are the explanation for the wide scattering of Ngoro villages and for the frequent moves. Fortunately, the appearance of the cacao tree has begun to stabilize a number of these settlements.

THE BAFÖK-YANGAFUK

●101 Location: widely scattered, to be found in
131 several settlements sometimes
361 very far from each other
Between 11°15 and 12°30 long.
and 4°30 and 5°50 north lat.

Ngoro

101
131

[MAP 3]

Bafök-Yangafuk

101 The peoples who are the subject of this chapter have been given several names spelled in a variety of ways by Europeans. On German maps they appear as "Fuk," "Fök," or "Fu." In French reports and maps they are called "Baveuk," "Bafeuk," or "Yangafouk." All these words seem to resemble each other, and, in reality, they are identical.

[161] Physical and Human Geography. Total population: 5, 352 inhabitants.

361 Three little enclaves of these people a few kilometers long may be
461 found on the Yoko road east of Bafia. They are settled in eight villages all told and inhabit an area of very fertile soil and forest. Cacao, palmettoes, or food crops could bring them prosperity, were it not for
[161] their laziness. (The people of these villages number 1, 556.)

173 The five southernmost villages of the eight say that their members
361 come from the southeast, from the plain of the Sanaga, or from the east, from the plain of Djerem.

The two neighboring villages to the northeast are called Yalongo (see the chapter on the Yekaba and the Bamvele). It is thought that the Yalongo conquered the Bafök and /64/ adopted their language. Finally, the eighth village is said to be related to the first five and to have come also from Djerem.

To the southeast of Yoko is an enclave whose two villages, in the
[161] middle of the prairie (445 inhabitants), claim to be related both to the Yalongo and the southern Bafök.

About 50 kilometers north of Yoko, in the Babute country, is the
[161] enclave of Lena consisting of 260 inhabitants. It is said that they came from the south and reached their present habitat by traveling an arc of 250 kilometers via Tibati. /Map 4/

[161] The 360 inhabitants of the enclave of Yassem, in the midst of the Tikar country, 120 kilometers west of Yoko, say that they sprang from the Bamvele. We would be more inclined to say that they share a common origin with the latter. The wars among the tribes brought them to the Tikar country where they isolated themselves on their mountain. They differ from other Bafök in that they have adopted the
[797] Islamic religion of the Tikar and that they recognize no kinship with the southern Bafök.

361 A single village may be found on the banks of the M'Bam, a few
161 kilometers from the town of Bafia. (It has 313 inhabitants.)

And lastly, on the right bank of the Sanaga, there are several Yangafuk villages (containing 2, 418 inhabitants) which are related to those found in the south on the Yoko road but separated from them by a thick forest. /65/

4:Dugast--11a S-4 (ca. 1947) 1949 FH9 Fang FH9
Bafök, Yangafuk

101
131

[Map 4]

BAFÖK-Yangafuk
Tsinga - Betsinga

174 The recognized kinship among the various groups clearly permits us to assert that their extraordinary dispersion is quite recent, going back no further than to the historical period when the Tikar and the Babute made their last advances and were driven back by the advancing Fulbe. Before that time these peoples probably inhabited the entire plain south of the Ndomé. Ndoumba was their most important center.

197 Language. The linguistic unity among the various groups of Bafök and Yangafuk confirms our impression. Dialect differences among them are minimal; they all understand each other.

G. Tessmann classifies their language as falling between that of the Bamvele and the group of Pahouin languages. As we have already mentioned, a passing observer at Lena, the Reverend Good of the American Mission, noticed a very great similarity between the language spoken there and that of the Bulu in the south.

THE EWONDO

● 101 These people are called Yaoundé (1) by the Europeans, but they

1. The etymology of this name is given nowhere. According to tradition, the name Ewundu is that of the original ancestor of the people; the prefixes ya, ye, and e occur frequently in Pahouin languages.

According to Nekes, the name means "peanut"; it would therefore be a nickname, because, they say, "They are as numerous as peanuts."

call themselves Ewondo.

131 Location: 10°40 to 11°40 long.
3°10 to 4°05 north lat.
The Evuzok branch: on a north-south trail at 10°05 long.
on an east-west trail 10°25 to 10°40 long.
3°10 to 3°25 north lat.

Physical Geography. Area: approximately 4, 320 square km.

133 The territory occupied by the Ewondo is a high plateau broken by
137 little valleys. In its northern section may be found several high hills which divide the waters of the Sanaga Basin from those of the Nyong. The entire territory is within the great forest zone, but much of the land has been cleared because of the density of the population. /71/ The dividing line between forest and prairie runs east to west about 10 kilometers north of Yaoundé.

133 The river Nyong, at 3°30 north latitude, first borders the Ewondo country north to south and then crosses it from east to west before flowing into the territory of the neighboring Basa. Much further downstream it flows north to south by the settlement of the Evuzok before reaching its mouth at the ocean.

133 The southeastern part of Ewondo territory is also watered by the high stream of the little river Lokoundje.

The whole country is very fertile, rich with food crops and beautiful groves of cacao trees.

Human Geography

161 Population: Ewondo (in the Yaounde subdivision)—70, 994 in 1946
" " " M'Balmayo ")—15, 359
" " " Lolodorf ")— 6, 674 in 1947
93, 027

Evuzok: 4, 273 inhabitants

The population density varies greatly in the different zones: the region north of the Nyong is most densely populated, 49. 3 persons per square kilometer; south of the Nyong there are 13. 1 persons per square kilometer; in Evuzok, 5 persons per square kilometer.

173 History. The Ewondo settled in their present habitat quite recently —one hundred and fifty years ago at most. According to their traditions, they began the last stage of their migrations somewhere on the right bank of the Sanaga near its junction with the M'Bam. They crossed the Sanaga about five generations ago, at the time when all the peoples north of the Sanaga suffered the consequences of pressure by the Fulbe. They spread southward, and some of them even crossed the Nyong and traveled in the "low" direction (west) toward the commercial roads.

It is believed that German expeditions first reached the Ewondo in about the year 1887 (during the exploration by Kund, Tappenbeck, and Weissenborr). The administrative "station" of Yaoundé was created in 1889, and its direction was placed in the hands of G. Zenker, a man of science whose name is not likely to be forgotten in the Cameroons.

According to most of the traditions, the Evuzok (1) were the last

[101] 1. Their name is said to be nothing but a nickname meaning "elephant's stomach," which was given them by the other Ewondo after a hunt which was followed by an unforgettable feast.

of the Ewondo to arrive during the last migration, and they were

THE FONG

131 Location: 11° and 11°15 long.
3°15 north lat.
and 11°30 to 12° long.

● 101 Physical and Human Geography. The Fong /Fang/ are not all settled in a single area. They constitute a very small population divided into three separate clusters, lined up from west to east; the total area of the different small zones occupied by these settlements is about 1, 152 square kilometers, and in the largest and most easterly, the enclaves of Bulu villages are to be found.

101 Bertaut has written: "The territory is occupied by Bane and Fong
563 without any geographical unity. Fong, Bulu, and Bane are intermingled, and one passes from a Bane area /76/ to a Fong area without noticing. This situation is the result of a mingling of tribes which must have occurred when the Bane and the Fong, who came from the north, encountered the Fang and the Bulu, who were also not yet permanently settled." (Report of May, 1932)

113 The Fong may be considered the southernmost participants in the recent invasion which brought the Ewondo and the Bane to the south

101
131

[Map 11]

101
131

Mvae Branch: 9°45 to 10°45 and 11°20 to 11°40 long.
2°15 (at the frontier of the South Cameroons) to 2°55 north lat. and a few islands at 3° north lat.

Ntumu branch: 10°25 to 11°35 long.
2°15 (on the frontier of the South Cameroons) to 2°35 north lat. /77/

Physical and Human Geography

131 Total area: about 11, 500 square km.

161 Population and density of each group:

Fang: 12, 583 inhabitants; 2 persons per square km.
Mvae: 5, 287 inhabitants; 5.8 persons per square km.
Ntumu: 16, 236 inhabitants; 9.8 persons per square km.

137 The whole territory of the Fang is within the great equatorial forest, in the basin of the N'Tem and those of its tributaries that flow to the right of it. /Map 12/

361 563 The Fang villages which are to be found furthest west in the direction of the ocean are situated near Bipindi and on the road from Bipindi to Kribi. Some of them alternate with Bulu villages, others are composed of mixed populations consisting, for example, of Fang and Bulu, Fang and Ngumba, or Mvae and Ntumu /Ntum?/. Nor are the villages and trails south of Ebolowa in the great forest inhabited by homogeneous populations. Enclaves from one group are settled with another, and intermingle with each other. The transition from the somewhat educated Bulu to the primitive inhabitants of the great forest occurs imperceptibly. Because of the inhospitable territory which they occupy, the Fang are dispersed in the enormous forest all the way to the ocean and are to be found here and there among the Mvae. They 313 lead the unstable existence of lumbermen in order to force from the land the bare means of subsistence.

The settlements of the Mvae are scattered. Some are located on the periphery of Ambam to the east and north, others are south-southeast of Ebolowa, and still others are to be found on the lower part of the N'Tem, from a point east of Nyabessan as far as the ocean.

THE BULU

131 The actual Bulu inhabit an area which stretches from east to west
● 101 in a thin band from 10° to 13°10 longitude and extends from 2°35
to 3°15 north latitude toward the east. Toward the west their villages
[36] only extend along two parallel trails, then go in a single line within 30 kilometers of the ocean.

North of this horizontal band, in an area which extends from 12° to 12°35 longitude and from 3°35 to 4°30 north latitude, are to be found the Yengono, the Yembama, and the Yelinda. We are including these groups among the Bulu on the authority of their traditions.

133 Physical Geography. The Bulu territory is a huge, very monotonous plateau covered with forest. It is situated at an altitude of 600 to 650 meters on the average, with a few hills rising 150 to 200 meters at most above the rest. The hills are round or conical in shape and generally wooded.

The actual Bulu country (an area of about 9,936 square km.) is watered, on the one hand, by little tributaries which flow from the left bank of the Nyong and form valleys going from southeast to northwest. In the east the branch called the Zaman flows for 60 kilometers, touches the only trail in the thickness of the forest at a distant spot, and meets the Dja River, a tributary of the Sanga /sic/, beyond 13° longitude.

361 The Yengono, the Yembama, and the Yelinda are settled on a
133 strip of land going from north to south in an area which is part prairie and part forest. From the plain of the Sanaga the country rises gradually, and in the northern part of the Yengono country a chain of hills separates the waters of the Sanaga and the Nyong basins. The three peoples are settled south of this line in the Nyong Basin

1. Bertaut, Le droit coutumier des Boulous. Monographie d'une tribu du Sud-Cameroun (The Customary Law of the Bulu. A Monograph Concerning a South Cameroon Tribe)," (Paris, 1935), p. 45.

As for the Yebekanga, the administrator Chauleur says that "it is impossible to show a common origin for the Yebekanga and the Yesum. It seems likely, however, that this tribe climbed from the shores of the Nyong at a fairly recent time." (2)

2. Unpublished report on February 28, 1933. /86/

Here we have grouped the Yesum and the Yebekanga together despite contradictions in our sources. We have done so simply because of the possibility that they migrated in the same direction. According to their accounts, it would seem that their migration took place quite recently, just a few years before the coming of the Europeans. In the course of it they clashed with peoples of the same Pahouin origin who had come from the north about a hundred years ago, and pushed them back toward their present habitats.

161 Demography. The population of the Yesum is decreasing in spite of apparently good conditions. At present the ratio of births to deaths is -2.6 percent.

163 The sterility rate rises as high as 25.53 percent, and the fertility rate is 3.4 pregnancies per woman.

THE YEKABA

● 101 Location: 12° to 12°50 long.
5°20 to 5°45 north lat.

Physical and Human Geography

131 Area: about 1, 602 square km.

161 Population: 14, 500 inhabitants

Density: 9.2 persons per square km.

133 All of the Yekaba country is located on the prairie which extends through the plain on the right bank of the Sanaga River. The country has few valleys; it is watered by tributaries of the Sanaga, the Tédé and the Nyé, which are bordered by forest.

101 The information provided by various observers (the administrators Chauleur, Cournarie, and Boudineau) gives no clear indications as to the general grouping in which we should place this group of peoples settled on the right bank of the Sanaga. All French maps give the general name of Badjia, and under it are classed several groups not all of whom are known to have a common origin. The name "Badjia" may be but a nickname (according to Boudineau). German maps use only the name "Yekaba, " concerning which Chauleur also says: "Among these tribes (of the Badjia group), the most important is the Yekaba, and it gives it's name to the region. " (1)

1. Unpublished report of February 28, 1933.

114 According to Cournarie, the Yekaba and several kindred groups originate among the Yalongo who live on the northern bank of the Sanaga, directly north of their present habitat. Under pressure from the Babute, who were themselves pushed back by the Fulbe, these peoples fled south and crossed the Sanaga River. It is possible that at first they occupied all of the territory north of the Nyong, together with their neighbors the Bamvele. Later they were pushed back toward the Sanaga by the migration of the Yesum-Yebekanga coming from the south. (2) These two waves moving in opposite directions clashed and interpenetrated, producing the present confusion. The Yekaba found themselves split in two by the Yebekanga, who formed /87/ an enclave in their midst. The peoples of the left bank of the Sanaga (in the administrative subdivision of Nanga-Eboko) are thus composed of two different elements: the somewhat older inhabitants who came originally from the north, went south, and were pushed back, and the more recent arrivals who came from the south and pushed back the former.

These two groups, one coming from the north, the other from the south, and arriving at different times, are probably both part of the

Yekaba
Bamvele, Bobili

174 long migration of the Pahouin—although the name "Yalongo" spoken of in their geneologies is reminiscent of the Beti. Once again we are aware of the complexity of the Beti-Pahouin intermixture.

361 The villages and huts spread through the bush give an impression
491 of poverty, although in 1903 the Germans noted that the great trade route from Bertoua to Yoko passed through Yekaba territory. /Map 16/ At the present time the whole length of the territory is serviced by the great eastern highway (Yaoundé—Nanga-Eboko—Bertoua).

197 Language. The fact that the Yekaba form part of the Pahouin migration is apparent from G. Tessmann's tribal map, where they are shown in the large Pahouin blot—under the general heading of "Mvele." We will return to this subject later in the chapter on the Bamvele.

161 Demography. The Yekaba are definitely decreasing in number.

165 The infant mortality rate among them is 34.3 percent. The sterility
163 rate is 33.93 percent; the fertility rate is 4.3 pregnancies per woman, but with about 10 percent stillbirths.

161 The population balance shows a ratio of -4.4 percent births to deaths.

THE BAMVELE AND THE BOBILI

131 Location: 12°30 to 13°30 long.
4°35 to 4°50 north lat.

● 101 On all German maps the people we call Bamvele are designated by the name of Bele (see the Moisel map and Tessmann's tribal map).

4:Dugast--43a S-4 (ca. 1947) 1949 FH9 Fang FH9
Yekaba

●101
131 YeKaba Peoples

[Map 16]

101 We connect the Bobili with the Bamvele because, on the one hand, they do not appear separately from the Bele on the Moisel map (Dume, G3), and, on the other, the traditions pertaining to their origins are not precise enough to permit us to draw a conclusion differing from that of the Germans.

Physical and Human Geography

131 Area: 2, 472 square km.

161 Population: Bamvele—18, 452 inhabitants
Bobili—6, 247 inhabitants

Density: 10 persons per square km.

133 The Bamvele are close neighbors of the Yekaba and the Yebekolo in the north; they occupy a large homogeneous territory on the border between forest and prairie. The country is almost flat, extending into the Sanaga plain and borders the river for about 30 kilometers. The territory is watered by several broad tributaries of the Sanaga. In the east, one of these tributaries, the Long, serves as a frontier between the Bamvele and the Babute, who surround them everywhere except in the south. A few Bamvele villages have been established [361] on the right bank of the Long, and they border the Bertoua road for a few kilometers.

174 Like their neighbors, the Yekaba, the Bamvele in their traditions tell that their origins are to be sought among the Yalongo north of the Sanaga. They too were pushed by the Babute who were under pressure from the Fulbe; they fled south and crossed the Sanaga a little more than a hundred years ago. Their history is identical with that of their neighbors, the Yekaba. /Map 17/ /89/

173 The Bobili believe that they are native to the territory, but they say that in former times their country extended west, beyond the Long. Therefore, the impact upon them of the Babute and Fulbe movements would have been very slight. (1)

1. Unpublished report of Mr. Brothier-Oubre for May, 1945.

114 The administrator Chauleur carried out prolonged research in an attempt to untangle the network of peoples on the banks of the Sanaga. He does not feel that he can make a statement about the remote origins of the Yalongo, but he poses the following problem: "Could they be related to the Ba-yoka of the Congo who emigrated south

[Map 19]

THE MBIDA-MBANE AND THE MVOGO-NIENGE

131 Location: Mbida-Mbane—11°40 to 12°15 long.
4°20 to 4°50 north lat.
Mvogo-Nienge—12° to 12°28 long.
4°20 to 4°45 north lat.

Physical Geography. Areas: Mbida-Mbane—1, 548 square km.
Mvogo-Nienge—710 square km.

101 The origins of the Mbida-Mbane and the Mvogo-Nienge seem to be similar enough for us to discuss them together here.

Geographically they are neighbors. The Mbida-Mbane are located on both sides of the Nyong River, in two sections of about equal size in the north and in the south.

The Mvogo-Nienge are their neighbors to the east, south of the Nyong.

133 Both peoples occupy fertile forest regions. The river Nyong flows northeast to southwest through the middle of Mbida-Mbane country. The Mvogo-Nienge inhabit its banks for only a few kilometers, upstream from Akonolinga.

Human Geography

161 Population: Mbida-Mbane—19, 707 inhabitants
Mvogo-Nienge—7, 291 inhabitants
Densities: Mbida-Mbane—12.8 persons per square km.
Mvogo-Nienge—10.26 per square km.

174 History. The traditions of the Mbida-Mbane as well as those of the Mvogo-Nienge tell of ancestors living on the right bank of the Sanaga, as do those of the Yeduma, the Yengono, and the Yembama (the last two groups have been classified by Tessmann among the Bulu). It is said that three slaves of the same master, whose lives were in danger as a consequence of a great palaver, escaped and crossed the Sanaga. Since they were slaves, naturally no mention is made of their ethnic family. Their descendants comprise a number of the peoples who live in the environs of the Nyong at the present time.

241 Both groups live in a fertile country where the cultivation of food crops may be found adjacent to prosperous cacao and coffee plantations. The inhabitants on the banks of the Nyong supplement their diets with fish.

114 their own penetrating movement, and in a way coming to meet them.

●101 [74] The Fang -- or Pahouin [Pahuin] -- occupy in an oblique direction, northeast to southwest, the upper part of Gabon, with the line of the Ogooué roughly forming their southern frontier. [161] They represent 127,000 inhabitants out of the 415,000 living in this territory. They are separated by the Cameroons frontier from a collection of related and particularly active peoples numbering more than 550,000 individuals. (1) They are divided by the

1. Cf. I. Dugast, Inventaire ethnique du Sud-Cameroun [Ethnical Inventory of the South Cameroons], I.F.A.N., Douala, 1949; or "Esquisse ethnologique pour servir à l'étude des principales tribus du Cameroun français... [Ethnological Sketch to Serve for the Study of the Principal Tribes of the French Cameroons]," Bulletin de la Société des Etudes Camérounaises, pp. 21-22, 1948.

frontiers of Spanish Guinea which, with an essentially Fang population (of nearly 100,000 individuals), isolates closely related groups. The hazards of colonial expansion have led to this partition into three "blocs" which were subject to different policies and condemned for a long time to ignorance of each other.

174 As to the arrival of the Fang in Gabon, we possess a few guide marks. According to our investigations in Woleu-N'Tem, the settlement goes back in this region eight or nine generations, which corresponds to the second half of the eighteenth century. According to E. Trezenem the Fang reached the Middle Ogooué at the beginning of the nineteenth century, (2) and their arrival at the estuary

2. E. Trezenem, "Notes ethnographiques sur les tribus Fan du Moyen-Ogooué [Ethnographic Notes on the Fang Tribes of the Middle Ogooué]," Journal de la Société des Africanistes, Vol. 6, f. I, 1936.

174 forest region was symbolized by the legend told of the adzap (ažambura) hole, referring to the obligation of all migrating groups [75] to pass through a hole dug in the adžap tree. Some of the educated Fang of the present day lay stress on the origins as reported by tradition, stressing the linguistic kinship between the Fang and Zandé dialects, (1) thus linking them to the civilizations of the

1. Kinship recognized by L. Homburger, Les Langues negro-africaines [Negro-African Languages], Paris, 1941, p. 35.

Upper Nile (and from there perhaps to Egypt), recalling the period when their ancestors were dressed "exactly like the Haoussa." (2)

2. In the modern version of the legend relating to the Ndong tribe (dispersed in Woleu-N'Tem).

This more or less explicit desire to give themselves "noble" origins corresponds to the more or less conscious desire of the Fang to force themselves on the forest populations of Gabon.

174 It is necessary to examine precisely the distribution of the
●101 Fang throughout Gabon, and to recall their relations with the neighboring territories of the Cameroons and Spanish Guinea. The first classification attempted by early authors (3) was a division into

3. Captain Maignan, "Etudes sur le pays Pahouin [Studies on the Pahouin Country]", (dating from 1912), Bulletin de la Société des Recherches Congolaises, No. 14, 1931; and L. Mba, "Essai de droit coutumier pahouin [Essay on Pahouin Common Law]," Bulletin de la Société des Recherches Congolaises, June 25, 1938.

"lands": Betsi land (region north-northwest of the Estuary, overlapping Spanish Guinea); Maké land (region southwest of the

174 Estuary and Ogooué-Ivindo), Ntoum land (region north of Woleu-
101 N'Tem, overlapping the Cameroons). This simplified division does not take into account all the groups existing in Gabon, and does not indicate the overlappings between tribes which occur in each of the "lands" where there is constant migratory movement. Moreover, these names have barely survived. (4) They have been

4. Maignan, nearly fifty years ago, considered such a division fictitious.

obliterated by the general designation of "Fang" and by specific names (of tribe or clan, especially of family lines) representing local reality. One might think from certain statements of G. Tessmann and I. Dugast (5) that these names have mostly denoted

5. G. Tessmann, Die Pangwe [The Pangwe], 2 vols., Berlin, 1913; I. Dugast, Inventaire ethnique [Ethnical Inventory], chapter devoted to the Pahuin.

migratory groups that have dominated and assimilated various foreign groups and have thus acquired certain distinctive cultural characteristics.

Father Trilles asserts in a study published in 1912 that similar distinctions can be explained "from the point of view of dialects [78] and not from that of the customs or habits (which) are exactly the same." (1) But the dialectal variants themselves which appear

1. Father H. Trilles, Le Totémisme chez les Fan [Totemism among the Fang], Bibliothèque Anthropos, Vol. 1, fasc. 4, 1912, p. 12.

notably at the level of the names of clans (beginning with Esa, Esé, Esi, ... in the case of the Betsi; with Eba, Ebi ... in the case of the Maké) have become blurred. At the time of the migrations several groups changed their clan name, having become

174 contaminated, so that the linguistic map is no longer indicative
101 of these ancient distributions.

From these facts two conclusions can definitely be drawn. The Fang population is not represented in Gabon by large homogeneous zones as in the Cameroons (where the Evondo country, the Boulou country, etc., can be clearly distinguished). The diverse Fang groups have become interdispersed and in the course of their almost incessant migrations since the second half of the eighteenth century have "digested" the foreign traits peculiar to the peoples they have met. And it is in the Lower Gabon, at the end of their journeyings that the Fang groups present a state of maximum confusion.

162 Administrative documents permit one to get a present-day
178 picture of the distribution of the Fang, a precise picture — at least so it seems. The weakening (indeed the near disappearance) of distinctions between tribes and clans, the breaking up, the scattering, and half autonomy of the various groups, have led to the confusion of these two types of grouping and to placing them on the same plane. The administration cannot be blamed for this, for these two notions are no longer always precise in the minds of the present-day Fang. Let us discuss, first of all, the two zones by which this people reached Gabon, Woleu-N'Tem, and Ogooué-Ivindo. (2)

2. Cf. G. Balandier, Rapport préliminaire de la Mission d'information scientifique en Pays Fang [Preliminary Report of the Mission of Scientific Information on Fang Country], Brazzaville, 1949, étude mimiographiée [mimeographed study], pp. 5-10.

162 Region of the Woleu-N'Tem
361

This region presents a certain physical unity and a true ethnic unity. It is inhabited exclusively by Fang, a relatively preferable demographic situation. In 1949 there were over 71,000 inhabitants. It is surrounded only by either identical or related Fang groups; it

1. Names in brackets / / are the equivalents used in Murdock's tribal list /George P. Murdock, Africa: Its Peoples and their Culture History, New York, 1959, pp. 425-456/. Those names asterisked are the same as those in Murdock's list, op. cit. This list was compiled by Mary Rouse, editor of the English translation.

131 (1) Names of stations.
132 (2) Geographical co-ordinates of the stations.
(3) T: mean monthly temperature in degrees (general mean for the last 10 years). R: mean monthly rainfall in millimeters (general mean for the last 10 years).
(4) Total annual rainfall in millimeters, 1946-1955.
(5) Temperature extremes: maxima and minima during the year (mean for the last 10 years, months and degrees) (Oyem and N'Djolé, have only pluviometric posts).

/4/

Chapter 2

Ethnological and Historical Position

1. Nomenclature

101 The term "Pahouin" is undoubtedly incorrect, but it is convenient. There exists in fact no African designation applicable to the whole of the group of peoples studied here. Some writers (Martrou, Trilles...) prefer to speak of the Fang or Fan group, which has the drawback of creating a confusion with the tribes properly called Fang, which constitute but a fraction of this group. That is why, along with Largeau, Tessmann, Madame Dugast, and others, I prefer to speak of the Pahouin.

It should be observed that this term, long taken amiss by the Africans, in recent years tends to be adopted by them in connection with the political regrouping of tribes, for the very reason that it
101 does not give prominence to any one of them. Thus the Mitzic
614 Conference in 1947, bringing together the Fang, Boulou /Bulu/, Ntoumou /Ntum/, Mvaé, and Fong, took the name Pahouin Conference, Ntoumou, Boulou, Mvaé, and Fong declining to be lumped together under the designation "Fang."

101 Even the origin of the word "Pahouin" is debatable. The most plausible hypothesis is that of Father Trilles, who derives it from m-fañ (radical fañ plus the singular classifier m/be) by way of Pongoué /Mpongwe/, which changes the F to P and is averse to ending

101 a word with a consonant. One would thus have *Mpa'ngwen, from which Europeans have made mpawen, then Pahouin.

About the term "Fang" itself it should be remarked that the regular form m-fañ (Class I or personal, m/be) is in actual fact hardly ever used by the Pahouin themselves, who prefer their usual ethnical constructions, that is, the radical preceded by mon (son, descendant). Thus one says mone fañ, bo' be fañ, like mon éwôndô, mone bulu (1), etc. The meaning of the word is obscure. It does not mean "man"

[104]

1. I usually employ current Boulou orthography, except for words that have an official spelling in general use, like the names of places (Ebolowa, Ambam, not ébolewo'o, mbam) and certain Gallicized names of tribes (the Boulou, the Ntoumou, but Bulu /adjectival use/ Ntum /adjectival use/; the Fang, but the Fañ group). /The last phrase is meaningless for English, because there is no English equivalent for the distinction between capitalized French nouns of "nationality" and the corresponding noncapitalized substantive adjectives. Hence, in the English translation this distinction will be ignored, the official spelling being used for tribal names whether used as noun or adjective. —Ed./

It should be observed, by the way, that bulu and éwôndo are plurals of which the singular (*mulu, *ôwôndo) is not used.

(vir), which is fam, a mistake rightly /5/ noticed by Father Trilles, who nevertheless connects it with a root FA connoting the idea of virility, of violence (fa = machete, fañe = to do on purpose, intentionally, etc).

2. Various Groups and Territorial Distribution

174 It is not easy to define the exact boundaries of the Pahouin group.
583 The lists given by different authors include up to ten tribes, one way or another—thousands of individuals. At the end of the nineteenth century, penetration in extended order* prevented ascertaining

174
53

/* Ordre disperse (Military conception) = extended order. —Ed./

definite relationships. Later, on the other hand, the Pahouinization of neighboring tribes, subjugated or merely influenced, brought about assimilations that were often misleading.

Broadly speaking, we may say that a large body of invaders, rather recently come from the northeast—the Pahouin properly so called—assimilated through contacts on the one hand, some of the inhabitants of the invaded area, on the other hand, likewise assimilated other invaders who followed in their wake. What is certain is that this assimilation or Pahouinization of foreign tribes is going on at the present day, partly due to the mere fact of colonization.

We shall distinguish in this study between the invaders—Fang, Boulou, Beti—on the one hand, and, on the other, the neighboring populations that have been or are being Pahouinized.

A. The Invaders or True Pahouin

● 101 Theories as to their boundaries are too many and contradictory for all me to expatiate on here.

In Father Trilles' view they are divided into two branches: b-Osyéba /Osieba/ in the east, Fang in the west. The Mekuk are connected with the first, the Méké, Betsi, "Mvègne" (Mvaé?), and "Boulé" (Boulou) with the second. Largeau like Schnee bases his division between Bedzi (betschi) and Mekei (makei) on linguistic considerations; the first, in the west, tend to begin their remarks with the formula ma zô na, the second, in the east, with me ki na. Here there appears to be a partial confusion between the Pahouin properly speaking, and the Pahouinized Maka (Mekaé) (1). Madame Dugast

[197]

1. There are indeed two Fang dialects, corresponding to the zô/ki (or jô/ki) criterion, but the people who speak them, all call themselves Fang. Besides, there is a Maka or Mekaé tribe whose language is close to eastern Fang, which it has perhaps influenced.

[197]

101 very rightly points out that the problem is visibly complicated by the existence of reciprocal influences. I therefore suggest, with many reservations, an empirical classification based on the geographical position of the various tribes, the dialectical differences, and the reconcilable portions of traditions and genealogies, all together.

Thus there may be distinguished:

in the south: a Fang group, in the rather broad sense
in the north: a Beti group, perhaps more Pahounized than Pahouin
between the two: a Boulou group /6/

a) The Fang group in the south would include:
the Fang, properly so called, of the Ogooué Valley in the southern Cameroons
the Ntoumou (or Ntum) in northern Gabon (Woleu-N'Tem), Spanish Guinea and the southern Cameroons (Ambam subdivision)
the Mvaé, split into two blocks, to the east and west of the Ntoumou
perhaps the Osyéba of the Ogooué-Ivindo region, nowadays merged with the eastern Fang

b) The Boulou group would include:
the Boulou of the Sangmélima, Kribi, and Ebolowa (Cameroons) regions
no doubt the Zaman of the valley of the Dja
probably the Yengono, Yembama, and Yelinda of the Nyong Valley and the Okak of Spanish Guinea
perhaps the Yesum, Yebekanga, Yebekolo /misprinted in text as Yekebolo/, and Mvélé (1)

1. The last, in spite of the similarity of name, are to be distinguished from the Bamvele or Bele and are to be connected with the Beti.

[104] The situation of the Beti is more obscure. They may perhaps have had a different origin from the true Pahouin, whom they would have followed in their migration toward the southwest. A striking cultural and linguistic likeness to the Fang is observed among certain tribes who are nevertheless separated from them geographically by the Boulou. This likeness disappears progressively as one moves northward. It might therefore be a question of some sort of intermediary

101 grouping between the Bantu of the central Cameroons and the Pahouin.

However that may be, certain tribes cannot be studied except in connection with the true Pahouin:

the Ewôndo of the Nyong-and-Sanaga region
the Bané of Nyong-and-Sanaga, N'Tem, and Dja-and-Lobo
the Fong of the Dja-and-Lobo and N'Tem (the last, moreover, influenced by the Boulou)
the Mbida-Mbané and Mvog-Nyenge, east of Yaoundé, who are probably descendants of prisoners-of-war of the preceding

The Eton of Saa and Obala may also be associated, but already with more difficulty, with the Ewôndo, for instance. On the other hand, the other Beti tribes ought rather to be classed with the Pahouinized peoples discussed below.

B. Assimilated or Pahouinized Tribes

101 Among these we must distinguish those who were in the country at
174 the arrival of the Pahouin from those that followed.
563 a) Tribes that followed the Pahouin invasion. These are fundamentally, as pointed out above, the Beti. According to Nekes, some
[197] of the tribes already mentioned still spoke an ati dialect at the time of the German conquest. At the present time one can point out as in the process of "Pahouinization" (Ewôndo dialect):

The Mangisa, Yekaba, Bamvele, Evuzok, Batchanga /Betchenga/ (Tsinga), /7/ Omvang, and Yetudi of the Sanaga. On the other hand, the Beti of the right bank (Bati, Kombe, Bundju, etc.), also few in number, are more drawn toward the Babouté /Wute/, Bafia /Fia/, etc.

b) Aboriginal tribes or tribes established before the Pahouin invasion. There is reason to treat separately the Pygmy groups (Bibaya, Babinga, Beye'ele) and mixed populations (Bekoé) who live symbiotically with the Pahouin without by this fact being really absorbed.

The Pahouin invasion seems to have come on a country occupied by two Bantu groups come from the east several centuries before, which it drove back either toward the sea or toward the present eastern boundary of the Cameroons.

The first of these would have been the Maka and Ngoumba /Ngumba/ group, which was cut in half by the invasion, Maka on the

101
174
563

east, Ngoumba and Mabéa /Bea/ on the west. The Maka (more correctly Mekaé) have been to a large extent absorbed by the invaders, to the point of being confused with them by several authors.

The second group would have been the Kozimé-Njem (or Jem) /Dzem/, Dzimou /Nzimu/, Bajoué /Badjue/ of nearby origin and likewise absorbed to the point of being confused with the true Pahouin group.

3. Neighboring Populations

As I have already pointed out in connection with the Pahouinized peoples, the Pahouin are literally submerged in a Bantu mass.

Their neighbors to the north, on the right bank of the Sanaga, are those whom Madame Dugast calls the Bantu of the central Cameroons. This represents an extremely heterogeneous group, including tribes that claim to be aboriginal along with others that say they are immigrants, with a linguistic, anthropological, and cultural network that effectively prevents any exact classification. The two main tribes contiguous with the Beti-Pahouin are the Bafia and Yambasa /Yambassa/.

Immediately to the east of the above tribes, still in the Sanaga Valley, are the Wutéré (sing. Wuté) /Wute/ known to the colonial administration by their Bantu name of "Bafouté /Bafute/." They are Sudanese, and it seems likely that it was on account of direct pressure from them that the Pahouin crossed the Sanaga.

To the west of the Yambasa-Bafia, the Sanaga Valley is occupied by the Basa-Bakoko group on both banks. These tribes are difficult to classify. They must certainly be Bantu. Some writers group them under the name Baso; others connect the Basa /Bassa/ with the central Cameroons, Bantu and the Bakoko with the Beti, even with the Pahouin, to whom they in fact show some cultural resemblances.

Along the coast there are Bantu groups: on the coastal range the Ngumba and Mabéa related to the Mekaé mentioned above; on the coastal plain the Duala group, with the Duala (Dawala /Diwala/), properly speaking, the Batenga, and the Kumbé. The Balengi /Lengi (Balenge) ?/ in Spanish Guinea are probably related either to the Mabéa or to the /8/ Duala. In Gabon the Pongoué (Mpongwé) are a residual Bantu-Myéné group, entirely isolated in the midst of the Fang.

To the east of the Cameroons Pahouin, on the left bank of the Dja, the Mekaé, Badjué, Dzimu /Nzimu/, and Jem are, I repeat,

●101 FM 83

Pahouinized to the point of finding themselves mixed with the Pahouin of the Middle Congo. This mingling is still going on at the present time among the other tribes of the Kozimé group and specifically among the Konabembé /Konambembe/, Esel (1), and Medzimé

[197]

1. The Esel require two comments: first, they appear to speak a language very close to Duala; second, they have the same name as one of the principal Pahouin clans.

/Ndsime (Medjimi, Mendsime)?/. All these tribes, coming from the northeast (Mekaé) or southeast (Kozimé), and Bantu-speakers, formerly had a much more extensive habitat to the west and north, whence they were driven back toward the south by the Baya and Kaka, and toward the east by the Pahouin.

The Bakwelé /Kwele/ of the Middle Congo apparently may also be connected with the Kozimé and, like them, may be considered Pahouinized. They were pushed back onto the left bank of the Ivindo at a comparatively recent date, like their neighbors to the south, the Bakota /Kota/ and the Okandé /Kanda/. The Séké and Akélé /Kalai (Akalle)?/ of the lower Ogooué are probably related to them.

Finally, the Pongwé /Mpongwe/—already mentioned—the Ouroungou /Rungu (rungu)/, Bapounou /Puno (Bapuno)?/, Galoa, and Nkomi of the lower Ogooué probably belong to an intermediary group between the Bantu of the northwest (Duala and coastal group) and the Vili-Kongo in the south (Baumann), the Myéné group. These tribes not long ago occupied most of the territory of the true Fang, whence they have been forced back for a century by the Pahouin invasion, which did not reach the sea until 1890-1900. The Benga (coastal Bantu) and Pongwé of Libreville, isolated in the midst of the Fang, the Ouroungou, Séké, Asembé, Galoa, and Bapounou of Port Gentil and Lambaréné are the last non-Pahouin peoples in existence on the right bank of the Ogooué. The Fang have, it must be added, a solid bridgehead on the left bank in N'Djolé District.

We must remember that throughout Pahouin country there are groups of Pygmies, whose status will be discussed further on.

[11] Chapter I

The Fan Tribe

000 1. Divisions of the Fan Nation. "Fan" and "Pahouin" are two words not only synonymous but identical. The four Fan groups. Tribe, clan, and family (elementary cell).

2. Allied Tribes. Likenesses and differences between the Fan and related and so-called related tribes.

3. Size of Population. Errors in official statistics.

1. Divisions of the Fan Nation

101 Before beginning this study, a word ought first to be said about the Fan [Fang] nation and its divisions into groups, tribes, and clans. [Footnote omitted. --Translator]

The Fan or Pahouin [Pahuin] or Mpawin [Mpangwe] (2) --

101 197

2. The word "Fân" is the truly native word to designate this tribe. Strange as it may seem at first glance and in spite of the great change, "Pahouin" is another form of the same word. The first tribes on the coast with whom we were in contact called the Fân "Mpân," or mu-pân (pân, man), abbreviated to mpân by a process common among these African languages. Thus mpira, powder, in Mpongwé becomes efira in Fan; mpilato, tray, becomes filato; epélé plate, from Spanish "plata," becomes mfil by way of plata, epilata, épila, épèle, efèl, mfèle, mfil, etc. Out of "Mpân," a word which only the tribes

101
197

of the Nsex branch pronounce this way, the northern tribes -- Kombé, Banoko, and others belonging to the Mpongwé branch -- have made "Mpangwé, as none of the languages of the Gabon or Mpongwé group let a word end with a consonant but always require a vowel. "Mpangwé" became "Mpangwen" for the French and soon thereafter "Mpangwin"; it has now turned into "Mpawin," "Pawin," and finally "Pahouin," in which form it is indeed difficult to recognize the original.

101 because these three words [12] refer to the same people -- are the most important tribe of the French Congo and the German [now French] Cameroons.

101 The Fan proper are divided into four distinct families
197 with respect to dialects: Bétsi [Betsi], Méké [Mekei], Fôn, and Bulé [Boale] (in manners and customs they are all absolutely alike). These four groups do not speak such different dialects that they cannot understand one another unless at first meeting; they certainly do so after several days of association.

[Five paragraphs in pp. 12-13 deleted here. --Translator]

101 [13][Of the four groups] the first two are by far the best known, having made the first migrations or at least having been the first in contact with the white man. Everything that has been written about the Fan relates to these [two], particularly to the Bétsi.

The Bulé group is often considered to be connected with either the Fan or the Yaundé, through whom it would form the intermediary link with the Méké. The Fôn (1), or people of the

1. Fôn, bamboo pith, dark depths of the forest.

interior, as the etymology of their name indicates, have remained up to the present time altogether inland beyond the Bétsi and
[197 Méké. Their dialect relates them to the Bétsi, differing in being
194] more guttural. The tribes live closely intertwined in the same

101 territory, though each keeps its own autonomy without intermingling.

101 Each of the four Fan groups are divided into tribes, each
619 with its own chief, territory, and autonomy; none is subordinate
727 to another, all the more so because slaves are not taken in war,
266 for unredeemed captives are promptly eaten.

619 The tribes vary in importance according to the level of
614 development, the kind of chiefs they have had, and the size of
174 their territory. Thus, the Yenkwax possess no more than three sparsely populated villages, and at the most they can muster 300 warriors; the Yengon, [14] though a long-established tribe, have only one village and a few warriors; while the Yemvi, on the contrary, inhabit several hundred villages and number thousands of warriors. But about this term "tribe," let me here mention a very important point: at present, and since a migration which, according to my own research, should be dated 32 or 33 generations back, no more tribes are being formed, only clans. Existing tribes (and we shall see in a moment how they may be distinguished from clans) may be said to have been established about ten centuries ago in our reckoning, which clearly does not mean that they did not exist before that time. Their origin must certainly go back much earlier.

619 A tribe rarely remains homogeneous for long. Many factors
614 contribute to its splitting up, such as a series of migrations, family disputes, and the activities of heads of families who are ambitious or eager to throw off excessive authority. The steady growth of a tribe at the same time leads to the overpopulation of villages and the necessity of looking elsewhere for new hunting and agricultural lands; hence, after an indefinite period, a tribe splits into clans composed of an unspecified and highly variable number of families. Some clans are very large, such as the Esingi, and make up hundreds of villages, while others, either because they are very recent or because of the same disintegrating forces as exist for the tribes, number only a few families.

Clans in turn, as a result of the same circumstances that made tribes split into clans, split into subclans, also of varying importance.

From what I have just said, a fact may be immediately deduced which runs counter to the usual generalizations accepted by Europeans and superficial observers. In the view of the latter the

2. Allied Tribes

101 619 Not only do these four large divisions -- Bétsi, Méké, Bulé, and Fòñ -- make up the Fan nation proper, but a certain number of other tribes revolve within their circle and are connected to the same branch. I say "a certain number" because the interior of the German Cameroons and the hinterland lying between the Woleu, N'tem, and upper Sanga rivers has been little explored. Before our arrival the existence of the Dzèm [Njem] was barely known; the Dzandzama had never been mentioned. These tribes form the intermediary link connecting the Fan to the Batéké branch and through this to the Kanioka and other central Congo tribes, [16] whose folklore has analogies with that of the Fan as I recently pointed out. (1)

1. See Anthropos, Vol. 4, pp. 945-971; Vol. 5, pp. 163-180.

A Yaundé grammar was published not long ago in Anthropos; (2) these people are without doubt an offshoot of the

2. See Anthropos, Vol. 4, pp. 684-701, 919-930.

Bétsi branch. The Bosyéba dialect is somewhat different and is nearer that of the Bubi of Fernando Po; the group also belongs to the Fan nation. Finally, deviating from the primitive stock in progressive order, there are the Dzèm, Dzimu [Ndsime], and Dzandzama, nowadays scarcely leaving the jungle and the country of the Nyamnyam [Niam-Niam, Azande]. In spite of what has 197 been said of them in the past, their language is only distantly related to that of the last tribe. (3)

3. Since certain observers and explorers -- such, for instance, as Allegret, a former Protestant missionary in Gabon, who connects them with the Nyamnyam, Fulah,

101 619 To sum up, the Fan may be divided as follows:

197 The Fan, Bosyéba, Bésèx, Dzèm, Dzandzama, and Guma tribes may be assumed to speak separate languages not dialects of one. These languages are, however, closely related; they have very nearly the same principles and are cognates.

Bétsi, Méké, etc., merely represent dialects.

[One paragraph deleted, repititive. --Translator]

101 619 161 The Dzèm, whose hitherto unpublished language I hope to make known soon, are grouped in the upper N'tem region; their population should not be more than 100,000.

The Dzandzama border them on the southeast and provide a linguistic link to the Batéké, southern neighbors; their population is about that of the Dzèm.

The Bésèx, or Bulu, who occupy a large part of the region to the north of the Ogooue, are a widely dispersed tribe, formerly very powerful, now almost extinct through poison, practitioners [feticheurs], and pressure from the Pahuoin. Their population is not likely to be greater than a few thousand. [18]

101 The Bosyéba ... are no more numerous than the Bésex.
619 They have been classed perhaps wrongly as a separate people
161 and in my opinion are basically only tribes long detached from the Méké branch, whose distinctive tattooing and little altered language they have preserved. In 1889 when Fourneau reached
[114] the Bosyéba country to the north of the Campo, he saw his porters, recruited in Méké country on the banks of the Ogooué, immediately fraternizing with the Bosyéba and delighted to discover their own tongue after crossing through Bétsi territory. (1)

1. Cf. A. Fourneau, "De l'Ogooué au Campo" [From the Ogooué to the Campo], Bull. Ste. Geogr. Vol. 12 (1891), pp. 190-215.

[One paragraph deleted about an etymology which author considers "incorrect."--Translator]

The Guma, nowadays very few in number, have been driven back towards the Cameroons; they also are related to the Méké branch. Europeans often refer to the people of this whole group by the term "Makina" from ma ki na, "I say that..."; they have, in fact, a habit of starting all their remarks with these words. The Bétsi are called "Mazuna" for the same reason.

3. Size of the Fan Population

161 The Fan are by far the most important branch. It is extremely difficult to estimate their number. Officially they are only a few hundred thousand. But the official figure is far from accurate, for government statistics only count the man who pays taxes. Furthermore, more than half of the French Congo is unexplored except by a few, infrequent

8: Bennett D-5 (ca. 1898) 1899 FH9 Fang FH9

114 and like a resistless army they are steadily approaching the coast, building towns
167 and displacing weaker tribes. That fine race of people, the Mpôngwes, often spoken of as the "aristocratic tribe," and ranking first in the scale of civilisation above all other tribes in the French Congo, is rapidly dying out, and they are already being supplanted even at Gaboon by the migratory Fang.

The Bulu people inhabiting a portion of the German sphere of influence in
114 West Africa are without doubt very closely related to, if not a direct offshoot from,
197 the Fang; their customs are identical and their language so markedly similar that a person who is able to speak Bulu is readily understood by the Fang. The first
173 day of my arrival among the Fang, after residing in Bululand, I was able to make known the reason for my coming and to ask and answer ordinary questions. While visiting on a small island called Nenge-nenge in the Nkomo River, a very old Fang man told me as follows: When a lad his grandfather had told him that, a long time ago, many of his tribe "changed their towns." These people first travelled far in canoes, and then after journeying for very many days through the forest, they "stopped walking and made new towns," and they did not return. My informant's father had told him later more about these people; they had been heard from, and their long absence from the original tribe had so changed them that "they spoke new words" (a new language).

Examples could be given almost without limit of the great similarity in the
197 language as spoken by the Bulu and Fang. A few will suffice; and I will select
539 from the proverbs of the people which are also identical. Tell a Bulu man to hurry with his work, he will often reply, "*Alu da dayi bol' nzok?*" (Will one day rot an elephant?). The Fang speak the same proverb thus: "*Alu avoti bol' nzok?*" Again, the Bulu use the words *Melu myus* (the days that are past), *Melu osu* (the days that are to come), *Melu mesese* (all the days). These sayings and numerous similar ones are in daily use among the Fang, the words used and the idiom being almost identically the same as in Bulu. I have wondered if the account given me by the old Fang man at Nenge-nenge about the people who years ago "changed their towns," might not be of more than passing interest as touching the genesis of the Bulu.

The Fang people are spread over an immense area of country, and when
101 questioned regarding their numbers they usually reply, "There are Fang and Fang; if you walk and sleep in towns and towns for many *moons* (months) you will find Fang." In the future it will be found that in the ethnography of equatorial Africa the Fang will hold a very important place. As before stated they are unquestionably closely related to the Bulu, and Compiègne recognised a marked similarity between them and the Osyeba, Monbutta and Nyamnyam people. There are
563 several scattered tribes of dwarfs among the Fang. Five of these pigmies live within two miles of my station, and they tell me that more of their people will soon "move their towns" and come to live on the banks of the Nkomo river. The Fang people look on the pigmies as a very clever and superior people, and not without good reason. An old headman told me that the *mon ngui* (dwarfs) first

●103 The place names are usually connected with either prominent landmarks of the natural environment, objects, events, experiences, or characteristics of the inhabitants. Thus, we have the following names.

(a) From palm trees.

103 824 1. Niescham from a nī = lay, žǎm = swamp, raffia palm, that is to say, the village is located where there are raffia palms, the most important plant for house construction.

2. Mabäscham from a bē = follow, žǎm = swamp, raffia palm.

3. Makoda from akōda (plural, makōda) = swamp palm, Sclerosperma mannii, Mann et Wendl., used like raffia for house construction.

4. Nkan from nkǎn(e) = Ancistrophyllum acutiflorum Becc., climbing palm, used for plaiting.

5. Mekan, the same, plural.

6. Nsamenkan from žǎm (nžǎm) = swamp, swamp of the climbing palm Ancistrophyllum.

7. Alen from alēn = oil palm.

8. Malen, the same, plural

(b) From cultivated plants.

9. Matumabai from atū (plural, matū) = taro, Colocasia antiquorum (L.) Schott, and mabai = two; thus, two taros. /52/

10. Bekaba from ekǎba (plural, bekǎba) = Xanthosoma violaceum Schott.

11. Emäangon from a mē ngōn = scatter ngon /a squashlike ground fruit/, that is, for drying in the village square.

(c) From edible wild fruit or fruit trees.

12. Essun from esǔn = fruit of the cardamom, Aframomum alboviolaceum K. Sch.

13. Madschab from madžǎb - oil from Mimusops djave (Lan.) Engl.

14. Fan from fǎ'ne = fruit of the Anacardiacea Sorindeia rubriflora Engl. (afǎ'ne).

15. Abe from abě = kola nut and tree, Cola acuminata (P. Beauv.).

103 824

16. Andok from andǒ̄k = Irvingia barteri Hook. f., Simarubaceae. Mandok.
17. Nkoandok from nkǒk = fallen tree trunk, that is, of the Irvingia.
18. Ngong from ngǒ̄n IV = fruit of the Trichoscypha sp. (engǒ̄n).
19. Alöb from alǒ̄b = Desbordesia glaucescens Engl. (Simarubaceae).
20. Mangame from mangǒ̄me III = Myrianthus arboreus P.B. (Moraceae), perhaps also the symbol of agreement, taken from syncarp.

(d) Derived from other trees.

21. Akak from akǒk = Leptonychia tessmannii Engl., Sterculiacea, the tree of peace, the peace linden.
22. Makak, the same, plural.
23. Nkomakak or Nkolemakak from nkō[l] = hill, that is, hill of Leptonychia trees (makak).
24. Abang (Abanga) from abǒ̄n = species of Ficus, particularly used in the manufacture of bark cloth.
25. Mabang (Mabanga), the same, plural.
26. Akam from akǒ̄m = several species of large Ficus, for instance, F. preussii Warb. and laurentii Warb., striking trees used for the manufacture of cloth.
27. Àjo, Jusch (Ajusch) from ayǒ̄s = Triplochiton tessmannii, used especially for the manufacture of house coverings.
28. Majo (Majusch), the same, plural.
29. Nkolemajo = Nkolajo, from nko[l] = hill of Triplochiton.
30. Owöng from ovǒ̄n = Copaifera tessmannii Harms, famous spirit tree, largest tree of the Fang region.
31. Awöngabai, two Copaifera (abai = two).

31a. Ndschiowöng from ndzéi = bridge, bridge of Copaifera.

32. Elun from elǒ̄n = Erythrophloeum guineense Don. (Leguminosae), striking because of its red bark, a poisonous tree.
33. Belun, plural.
34. Ejen (Elibengang) from ejǒ̄n, elǒ̄bengǒ̄n = Distemonanthus benthamianus Baill., striking because of its beautiful violet-red bark; a medicine tree.

103 824 35. Andung from andŭ̄n = Croton welwitschianus Muell. Arg. (Euphorbiac.), beautiful by virtue of its shining silvery leaves.

36. Akom from akŏ̄m = Terminalia superba Engl. and Diels. /53/

37. Makom (Makomo), the same, plural.

38. Nkoakom from nkok = fallen tree trunk, that is, of the Terminalia.

39. Engo from engṓ, an unidentified tree.

40. Akoga from akō̄ga = Lophira alata Banks, with beautiful, fragrant blossoms.

41. Makoga, the same, plural.

42. Assam from asǎ̄m = Uapaca guineensis Muell. Arg., with a rich, fragrant cover of blossoms.

43. Massam (Massama), the same, plural.

44. Angok from angŏ̄k = Albizzia brownei Oliv., a beautiful tree.

45. Dum from dum = Ceiba pentandra (L.) Gärtn.

46. Medschimitum from mdezī = roots, and tŭm = Piptadenia africana Hook. f.

47. Asseng or Assöng from asŏ̄ń = umbrella tree, Musanga smithii R. Br.

48. Massöng, the same, plural.

49. Nkoassöng from nkok = fallen trunk of the umbrella tree.

(e) From characteristics of the landscape.

103 823 50. Ngbai from ngbǎ̄ī = leafless living tree (its winter condition).

51. Mekumu from nkūm I = standing dead tree trunk without a crown.

52. Ndangöng from ndǎngŏ̄n = clearing.

53. Ewüöle from eyüŏ̄le = clearing.

54. Nko from nkō = hill.

55. Anko = at the hill.

56. Akok from akō̄k = stone, rock.

57. Makok, the same, plural.

58. Maschok from mažōk = rapids, falls.

103 825 (f) Derived from animals or parts of animals.

59. Schok from žōk = elephant.

103 825 60. Mbang, and 61, Mbangschok from mbǎ,n = ivory, and zǒk from elephant.

62. Mboleschok from ebō[l] = spoiled, that is, spoiled elephant.

63. Akuleschok from aku[l] = feet of animals, feet of the elephant.

64. Nnoschok = Nloschok from nlǒ', nnǒ' = head, head of the elephant.

65. Abumeschok from abǔm = belly, belly of the elephant, because they had eaten up the village plantation.

66. Bindeme from indēm V = fruit bat.

67. Böngomo from ongǒmo III = chimpanzee.

68. Akulangomo from akū[l] = feet, claws of the chimpanzee.

69. Ebóloua (1) from ebō[l]-o-wǫā = spoiled matter of the chimpanzee, spoiled chimpanzee.

1. The official spelling is Ebolowa. For the sake of consistency I write Ebóloua, since by 'w' in German spelling I denote only labial sounds.

70. Akuasö from akū'a = animals' lair, zö = leopard.

71. Olamesö from olǎm = trap or snare, zö = leopard.

72. Ewes from evés = bone. /54/

73. Bojabúnkulu from boyā = little wives (plural), bo = of, (n)kū[l]u = turtles; thus, the little wives of turtles.

74. Bebass from ebǎ,s = scale; the inhabitants of this place probably eat a lot of fish.

(g) From objects.

103 75. Ntum from ntúm = walking stick.

76. Ebai from ebai = strands taken from the stalk of a raffia leaf, used for house construction.

77. Bebai, the same, plural.

78. Ngam from ngǎm = barbed hook on a spear.

79. Bebada from ebā'da = carrying baskets used by men.

103

(h) Derived from experiences or characteristics of the inhabitants.

80. Bissis from isi.s V = he who represents the shadow in the moon cult.

81. Elanga from elǎ́ń actually = the anus or, metaphorically, bad people.

82. Ekekö from a ke ekekǒ = stay away completely, because strangers were seized and killed and they did not come back.

83. Esamedulu from a zǎmǎdǔlú = to carry on shamefully, that is, to have sexual relations with a woman of the same family.

84. Nssälang from nsɛ̌n = village square, and elǎ́n (see under 81); the people committed immoral acts, acts of hostility, whenever a stranger passed through.

85. Bilnemajong from a bɛ̂ne, biɛne = not to be afraid of someone, that is, to have no respect, and mayon = families; the people have no respect for the members of other families.

86. Ajaofun from a ńǎ or nǰǎ = to feed oneself, and fūń = maize.

87. Akinebetom from a kīne = to converge (by running) upon one place, and etǒm = quarrel; the people come running to one place in order to start a quarrel.

88. Olunemang from olūń = annoyance or anger, and mǎń = coast; the people had been annoyed about the inhabitants of the coast - perhaps Whites; or it was on account of the distance.

89. Ngba from ngbǎ′ = quiet, peaceful people (in contrast to 82).

90. Massambe from a sǎmǎ tǎń = to fish with a net.

91. Nschugebot from nzuge = to talk all at the same time, and bot = people; there are many people who talk there.

92. Euuma from a wū′mǎń = to have a relapse in an illness.

93. Awomo from a yǒ′mǒ = to faint; this name, like the previous one, alludes to the entanglements of these frontier villages between Ntum and Bulu.

94. Nnoajong from nnǒ′ = the head, and ayǒń = family; thus, the "chief representative" of the kin group.

95. Ajene from a yɛ̌n = to see, referring to the mountains that are visible from the village, "Montevideo."

103 96. Ntedenga from ntĕt = hundred, and ngā = rifle; a hundred, thus, an infinite number, of rifles. /55/

97. Makunanam or Makonanam from akŭn = post, pillar, and nnăm = the locality; that is, a locality which stands as firm as a post.

98. Ndschiabot from ndzĕi = bridge, and bōt = people; that is, a bridge for people.

99. Ejamang from a yăk = to stay the night, and a măn = on the way to the coast; thus, one of the few villages favorable to travel and progress.

100. Ajaamentangan from a yăk = to rest, and mentangan = Whites.

101. Akunekiä from akŭn = post, pillar, stake, and ekiĕi, of iron (compare 98).

102. Ebualebambe from a bŭele = to be broken in pieces, and mbāmā III = large village; the houses were extremely dilapidated.

103. Niemajong from a nĭĕ = to put inside, and mayŏn = family unit; that is, the village had been established between villages of other kin groups.

104. Ndschobangon from dzōb = sky, and ngŏn = moon; thus, moonlit sky.

105. Olŏadzob from olŏĭ = hole, and dzōb = sky; a hole in the sky (probably between the clouds).
/Fig. 16 appears here in the original text./

Aside from place names, the Pangwe also have names for fields. For instance, in the environs of the settlement Alén (Essauong) there are the following: enumepfidi = powder path; nsa[k]-abea = abea swamp forest. There are only a few special names for mountains, for instance, Nemembŏng = good heart (see the map); usually the names of mountains and mountain ranges are borrowed from those of the neighboring settlements. According to the statements of the present inhabitants, the names of rivers for the most part can no longer be explained, because, as the inhabitants claim, these names were taken over from the former inhabitants of the region. The same would seem to apply in part also to the place names.

342
353
354

Fig. 37. Ground Plan of a Pangwe Dwelling.
a, sleeping benches; b, fireplace (kitchen); c, pot with water; d, grindstone; e, baskets; f, bundle of maize cobs; g, hens' nest; h, door posts.

like the toys of a gigantic child that have just been finished by a giant toy dealer and are placed on the clean earth as though on a gigantic table. There are others in which one actually finds not a single house which does not let in the rain in torrents, not a single house whose walls are still standing straight and which does not provide entry for nocturnal reptiles between its walls and the ground. The reader should consider the significance of the name of the village of Ebualebambe ("tumble-down village") which, indeed, as I [103] saw, did full justice to its name. 342

Whether the houses are carefully built or not, they always look depressed because they are too low in relation to their length, which seems even greater /73/ /Fig. 37 appears here in the original text/ than it actually is because of the way the houses are arranged in rows. One gets the same impression when one goes inside; on the average it is so low that one can stand in it only in a bent position for fear of coming into painful contact with the roof or the household utensils hanging from it. It is rare indeed that one can stand upright on one of the low sleeping benches without bumping his head.

As in the case of the meeting house, the interior of the dwelling (Fig. 37) has a single room which the Pangwe divides into atüm a nkiai and atüm akui, that is to say, into a western "room" (on a lower level) and an eastern "room" (on a higher level) which are to the left and right of the door. Figure 38 gives a view of the interior of a Fang hut. In this illustration one side wall and the right

173
[533
538]

superhuman heroes, who include not only their ancestors but also the earliest well-known Europeans: Ngôtô Zambe (Rev. Good), Mendômô (Hauptmann von Hagen), Akôk (Marius Pascalet), etc., thus are found to be naturalized as it were and incorporated into tradition.

Driven out of this country by red giants (or by a red giant), the ancestors, fleeing to save their lives, were brought to a standstill at the Sanaga, incapable of crossing it until the intervention of the guardian of the waters, a python according to Beti and Boulou, a crocodile according to /16/ the Fang (1). By stretching himself across

1. Bertaut gives the names as mot yom and nga medja or ngan meja. Discounting a mistake in transcription, these expressions could mean "a being to be supplicated," "crocodile to be supplicated," from môt (Fang, môt, mur) = person; ngan = crocodile; ja'é (Boulou) dzak, dzaghé (Ewondo, Fang) = to ask, to supplicate; yom = to beg, to implore.

the river this animal formed a bridge which the ancestors crossed family by family, in order of primogeniture, until the moment when a child (or woman) wounded the animal's back by letting fall a weapon (or a torch). The animal dived below, abandoning on the right bank the Beti group that is still there today.

[103] Osoe Nnanga, whence Europeans have derived "Sanaga," means
[822] "white river" or "river of the albino." White is the color of death;
[124] ghosts (bekôn) are white; albinos are thought to be offspring of incubi.
[775] Lastly, the land of the dead has always been situated in the west, toward the sea (mañ), even though the Pahouin could not have known the sea except by hearsay. Considered in connection with some of the legends collected by Trilles, these facts may lead us to think that the Pahouin in crossing the Sanaga were entering, at least symbolically, the land of the dead.

When they had reached the left bank, they found their road blocked by an impenetrable forest, with the single path obstructed by an

such a case we gather that each principal town of a subdivision is a genuine center of attraction. Although new these towns are not artificial. There is another piece of evidence for this, the social-occupational distribution of the urban population is almost constant from one town to another, a proof that it corresponds to needs that are also constant.

Out of 100 inhabitants one generally finds: laborers 16.5, employees 12, traders 8.3, chauffeurs 6.9 (and "motor boys" 4.3), public service employees 6.7, domestic servants 5.8, carpenters 4.9, masons 4, farmers 3.5, tailors 3.2, mechanics 2.9, photographers 0.8, herders 0.5, catechists 0.1, without occupation 9, etc.

This in general outline is the present-day distribution. Let it simply be kept in mind that, with the diffusion of a new culture, the whole society becomes modified. The techniques and tools in use have been increased and diversified at the same time as social conditions.

Chapter 5

Social Organization

1. Forms of Settlement, Habitat

The basic social group is the patriarchal family (nda bot = lit., house of the people), to which corresponds the hamlet or elementary village, the jal (Boulou, pl. mal; Fang, Ewondo, dzal), generally called by the name of the patriarch (ésa = father; nnôl = eldest, senior), but sometimes, when isolated, carrying a special toponym (éyôlé = proper name, designation; a person's name is rather ŋôé; Fang, édzoé). These mal are usually arranged into multifamily, sometimes multi-clan, villages, minlam (sing. nlam), the latter term designating both the group of dwellings and the soil appertaining to them. The nlam always has a place name of its own, which may refer to its geographical situation: nkôlayôp = on the hill; to a topographical or botanical peculiarity: ako'abete = dressed stone, ajap = the name of a tree, ma'an = crossroads; or to an incident connected with the founding: éholewo'o (Eholowa) = decayed chimpanzee, because the village was

103 set up at a spot where the body of a chimpanzee had been found; menjikɔ̂m = from me nji kɔ̂mbo, I did not want to, the founding family not having wanted to go any further. /Or the nlam may take its place name/ from a nickname or whimsical name: mafi = sea, the site being considered "as beautiful as the sea"; kameiɔ̂n = Kamerun, "because a white man told us that the country would be called thus henceforward; évuzok = elephant's stomach, because of the appetite of its inhabitants, etc. It may also happen that a village name repeats that of its founder's native village, sometimes coupled with an indication like baa = second, mfefé = new, or with the name of its founder or chief, Méyo me Nkulu, the Méyo of Nkulu.

166 The leapfrog advance of small Pahouin groups at the time of the
621 invasion has already been described. Each of these groups generally
TR corresponded to a hamlet—jal—or to a village—nlam—or, rather, to the corresponding family units, nda bɔ̂t or mvɔ̂k. The migrating group retained rights to the abandoned site (bilik). Today the migration of whole villages is much less common. Rather, we are witnessing either a "swarming off" of villages that are overpopulated in relation to the amount of land available for plantations (in particular land near a vehicular road, especially in Cameroons), or a kind of explosion or social disintegration, /41/ the latter phenomenon being particularly noticeable among the Fang, where it has been well described by Balandier. Administrative action has often been a prime mover in the latest migrations: in Gabon, for instance, there has been an attempt to move whole villages for administrative, economic, or hygienic reasons, but in doing so collective groups have been broken up that had already been weakened by the disappearance of ancient defense needs and by the economic changes resulting from colonization. The new villages, often reconstituted without taking into account previous clan or family structures, no longer had any cohesion and split up into small rootless hamlets, poorly populated, continually moving their sites in disorderly fashion and usually seeking to escape contact with the administration. Since 1946, especially at the instance of the deputy, Aubame, himself a Fang, there has come into existence in Gabon a movement to regroup villages by clans, the results of which do not seem to have corresponded to the hopes of its promoters.

166 The situation is perceptibly different in the Cameroons, where the
621 early introduction of the cultivation of cacao (before 1914 in Ewɔ̂ndo

101 a word with a consonant. One would thus have *Mpa'ngwen, from which Europeans have made mpawen, then Pahouin.

About the term "Fang" itself it should be remarked that the regular form m-fañ (Class I or personal, m/be) is in actual fact hardly ever used by the Pahouin themselves, who prefer their usual ethnical constructions, that is, the radical preceded by mon (son, descendant). Thus one says mone fañ, bo' be fañ, like mon éwôndô, mone bulu (1), etc. The meaning of the word is obscure. It does not mean "man"

[104] 1. I usually employ current Boulou orthography, except for words that have an official spelling in general use, like the names of places (Ebolowa, Ambam, not ébolewo'o, mbam) and certain Gallicized names of tribes (the Boulou, the Ntoumou, but Bulu /adjectival use/ Ntum /adjectival use/; the Fang, but the Fañ group). /The last phrase is meaningless for English, because there is no English equivalent for the distinction between capitalized French nouns of "nationality" and the corresponding noncapitalized substantive adjectives. Hence, in the English translation this distinction will be ignored, the official spelling being used for tribal names whether used as noun or adjective. —Ed./

It should be observed, by the way, that bulu and éwôndo are plurals of which the singular (*mulu, *ôwôndo) is not used.

(vir), which is fam, a mistake rightly /5/ noticed by Father Trilles, who nevertheless connects it with a root FA connoting the idea of virility, of violence (fa = machete, fañe = to do on purpose, intentionally, etc).

2. Various Groups and Territorial Distribution

174 It is not easy to define the exact boundaries of the Pahouin group.
563 The lists given by different authors include up to ten tribes, one way or another—thousands of individuals. At the end of the nineteenth century, penetration in extended order* prevented ascertaining

105

Identification

The Fang (Fan, Fanwe, Mfang, Mpangoue, Pahouin, Pangwe) are a Bantu people. Dugast (1949) reports nearly 600,000 in Cameroon, and other sources report about 125,000 in Gabon. They are relatively recent immigrants from the upper Sanga in the NE, whence they were pushed by the Mbum and Baya. They did not reach the equator until about 1837. Among them live numerous scattered Pygmies of the Ajongo, Beku, and Jelli (Bagielli) groups. Of the numerous subtribes, the following are among the most important:

Bene (Bane), numbering about 60,000.
Betsi (Batchenga, Betchenga, Betsinga, Tsinga), numbering about 16,000.
Bobili, with the Bamvele, numbering about 25,000.
Bulu (Boulou), with the Tembama, Yelinda, Yengono, and Zaman, numbering about 110,000.
Eton (Etun, Toni), numbering about 112,000.
Ewondo, with the Evuzok, numbering about 100,000.
Fang proper, with the Mvae (Mwai, Mwei) and Ntum (Ntumu).
Mvele (Mwelle), numbering about 37,000.
Syeba (Osheba, Osieba).
Yaunde (Jaunde, Yaounde).
Yebekolo, numbering about 23,000.
Yekaba, numbering about 15,000.

Basic Economy

Primarily agricultural, with fishing of considerable subsidiary importance, followed by hunting and animal husbandry. The staple crops, in order of importance, are manioc, bananas, groundnuts, ngon (Cucumeropsis edulis), maize, taro, and yams, but makabo (Xanthosoma violaceum), sweet potatoes, squash (Cucurbita maxima), and peppers are also raised. Goats, sheep, dogs (eaten and used for hunting), and chickens are kept; ducks, pigs, and cats are recent introductions. Trade is of considerable importance. Cattle are not kept. There are markets.

Sex Division of Labor

Men hunt, fish (but women engage in fish drives), tend livestock, and clear land, but women do all other agricultural work except the planting of ngon.

Property

Iron bars and spearheads are used as currency; other valuables include livestock and land. Women own no property except chickens. Movables are privately owned, but land is owned by the village headman, who receives a share of all game caught. Individual men have usufruct rights to land under cultivation.

Inheritance is patrilineal--by sons, by Br in default of sons. The ElSo (or another son designated by Fa) inherits half of all movable property, the remainder being divided among the younger sons.

Social Stratification

The Fang do not keep slaves.

Marriage

There are three prevailing modes of marriage:

a. By payment of a substantial bride-price--the equivalent of 200-750 German marks (1912) in spearhead money, weapons, sheep, and cloth.
b. By exchange, in which a man gives his Si or Da in exchange for a wife.
c. By gift of a daughter from a chief to a man of another sib to whom the chief has previously "lent" one of his wives, in return for faithful service.

Polygyny is general and preferred. The first wife is chief wife. Each wife has her own hut, and the husband sleeps with each for three nights in rotation. Secondary marriages are preferential with FaWi.

Family

The residential unit is a patrilocal extended family, which includes the families of brothers and sons and also of dependents.

105

Residence

The patrilocal rule prevails, at least for marriages of the first two types.

Kin Groups and Exogamy

Local exogamy is usual.

There is some suggestion of bilateral kindreds; relatives on both the father's and mother's sides are called "my relations," and certain obligations of hospitality and sanctuary are involved. Marriage and sex relations are forbidden by maximally extended bilateral incest taboos.

There are exogamous unnamed patri-sibs and localized patrilineages bearing ancestral names.

Kinship Terminology [from Johnston; K from Koch]

Fa--tata, tara, esa, tate (K). Mo--nya, nyie, nanne (K). Ch--mone, mon. Br--ndoma. Si--kal. Hu--fam. Wi--ngal, minningga (K).

GrFa, GrMo--nvamba.

Settlement Pattern

Settlements are compact villages of 2-50 huts arranged in two parallel rows, with one or more men's houses. The huts are rectangular with gable roofs.

Community Organization

The village is normally a patrilocal clan-community, consisting of one patrilocal extended family or of several headed by men of the same patrilineage. Boys are circumcised at about the age of puberty.

Local Government

Each village has a headman, who is normally succeeded by his ElSo.

105

State

In general, there is no political integration above the local level. However, in the north, especially among the Mwele, chiefs commonly have authority over several villages.

Warfare

Intervillage warfare is common--caused usually by revenge for murder or by failure to return a bride-price or substitute another daughter when a bride dies. Cannibalism is practiced on slain enemies.

Panyella, Augusto and Jorge Sabater. Los Cuatros Grados de la Familia on los Fang de la Guinea Española, Camerones y Gabon [The Four Social Groupings of the Fang of Spanish Guinea, Cameroons and Gabon]. Archivos del Instituto des Estudios Africanos, Vol. 9, No. 40, pp. 7-18. Madrid, 1957.

[The following is taken from Vol. 9, Abstract 65, of African Abstracts, January 1958. The four social groupings below the clan (ayong) are, in decreasing order, the maximal lineage (etunga-bot), the lineage (ayom-bot), the extended family (nvogo-bot) and the family (nda-bot). Baumann's statement, that the only political and social unit among the Fang is the agon (ayong, clan) composed of family units or groups, must be refuted. The Fang clan and family is exogamous and patrilineal. Each of the social groupings is given the name of a person who is regarded as its founder. The family has little judicial authority. The extended family occupies its own section of the village, with its chief and meeting-house. The lineage is made up of a number of extended families, socially and territorially unified. The maximal lineage is the highest social grouping, consisting of all those lineages which acknowledge descent from a common ancestor, who is the eponymous ancestor of the whole group. The Fang village consists of exogamous patrilineal clans and polygynous families. -- Analyst]

[The following is an abstract by J. Cola Alberich, taken from African Abstracts, Vol. 9, Abstract 558.

"Fang society is crossed by a network of associations which links its members independently of the natural blood tie, forming an extension of this. Its characteristics are: the attainment of a desired end; the widening of the ambit of the natural circles of social life, embracing members of the etunga and adyon, including enemies; the importance of secrecy and the existence of a mysterious power linked to the association. This power can be the personification of some natural phenomenon, the spirit of a dead person, or an anthropomorphically conceived being. The secret association forms a closed circle and is a true hierarchy, consisting of graduated stages of initiation. Elevation to a grade requires the undergoing of certain ritual ordeals."--Analyst]

Trujeda, Luis. Sociologia Pamue: La Norma Consuetudinaria [Fang Social Organization: The Customary Pattern]. Africa, Vol. 3, Nos. 31/32, pp. 115-117. Madrid, 1944.

[The following is an abstract by J. Cola Alberich, taken from African Abstrcts, Vol. 9, Abstract 559.

"The Negro does not feel himself to be fundamentally independent. Law is established by custom, whether for members of the etunga, adyon, secret association, or groups linked by a pact. The pattern is shown in a negative aspect in the form of prohibitions (eki), some applying to all members of the group, others to certain persons only. This pattern is often confused, the existence of contradictory authorities being common."--Analyst]

The Groundnut, Arachis hypogaea L.

(Plate 6)

244 The groundnut (owǐnó, derived from the stem a wǐno = to set, to plant) occupies the third – with the Jaunde the second – rank in the order of the most important food plants. In the Fang region five different varieties are distinguished, of which one, mǒne owǐnó, has again been given up because of its small fruit. Of the remaining four, the following are found together in one and the same field with equal frequency: the upright, more hairy asǐmena, which according to Sadebeck (1) is Arachis

[113]

1. R. Sadebeck, Die Kulturgewächse der deutschen Kolonien und ihre Erzeugnisse /The Cultivated Plants of the German Colonies and their Products/ (Jena, 1899), p. 230.

asiatica Lour. (it is illustrated by Plate 6), and the low-growing Arachis africana Lour. or var. glabrata D.C. (ebǎn, Nzum; ekǎ'b or engǎ, Fang. The variety eyǒ'lo (Fang) or evǒ'le (Nzum), distinguished by fruit that is thicker and not quite so long, and the variety eǎ'na are likewise sometimes found in the same field.

244 311 Anyone who travels in the land of the Pangwe will immediately recognize how important a role the groundnut has in the agricultural economy of the natives. The only farm that may delight the eye of a European are the groundnut farms. Walking through the camava and sugar cane plantations, one is afforded no unobstructed over-all view of them, and on the open farms one constantly has to climb over tree trunks that have been left lying around. After passing through these or even through a stretch of dense forest or bush and then coming upon a groundnut plantation, one draws a breath of relief. The wanderer will see the plantation lying before him, framed by the darkness of the forest interspersed with the brighter green of the young maize which is usually planted, along with the groundnut, as a border

285 The second class of baskets displays a variety of braiding elements: one that is flexible and active (braiding strips) (2), forms

[13] 2. See the discussion in J. Lehmann, Systematik und geographische Verbreitung der Geflechtsarten /System and Geographic Distribution of Types of Braiding/, Leipzig, 1907.

the bottom of the basket, and, ascending upward, is tied around the second, stiffer, passive one (braiding strand). /215/ Placed in the form of a spiral, this second element forms the wall of the basket. The sources of the braiding elements are as follows.

285 824 The active elements are taken from Sarcophrynium stalk strips, Pandanus leaves, or -- this is the predominant source -- the outermost wood layer of the rattan palms. The term for these current today is the collective name nlɔ̄ŋ I, a word derived from the root a lɔ̄n "to braid, to twine" (compare a lɔ̄n ndɨ, "to weave a house together, to build"; a lɔ̄n nkɔ̄ɔ̄, "to weave baskets"), and used at the same time for the "bush rope" obtained from the rattan palms. Formerly, nlɔ̄ŋ designated only the Eremospatha macrocarpa M. et W., which occurs only in the coastal strip west of 11 degrees longitude and in the north or northeast of the Pangwe region. Later, when the Pangwe came south, the term was transferred to the two rattan palms occurring there which are used for the same purpose, namely, Eremospatha tessmanni Becc. (ongɨm) and especially Oncocalamus mannii Wendl. (ebɔ̄ŋ Fang, ebɔ̄ŋ Ntum; young, ebɔ̄ŋ). Plate 16, Drawing 1, which is important there (1).

342 824 1. The rattan palms mentioned, aside from being used in weaving, are also used in the following ways.
1. In house construction: as rough bands, to tie together the framework of the house; as finer bands, to tie together the lathes of the side walls and the raffia leaflets of which the sleeping

325

trellis is constructed over the smelting box. Smelting requires a number of hours. The very soft iron obtained is pounded to pieces and then forged."

[113] (From Mitteilungen von Forschungreisenden und Gelehrten aus den deutschen Schutzgebieten /Reports by Explorers and Scholars from the German Protectorates/ by Friedrich von Danckelman, 1890, page 63.

/230/ /Fig. 182 appears here in the original text./

/231/ Now the bellows workers (ndɔ́, -ndɔ́m) put their two tools, which they have brought with them, into position, and in the manner already indicated stick the blast pipe into the furnace in place of the guide rod, so that the funnel-shaped end juts outward about ten to twelve centimeters. Then they arrange the bellows (Drawing 1, g) in such a way that its mouth is from two to three centimeters from the blast pipe and clamp it between two pairs of sticks, called mvɛ̂k (see Fig. 183), which are planted in the ground. This simple arrangement has given rise to the following

[539] proverb:

bɔ́kɔ́ bɔ vɔ̂de akɔ́ɔ́ o mvɛ̂k .

The Pygmies, they despaired of smelting because (of the) the holding sticks (which they did not know how to attach).
This proverb is said whenever some great enterprise fails because of a trifle.

325 461 791 Now everybody sits down on tree trunks around the furnace. A piece of red-hot charcoal is introduced into the furnace through one of the blast pipes, and then the working of the bellows begins (Fig. 184). This is done in the following manner. First one and then the other hide are alternately pulled up and down by hand, or, if one wants to work at high pressure, both hides are pulled together. This is a strenuous and monotonous job which the natives try to alleviate as much as possible by singing, which is led by the medicine man (in Plate 17, the gentleman to the right with folded arms), by shouting, laughing, talking, and telling stories. Above all, the

551 (something small, delicate on something gigantic, strong) -- file
539 (something that destroys something else) -- man in salt water (unclear, perhaps corresponding to our "cart that is stuck in the mud"). -- One chops off the young leaf tips of the fern (since this is the food of women, it is unsuitable for a man). -- The Solanum puts forth fruit, and the harvester stands ready (sense clear). -- The caterpillars that sit on the trees are ripe for eating, and the mother has a climber who gets them down (this refers to Amwôn himself). -- The Musanga has no guy ropes (lianas, and so forth), the Macrolobium no buttress roots. -- Son of one born an Eja.

As one can see, the jocular names, like the drum names
551 (chiefly in the south), are largely taken from a kind of proverbial speech /285/ that alludes to a peculiarity of the bearer; the peculiarity was no longer known in the foregoing case.

Of course, the Whites also have their nicknames; indeed, they are known almost exclusively by these since the natives usually do not know the European names or cannot pronounce them.

To the name given by the father, the father's own name is added. If, for instance, the father is called Esun and the son is called Boka, the complete name of Boka is Boka-Esun, that is, Boka, son of Esun, or -- with a genitive particle -- Boka Bosun(e): if Boka's son is called Ayong, his complete name is Ayong-Boka, etc. (1).

[113]

1. Von Stein (Mitteilungen aus den Schutzgebieten /Reports from the German Protectorates/, Vol. 12, p. 137) says of the Bane (= Bene): "Almost all names are double names, and in sharp contrast to the custom of the Bakoko /Koko/ (should probably read: Basâ), the name occupying the second place almost always signifies the mother's name. Only in very exceptional cases does the Bane, if he has an especially famous father, add the baptismal name, if I may use the term, of his father's name. Balingekore thus

means: Balinge, son of Ekore."

551 [113] The custom of the Bane of adding the mother's name to one's own, as reported here, is found also among the Jaunde according to Zenker (Mitteilungen aus den deutschen Schutzgebieten, Vol. 8, p. 50).

Family names in our sense are unknown to the Pangwe. Towards strangers they use the name of the kin group, which is after all to be understood as a "family" in the Pangwe sense; to this, at the same time, is added the name of the mother's familial group. My faithful factotum, Ayong, who has already been presented to the reader in the picture on Plate 3 /Ed., Vol. 1/, would, for instance, introduce himself as follows:

[539] ma ne ayŏn-bokǎ, mǫ̃ne eszǎwǔ̃n,
I am Ajong-Boka, child (of the family) Essauong,

mone ngǔ̃n esatǫ̃p.
child (of a) girl (of the) Essatop.

To learn this complete name by heart is the child's first task. 551 867 Once the child can recite it without a mistake, the father, proud of the cleverness of his offspring, proceeds to the further task of acquainting the little one with the names of his grandfather and great-grandfather (naturally on the father's side). Let us again take an example.

The child is called Ndungo, his father Essun, from the Abai family, in other words: ndǔ̃ngo-esǔ̃n, mǫ̃ne abai, etc., Ndungo of Essun from the Abai family. -- "But from whom am I, Essun, descended?" asks the father. "esǔ̃n-nzǎma, that is, Essun from Nsema," is the answer. "And from whom is Nsema descended = nzǎma nza?" "nzǎma-ngǔ̃." -- The child learns it all very [116] quickly, because as regards its ability to grasp things /286/, the Negro child is far superior to white children. -- The Pangwe, however, does not stop with the grandfather. Each of these black gentlemen has all his ancestors in his head, just like our feudal lords. To be sure, none of them knows more about them than

578 publicly, as in the case of the paternal curse, or in the field
595 when the women are among themselves. /293/

A droll effect is created when the souls are cursed by their
769 descendants. The curse is pronounced at the ancestral feast if it
578 is believed that the souls of the ancestors no longer care about the living, and the curse is also revoked on the same occasion. Although, as ancestors, the souls were more elevated persons who actually cannot be cursed, here is another instance where might comes before right, for after death the souls are powerless on earth, as we know.

Finally, there is a belief in secret curses, and thus, if people
578 are constantly unlucky in life, they are sometimes afraid that they are being cursed by this or that person.

The most terrible curse is that which was pronounced by Nzambe (God) upon human beings when they commited the first major offense against his paternal will. As described in Volume II, page 59 /Ed., not translated/, the curse is symbolically erased during the cult celebration.

3. Children's Games (1)

524
[113]

1. See G. Tessmann, "Die Kinderspiele der Pangwe" /The Children's Games of the Pangwe/, in the Baessler-Archiv, Vol. 2, No. 5-6, p. 250. The children's games are discussed there in detail.

I divide children's games into two major clases: the generally imitative games, and the independent games. Of the former I distinguish three groups: first, gymnastic games which imitate the movements of adults (running, sport, and dancing); second, war and hunting games which imitate the main occupations, not to say professions, of adults; and third, all the rest of the imitative games. The independent games, which are on a higher level, I divide again into three groups: first, toy games, that is, games that are played with objects and do not imitate any

2: Tessmann--200 E-5 (1904-1909) 1913 F919 Fang F919

524
113

In Mitteilungen aus den deutschen Schutzgebieten /Reports from the German Protectorates/, Berlin, 1895, Zenker mentions wrestling matches between female women and girls. I myself have never heard of these.

[81] This group of Beti, or Beti, north of the Sanaga, whom the Ger-
[83] mans—being good linguists—recognized easily by their language, were all those whom the French administration later called by the general name "Sanaga." They included the Tsinga, the Mvele /Mvelle/ (contrary to Nelson' opinion), the Bevek, the Mangisa, the Ngoro, and the Komba.

[84] What is the origin of these Beti? G. Tessmann thinks that they may
[79] be related to the peoples he has named "Mittelkamerun Bantu /Middle Cameroons Bantu/" (Bafia, Bassa /Basaa/, Tembosa, etc.). But he does not confuse the two groups. He believes that the Beti came from the north, where they first lived on the left bank of the M'Bam. Then, pushed by the Bakoua, some of them moved to the right bank. He notes that from that point on two tendencies are apparent: Some of the Beti were attracted by the civilization of the northeast (Bakoua), others by that of the southeast (Pahouin). Thus the Bevek and the Tangabak (the Pik and the Fak) migrated and scattered in a direction that differed from the one taken by groups such as the Bessings and the Mangisa, who were moving toward the Pahouin. The latter two let themselves be assimilated quite rapidly.

According to G. Tessmann, the Beti are not Pahouin but rather a population encountered by the latter in their migrations. These people were attracted or influenced by the Pahouin and, in turn, influenced the invaders, just as they influenced, or were influenced by, the central Bantu. In the course of influences and counter influences, the intermingling of Pahouin and Beti, as much in culture as in language, has been so great that it is now difficult to untangle the threads of their various ramifications. Some threads have been lost, others broken, and those that remain have taken on a variety of hues.

THE PAHOUIN

[10] It has seemed necessary to us to employ the term "Pahouin,"
[9] generally used by the French to designate a group of peoples who,

[34] with names beginning either with Eb (Makaci) or with Ib (Bewaiti).
[0] The Governor General, Courmeric, after carefully surveying the peoples in the vicinity of Tonundé, where he was administrator, prepared the following table:

And he concluded: "It appears that among the Beti one can also include the Bedjia, the Bevek, the Bemvele, the Djemi, the Ngum, and the Tsogefub."

It is impossible to say whether or not this problem will ever be solved, for it becomes more and more complex from decade to decade because of the changes which are taking place, with perhaps increasing speed. We would like future researchers to be aware of its complexity; they should not believe that we have thought to present solutions here.

THE BUNDJU AND THE KOMBE

[3] Location: 11°25 to 11°50 long.
[0] 4°30 to 4°35 north lat.

We cannot silently slip over these minor groups whose names are known only to administrators working in the region of M'Bam, east of Bafia. As a matter of fact, they are essentially a part of the Beti group.

Physical and Human Geography

[4] Population: Bundju—about 550 inhabitants
Kombe—about 1,126 inhabitants

[3] The Kombe are settled in three villages in the valley of the
[3] M'Bam, on the right bank of that river and on the highway from Bafia to Yaoundé, from the 16th kilometer to the 22nd kilometer southeast of Bafia. /Map 2/

The Bundju occupy two villages, also on the vehicular road, southeast of the Kombe but between the M'Bam and the Sanaga rivers. The two villages are separated by a Ngoso village which is wedged in between them. /02/

[3] According to the Moisel map of April, 1913 (G2, Jaunde), these
[0] two peoples occupied far greater territories at that time. The Kombe (then known as the Nkombe) were found all the way to the borders of

Bafik - Tangafok
Tsinga - Betsinga

174 The recognized kinship among the various groups clearly permits us to assert that their extraordinary dispersion is quite recent, going back no further than to the historical period when the Tikar and the Bakoko made their last advances and were driven back by the advancing Fulbe. Before that time these peoples probably inhabited the entire plain south of the Nkam. Ndcumba was their most important center.

197 Language. The linguistic unity among the various groups of Bafik and Tangafok confirms our impression. Dialect differences among them are minimal; they all understand each other.

G. Tessmann classifies their language as falling between that of the Bamvele and the group of Pahouin languages. As we have already mentioned, a passing observer at Lana, the Reverend Good of the American Mission, noticed a very great similarity between the language spoken there and that of the Bulu in the south.

Bulletin de la Société d'Études Camerounaises, No. 3, (July 1947).
Unpublished reports by administrators Delneil and Coquereaux.

TSINGA - BETSINGA

131 Widely scattered habitat: 11°20 to 11°30 long. and from south to north: 3°35 to 3°50 north lat. near Tsoundé 4°15 to 4°40 north lat. on the two banks of the Sanaga.

101 Physical and Human Geography. Like the administrator Courtaric in the past, we have grouped together under one term the peoples generally designated as Tsinga, Betsinga, Betchenga, or Batchenga. One name is probably a transformation of another. Since the traditions of the various groups are the same, it seems inappropriate to draw distinctions among them.

361 The Tsinga are so widely dispersed that their territory does not form a unit. They are located on both banks of the Sanaga (there known as

361 the Betsinga) as far north as its tributary the Makiko and, toward the south, for about a dozen kilometers inland. Another Tsinga zone exists in the northwest on both sides of the M'Bam. Another fairly homogeneous center may be found much farther south, east of Yaoundé. Finally, there are several Tsinga villages just south of the Nyong in the vicinity of the southern road.

It is impossible to calculate the area of their ~~various~~ habitat concept near the M'Bam (75 square km.), among the Betsinga of the Sanaga (180 square km.), and for the few purely Tsinga villages east of Yaoundé (180 square km.). Elsewhere these people appear only together with other populations.

[61] The total population comes to 15,002 persons.

361 Near the M'Bam, as well as on the Sanaga and its little tributaries, the Tsinga are settled in a land of small hills and valleys, on a prairie 173 broken by groves and by clumps of forest. According to their traditions they originally lived north of the Sanaga, but the Bakoko advanced upon them. Many of them crossed the river. It appears that as soon as the Germans came and /67/ mapped the Bakoko, some of the Tsinga returned to the north of the Sanaga. /Map 5 covers p. 66./

197 Some say that the Tsinga are related to the Eno, and this statement 173 seems to be confirmed by the similarity between the two languages (See Nekes) /"Jaunde und seine Bewohner (Sudkamerun)"/Yaoundé and its inhabitants (South Cameroons/, " Koloniale Rundschau, 1912/. See a few words of vocabulary in G. Tessmann's Die Pangwe /The Fang/, Völkerkundliche Monographie eines westafrikanischen Negerstammes. Ergebnisse der Lübecker Pangwe-Expedition 1907-1909 und früherer Forschungen 1904-1907 /Anthropological Monograph on a West African Negro Tribe, Results of the Lübeck Fang Expedition 1907-1909 and Earlier Research in 1904-1907/ (Berlin: Wasmuth, 1912), p. 34, under the name "Beti (Betjenge)," as well as H. H. Johnston, A Comparative Study of the Bantu and Semi-Bantu Languages (Oxford University Press, Vol. I, 1919, Vol. 2, 1922), Vocabulary No. 216, under "Beti (Bezenge)."

161 Demography. Their population balance is favorable; the ratio of births to deaths is ~~+~~ 1.14 percent.

MANGISA

[3] Location: 11°15 to 11°30 long.
4°15 to 4°30 north lat.

Physical and Human Geography

[3] Area: about 316 square km.
[4] Population: 14,589 inhabitants
Density: 46.3 per square km.

[3] The Mangisa occupy the right bank at the bend of the Sanaga, a land of wooded hills.

173 They were probably among the peoples who crossed the Sanaga rather early, for their traditions say that, in later times, when the Etoo also crossed the river, they found the Mangisa occupying the territory. /Map 6/ Fairly intensive struggles followed; then the two peoples formed an alliance which enabled them to live in peace side by side.

56 Like the Etoo, the agricultural Mangisa live in large villages. Be-
311 cause of the density of the population, the entire /68/ woodland has to a large extent been cleared for their plantations, and palm trees have been planted.

197 But what is the exact origin of the Mangisa?
174 Language. The question has been raised in linguistics.

G. Tessmann has written: "In the classification of the Pahouin tribes of the north, the situation is not yet clear. One thing is certain: all the tribes—at least all those of the northeast—contain a more or less pronounced component derived from the Beti-Mbam. Thus, a few decades ago, the Etoo and the Mangisa spoke a pure Beti; they have therefore become Pahouinized only in recent times, at least as regards language (1)."

Bulletin de la Société d'études Camerounaises, No. 15-16 (Dec. 1946), p. 45.

General Bibliography

On the subject of the settlement, subsistence, and customs of the Fang, only unpublished sources are available.

We also want to mention an important demographic report by Dr. Aujoulat of the "Ad Iucem" Foundation at Efok (Subdivision of Sac). The work was carried out in 1944 (Archives du Service de Santé).

Finally, we must not neglect to mention that at the Musée de l'Homme in Paris there is a film of great ethnographic and artistic

(13 worth on the subject of the "Bite SSO" as it is practiced among the Eton and the Mengisa. The film was made in an Eton village in 1955.

THE EWONDO

(8) These people are called Yaoundé (1) by the Europeans, but they call themselves Ewondo.

1. The etymology of this name is given nowhere. According to tradition, the name Ewondo is that of the original ancestor of the people; the prefixes ya, ye, and e occur frequently in Palatian languages.

According to Nekes, the name means "peanut"; it would therefore be a nickname, because, they say, "They are as numerous as peanuts."

(3) Location: 10°40 to 11°40 long.
3°10 to 4°55 north lat.

The Ewondo branch on a north-south trail at 10°05 long.
on an east-west trail 10°25 to 10°40 long.
3°10 to 3°25 north lat.

Physical Geography. Area: approximately 4,200 square km.

(33) (37) The territory occupied by the Ewondo is a high plateau broken by little valleys. In its northern section may be found several high hills which divide the waters of the Sanaga Basin from those of the Nyong. The entire territory is within the great forest zone, but much of the land has been cleared because of the density of the population. /71/ The dividing line between forest and prairie runs east to west about 10 kilometers north of Yaoundé.

(33) The river Nyong, at 3°30 north latitude, first borders the Ewondo country north to south and then crosses it from east to west before flowing into the territory of the neighboring Basa. Much further downstream it flows north to south by the settlement of the Evuzok before reaching its mouth at the ocean.

197 Language. Father Nekes, who is an authority on the subject, was the first to show the very close relationship which exists between the Ewondo language and the languages spoken by the Pahouin of Gabon and of Spanish Guinea, despite the wide Bulu zone that separates them. The people of Gabon and the Ewondo readily understand each other.

Nevertheless, in the same year R. Strack and Nekes pointed out that in the past the Ewondo and the Bane spoke "Ati," and that they only recently adopted the Pahouin language (See Koloniale Rundschau, 1912, p. 220 and H. Nekes, "Jaunde und seine Bewohner (Südkamerun) /Yaoundé and its inhabitants (South Cameroons)/, "Koloniale Rundschau, 1912, p. 469). In 1913, when Father Nekes published his book, Die Sprache der Jaunde in Kamerun /The Language of the Yaunde in the Cameroons/, he actually wrote in his introduction: "The old Ewondo today still speak 'Ati'."

Although the evolution of the language was probably completed under the eyes of Nekes a few years before World War I, at the present time the new language has been adopted entirely.

On this subject see also Gunter Tessmann, Die Pangwe. /The Fang/. Völkerkundliche Monographie eines westafrikanischen Negerstammes. Ergebnisse der Lübecker Pangwe-Expedition 1907-1909 und frühere Forschungen 1904-1907 /Anthropological Monograph on a West African Negro Tribe, Results of the Lübeck Fang Expedition 1907-1909 and Earlier Research in 1904-1907/, (Berlin: Wasmuth, 1913), pp. 30-31.

Mental map, GE, Ewondo.

THE BANE

[3] Location: 11°15 to 11°30 long.
3°45 to 3°30 north lat.

Physical Geography. Area: about 1,736 square km.

The territory of the Bane borders on the Western side of the Ewondo country and stretches north to south from the vicinity of Yaoundé to 25 kilometers northwest of Ebolowa and northwest of Sangmélima.

[D7] The country is located entirely within the forest zone, which is quite thinned out because of the density of population.

[33] At 3°30 north latitude the river Nyong crosses the country from east to west. At that point it is a navigable canal. Further down, the river turns south and marks the boundary between the territories of the Bane and the Ewondo.

[61] Human Geography. Total population: 18,309 inhabitants.

More than half of the total number of inhabitants in Bane territory live in the small area located north of the Nyong, where the population density is 40.1 per square kilometer. South of the Nyong, the density is 14.1 persons per square kilometer. /74/

[74] History. Like their neighbors of the same Fabouin family, the Bane lived north of the Sanaga in the past before the last invasion. Their southward migration occurred at about the same time as that of the Ewondo, and was brought about by the same cause. The Bane crossed the Sanaga rather late, and found the Ewondo already settled on the other side. Therefore, they infiltrated little by little from north to south among the people who preceded them /Map 10/ They were not completely pacified until 1897.

At that time they were already situated along one of the principal commercial routes of the south, used to ship from the east many sought-after products, especially ivory.

The Bane are settled in large villages and hamlets. The population in these settlements is no more homogeneous /75/ than the Ewondo's. The major intermixtures are shown on our map.

The road from Yaoundé to Ebolowa now crosses the Bane country from north to south. Another road, south of the Nyong, is the terminal point of the trade routes coming from the southeast. Because of these roads and the connection with the railroads at M'Balmayo, all the wealth of this country of great food crops, rich farmlands (cacao and coffee), and forests is easily brought to market.

Language. The subject is discussed in the paragraph on the linguistics of the Ewondo.

Physical Anthropology and Demography. The Bane are of above-average height, fairly slender, mesocephalic, and only slightly platyrhinian.

Their blood-type ratios are as follows:
O: 49 percent; A: 18 percent; B: 14 percent; AB: 19 percent—index $\frac{[A+AB]}{[B+AB]}$: 1.121.

Indexes	Men	Women
Cephalic	77.3	77.0
Facial	81.8	80.8
Nasal	85.2	86.0
Cormique	50.9	51.8
Envergure/T	104.9	103.9

The population balance is stable: the ratio of births to deaths is +0.2. The fertility rate is 4.7 pregnancies per woman. See the studies in physical anthropology in Bulletin de la Société d'Etudes Camerounaises, Nos. 10, 12, 15-16.

Bibliography

Von Stein. "Bericht ü ber die Bane-Buli-Expedition /Report on the Bane-Buli Expedition/," Deutsches Kolonialblatt, 1898, pp. 173-75.

113 The oldest sketch map on which the Bane are shown is a map without scale, but where the distances are calculated in terms of "hours on foot"; it appears in Von Stein's report entitled "Ueber die geographische Verhältnisse des Bezirkes Lolodorf (Südkamerun Gebiet), speziell die dort wohnenden Volkstämme /The Geographic Relationships of the Lolodorf District (South Cameroons), especially the Resident Tribes/," in Mitteilungen aus den deutschen Schutzgebieten, 1898, pp. 120-41. This report also contains an extensive genealogical table which includes the Bane; ethnographic details on pp. 135-38 should be especially noted.

Search. "Le Noig N'tu, ancienne coutume Bane /The Noig N'tu, an Ancient Bane Custom/." Togo-Cameroun, January 1930, pp. 19-22.

Important unpublished documents exist on the subject of customs, dwelling, and subsistence among the Bane.

THE FONG

131 Location: 11° and 11°15 long.
3°15 north lat.
and 11°30 to 12° long.

101 Physical and Human Geography. The Fong /Fang/ are not all settled in a single area. They constitute a very small population divided into three separate clusters, lined up from west to east; the total area of the different small zones occupied by these settlements is about 1,152 square kilometers, and in the largest and most easterly, the enclaves of Bulu villages are to be found.

101 563 Bertaut has written: "The territory is occupied by Bane and Fong without any geographical unity. Fong, Bulu, and Bane are intermingled, and one passes from a Bane area /76/ to a Fong area without noticing. This situation is the result of a mingling of tribes which must have occurred when the Bane and the Fong, who came from the north, encountered the Fang and the Bulu, who were also not yet permanently settled." (Report of May, 1932)

113 The Fong may be considered the southernmost participants in the recent invasion which brought the Ewondo and the Bane to the south

173 of the Nyong. According to their traditions they come from an area north of the Sanaga, as do the other groups which preceded them. They settled in the forest, where there are at present 12,783 of them (a density of 6.9 persons per square km.).

231 242 The Fong are an agricultural people. They seem to have little inclination to hunt so that their diet consists chiefly of vegetables, although they have a fairly large number of domesticated animals. /Map 11/

141 Physical Anthropology and Demography. Average height: men 169.7 cm.; women 162 cm.

Indexes	Men	Women
Cephalic	80.8	81.5
Nasal	95.21	84.01

141 143 The population balance is slightly positive, the ratio of birth to deaths being +0.77. The rate of sterility is high, 25.6 percent, but is fortunately compensated for by the fertility rate, 5.3 pregnancies per woman.

THE BULU

131 The actual Bulu inhabit an area which stretches from east to west
101 in a thin band from 10° to 13°10 longitude and extends from 2°35
to 3°15 north latitude toward the east. Toward the west their villages
[36] only extend along two parallel trails, then go in a single line to within 30 kilometers of the ocean.

North of this horizontal band, in an area which extends from 12° to 12°35 longitude and from 3°35 to 4°30 north latitude, are to be found the Yengono, the Yembama, and the Yelinda. We are including these groups among the Bulu on the authority of their traditions.

133 Physical Geography. The Bulu territory is a huge, very monotonous plateau covered with forest. It is situated at an altitude of 600 to 650 meters on the average, with a few hills rising 150 to 200 meters at most above the rest. The hills are round or conical in shape and generally wooded.

The actual Bulu country (an area of about 9, 936 square km.) is watered, on the one hand, by little tributaries which flow from the left bank of the Nyong and form valleys going from southeast to northwest. In the east the branch called the Zaman flows for 60 kilometers, touches the only trail in the thickness of the forest at a distant spot, and meets the Dja River, a tributary of the Sanga /sic/, beyond 13° longitude.

361 The Yengono, the Yembama, and the Yelinda are settled on a
133 strip of land going from north to south in an area which is part prairie and part forest. From the plain of the Sanaga the country rises gradually, and in the northern part of the Yengono country a chain of hills separates thewaters of the Sanaga and the Nyong basins. The three peoples are settled south of this line in the Nyong Basin

361 The settlements of these peoples vary in appearance. The villages and hamlets of the Yengono, the Yembama, and the Yelinda are located in relatively open country and they stretch out along numerous trails. The Bulu in the south, situated in a land of parallel valleys through which flow the tributaries of the Nyong and by thick forest, can only build their villages along the valleys. This whole area, es-
241 pecially in the Nyong Basin, is very fertile. The natives have fine fields of food crops and many palm trees. Many prosperous enterprises, lumber yards, and fine groves of cacao trees can also be found. /81/[Map 13]

489 All the products are transported to the railroad at M'Balmayo along a large network of roads and the navigable parts of the Nyong.

181 The Bulu are intelligent and hard working, and are capable of becoming excellent craftsmen.

197 Language. We have seen that Father Nekes and G. Tessmann see a very close relationship between the language of the Bulu and that of the Mvele. The Bulu language includes a number of dialects with only slight variants, and falls between the speech of the Ewondo and that of the Gabon Pahouin, which are almost identical.

Cormique	51.2	52.2
Envergure/T	103.7	102.9

161 The population is barely increasing: the ratio of births over deaths is + 0.30 percent.

163 The sterility rate is 7 percent; the fertility rate is 4.12 pregnancies per woman.

164 Yengono. Sleeping sickness has been rampant in this area in the past but now seems to have been conquered.

143 Their blood group ratios are as follows:
O: 50.1 percent; A: 15.7 percent; B: 29.5 percent; AB: 4.7 percent; —index $\frac{A+AB}{B+AB}$: 0.59.

161 The population balance is slightly favorable; the excess of births over deaths is .63 percent.

163 Sterility rate 9 percent; fertility rate, 3.47 pregnancies per woman.

161 Yelinda. The population balance is not being maintained; the index of births over deaths is -0.1 percent.

163 Sterility rate 18 percent; fertility rate, 3.30 pregnancies per woman.

164 Yembama. Sleeping sickness has been very prevalent among these people, but it is continually decreasing.

161 The population balance is favorable: the excess of births over death is .72 percent.

163 The sterility rate is 16 percent; the fertility rate, 3.97 pregnancies per woman. /82/

THE YESUM AND THE YEBEKANGA

131 Location: 11°55 to 12°30 long.
5°05 to 5°35 north lat.

Physical Geography. Area: Yesum: about 1,296 square km.
Yebekanga: about 315 square km.

133 The country of the Yesum appears on a map as an irregular four-sided figure. The territory stretches through the plain of the Sanaga

Yesum
Yebekanga
Yekaba

174 1. Bertaut, Le droit coutumier des Boulous. Monographie d'une tribu du Sud-Cameroun (The Customary Law of the Bulu. A Monograph Concerning a South Cameroon Tribe)," (Paris, 1935), p. 45.

As for the Yebekanga, the administrator Chauleur says that "it is impossible to show a common origin for the Yebekanga and the Yesum. It seems likely, however, that this tribe climbed from the shores of the Nyong at a fairly recent time." (2)

2. Unpublished report on February 28, 1933. /86/

Here we have grouped the Yesum and the Yebekanga together despite contradictions in our sources. We have done so simply because of the possibility that they migrated in the same direction. According to their accounts, it would seem that their migration took place quite recently, just a few years before the coming of the Europeans. In the course of it they clashed with peoples of the same Pahouin origin who had come from the north about a hundred years ago, and pushed them back toward their present habitats.

161 Demography. The population of the Yesum is decreasing in spite of apparently good conditions. At present the ratio of births to deaths is -2.6 percent.

163 The sterility rate rises as high as 25.53 percent, and the fertility rate is 3.4 pregnancies per woman.

Bibliography

● 113 Thierry. "Dienstreise nach Esum-Sannaga /Official Trip to Esum-Sanaga/," Deutsches Kolonialblatt, 1903, pp. 521-23.

THE YEKABA

101 Location: 12° to 12°50 long.
5°20 to 5°45 north lat.

Yekaba
Bamvele, Bobili

174 long migration of the Pahouin—although the name "Yalongo" spoken of in their geneologies is reminiscent of the Beti. Once again we are aware of the complexity of the Beti-Pahouin intermixture.

361 The villages and huts spread through the bush give an impression
491 of poverty, although in 1903 the Germans noted that the great trade route from Bertoua to Yoko passed through Yekaba territory. /Map 16/ At the present time the whole length of the territory is serviced by the great eastern highway (Yaoundé—Nanga-Eboko—Bertoua).

197 Language. The fact that the Yekaba form part of the Pahouin migration is apparent from G. Tessmann's tribal map, where they are shown in the large Pahouin blot—under the general heading of "Mvele." We will return to this subject later in the chapter on the Bamvele.

161 Demography. The Yekaba are definitely decreasing in number.

165 The infant mortality rate among them is 34.3 percent. The sterility
163 rate is 33.93 percent; the fertility rate is 4.3 pregnancies per woman, but with about 10 percent stillbirths.

161 The population balance shows a ratio of -4.4 percent births to deaths.

Unpublished reports of the administrators Cournarie, Chauleur, Gatau, and Boudineau.

Moisel map, G3, Dume. /88/

THE BAMVELE AND THE BOBILI

131 Location: 12°30 to 13°30 long.
4°35 to 4°50 north lat.

101 On all German maps the people we call Bamvele are designated by the name of Bele (see the Moisel map and Tessmann's tribal map).

197 Language. The linguistic map of G. Tessmann shows without comment, the Yebekolo, under the category of "Mvele."

141 Physical Anthropology and Demography. The average height of the Yebekolo is 165.5; the average cephalic index is 78.8.

143 Their blood-group ratios are as follows:
O: 69.3 percent; A: 13.1 percent; B: 12.1 percent; AB: 5.35 percent; —index $\frac{A+AB}{A+AB}$: 1.197.

165 The extremely high rate of infant mortality (58.64 percent) is due
164 to malaria. The disease is fostered by the marshiness of the region, which is likely to remain a source of sleeping sickness as well.

161 The population balance is stationary; the ratio of births to deaths is + 0.09 percent.

163 The sterility rate is 5 percent; the fertility rate is 3.98 pregnancies per woman.

See:

113 Olivier, G., with the collaboration of Drs. Moisel map, G3, Dume

241 fields of peanuts and maintain beautiful palm groves and coffee and cacao plantations.

197 Language. G. Tessmann is no more definite as regards the language of the Omvang than other authors concerning their folk history. His tribal map shows the two Omvang sections stand out clearly on the large Pahouin area /Map 19/ His only comment on the subject is the following: "Probably they should be grouped with the Neo-Bantu, perhaps with the Pahouin, " ("Die Völker und Sprachen Kameruns /The People and Languages of the Cameroons/, " Petermanns geographische Mitteilungen, 1932, p. 190).

164 Demography. The western Omvang have one of the highest incidences of sleeping sickness.

161 Nevertheless, their population balance is slightly favorable; the ratio of births to deaths is + 0.83 percent.

163 The sterility rate is 8 percent; the fertility rate is 3.57 pregnancies per woman.

164 The eastern Omvang also have suffered greatly from sleeping sickness. /93/

161 Their population balance also shows a slight increase; the ratio of births to deaths is 0.92 percent.

163 The sterility rate is 9 percent; the infant mortality rate is very low.

Moisel map, G3, Dume.

463 The role of the towns in the external trade of the region is evident, but their role in regional economy is no less essential. In fact, formerly the population had hardly any specialization, because of limited needs: each group was self-sufficient. No division of labor was prescribed aside from the allotment of tasks to men and women. Only smiths possessed a special technique which allowed them to ply a
326 trade. Yet they were not a caste; a smith could ally himself by marriage with any family whatsoever, and a farmer's son might become a smith.

Everyone could extract iron ore, but only a skilled man who had acquired knowledge and magical power could work metal. Professional differentiation is /sic/ obviously still rudimentary. Perhaps it corresponds to a mediocre technological level: the stock of tools is limited—a stone used as an anvil, an iron bar as a hammer, and a bellows as a forge. The smith does not seem to have been the mysterious and awesome figure found in other societies. At most we may believe that there were sexual prohibitions connected with certain phases of his work, which allows us to assume a magical or religious aspect (1).

1. Miss /Mary/ Kingsley, Travels in West Africa, London, 1897; we should note however "an important pottery art, ironwork that deserves particular mention owing to its excellence, a technique for treating latex, an art of plaiting clothes" (in Balandier, "Village fang /Fang Village/, " Études centrafricaines, 1951).

[113]

463 The small number of objects in use did not require a real division of labor. A piece of grooved ivory was used for beating bark to soften it for the making of clothes. This technique has evidently disappeared. There /were/ a few potteries; the wooden bowls are now replaced by imported ware. One still fairly often finds calling drums, wooden ladles or spoons carved by artisans, and mortars. Spearheads are currently sold in the markets. Crossbows are less and less used, and hunters make their own nets.

Needs which are now more varied have given rise to /36/ many professional specializations. A few are represented in rural districts,

Monsieur de Compiègne is ironical about "Duchaillu," the particle of whose name induces in him suspicion of his sincerity. He is mistaken.

17. Du Chaillu. P. Explorations and Adventures in Equatorial Africa. London, John Murray, 1861.

Alongside exaggerations which sometimes come near to being jokes, the book contains very exact and very valuable observations of the Fang invasion.

21. Horn, A. Trader Horn. La Côte-d'Ivoire (sic) aux temps héroïques /The Ivory Coast—sic—in the Heroic Period/. Paris, Stock, 1932. 303 pp.

Old Horn was a much more daring liar than Du Chaillu; nevertheless, his memoirs are interesting just because they are those of a "trader." /139/

25. Leroi-Gourhan, A., and Poirier, J. Ethnologie de l'Union française /Ethnology of the French Union/. Paris, Presses Universitaires de France, 1953.

This has the Fang coming from Bahr-el-Ghazal (following Bowditch, Gautier, and Vallois).

30. Richard-Molard, J. "Groupements ethniques et civilisations nègres d'Afrique /Ethnic Groupings and Negro civilizations of Africa/," Cahiers d'Outre-mer, 1952, no. 17.

A brief and very good analysis of the results of the "ayoñ regrouping" movement.

41. Cottes, A. La mission Cottes au Sud-Cameroun (1905-1908). Paris, Leroux, 1911. 254 pp., ill.

Anthropological information and photographs. /140/

46. Grebert, F. Au Gabon /In Gabon/. Paris, Société des Missions évangéliques, 1948. (3rd ed.), 237 pp., ill.

This deals primarily with the Fang of the Ogooué; good illustrations.

48. Largeau, V. Encyclopédie pahouine /Pahouin Encyclopedia/. Paris, E. Leroux, 1911. 700 pp.

In spite of the criticisms of Father Trilles, who accuses Largeau of not knowing the Fang language and of having an uninitiated "boy," the Encyclopédie is still a mine of invaluable information, often more accurate than that of Trilles.

6:Alexandre and Binet--175 G-5 (1946-1954) 1958 FH9 Fang FH9

113
114

51. Pedrals, D. P. de. "L'origine des Fang /The Origin of the Fang/, " Tropiques, 1952, vol. 50, no. 348.

A version of traditional history collected from prominent persons in the southern Cameroons, some of whom were our own informants. Hard to use because of faulty transcription of certain names.

54. Tessmann, G., and Wasmuth, E. Die Pangwé, Volkerskundische Monographie eines westafrikanisches Negerstammes /The Pangwe, An Ethnological Monograph on a West African Negro People/. Berlin, Hansa verlag für mod. Literatur, 1913. 2 vols., 275 and 402 pp., ill.

The summa on the group as a whole, including "Pahouinized" neighbors. It would be worth translating, even after a half century.

55. Trezenem, Edouard. "Notes ethnographiques sur les tribus Fan du Moyen Ogooué /Ethnographic Notes on the Fang Tribes of the Middle Ogooué/, " Journal de la Société des Africanistes, 1936, vol. VI.

One of the best recent works on the Fang of Gabon; unfortunately the transcription of certain words makes them unrecognizable. /141/

68. Good, A. I. Bulu Handbook Supplement. Elat, Halsey Memorial Press, 1934. 131 pp.

The only work to give a glossary of exclamatives, descriptives with ne, which play an important role in the oral literature.

70. Greenberg, J. "Etude sur la classification des langues africaines /A Study of the Classification of African Languages/, " B. I. F. A. N. P., vol. XVI, nos. 1-2 (Jan.-April, 1954), pp. 83-142; vol. XVII, nos. 1-2 (Jan.-April, 1955), pp. 59-108. Ill.

There is no specific reference to the Pahouin group, which appears to be included in the Nigero-Congo /language/ family.

71. Guillemin, L. "Le tambour d'appel des Ewondo /The calling drum of the Ewôndo/, " B. S. E. C., 1948, nos. 21-22, pp. 69-84.

Indispensable to a study of the nkul; it contains many mindan (indicative) notations, words, and music.

913
114

72. Guthrie, Malcolm. The Classification of Bantu Languages. London, Oxford University Press, 1948.

This classes the Pahouin language in Zone A, Group 60 of Bantu. It ascribes as characteristics the absence of size-gender (inaccurate, for there is Class ô/a for small objects, Class a/me for collectives and for large objects) and the absence of the correlation of gender with idea (inaccurate).

77. Homburger, Lysias. Le langage et les langues /Speech and Language/. Paris, Payot, 1951. 256 pp.

This describes the "leapfrog" advance of the Pahouin. It places their languages in a separate family, close to, but different from, that of the coastal Bantu languages of northern Congo.

78. Homburger, Lysias. Les langues négro-africaines et les peuples qui les parlent /Negro-African Languages and the Peoples Who Speak Them/. Paris, Payot, 1941. 350 pp.

Classes the Pahouin languages in a group intermediate between the Sudanese and Bantu.

79. Lejeune, R.P. /Rev. Father?/. Dictionnaire français-fang, précédé de quelques principes grammaticaux sur cette même langue. Paris, Faivre & Teillard, 1892. 347 pp.

Like nearly all such works of the period this follows too closely the grammar and syntax of French and Latin. /142/

81. Martrou, L. Lexique fân-francais. Paris, Procure générale, n.d.

A "Catholic Fang" transcription which cannot be reproduced on the universal keyboard; it does not give tone levels; has about 3,500 words.

84. Stoll, A. La tonétique des langues bantu et semi-bantu du Cameroun /The Tone System of the Bantu and Semi-Bantu Languages of the Southern Cameroons/. Paris, n.d. Memorandum No. IV of the I.F.A.N. Center, Cameroon, 1955. 172 pp., 2 tabls.

In addition to a new theory of tone levels, this has interesting suggestions about the so and melan rites, with an account of the theory of double symmetry, which is supposed to underlie Pahouin cosmogony.

93. Binet, J. Budgets familiaux des planteurs de cacao au Cameroun /Family Budgets among the Cacao Planters of the Cameroons/.

•113
114

Paris, C.S.R.S.O.M., "L'Homme d'outre-mer" series, no. 3, 1956. 154 pp., ill.

Research done in the southern Cameroons in 1955-56. This is comparable with the work of Sautter and Balandier in northern Gabon.

98. Grebert, F. Monographie ethnographique des tribus Fang, Bantous de la forêt du Gabon /Ethnographic Monograph on the Fang Tribes, Bantus of the Gabon Forest/. Geneva. Manuscript, 36 pls., 719 drawings.

This unfortunately unpublished work constitutes the best pictorial representation of the Pahouin peoples. One of the six copies can be consulted in France, at the library of the Evangelical Missions. /143/

109. Bearth. "Le nsig-n'to, ancienne coutume Bane /Nsig-n'to, An Old Bane Custom/, " Togo-Cameroun, January, 1930, pp. 313-332, ill.

The high judge nsig-nto was perhaps a high-ranking ngil dignitary.

110. Bertaut, M. Le droit coutumier des Boulou /Customary Law of the Bulu/. Paris, Domat-Montchrestient, 1935. 308 pp.

In spite of the title this book deals not only with the Bulu but also with their northern neighbors, including the Ewôndo; there is a detailed description of the sô ceremony, a good study of juridical customs and also of living habits.

119. Koch, H. "Le petit bétail chez les Badjoué et Bikélé de Messaména /Small livestock among the Badjue and Bikele of Messamena/, " Bulletin de la Société d'Études camerounaises,

This gives concrete examples of the progressive "Pahouinization" of the border tribes (here under Bulu influence). /144/

120. Mba, L. "Essai de droit coutumier pahouin /Essay on Pahouin Customary Law/, " Bulletin de la Société de Recherches congolaises, 1938, no. 25, 46 pp.

An interesting essay by one of the Fang political leaders in Gabon.

122. Panyella, A., and Sabater, J. "Esquema de la antroponimia Fang de la Guinea española desde el punto de vista etnologico /Outline of Fang Nomenclature (?) in Spanish Guinea from the Ethnological Point of View/, " A.I.E.A., 1955, VIII, no. 34.

113
114

The most recent study of the anthroponymy /nomenclature?/ and rules for name giving; interesting observations on the designation of segments and lineages by the name of a female ancestor.

125. Zoll'Owambe, Ch. "Visage africain d'une coutume indienne et mélanésienne /An African Aspect of a (North American) Indian and Melanesian Custom/," Bulletin de la Société d'Études camerounaises, 1947, nos. 19-20, pp. 55-60.

A description of the bilaba potlatch, somewhat marred by confusions in the translation of salient points.

126. X.... "Tenue de palabre /Discussion Session/," B.S.E.C., 1947, nos. 19-20, pp. 141-146.

An extract from the archives of the Ambam subdivision; observations by Ntumu and Mvae men of standing on marriage customs and their evolution.

133. Dugast, I. "Inventaire ethnique du Sud-Cameroun /Ethnic Inventory of the Southern Cameroons/," Mémoires of the I.F.A.N. (Cameroons Center), "Populations" Series, no. 1, 159 pp., ill.

The most recent synthesis of the subject. It is to be regretted that the same work could not have been done for Gabon and Guinea. /145/

147. Allegret, E. "Les idées religieuses des Fang /The Religious Ideas of the Fang/," Revue d'histoire des Religions, vol. 50, 1904, pp. 214-233.

An interesting note on the religious "defeatism" which the Fang seem to have experienced especially after contact with Europeans.

151. Garnier, C., and Fralon, N. Le fétichisme en Afrique noire /Fetishism in Black Africa/. Paris, Payot, 1951.

Some notes on the rites of the Cameroons Pahouin.

152. Guillemin, R.P. Le rite "ésye." B.S.E.C., 1948, nos. 23-24, p. 71.

An excellent description of a purification rite among the northern tribes. Interesting notes on practices of divination.

153. Jemba Medu. Nnanga Kon. Elat, Halsey Memorial Press, n.d.

This novel, which is unfortunately out of print, is a mine of ethnological and linguistic information. Written in rather archaic and learned language, it is quite difficult to read

113
114

nowadays. It is to be hoped that it will be translated by a Bulu of today.

155. Lavignotte, H. L'évur, croyance des Pahouins du Gabon /The Evur, A Belief of the Pahouin of Gabon/. Paris, Société des Missions évangéliques, 1936. 118 pp.

A very full commentary on ngbwel sorcery and methods of protection against it. /146/

156. Leroux, L. G. "Etude sur le ngil, confrérie fan /A Study of ngil, a Fang confraternity/, " Bulletin de la Société de Recherches congolaises, 1925, no. 6.

The author, although thoroughly understanding the judicial and warlike functions of ngil, is in favor of its suppression in the interests of public order.

158. Martrou, L. "L'âme fang après la mort /The Fang Soul after Death/, " Anthropos, VI, 1911.

This bears comparison with the traditions collected by Largeau; Martrou knew the country and the language better, but, like Trilles, his interpretation seems at times to be influenced by his preoccupations as a priest.

159. -----. "Les éki des Fang /Fang éki/." Münster. Anthropos, I, 1906.

A good study of prohibitions, though far from exhausting the subject.

161. Nassau. Fetishism in West Africa. New York, Young Peoples' Missionary Movement, 1904.

Little information relative to the Fang; the author knew primarily the coastal populations.

165. Trilles, H. "Proverbes, légendes et contes fang /Fang Proverbs, Legends, and Tales/, " Neufchâtel. Bulletin de la Société neufchâteloise de géographie, Vol. XVI, 1905. 247 pp.

Phonetic transcriptions and translations "omitting what is smutty" (sic). In spite of the cuts this is the most complete collection.

166. -----. Le totémisme chez les Fân /Totemism among the Fang/. Münster i. W., Bibliothèque Anthropos, 1912, 653 pp.

This is Father Trilles' magnum opus. As in all his works, there are, along with subtle and accurate observations, somewhat risky generalizations and surprising lacunae, which may come from a certain professional slant. In spite of these, Father Trilles remains the great authority on the Fang.

113 114 171. Aubame, J. Renaissance gabonaise /Renaissance in Gabon/. Brazzaville, 1947.

A program for clan regrouping of Fang villages put forward by the deputy of the second constituency. /147/

175. Balandier, G. Sociologie actuelle de l'Afrique noire, dynamique des changements sociaux en Afrique centrale /The Contemporary Sociology of Black Africa, The Dynamics of Social Change in Central Africa/. Presses Universitaires de France, 1955, 510 pp.

The first part of this work, which is devoted to the Fang of Gabon, contributes a new explanation of the social malaise afflicting the Fang and of the attempts at social reconstruction based on tribal regrouping and syncretist cults. It is the best book on the Fang since Trilles, Largeau, and Tessmann.

180. Celine, L. F. Voyage au bout de la nuit /Journey to Night's End/. Paris, Denoël, 1932.

The same kind of thing as no. 187 and no. 195.

182. Eza Boto. Ville cruelle /Cruel City/. Paris, Editions africaines, n.d., 219 pp.

A good study of the present younger generation, of the attraction of towns and the fear they inspire, and the conflict between generations.

183. Faure, F. Le diable dans la brousse /The Devil in the Bush/. Paris, Société des Missions évangéliques, "Je sers," 1953. 165 pp.

These edifying tales contain a good deal of information about the social and family organization of the Fang of Gabon.

187. Marie-André du Sacré-Coeur, Sister. La condition humaine en Afrique noire /Man's Fate in Black Africa/, Paris, Grasset, 1953. 260 pp., ill.

Notes on marriage in the southern Cameroons, sometimes a bit farfetched. /148/

191. Mongo Beti. Le pauvre Christ de Bomba /The Poor Christ of Bomba/. Paris, R. Laffont, 1956. 370 pp.

A novel concerned with the consequences of Roman Catholic mission activity; often unjust, but indispensable for an understanding of the most recent developments.

113 114 193. Oyono, F. Le vieux nègre et la médaille /The Old Negro and the Medal/. Paris, Julliard, 1957. 209 pp.

Oyono belongs to the tradition of the mvet players, satirical story-tellers, always harsh and often unjust.

195. Schweitzer, A. A l'orée de la forêt vierge /On the Edge of the Virgin Forest/. Paris, Payot, 1929. 231 pp.

Interesting though rather abbreviated comments on the social disorganization of the Pahouin of the Ogooué and of their reactions to culture contact.

196. X....Ekomi, histoire d'un petit Pahouin racontée par lui-même aux enfants d'Europe /Ekomi, The Tale of a Little Pahouin boy, Told by Himself to European Children/. Paris, Société des Missions évangéliques, 1921.

Conveys a moral.

Bulletin de la Sté Royale de Madrid. 1904. Le Muny espagnol.

539 514 "to look for firewood"; ma ke ofē ī, "I am going into the bush," and so forth. Even today I have to smile when I think of an incident that happened at the beginning of my stay in Alén. One of my Fang boys, who accompanied me on the hunt and was near a thick, half-rotted tree stump, suddenly said, "ma ke tsǎ ndžā,ǎ (I am going to get some firewood)." Under the impression that he really wanted to cut off some firewood from the tree stump, I countered this, to me unintelligible, notion, half amazed, half mockingly, with the words, "ye oa bělе ovŭ́n (but do you have an axe)?" It was only after a while that I understood why I was struck by such an annihilating look of moral disapproval. After this faux pas, I became more cautious and was soon sufficiently polished to be a highly civilized person in the Pangwe sense, who in strange villages no longer spoke of the eduk (toilet), but instead, as a well brought-up "Pange," merely asked:

114 514

nge ba tší'dǎn ma, ma yā'le
If one drives (urges) me, I duck (hide)
[539] vě'?
where?
or: zě'n e medžā e ne vě'?
Where is the way to the host (actually: head of the village)?

539 757 514 Further demonstrations of the Pangwe's feeling of shame with respect to natural requirements are the use of an enema syringe (which is directly connected with

101 This group of Beti, or Bati, north of the Sanaga, whom the Ger-
131 mans—being good linguists—recognized easily by their language, were all those whom the French administration later called by the general name "Sanaga." They included the Tsinga, the Mvele /Mvelle/ (contrary to Nekes' opinion), the Bavek, the Mangisa, the Ngoro, and the Kombe.

● 114 What is the origin of these Bati? G. Tessmann thinks that they may
174 be related to the peoples he has named "Mittelkamerun Bantu /Middle Cameroons Bantu/" (Bafia, Banen /Banend/, Yambasa, etc.). But he does not confuse the two groups. He believes that the Bati came from the north, where they first lived on the left bank of the M'Bam. Then, pushed by the Babute, some of them moved to the right bank. He notes that from that point on two tendencies are apparent: Some of the Bati were attracted by the civilization of the northeast (Babute), others by that of the southeast (Pahouin). Thus the Bavek and the Yangafuk (the Fök and the Fuk) migrated and scattered in a direction that differed from the one taken by groups such as the Betsinga and the Mangisa, who were moving toward the Pahouin. The latter two let themselves be assimilated quite rapidly.

According to G. Tessmann, the Bati are not Pahouin but rather a population encountered by the latter in their migrations. These people were attracted or influenced by the Pahouin and, in turn, influenced the invaders, just as they influenced, or were influenced by, the central Bantu. In the course of influences and counter influences, the intermingling of Pahouin and Bati, as much in culture as in language, has been so great that it is now difficult to untangle the threads of their various ramifications. Some threads have been lost, others broken, and those that remain have taken on a variety of hues.

Lang

113 Language. See:

Johnston, H. H. A Comparative Study of the Bantu and Semi-Bantu Language (Oxford University Press, Vol. 1, 1919, Vol. 2, 1922), Vocabulary No. 216, and his reference to the study by Carl Meinhof, "Die Sprachverhältnisse in Kamerun /Linguistic Relationships in the Cameroons/," Zeitschrift für afrikanische und oceanische Sprachen (Berlin, 1895).

Tessmann, Günter. Die Pangwe /The Fang/. Völkerkundliche Monographie eines westafrikanischen Negerstammes, Ergebnisse der Lübecker Pangwe-Expedition 1907-1909 und Früherer

101 barely a century and a half ago, invaded and took over more than
131 176, 000 square kilometers of land in the western part of Equatorial Africa. For a century these peoples have occupied the huge forest area which stretches from 1° south of the equator to 4° 30 in the north, and from 9° 30 to 14° meridian in longitude.

101 Poutrin uses the term "Fan" to designate these peoples. Tessmann
114 uses the term "Pangwe /Mpangwe/."

We have rejected Poutrin's term "Fan" for the same reason that Tessmann did. There exists in the Cameroons a subgroup of Pahouin known as Fang, and it seems to us that using the same term to designate two different entities—on the one hand, a large group occupying a vast territory, and on the other, a very small unit comprising 12, 583 persons within this group—could lead to confusion and misunderstanding.

114 The penetration of the area by the Germans, which brought them into contact with the Pahouin of the southern part of the territory, had to be carried out slowly. The first expeditions started from Grand-Batanga near Kribi. It was possible to explore quite rapidly the lower part of the Sanaga River as far as Edea Falls. At that time the river was called "Grand (Big) Nyong," and the present-day Nyong was "Petit (Little) Nyong." The natives on the coast said at that time that in the interior there flowed a great river whose waters moved from west to east. This detail posed a great problem for the Germans: Did the separation of the waters reaching the Congo and Grand-Nyong basins occur so near the coast? The first expedition was led by Lieutenant R. Kund, who was accompanied by Lieutenant Tappenbeck, the zoologist Weissenborn, and the botanist Braun. On October 15, 1887, they left Grand-Batanga, traveled through the Ngumba country and the valley of the Nyong, and, going northeast, reached the Sanaga on January 19, 1888. According to the reports they were "at least 300 kilometers from the coast," but it is not possible to locate the exact spot.

Within a few years from that date nearly the whole forest region had been explored, opened up to commerce, and studied both from ethnographic and economic viewpoints.

114 The first observations were based on linguistic notations, and the
174 extension of the Pahouin invasion above the second parallel was easily perceived when it was investigated also from the south through Gabon.

Pahouin

114 The great explorer Schweinfurth was the first to present the theory
174 that the invasion must have begun far to the east among the Azande, south of Bahr el Ghazal (approximately 23° long., and 5° north lat.). Dr. Poutrin, R. P. Trilles, Largeau, and Avelot accepted his conclusions, but Baumann and Westermann rejected them as greatly exaggerated. According to them, the Pahouin came only from the high Sanaga and had reached the western part of Equatorial Africa through a series of successive westward migrations, avoiding the great equatorial forest by going around it in the north and going through the valleys of the Lom and the Adamawa. "The advance of the subgroups," write Baumann and Westermann, "was made in successive leaps, as each group pushed the other ahead or passed them by. The migration was made by kin groups, about thirty to a tribe, which constituted the only political and social unit. These kin groups (agon) moved continuously westward, often passing one another; the last comers settled beyond their predecessors for a generation or two and then departed again."

The last push was made quite recently, /60/ in the southern part of the plateau of the Adamawa, by the Mbum and the Baya, who subsequently had to yield to the Fulbe /Fulani/. This last move from the right bank of the Sanaga to the forest dates back no more than about a hundred years. When the Europeans came, they in turn stabilized the positions of all these peoples.

114 In spite of the linguistic investigations quickly undertaken by the
101 Germans, whose great specialist was Father Nekes, and the study of oral traditions carried out to a greater extent by the French, the con-
197 clusions arrived at concerning the distribution of the Pahouin in the Cameroons are not entirely in agreement with one another. They are as follows:

Father Nekes is the authority on the subject, but his classification is chiefly linguistic. According to him there are two major groups, the Beti and the Mvele. In the first he includes the Ewondo, the Bane /Bene?/, the Yetenga, the Yetudi, the Eton, and the Betsenga; in the second, the Mvele, the Yebekolo, the Yebekanga, the Bulu, the Ntumu /Ntum?/, the Okak, the Omvang, and the Fang. Tessmann connects the Yesum with the Bulu.

114 According to Dr. Schnee, the "Fang" are divided into two large
101 groups, the Betschi /Betsi/ (established in the northwest) and the Makei /Mekei/ (settled in the southwest). His division is based on whether they pronounce the phrase, "I say that," as Mekima or Matsina. The groups are divided into an infinite number of tribes,

114 with names beginning either with Eb (Makei) or with Es (Betschi).
101 The Governor General, Cournarie, after carefully surveying the peoples in the vicinity of Yaoundé, where he was administrator, prepared the following table:

- NANGA ....
  - Beti ....
    - Kolo ....
      - Ewondo
      - Bane
      - Mangisa
      - Kombe
      - Tsinga
      - Etudi
      - Emfek
    - Eton
    - Mvele
    - Badzu
    - Omvang
    - Ntumu
  - Yesum

And he concluded: "It appears that among the Beti one can also include the Badjia, the Bavek, the Bamvele, the Djanti, the Ngoro, and the Yangafuk."

It is impossible to say whether or not this problem will ever be solved, for it becomes more and more complex from decade to decade because of the changes which are taking place, with perhaps increasing speed. We would like future researchers to be aware of its complexity; they should not believe that we have thought to present solutions here.

Bibliography

113 "Bericht über den äusseren Verlauf der Batanga-Expedition (Ende Oktober 1887 bis März 1888)" /Progress Report of the Batanga Expedition (End of October, 1887 to March, 1888)/ Mitteilungen aus den deutschen Schutzgebieten, 1888, pp. 6-30, 112-21.

173 therefore forced to settle in the most westerly area. (See the unpublished report of Father Sohler.) Others say (according to the report of X. Béliard) that they are only brothers of the Ewondo, who crossed the Sanaga, entered the southern forest as far as the present-day region of Ebolowa, stayed there a few years, and, step by step, took the northwest route, crossing the Lokoundje River. Then they infiltrated among the Basa tribes and settled in their present habitat. What we know for certain is that not until 1910 did they occupy the three villages on the road between Kribi and Edéa, and that their migration was still in full swing when the German occupation forced them to settle in one spot.

184 The population in the vast territory occupied by the Ewondo is not
563 culturally homogeneous. In many villages and even in the hamlets, the Ewondo live side by side with members of neighboring groups. On our map we have indicated the most important enclaves and mixed settlements /Map 8, facing p. 72/, namely those where the strangers are as numerous as the Ewondo or even more so. /72/ The actual situation is more complex than this, but on a map of this scale it has not been possible to show the minorities. (1)

[114]

1. A remarkable large-scale diagrammatic map of the administrative subdivision of Yaoundé should be mentioned here. It was set up in 1944 by the administrator J. Christol and shows even the smallest intermixtures, with proportional strengths, for every village and hamlet.

361 The Ewondo live in sizable villages which stretch along the many
511 roads in the area. The villages are well maintained and show evidence of a comfortable standard of living which is largely the result of the prosperity of their cacao trees and their trade.

181 The Ewondo are robust and muscular, skillful and intelligent. They emigrate readily, and their workers are valued in all enterprises.

497 The shipment of their products is facilitated by a major branch of the railway which crosses their territory between Yaoundé and Otélé, and transportation on their roads plays an important role in getting the various foodstuffs and the cacao from the great markets in the bush to the railroad.

101 We connect the Bobili with the Bamvele because, on the one hand, they do not appear separately from the Bele on the Moisel map (Dume, G3), and, on the other, the traditions pertaining to their origins are not precise enough to permit us to draw a conclusion differing from that of the Germans.

Physical and Human Geography

131 Area: 2, 472 square km.

161 Population: Bamvele—18, 452 inhabitants
Bobili—6, 247 inhabitants

Density: 10 persons per square km.

133 The Bamvele are close neighbors of the Yekaba and the Yebekolo in the north; they occupy a large homogeneous territory on the border between forest and prairie. The country is almost flat, extending into the Sanaga plain and borders the river for about 30 kilometers. The territory is watered by several broad tributaries of the Sanaga. In the east, one of these tributaries, the Long, serves as a frontier between the Bamvele and the Babute, who surround them everywhere except in the south. A few Bamvele villages have been established [361] on the right bank of the Long, and they border the Bertoua road for a few kilometers.

174 Like their neighbors, the Yekaba, the Bamvele in their traditions tell that their origins are to be sought among the Yalongo north of the Sanaga. They too were pushed by the Babute who were under pressure from the Fulbe; they fled south and crossed the Sanaga a little more than a hundred years ago. Their history is identical with that of their neighbors, the Yekaba. /Map 17/ /89/

173 The Bobili believe that they are native to the territory, but they say that in former times their country extended west, beyond the Long. Therefore, the impact upon them of the Babute and Fulbe movements would have been very slight. (1)

1. Unpublished report of Mr. Brothier-Oubre for May, 1945.

● 114 The administrator Chauleur carried out prolonged research in an attempt to untangle the network of peoples on the banks of the Sanaga. He does not feel that he can make a statement about the remote origins of the Yalongo, but he poses the following problem: "Could they be related to the Ba-yoka of the Congo who emigrated south

114 from the Masai territory during the sixteenth and seventeenth centuries? The presence of Ba-yoka in the midst of the tribe is, of course, insufficient evidence. In order to give a satisfactory answer to this question we would have to be able to make a comparison between the languages."

245 The country of the Bamvele and the Bobili is enriched by the presence of beautiful palm trees which are the sole source of prosperity for these peoples.

491 The country is serviced in the south by the eastern highway and also by a central road which runs from the Yekaba frontier to the north of their district.

197 Language. Although the traditions of the Yekaba and the Bamvele state that the ancestors of both peoples fled from among the Yalongo north of the Sanaga, the linguistic map of G. Tessmann clearly distinguishes between the two.

As we have seen, he says that the Yekaba speak a Pahouin tongue. The Bamvele (Bele in the German terminology) are said to have brought from their land of origin a language which is different from, although related to, the Pahouin languages, but mixed with that of the Beti. This observation is interesting and plausible. The Yekaba of the same origin as the Bamvele may thus have borrowed their language.

See Günter Tessmann, "Die Völker und Sprachen Kameruns /People and Languages of the Cameroons/," Petermanns geographische Mitteilungen (Gotha, 1932), pp. 117 and 184.

141 Physical Anthropology. The people are almost all tall and strong, with flat noses and a marked prognathism. The trunk of the body is proportionately long.

Average height: men 169.7 cm.; women 158.9 cm.

Indexes	Men	Women
Cephalic	79.3	78.7
Facial	84.7	84.9
Nasal	87.0	81.8
Cormique	51.5	52.5
Envergure/T	104.5	104.2

[73] Part II. Chapter I

Fang Society

I. The Fang Country

●114 Fang migrations toward the Gabon coast continued until the beginning of the twentieth century. This thrust continues, and the terror it inspired among the populations which were driven back soon attracted the attention of the first explorers and colonists. As early as 1856, Du Chaillu succumbed to the attraction of the Fang country, conjuring up this "apparently restless and enterprising race" which strives to "take possession of the whole coastline." He knew that the key trading positions of the interior were to be found there. In 1884, A. Fourneau, then making his first expedition, was astonished by the conquering vitality of the Fang. He describes them as "intelligent, with very well-developed commercial instincts, not yet having the vices of the coastal tribes; there is no doubt that before long they will cause all the aborigines to disappear by absorbing them." (1) During the entire period of

1. A. Fourneau, Au Vieux Congo, Notes de route [In Old Congo, Travel Notes], Editions du Comité de l'Afrique Française, 1932, pp. 41-42.

penetration, there was a kind of Fang mirage which tended to overestimate the importance of the group: according to the Marquis de Compiegne (about 1875), "an extreme density of population extending over a length of more than 400 kilometers"; according to Lesieur-Trilles (1900), a population "that must number several million"; and following his mission (1905-08), Captain Cottes, more precisely and affirmatively, puts the figure at "two or three million subjects " Actually, Europeans discovering the "interior" during the second half of the nineteenth century were surprised at a large migration toward the coast taking place under their eyes, along the Ogooué River in the opposite direction from

●114 their own penetrating movement, and in a way coming to meet them.

101 [74] The Fang -- or Pahouin [Pahuin] -- occupy in an oblique direction, northeast to southwest, the upper part of Gabon, with the line of the Ogooué roughly forming their southern frontier. [161] They represent 127,000 inhabitants out of the 415,000 living in this territory. They are separated by the Cameroons frontier from a collection of related and particularly active peoples numbering more than 550,000 individuals. (1) They are divided by the

Dugast, Inventaire ethnique du Sud-Cameroun [Ethnical Inventory of the South Cameroons], I.F.A.N., Douala, 1949; or "Esquisse ethnologique pour servir à l'étude des principales tribus du Cameroun français... [Ethnological Sketch to Serve for the Study of the Principal Tribes of the French Cameroons]," Bulletin de la Société des Etudes Camérounaises, pp. 21-22, 1948.

frontiers of Spanish Guinea which, with an essentially Fang population (of nearly 100,000 individuals), isolates closely related groups. The hazards of colonial expansion have led to this partition into three "blocs" which were subject to different policies and condemned for a long time to ignorance of each other.

174 As to the arrival of the Fang in Gabon, we possess a few guide marks. According to our investigations in Woleu-N'Tem, the settlement goes back in this region eight or nine generations, which corresponds to the second half of the eighteenth century. According to E. Trezenem the Fang reached the Middle Ogooué at the beginning of the nineteenth century, (2) and their arrival at the estuary

2. E. Trezenem, "Notes ethnographiques sur les tribus Fan du Moyen-Ogooué [Ethnographic Notes on the Fang Tribes of the Middle Ogooué]," Journal de la Société des Africanistes, Vol. 6, f. I, 1936.

114 Pierre Alexandre made several field trips to Gabon and Spanish Guinea while carrying out official duties in the southern Cameroons from 1946 to 1951. Since 1955 he has been connected with the University of Paris as executive secretary of the Centre de Hautes Études d'Administration musulmane, (C. H. E. A. M.) /Center for Advanced Study in the Department of Moslem Affairs/.

Jacques Binet has also held an administrative post in the /French/ Cameroons, and since 1954 has been on the staff of the Office de la Recherche scientifique et technique outre-mer, (O. R. S. T. O. M.) /Bureau for Oversea Scientific and Technical Research/. He has carried out several missions in Pahouin country for the Conseil supérieur de la Recherche sociologique outre-mer /Higher Council for Oversea Sociological Research/, during the course of which he did research in juridical and economic sociology.

The authors wish here to express their thanks to the authorities of French Equatorial Africa whose kind assistance made this book possible.

4. Survey of Demography

914
127
161

In addition to the usual reasons for lack of precision in demographic data, common to all the African territories (absence or inadequacy of a registery office, weak administrative structure, especially in the medical branch), there is in relation to the Pahouin group the fact of their belonging politically to four territories, of which one is not French.

For the southern Cameroons we have at our disposal good census returns and competent, up-to-date medical information issued periodically as a result of the obligation to furnish reports at regular intervals to the League of Nations and then to the United Nations. The heads of mobile teams of the S. H. M. P. /?/, which have been especially well staffed since Dr. Jamot's campaigns, collect during each tour anthropological information /9/ as satisfactory as their multiple duties and the intellectual and social level of the surveyed areas allow. The military personnel provided in varying proportions by the territorial administration permitted many colonial officials, particularly before and during the last war, to make individual studies, often detailed, such as those of E. André on the demographic development of the Ntoumou of Ambam.

The situation is less satisfactory in French Equatorial Africa. First of all the Federation government has never, like that of the Cameroons, had to arrange for regular reports to be submitted to international agencies. Furthermore—and especially—meager budgets have often forced the administration to assign territorial commands—whose headquarters and location have many times been changed—to junior officers or to subordinate civil servants lacking the necessary training for profitable work in this field and hampered, moreover, by the very size of the thinly populated districts. For a long time only approximate estimates were available for Gabon and the Middle Congo, erring mostly on the side of administrative optimism, in no way motivated by scientific considerations. The situation has greatly improved since 1946, but the imaginary character or inadequacy of earlier data may well falsify the conclusions to a considerable extent (1).

1. Cf. Sautter, L'utilisation des documents administratifs pour l'etude de la population du Moyen-Congo et du Gabon /Utilization of

114
127
161

administrative documents for population study in the Middle Congo and Gabon/, Bulletin de l'Institut d'Études centrafricaines, 1954, Nos. 7-8; Ziegle, Afrique équatoriale française /French Equatorial Africa/, Berger-Levrault, Paris, 1952, p. x; Christol, Un essai de fichier demographique au Cameroun /An Attempt at Demographic Classification in the Cameroons/, Bulletin mensuel de statistique d'Outre-mer, 1951, No. 20.

Finally, for Spanish Guinea the sources are rather inaccessible and of very uneven value. The best are probably the reports submitted by the scientific expedition of 1948 organized by the /Spanish/ Department for Morocco and the Colonies, of which the Anthropological Commission apparently made a study of demographic development in collaboration with the colony's health service: these reports I have not been able to obtain. The fiscal census carried out by Civil Guard officers in command of the "Demarcaciones /Demarcations/" seems to be considered a state secret; the census returns prepared by the Roman Catholic missions appear unreliable. If one accepts the total population figure given by official statistics, supposedly 172, 000 persons, it would be necessary to put the number of "Pamue" (the Spanish form of mpangwé) at about 50 percent of that total. Estimates made during the recent war by civil administrators and frontier officers of Gabon and the Cameroons are much lower, giving a total of about 130, 000 inhabitants, 50, 000 to 60, 000 of whom were Pahouin. Likewise, Spanish medical reports seem to be colored with a possible excessive optimism, attributing specially to biological causes a rise in population that results mainly from immigration.

In conclusion, the lack of agreement about even the composition of the Pahouin group makes the figures vary greatly, whether round estimates /10, table on pp. 12a-12e/ or genuine demographic indices. Thus we meet with totals that vary from 650, 000 to 1, 500, 000 Pahouin, with the differential index clearly positive or clearly negative according to the writer.

161
163

My own estimate of about 820, 000 takes account of Pahouin only in the strict sense and leaves out the tribes whose affiliation is debatable (1). This group as a whole is growing slightly (the differential

193 pl. bisa) it means "extended family." The two words (which have different tones) come from sak, to ejaculate, to f.... /sic: probably foutre/ which would have led to *nsak, besak = genitor, father.

The pronominal classifiers have an important and typical role, that of connecting a noun and its complement or a noun-subject and its verb. Nevertheless, this rule does not seem to be absolute, and Boulou especially is quite ready to omit the connective in the genitive, particularly in the singular:

jôm é ntañgan or jôm ntañgan, biôm bi ntañgan or biôm ntañgan = thing or things of whiteness;

mon a fañ, bo' be fañ = a or some Fang;

alu e ne dibi, melu me ne dibi = the night (s) is (are) dark;

mvu j'adi, bemvu b'adi = the dog (s) eats (eat).

Fundamentally, verbs are divided into verbs of state or position and verbs of action, which are not conjugated the same way. One type is derived from another by affixation to the radical, which makes it possible to complete the defective conjugation of verbs of state by recourse to their active derivatives. Tense, mood, voice, and aspect are indicated either by affixation or inflection, or by using auxiliary verbs, some of which have a meaning by themselves, while others may only be used with another verb (the last are perhaps simple affixes).

Pronouns and pronoun-adjectives are well represented, while qualifying adjectives are rare, especially in Boulou, and are most frequently replaced by nouns of quality or state that do not agree. The same is to be observed concerning tool-words /mots-outils/: aside from a few adverbs, the invariable conjunction and preposition, nouns are mainly used:

éyoñ = time, circumstance = when; mfa'a = direction, orientation = toward; ajô te = this matter = thus, therefore, consequently, etc.

194 From the phonetic point of view the outstanding trait of the group is undoubtedly the use of tones, which is the basis of telephony by drum (nkul), bell (nkeñ), or modulated cry (ékiga). Bates and Johnson recognize five tones, plus the glissando of the negative. Bertaut, following the German scholars, distinguishes two fundamental tones, high and low; two derived ones, ascending and descending;

and a middle tone. Father Stoll, raising the problem again in a recent work, turns it upside down by describing two fundamental tones, symmetrically contrasted, two dominant tones, and eight compound /composés/ or gliding ones, all of them together classed as eight principal (four simple and four gliding) and four secondary ones. He connects this symmetrical system with the cosmogony, proving his point with an illustration from the sô rite. The battle among specialists is too violent for me to express an opinion. I shall restrict myself /25/ to pointing out that the nkul and the nkeñ only give two tones, and that in sending a message by one of these methods rhythm plays as important a part as do the tones (1).

1. But the balafo, mejeñ, consist of five xylophones of different tonality, each having six notes.

In the spoken language, and especially in formal speech, rhythm is just as important, and even those missionaries who possess a fine enough ear to avoid involuntary puns through tone usually do not succeed in mastering rhythm as can the last of the poet-storytellers. Current transcriptions do not, moreover, take rhythm or tone into account, the meaning of homographs emerging from their context. I think I observed here as elsewhere that the younger generation is inclined to forget the fine points of the language and no longer distinguish more than two tones, high and low, while the use of the nkul is daily losing ground.

A final important element in the language, especially in the oral literature, is represented by exclamative-descriptives, a series of locutions based on onomatopoeias or derived from verbs or modified nouns, reduplicated and often introduced by an exclamative particle or a click (2). Some of them are sufficiently accepted to be used in

2. Bertaut is one of the rare authors, if not the only one, to point out these clicks. I know of three in general use: one of approval, one of denial, one of warning. Others exist, used in hunting and still little known, which were perhaps borrowed from the Pygmies.

194 written texts, but the majority remain current only in the spoken language, the speaker moreover not hesitating to invent as need arises.

4. Classification

197 Most writers, from Meinhof to Guthrie, class the languages of the
114 Pahouin group with the Bantu. In his general classification of Bantu languages (1948), Guthrie puts them in his area A, under the decimal number 60, including Ewondo, Bulu /Boulou/, Ntum /Ntoumou/, Mekaé, Zimu, Fañ /Fang/ (the so-called Betsi or Mazouna dialect, although he does not specify this) and Maké (doubtless eastern Fang, the dialect called Makina). Stoll includes Ewondo in his work on the Bantu and semi-Bantu languages of the Cameroons, without specifying whether he classes it with one or the other (3).

3. In its reports to the United Nations, the Cameroons government qualifies the Pahouin of the southern Cameroons as "neo-Bantu."

197 Yet it seems certain that, if these languages are really to be included in the Bantu family, they form a special category, which cannot be likened purely and simply to the unquestionably Bantu languages of adjacent populations. Besides, there is discussion as to whether the Pahouin invaders brought their language with them or have adopted and changed that of the peoples established before them on the Cameroons-Gabon plateau. There has also been some hesitation about classing the languages /26/ of the border tribes, notably Mekaé and Kozimé, either with the Pahouin group or with the adjacent Bantu groups. For instance, while it is agreed to put Ngumba beside the Bantu languages of the coast, Mekaé, which is certainly related to it, is classed sometimes with the Pahouin tongues, sometimes with those of the Bantu of the eastern Cameroons.

197 The existence of a nominal gender (Bates' Class III) lacking a
114 classifier prevents our putting the group among "agglutinating languages with a perfect class system having a special pronoun for each class," where Delafosse places Bantu. Mademoiselle Homburger (Le langage et les langues /Speech and Language/, p. 69) makes of it a separate family, close both to coastal Bantu and to semi-Bantu. In the chapter she devotes to Bantu in Les langues du monde /Languages of the World/

197 she connects it with Delafosse's West African group, harking back to
114 its non-Bantu character in Les langues africaines et les peuples qui les parlent /African Languages and the Peoples Who Speak Them/.

Father Trilles and Abbé Walker believe that they have found Semitic and Hamitic influences in Fang. A borrowing from Sudanese appears more likely. Westermann classes "Bati" in the semi-Bantu group, pointing out that the term "Sudanese languages possessing classes" seems to him more appropriate. Now, we know that Beti (Ati), which is losing ground today to Ewondo, is itself very close to Fang (Betsi-Mazouna) and recently reached to the northern limits of Boulou, which it has influenced.

We may therefore come to the conclusion that the Pahouin linguistic group, at present very close to Bantu, ought probably to be considered intermediate between the true Bantu tongues and the semi-Bantu or Sudanese class languages, historical circumstances and contact with neighboring peoples having accentuated the Bantu traits in such a way that it is proper, from the methodological point of view especially, to classify it as a special family of the Bantu group (1).

1. In the absence of specific mention, it seems that Greenberg (no. 70) would classify it in his Nigero-Congo group. [i.e., Niger-Congo.-Analyst]

Chapter 4

Economic Life

1. Subsistence

222 The diet of the Pahouin peoples would be enough to prove that
262 their attachment to the land is quite recent. In fact the importance of collected produce is striking. According to a study carried out in Eton country (region of Yaoundé) by Dr. Masseyeff, the consumption of mushrooms amounts on Eton average to 4.1 grams per day per person (1). Snails, termites, caterpillars, palm larvae, and crickets

1. R. Masseyeff, A. Cambon, Enquête sur l'alimentation au Cameroon, Rapport à l'Office

shed with a roof low enough to /43/ give good protection from the sun. Some villages are placed at right angles to the road; others follow an L or Y plan, with several minseñ. Family "allotments" are separated by hedges of euphorbia, castor-oil plant, hibiscus, and bougainvillea. Sometimes one comes across sheepfolds, although in old-style (and most contemporary) villages small livestock roam at will. A village often includes a guesthouse (ayak).

In building operations the man generally takes charge of the framework and the laths, leaving to the women the preparation and application of the banco /clay daub?/. But European-style huts with their elaborate door frames and often cement floors are more and more the work of specialized artisans, who are paid to supervise the family labor provided by the owner. These men have nevertheless preserved, along with the English term "mason," the old name nloñ nda, literally, hut-weaver, which goes back to the time when huts were made of sewn bark (1).

1. The dwelling continues to evolve: framed doors, windows, and shutters are in general use today. The dimensions of the buildings lead to the construction of a real frame. Finally, to possess a sheet-iron roof is a sign of wealth. In recent years there has arisen a real passion for the improvement of dwelling: in the Cameroons we may estimate that 10 percent of the dwellings now built in the bush are the most modern type. (J.B.)

2. Groupings and Relationships

The main divisions of Pahouin society are both exactly defined in the minds of its members themselves and at the same time uncertain for the European observer, who is constantly tempted to state them clearly in organic forms accessible to his "logic" and who is hindered by the variations or the dialectal confusions of Pahouin terminology. Father Trilles, basing his observations on the Fang of Gabon alone, reached a sort of palaeontological reconstruction of the "Fang nation," extremely theoretical, yet not without basis

however, since traces of it can be recognized in the contemporary movement for Pahouin Regrouping represented in the Cameroons by the U. T. N. K. party (N'Tem Kribi Tribal Union). Such /theoretical/ constructs are still rather risky in our present state of knowledge, and it is better to limit ourselves to a pure and simple description, resorting as little as possible to interpretation, which in any case should be done with hesitancy.

I shall therefore limit muself here to the attempt to perceive Pahouin society on three essential structural levels, while emphasizing again the necessarily arbitrary and incomplete nature of such a proceeding.

These three levels are the most easily perceptible to the European observer and at the same time the most significant, apparently, in the eyes of the Pahouin themselves. These are, what I shall call, for lack of anything better and because they are the terms particularly retained by the administration, the tribe, the clan, and the extended family or village family. Something will also have to be said about intermediate structures such as lineages, segments /fractions/, and village groups, and a little more on the subject of the household or limited family, whose importance is increasing. /44/

a. The Tribe

I designate as "tribe" what Trilles calls "group," while he keeps the term "tribe"—as do many observers in Gabon—for what I call "clan." This is because in southern Gabon there is only one "tribe" in the sense I understand, that of the true Fang, or Fang-Fang as Spanish writers call them.

I know of no Pahouin word specifically denoting tribe, Trilles uses the expression mfulane meyoñ, that is, "all of the clans together." In fact, and this is no doubt significant, the term most commonly used is ayoñ, which also denotes what I call clan. Mfulane meyoñ is used particularly when there is occasion to specify that one is referring to a higher structural level, sometimes also referred to as ngum ayoñ, "the clan as a whole," or meyoñ mese, "all the clans." (1) Nevertheless, the tribe is indeed a reality, in spite of this

1. American translators of the Bible have used ayoñ for "people" as well as for "tribe" and "realm."

181 opinion is quite widely shared by foreign observers. "Much more intelligent and... more active and harder working than the average Negro... they also have more forethought... they compare with other Negroes as do Aryans with Semites and the red men /Rouges/ ... capable of acquiring a certain amount of intellectual cultivation and of performing all sorts of industries," wrote Largeau in 1900. Before him, Du Chaillu /had written/: "Proud and fierce warriors... clever and industrious... that will supersede... the degenerate tribes (of the Ogooué)," while Horn, who did not like the French at all, thought the "Mpangwe" of 1875 to be the "Prussians of Africa," which, considering his attitude and the period, was a compliment. Later, Trilles favorably compares their moral standards with those of Europeans; his Protestant colleague Grebert speaks of their "individualism," their "fierce love of liberty." The portrait admits, it is true, of some reservations: "brusqueness," "brutal frankness," along with "unreliability," "malice," and "greed for gain" for Largeau, "pride," "tendency to hoard," "stubbornness," for Grebert, "cruelty," "avarice" for Du Chaillu, "superstition" for Horn, while Compiègne thinks they "disappointed Admiral de Langle's hopes (for their ability to become assimilated)." It is a remarkable fact that these "defects" may just as well appear aspects of their "good qualities," just like the strictures on "anarchy" and "rebelliousness" that often turn up in the official reports.

All these evaluations still hold good, clearly subjective and /89/ nonscientific as they are, just as are those I have been able to make myself and which lead me to say that I have actually met among the Pahouin I associated with a large proportion of intelligent, energetic, high-spirited /fiers/ people, endowed with a sarcastic humor well illustrated in many recent novels and also in the giving of nicknames, especially to government officials, and in the celebrated caricatures of Monewoso among the Boulou.

●114 153 The only scholarly work on this subject that I know is some research done in the Cameroons by Stoerkel, head of the Service de Psychotechnie et d'Orientation professional /Psychotechnical and Vocational Guidance Service/, which does not seem to have been published. This research was done in 1949-50 at the beginning of the construction of the Edéa dam. The studies revealed, among the Pahouin of the southern Cameroons, motor adaptability, concentration, and capacity for integration superior on the whole to those of other

114 ethnic groups in the same region, the Boulou subjects being classed
153 first on these points among the Pahouin tribes. Intelligence tests and mental-age evaluations made among school children and lycée students gave similar results in comparison with Africans of the same age. On the other hand, a comparison with European children living in the Cameroons showed a certain inferiority, from which it is still impossible to draw definitive conclusions because of the scarcity of "culture-free tests" used at the time. Projective tests administered
114 under the same conditions revealed schizoid tendencies with rather
157 marked aggression and a fairly high frequency of the Oedipus fixation with some transference /assimilation/ from father to white man. The difference in level from neighboring tribes was less clear among the lycée students than among school children, and less clear among the latter than among the laborers at Edéa. It must be emphasized
[125] that these tests, especially the projective ones, involved a limited number of persons in particular situations outside the village milieu, that remains the background of the majority of their fellow tribesmen. I am not acquainted with the results of later research.

156 With regard to social psychology, we are also largely restricted to subjective evaluations in the same class as those mentioned at the beginning of this section. Allégret a half century ago remarked upon a defeatism more bitter since the Fang had come in contact with Europeans, and certain legends reported by Trilles and Largeau on the Jacob and Esau theme, with the white man in the role of the usurping younger brother, go some way to confirming this. Balandier has given a good description of contemporary expressions of this feeling of collective frustration, both in his Sociologie actuelle and in various articles, one of them with the significant title, "Les Fang, conquérants en disponibilité" /The Fang, Unattached Conquerors/, (nos. 175 and 173).

One striking trait, also emphasized by Balandier, is that of collective mistrust of successful persons. This may appear to contradict the previous statement about Pahouin individualism, but in fact it is precisely /90/ this individualism that produces a good share of the suspicion of the other individual (cf. in Ezo Boto, Ville cruelle, no. 182, the reactions of the hero Banda vis-à-vis the rebel Koumé).

656 We must also point out the psychological and social importance
156 of akum, wealth, and of biôm, possessions, especially imported possessions. Combined with the as yet little-studied concept of the

882 is not yet admitted to the essential functions of full manhood: ritual, warfare, and marriage. Formerly, he was not until after the great 881 tribal initiation, sô. Sô is the name of a large red antelope, Cephalophus castoneus, found in great quantity in the forest and in [825] the galleries of the park-savanna. The meat is taboo, étyi, to the [262] uninitiated (bibis) and, a fortiori, to women. It may seem strange that Trilles does not mention it in Le totemisme chez les Fang, although the sô seems to be one of the most important tribal totems. [171] It should be observed in this connection that the sô rite, widespread among the Cameroons Pahouin, including the Beti, and among those of the Woleu-N'Tem, seems to vanish somewhere between Mitzic and N'Djolé, while some of its features are to be found in the initiation to the biéri, which is basically merely an adjunct. It would therefore appear to have gone to pieces at the same time as the structure of the meyoñ, to be revived in the extreme south by the bwiti, reported by Trilles, which is at present moving northward. Nevertheless, I must point out that what Trilles describes under the name of bawu may well be sô.

Initiation ceremonies were filmed among the Eton of Saa in 1935; [114] the film is kept at the Musée de l'Homme. Bertaut (no. 110) gives a very full description of the outward forms of the initiation, Stoll (no. 84) an interpretation of its symbolism.

Initiation took place about every three years (every seven mimbu?); Bertaut states that a ceremony might be arranged after some serious happening in a village. It lasted three months (one year, according to Stoll, who counts in the preliminary ceremonies for the initiation proper and the period following) and entailed great expense for sacrifices on the part of the parents of initiates and especially the initiation leader, the nkpwé sô (judge of the sô; lit., butcher of the sô), a senior chosen from the most wealthy and respected. From this point [181] of view, one may believe that the rite coincided with the desire for levelling of wealth which appears to have been so constant in Pahouin society. The nkpwé sô did not himself lead the ceremony; he was the instigator and the person responsible, but the celebrant was a diviner, a mfek sô, "sô wise man" or "sô measurer" or "sô pouch," if the tone is changed (vek = to take aim, to compute, to divine, to measure).

The main theme of the rite, of which the following description is quite incomplete, was the death of the sô, awu sô, afterwards eaten

88| community. After another sacrifice, the bevôn were again confined inside the ésam sô, where initiates had dug a narrow passage and covered it with wattling and earth, the bottom strewn with thorns, crushed pimento, and warrior ants. The bevôn would receive final instructions, then, after taking mud baths, grunting like hogs, they had to crawl through the passage previously filled with smoke, while the minkpwangôs struck and pricked them with assagais through the cover; a mvôn who rose up or tried to escape was immediately killed by prisoners stationed outside the enclosure. This was the third stage, the true "death of the sô," awu sô.

After leaving the esam, the bevôn were supposed to be aggressive, teasing, to worry the other villagers, steal food, fowls, etc., tear down barriers, and in general behave like wild beasts. This period lasted for several days, preceding the sortie of the sô, akui sô, a parade of the group in war dress, carrying spears engraved with the distinctive clan mark, ndem, which had been consecrated during the initiation. A feast followed. For six months (mbu) afterward, the new initiates were still subject to certain sexual and food prohibitions, from which they were freed if they killed a man during the period. At the end /100/ of this waiting time, they went away, painted white, into seclusion for a night and came back painted red, making the rounds of the village nine times in procession. Then they bathed in a stream where fishing was afterward forbidden until the initiation of the next group, apparently.

A young man thus initiated became a mone wôsô, child of the death of the sô (wu = to die; wôé = to kill), thereafter ready for marriage, which would make him a complete man, nya môtô. His [76] father might instruct him in the family cult, which till then he knew only in its externals; he was taught to identify the ancestral skulls kept in the biéti basket and to enter into communication with them [276] by means of the narcotic herb alan. Sometimes the instruction was given collectively in the melan rite, which, according to Stoll, complemented sô, the latter being androgynous, while the former was gynandrous. Sô was to give creative power, melan fecundity and wealth. Melan has a medical aspect lacking in sô; the participation of women is greater. Some elements seem to have survived until the present day, whereas the last sô ceremonies must have occurred about 1940. Stoll gives a pretty full description in La tonétique des langues [114] bantu... du Cameroun /The Tonal System of the Bantu Languages ... of the Cameroons/ (no. 84).

771 The first observers described the Pahouin, especially the Fang,
781 as "less superstitious," "less given to fetishism" than neighboring
114 populations. Trilles and Martrou emphasized their profound religious sentiment, while Allégret (no. 147) gives very interesting information about the feeling of religious destitution they experienced, particularly after contact with Europeans. Often observed also has been the ease with which they would adopt new beliefs and ceremonies, and this refers not only to Christian sects but to cults like bwiti and ngôl and even, before the last war, to freemasonry in the vicinity of Libreville.

All these influences are so intermingled that we must resort to a kind of conjectural palaeontology in order to reconstruct their original beliefs. Without casting any reflection upon the intellectual integrity of observers like Trilles and Martrou, we must recognize—and regret—that a certain professional slant from time to time affected their conclusions, to a point that induces us to turn instead to laymen much less well qualified linguistically, like Largeau, of whom Trilles has shown himself perhaps a little too critical.

a. Concept of God, Creation

776 The Pahouin believe (or used to believe, see later on) in a creator god Mebe'e (Fang, Mebere, Mebeghe), eternal, formerly immanent, becoming infinitely transcendant after the first nsem.

The word Mebe'e seems to be related to the verb be'e, to carry, which has the agent-noun, mbe'e. Mbe'e is a plural form, corresponding to nouns of action and also to the collective plural forms of names of liquids (mendim = water, metyi = blood, meyôm = sperm, etc.). It is usually accompanied by triple apposition: "Mebe'e, Mebe'e menkpwa, sokuma, mbongbwe" (or, according to Trezenem, mba angwe). The meaning of these three qualifiers is as uncertain as that of Mebe'e; menkpwa should probably be connected with kpwaé = to strike down, to judge, to condemn; sokuma with kôm (kum) = to arrange, to direct, sô conveying the idea of generosity, rectitude, balance (Boulou, soso, zoso); mbongbwé would then, according to Grebert, mean "creator of generations" (bo = to make; ngbwé = maternal kinship), but could also be /108/ connected with ngbwa = love, friendship, alliance, with the sense of "he who makes an alliance" or "he who loves."

769 The figure was placed on the new group's first family altar, and so afterwards were the skulls of the founder and of the benya bôtô of succeeding generations. A full biéri basket was the sign of a group's [554] antiquity, which doubtless implied prestige more than genuine authority, yet nevertheless represented the nearest approach to political authority that existed in the Fang group, particularly if one takes into account the fact that officials of interclan associations were chosen from among the owners of many skulls, whence prestige extended to a large number of mvôk or meyom. The prestige of the living was exerted through the authority of the dead.

[826] Skulls were, indeed, the seat or receptacle of the individual's capacity for action (we must remember that bo = to make, boo = brain), and the use of skulls in the practice of magic was not confined to ancestral skulls only: the skulls of enemies killed in battle or sacrificed in anthropophagous ceremonies before or afterward were preserved, and so were those stolen from neighbors. In the same way the skulls of the kinds of animals desired were used for hunting rites. However, it seems that a distinction was made between family skulls and outsiders' skulls, only the first having a place in the éwolé biéti and [782] appearing in family rites. The power of the skulls was increased by sprinkling them with sacrificial blood.

769 When a youth reached nya môtô age he had to learn to recognize 869 his ancestors so as to be able to ask for their help when the occasion 881 arose. Their skulls were shown to him until he could identify them individually and put them in the correct genealogical order. When he was able to do this, he was given a brew of the narcotic herb alan, [276] then spent a night in the biéti hut, facing the skulls, which had been removed from the éwolé and placed on the altar on which strongly scented plants were burned. During the night the ancestors appeared and gave him a cognomen and imposed one or more new taboos (at the same time he was relieved of certain prohibitions connected with age). Apparently it was during this initiation that his individual totem was revealed (if it was indeed a totem).

769 This question of the totem is very poorly elucidated, in spite of 614 some 600 pages devoted to the subject by Father Trilles. He dis- 114 tinguishes between clan, segment, individual, family, and society totems, etc. He also distinguishes a tutelary being, mvame, from the "effect of a tutelary being"; akam, an animal totem, from a dedicated animal or an incarnation of a man in an animal, etc. He

769 also discriminates between the ésayoñ, ancestor cult /112/, and the
614 mvamayoñ, totemic cult. It must be admitted that there is now no
chance of obtaining a cross-checking of his theories except on points
114 of detail, although that is no formal condemnation of his theories;
it is the consequence of a shortage of researchers, lack of respect on
the part of the researchers, or loss of traditions of initiation. The
following points may be considered as established:

mvam (émvam) connotes ideas of a forefather, dead or alive, lineal and protective.

[784] akam, protection, is sometimes used in speaking of animals, to indicate the reason for a prohibition; the verb kam having a defending-protecting meaning as well as that of forbidding-prohibiting.

All prohibitions are not tied up with these notions, but some are and they may well be individual prohibitions as well as hereditary collective ones, not necessarily involving animals.

Clan markings, mindem, and tattoo marks, mindan, are often connected with a prohibition.

825 There is a whole system of animal symbolism, evident particularly
[787] in tales and augury ("zoomancy," divination by spiders).

Certain animals are connected with initiation cults: very definitely the sô and snakes (dendraspis and python); probably the porcupine and tortoise (with feminine rites); perhaps the gorilla (njil; ngil, Johnson's tone 4, the ngil rite having tone 5).

[551] There does not appear to be any connection between an animal name borne by a person (Mvômô = Python, Zo'o = Elephant, Ze = Panther, etc.) and the prohibitions he is subject to.

Moreover, the following, it seems pretty certain, are not specifi-
614 cally related to totemism:

825 Alliance, élat or ngbwa, between a person and a particular animal.

A sorcerer's employing an animal, nkuk (observe that nkuk also means "mask") to carry out his sorcery at a distance.

[775] The incarnation of a sorcerer in the body of an animal, élañela (Trilles applies this name to the nkuk).

The temporary incarnation of a dead man in an animal's body.

The first three phenomena often seem to be confused in the minds of present-day Pahouin, and the fourth may be the consequence of this.

773 It is curious that the legend recounted by Trilles about the crocodile, which he considers to be the "national totem," represents

772 the two opposite angles and would represent the axis of migration,
823 mfa'a mañ, "toward the sea." The masculine direction seems to have been the place of origin of the ye (feminine?) clans, the feminine direction, that of the ésa clans. Trilles places with the latter the ébi clans, which are, geographically, from eastern clans; I wonder if they ought not rather to be connected with the ye clans since ébi means "hole," "chasm" (yee = valley, ravine). In the bilaba, masculine commodities come from the female sector, and vice versa.

772 These apparent contradictions would be resolved by applying the principle of double symmetry, or of sexual complementarity, similar to that which makes paternal, nonuterine half brothers called bobenyañ, [601] "my mother's sons." This principle might be expressed somewhat as follows: every being capable of life must, in order to exist and be complete, include the opposite sex. In other words, bisexuality, a universal vital principle, should be found in every part of the universe /création/. Stoll finds proof of this in the language, where the tone [194] levels in his view constitute genuine differentiation by grammatical sex genders, and especially in the rites whose purpose appears to be not to make men entirely masculine or women entirely feminine, but rather to give to each sex the necessary complement of the opposite sex.

Whatever may be thought of this theory, it is a fact that, because [114] of the apparent or real absence of grammatical sex gender in the language, the majority of the early writers, even Trilles, did not attach enough importance to real gender, to the sex actually attributed to objects, particularly to magical and ritual materials. We know that spear, akoñ, saber, fa, and probably the large drum, mbaé, are male; calabashes and cooking pots, rattles (mengoñ), the double bell (nkeñ) are female; the drum-telephone, nkul, is androgynous; horns for medicaments, minlak, are male at the pointed end, female at 801 the hollow end, and the same with the rifle. As to numbers, my conclusions are diametrically opposed to those of Stoll, who believes even numbers to be male, and odd, female, though admittedly he advances as proof the large part played by odd numbers in feminine rites, which runs directly counter to his theory of double symmetry.

The numerical system is in any event only imperfectly known. [802] Counting is based on 10, with traces of an 8:10, (awôm), basis /116/ and of 8, mwom, /having?/ perhaps the same root as different classifiers. The so number is 9. Nyin, 4, seems related to a YI

/137/ Concise Analytical Bibliography

113 In addition to the works indicated below, the following periodicals,
114 among others, should be referred to:

. . . . . .

Bulletin de la Société d'Études camerounaises, at present the Cameroons section of the I. F. A. N. /Institut Français d'Afrique Noir/. (B. S. E. C.)

. . . . . .

And from the local press, among others:

Radio-Presse du Cameroun: has published stories and, in 1949-50, an open debate upon marriage problems.

. . . . . .

For the Cameroons, the Annual Reports to the League of Nations, then to the United Nations, contain a great deal of material, especially on social, political, and economic development; see also the publications of the O. M. S. /?/

Many of the works mentioned contain bibliographies, in part included below; see particularly Trilles (no. 166), Dugast (no. 133), Balandier (no. 175), Baumann and Westermann (no. 5), Leroi-Gourhan and Poirier (no. 25), Encyclopedie de l'Union française (nos. 37 and 38).

The archives of the colonial government, in the /local/ posts as well as in the political offices of /district/ headquarters, constitute a very rich source, partly exploited for Gabon by Balandier, for the Cameroons by Binet, Madame Dugast, and Sister Marie-André of the Sacred Heart. Further, J. P. Nicolas has microfilmed for the I. F. A. N. /Institut Français d'Afrique Noir/ certain material preserved at Yaoundé. /138/

5. Baumann, H., and Westermann, D. Les peuples et civilisations de l'Afrique /The Peoples and Civilizations of Africa/. Paris, Payot, 1948. 605 pp., ill.

In Baumann's view the "Fan" are a people of Sudanese origin who came from the Upper Sangha and mingled with the Bantu inhabitants of the invaded region; linguistically Bantu; culturally placed in the group of "North Congo peoples."

113 114

13. Compiègne, Marquis de. L'Afrique équatoriale. I. Gabonais, Pahouins, Gallois; II. Okenda, Bangouens, Osyéba. Paris, Plon, 1875. 2 vols. of 360 pp., ill.

Monsieur de Compiègne is ironical about "Duchaillu," the particle of whose name induces in him suspicion of his sincerity. He is mistaken.

17. Du Chaillu, P. Explorations and Adventures in Equatorial Africa. London, John Murray, 1861.

Alongside exaggerations which sometimes come near to being jokes, the book contains very exact and very valuable observations of the Fang invasion.

21. Horn, A. Trader Horn. La Côte-d'Ivoire (sic) aux temps héroïques /The Ivory Coast—sic—in the Heroic Period/. Paris, Stock, 1932. 303 pp.

Old Horn was a much more daring liar than Du Chaillu; nevertheless, his memoirs are interesting just because they are those of a "trader." /139/

25. Leroi-Gourhan, A., and Poirier, J. Ethnologie de l'Union française /Ethnology of the French Union/. Paris, Presses Universitaires de France, 1953.

This has the Fang coming from Bahr-el-Ghazal (following Bowditch, Gautier, and Vallois).

30. Richard-Molard, J. "Groupements ethniques et civilisations nègres d'Afrique /Ethnic Groupings and Negro civilizations of Africa/," Cahiers d'Outre-mer, 1952, no. 17.

A brief and very good analysis of the results of the "ayoñ regrouping" movement.

41. Cottes, A. La mission Cottes au Sud-Cameroun (1905-1908). Paris, Leroux, 1911. 254 pp., ill.

Anthropological information and photographs. /140/

46. Grebert, F. Au Gabon /In Gabon/. Paris, Société des Missions évangéliques, 1948. (3rd ed.), 237 pp., ill.

This deals primarily with the Fang of the Ogooué; good illustrations.

48. Largeau, V. Encyclopédie pahouine /Pahouin Encyclopedia/. Paris, E. Leroux, 1911. 700 pp.

In spite of the criticisms of Father Trilles, who accuses Largeau of not knowing the Fang language and of having an uninitiated "boy," the Encyclopédie is still a mine of invaluable information, often more accurate than that of Trilles.

113
114

51. Pedrals, D. P. de. "L'origine des Fang /The Origin of the Fang/, " Tropiques, 1952, vol. 50, no. 348.

A version of traditional history collected from prominent persons in the southern Cameroons, some of whom were our own informants. Hard to use because of faulty transcription of certain names.

54. Tessmann, G., and Wasmuth, E. Die Pangwé, Volkerskundische Monographie eines westafrikanisches Negerstammes /The Pangwe, An Ethnological Monograph on a West African Negro People/. Berlin, Hansa verlag für mod. Literatur, 1913. 2 vols., 275 and 402 pp., ill.

The summa on the group as a whole, including "Pahouinized" neighbors. It would be worth translating, even after a half century.

55. Trezenem, Edouard. "Notes ethnographiques sur les tribus Fan du Moyen Ogooué /Ethnographic Notes on the Fang Tribes of the Middle Ogooué/, " Journal de la Société des Africanistes, 1936, vol. VI.

One of the best recent works on the Fang of Gabon; unfortunately the transcription of certain words makes them unrecognizable. /141/

68. Good, A. I. Bulu Handbook Supplement. Elat, Halsey Memorial Press, 1934. 131 pp.

The only work to give a glossary of exclamatives, descriptives with ne, which play an important role in the oral literature.

70. Greenberg, J. "Etude sur la classification des langues africaines /A Study of the Classification of African Languages/, " B. I. F. A. N. P., vol. XVI, nos. 1-2 (Jan.-April, 1954), pp. 83-142; vol. XVII, nos. 1-2 (Jan.-April, 1955), pp. 59-108. Ill.

There is no specific reference to the Pahouin group, which appears to be included in the Nigero-Congo /language/ family.

71. Guillemin, L. "Le tambour d'appel des Ewondo /The calling drum of the Ewôndo/, " B. S. E. C., 1948, nos. 21-22, pp. 69-84.

Indispensable to a study of the nkul; it contains many mindan (indicative) notations, words, and music.

113 114

72. Guthrie, Malcolm. The Classification of Bantu Languages. London, Oxford University Press, 1948.

This classes the Pahouin language in Zone A, Group 60 of Bantu. It ascribes as characteristics the absence of size-gender (inaccurate, for there is Class ô/a for small objects, Class a/me for collectives and for large objects) and the absence of the correlation of gender with idea (inaccurate).

77. Homburger, Lysias. Le langage et les langues /Speech and Language/. Paris, Payot, 1951. 256 pp.

This describes the "leapfrog" advance of the Pahouin. It places their languages in a separate family, close to, but different from, that of the coastal Bantu languages of northern Congo.

78. Homburger, Lysias. Les langues négro-africaines et les peuples qui les parlent /Negro-African Languages and the Peoples Who Speak Them/. Paris, Payot, 1941. 350 pp.

Classes the Pahouin languages in a group intermediate between the Sudanese and Bantu.

79. Lejeune, R.P. /Rev. Father?/. Dictionnaire français-fang, précédé de quelques principes grammaticaux sur cette même langue. Paris, Faivre & Teillard, 1892. 347 pp.

Like nearly all such works of the period this follows too closely the grammar and syntax of French and Latin. /142/

81. Martrou, L. Lexique fân-francais. Paris, Procure générale, n.d.

A "Catholic Fang" transcription which cannot be reproduced on the universal keyboard; it does not give tone levels; has about 3,500 words.

84. Stoll, A. La tonétique des langues bantu et semi-bantu du Cameroun /The Tone System of the Bantu and Semi-Bantu Languages of the Southern Cameroons/. Paris, n.d. Memorandum No. IV of the I.F.A.N. Center, Cameroon, 1955. 172 pp., 2 tabls.

In addition to a new theory of tone levels, this has interesting suggestions about the so and melan rites, with an account of the theory of double symmetry, which is supposed to underlie Pahouin cosmogony.

93. Binet, J. Budgets familiaux des planteurs de cacao au Cameroun /Family Budgets among the Cacao Planters of the Cameroons/.

113
114

Paris, C.S.R.S.O.M., "L'Homme d'outre-mer" series, no. 3, 1956. 154 pp., ill.

Research done in the southern Cameroons in 1955-56. This is comparable with the work of Sautter and Balandier in northern Gabon.

98. Grebert, F. Monographie ethnographique des tribus Fang, Bantous de la forêt du Gabon /Ethnographic Monograph on the Fang Tribes, Bantus of the Gabon Forest/. Geneva. Manuscript, 36 pls., 719 drawings.

This unfortunately unpublished work constitutes the best pictorial representation of the Pahouin peoples. One of the six copies can be consulted in France, at the library of the Evangelical Missions. /143/

109. Bearth. "Le nsig-n'to, ancienne coutume Bane /Nsig-n'to, An Old Bane Custom/," Togo-Cameroun, January, 1930, pp. 313-332, ill.

The high judge nsig-nto was perhaps a high-ranking ngil dignitary.

110. Bertaut, M. Le droit coutumier des Boulou /Customary Law of the Bulu/. Paris, Domat-Montchrestient, 1935. 308 pp.

In spite of the title this book deals not only with the Bulu but also with their northern neighbors, including the Ewôndo; there is a detailed description of the sô ceremony, a good study of juridical customs and also of living habits.

119. Koch, H. "Le petit bétail chez les Badjoué et Bikélé de Messamena /Small livestock among the Badjue and Bikele of Messamena/," Bulletin de la Société d'Études camerounaises,

This gives concrete examples of the progressive "Pahouinization" of the border tribes (here under Bulu influence). /144/

120. Mba, L. "Essai de droit coutumier pahouin /Essay on Pahouin Customary Law/," Bulletin de la Société de Recherches congolaises, 1938, no. 25, 46 pp.

An interesting essay by one of the Fang political leaders in Gabon.

122. Panyella, A., and Sabater, J. "Esquema de la antroponimia Fang de la Guinea española desde el punto de vista etnologico /Outline of Fang Nomenclature (?) in Spanish Guinea from the Ethnological Point of View/," A.I.E.A., 1955, VIII, no. 34.

113
114

The most recent study of the anthroponymy /nomenclature?/ and rules for name giving; interesting observations on the designation of segments and lineages by the name of a female ancestor.

125. Zoll'Owambe, Ch. "Visage africain d'une coutume indienne et mélanésienne /An African Aspect of a (North American) Indian and Melanesian Custom/," Bulletin de la Société d'Études camerounaises, 1947, nos. 19-20, pp. 55-60.

A description of the bilaba potlatch, somewhat marred by confusions in the translation of salient points.

126. X.... "Tenue de palabre /Discussion Session/," B.S.E.C., 1947, nos. 19-20, pp. 141-146.

An extract from the archives of the Ambam subdivision; observations by Ntumu and Mvae men of standing on marriage customs and their evolution.

133. Dugast, I. "Inventaire ethnique du Sud-Cameroun /Ethnic Inventory of the Southern Cameroons/," Mémoires of the I.F.A.N. (Cameroons Center), "Populations" Series, no. 1, 159 pp., ill.

The most recent synthesis of the subject. It is to be regretted that the same work could not have been done for Gabon and Guinea. /145/

147. Allegret, E. "Les idées religieuses des Fang /The Religious Ideas of the Fang/," Revue d'histoire des Religions, vol. 50, 1904, pp. 214-233.

An interesting note on the religious "defeatism" which the Fang seem to have experienced especially after contact with Europeans.

151. Garnier, C., and Fralon, N. Le fétichisme en Afrique noire /Fetishism in Black Africa/. Paris, Payot, 1951.

Some notes on the rites of the Cameroons Pahouin.

152. Guillemin, R.P. Le rite "ésye." B.S.E.C., 1948, nos. 23-24, p. 71.

An excellent description of a purification rite among the northern tribes. Interesting notes on practices of divination.

153. Jemba Medu. Nnanga Kon. Elat, Halsey Memorial Press, n.d.

This novel, which is unfortunately out of print, is a mine of ethnological and linguistic information. Written in rather archaic and learned language, it is quite difficult to read

113
114

nowadays. It is to be hoped that it will be translated by a Bulu of today.

155. Lavignotte, H. L'évur, croyance des Pahouins du Gabon /The Evur, A Belief of the Pahouin of Gabon/. Paris, Société des Missions évangéliques, 1936. 118 pp.

A very full commentary on ngbwel sorcery and methods of protection against it. /146/

156. Leroux, L. G. "Etude sur le ngil, confrérie fan /A Study of ngil, a Fang confraternity/, " Bulletin de la Société de Recherches congolaises, 1925, no. 6.

The author, although thoroughly understanding the judicial and warlike functions of ngil, is in favor of its suppression in the interests of public order.

158. Martrou, L. "L'âme fang après la mort /The Fang Soul after Death/, " Anthropos, VI, 1911.

This bears comparison with the traditions collected by Largeau; Martrou knew the country and the language better, but, like Trilles, his interpretation seems at times to be influenced by his preoccupations as a priest.

159. -----. "Les éki des Fang /Fang éki/. " Münster. Anthropos, I, 1906.

A good study of prohibitions, though far from exhausting the subject.

161. Nassau. Fetishism in West Africa. New York, Young Peoples' Missionary Movement, 1904.

Little information relative to the Fang; the author knew primarily the coastal populations.

165. Trilles, H. "Proverbes, légendes et contes fang /Fang Proverbs, Legends, and Tales/. " Neufchâtel. Bulletin de la Société neufchâtelloise de géographie, Vol. XVI, 1905. 247 pp.

Phonetic transcriptions and translations "omitting what is smutty" (sic). In spite of the cuts this is the most complete collection.

166. -----. Le totémisme chez les Fân /Totemism among the Fang/. Münster i. W., Bibliothèque Anthropos, 1912, 653 pp.

This is Father Trilles' magnum opus. As in all his works, there are, along with subtle and accurate observations, somewhat risky generalizations and surprising lacunae, which may come from a certain professional slant. In spite of these, Father Trilles remains the great authority on the Fang.

113 114 171. Aubame, J. Renaissance gabonaise /Renaissance in Gabon/. Brazzaville, 1947.

A program for clan regrouping of Fang villages put forward by the deputy of the second constituency. /147/

175. Balandier, G. Sociologie actualle de l'Afrique noire, dynamique des changements sociaux en Afrique centrale /The Contemporary Sociology of Black Africa, The Dynamics of Social Change in Central Africa/. Presses Universitaires de France, 1955, 510 pp.

The first part of this work, which is devoted to the Fang of Gabon, contributes a new explanation of the social malaise afflicting the Fang and of the attempts at social reconstruction based on tribal regrouping and syncretist cults. It is the best book on the Fang since Trilles, Largeau, and Tessmann.

180. Celine, L. F. Voyage au bout de la nuit /Journey to Night's End/. Paris, Denoël, 1932.

The same kind of thing as no. 187 and no. 195.

182. Eza Boto. Ville cruelle /Cruel City/. Paris, Editions africaines, n.d., 219 pp.

A good study of the present younger generation, of the attraction of towns and the fear they inspire, and the conflict between generations.

183. Faure, F. Le diable dans la brousse /The Devil in the Bush/. Paris, Société des Missions évangéliques, "Je sers," 1953. 165 pp.

These edifying tales contain a good deal of information about the social and family organization of the Fang of Gabon.

187. Marie-André du Sacré-Coeur, Sister. La condition humaine en Afrique noire /Man's Fate in Black Africa/, Paris, Grasset, 1953. 260 pp., ill.

Notes on marriage in the southern Cameroons, sometimes a bit farfetched. /148/

191. Mongo Beti. Le pauvre Christ de Bomba /The Poor Christ of Bomba/. Paris, R. Laffont, 1956. 370 pp.

A novel concerned with the consequences of Roman Catholic mission activity; often unjust, but indispensable for an understanding of the most recent developments.

113 114 193. Oyono, F. Le vieux nègre et la médaille /The Old Negro and the Medal/. Paris, Julliard, 1957. 209 pp.

Oyono belongs to the tradition of the mvet players, satirical story-tellers, always harsh and often unjust.

195. Schweitzer, A. A l'orée de la forêt vierge /On the Edge of the Virgin Forest/. Paris, Payot, 1929. 231 pp.

Interesting though rather abbreviated comments on the social disorganization of the Pahouin of the Ogooué and of their reactions to culture contact.

196. X....Ekomi, histoire d'un petit Pahouin racontée par lui-même aux enfants d'Europe /Ekomi, The Tale of a Little Pahouin boy, Told by Himself to European Children/. Paris, Société des Missions évangéliques, 1921.

Conveys a moral.

101 The Bosyéba ... are no more numerous than the Bésex.
619 They have been classed perhaps wrongly as a separate people
161 and in my opinion are basically only tribes long detached from the Méké branch, whose distinctive tattooing and little altered language they have preserved. In 1889 when Fourneau reached
[114] the Bosyéba country to the north of the Campo, he saw his porters, recruited in Méké country on the banks of the Ogooué, immediately fraternizing with the Bosyéba and delighted to discover their own tongue after crossing through Bétsi territory. (1)

1. Cf. A. Fourneau, "De l'Ogooué au Campo" [From the Ogooué to the Campo], Bull. Ste. Geogr. Vol. 12 (1891), pp. 190-215.

[One paragraph deleted about an etymology which author considers "incorrect."--Translator]

The Guma, nowadays very few in number, have been driven back towards the Cameroons; they also are related to the Méké branch. Europeans often refer to the people of this whole group by the term "Makina" from ma ki na, "I say that..."; they have, in fact, a habit of starting all their remarks with these words. The Bétsi are called "Mazuna" for the same reason.

3. Size of the Fan Population

161 The Fan are by far the most important branch. It is extremely difficult to estimate their number. Officially they are only a few hundred thousand. But the official figure is far from accurate, for government statistics only count the man who pays taxes. Furthermore, more than half of the French Congo is unexplored except by a few, infrequent

XX. Fang Proverbs and Sayings.

I have the honour to come before you this evening, for the purpose of making known to you the result of my observations while dwelling and labouring among that great and powerful tribe of the Bantu family, known as Fang. In presenting this paper, I do so fully aware of its deficiency; but the information obtained from natives was never accepted nor recorded as authentic, until it had been frequently confirmed by others. I also desire to acknowledge my indebtedness to the Council of the Anthropological Institute of Great Britain and Ireland, for sending me a copy of *Notes and Queries on Anthropology*, a book which ever proved an invaluable guide and help to me while living among the Fang, and studying their customs.

I.—*Introduction.*

114 The large tribe of people known as Fang inhabiting a considerable portion of the French Congo was first described by Du Chaillu.

167 Records show that in 1867 the French naval officer Admiral Fleuriot de Langle placed the number of Fang within French territory at nearly sixty thousand. Since that time this powerful tribe has rapidly increased in numbers. Between the Ogowe River and the Gaboon, the Fang may be counted by thousands,

8: Bennett D-5 (ca. 1898) 1899 FH9 Fang FH9

114 and like a resistless army they are steadily approaching the coast, building towns
167 and displacing weaker tribes. That fine race of people, the Mpôngwes, often spoken of as the "aristocratic tribe," and ranking first in the scale of civilisation above all other tribes in the French Congo, is rapidly dying out, and they are already being supplanted even at Gaboon by the migratory Fang.

The Bulu people inhabiting a portion of the German sphere of influence in
114 West Africa are without doubt very closely related to, if not a direct offshoot from,
197 the Fang; their customs are identical and their language so markedly similar that a person who is able to speak Bulu is readily understood by the Fang. The first
173 day of my arrival among the Fang, after residing in Bululand, I was able to make known the reason for my coming and to ask and answer ordinary questions. While visiting on a small island called Nenge-nenge in the Nkomo River, a very old Fang man told me as follows: When a lad his grandfather had told him that, a long time ago, many of his tribe "changed their towns." These people first travelled far in canoes, and then after journeying for very many days through the forest, they "stopped walking and made new towns," and they did not return. My informant's father had told him later more about these people; they had been heard from, and their long absence from the original tribe had so changed them that "they spoke new words" (a new language).

Examples could be given almost without limit of the great similarity in the
197 language as spoken by the Bulu and Fang. A few will suffice; and I will select
539 from the proverbs of the people which are also identical. Tell a Bulu man to hurry with his work, he will often reply, "*Alu da dayi bel' nnok?*" (Will one day rot an elephant?). The Fang speak the same proverb thus: "*Alu ovoti bel' nnok?*" Again, the Bulu use the words *Melu nyus* (the days that are past), *Melu ozu* (the days that are to come), *Melu messe* (all the days). These sayings and numerous similar ones are in daily use among the Fang, the words used and the idiom being almost identically the same as in Bulu. I have wondered if the account given me by the old Fang man at Nenge-nenge about the people who years ago "changed their towns," might not be of more than passing interest as touching the genesis of the Bulu.

The Fang people are spread over an immense area of country, and when
101 questioned regarding their numbers they usually reply, "There are Fang and Fang; if you walk and sleep in towns and towns for many *moons* (months) you will find Fang." In the future it will be found that in the ethnography of equatorial Africa the Fang will hold a very important place. As before stated they are unquestionably closely related to the Bulu, and Compiègne recognised a marked similarity between them and the Osyeba, Monbutta and Nyamnyam people. There are
563 several scattered tribes of dwarfs among the Fang. Five of these pigmies live within two miles of my station, and they tell me that more of their people will soon "move their towns" and come to live on the banks of the Nkomo river. The Fang people look on the pigmies as a very clever and superior people, and not without good reason. An old headman told me that the *mon ngui* (dwarfs) first

8: Bennett D-5 (ca. 1898) 1899 FH9 Fang FH9

Translation.

They put cassava to soak in the river, in a place where there is (plenty of) mud. When it has lain there three days, they go and rub off the rind. They bring it (to the house). They take a trough, and put the cassava in it. They take the mashing stick. They mash the cassava. They wrap it up (in leaves). When they have finished that, they put it in the pot. Then they light the fire. They put the pot of iguma (on the fire). Then the iguma is *boiled.* 252 539

Aso Mfini: (Plantation).

Betata basa leua be dia infini (our fathers did not make plantain villages), *n'afun eto bè* (because their land was near at hand, *i.e.*, near the regular village). *Faň b'anyege infini ne be bidji binne* (Faň likes plantain village to make good food, *i.e.*, because thus they get good food). *Bikoa e djal ine, betok* (Plantains in town have (one) small). *Infini O ne djal mee afun bibè* (Plantain village is a good town (because) land (*i.e.*, good land) near). *Nem ane afan betata benge to bibè* (Like the land where the fathers were near). *B'angège infini, ne dzi bidji binné. Mo'mbok a gouevi betyit: bevok benge ebm* (They like the plantain village (because) there they eat good food. One person kills game (meat) others buy). *Menda infini me vie be ebé* (Houses of plantain villages soon spoil).[1] *Faň, Ba'dji anee mbéa bidiane* (Faň they eat a meal of cassava in the morning). 539 262 311 361

Regarding the *Eki* tabooing certain foods or performance of certain actions as in vogue among the Fang, I learned from a friend and *confrère*, Rev. R. H. Nassau, D.D., M.D., of Gaboon, that the *Eki* of the Fang is precisely similar to the *Orunda* of the Mpongwe. Dr. Nassau is a veteran missionary of thirty-seven years' African experience, and he is always ready to help others who are sufficiently interested in the natives to inquire about them. I know of no one on the West Coast more willing or eminently able than he for imparting information regarding the people among whom he has laboured. 262 114 171

XI.—*Anthropophagy.*

Cannibalism prevails among the Fang beyond question, and only fear of the law keeps him somewhat in check. I am able to speak of the Fang as anthropophagi; not alone from information gathered, but from having once had the opportunity of visiting a town two days after a victim had been killed and eaten. 266 114

This town, named Olunda, is on the right bank of the N'komo river, about 60 miles from the seat of government in the Congo Française. Whilst visiting the town Nenge-nenge (the island of islands) in the autumn of 1898, a native trader named Arkendengi, employed by a British trading house at Gaboon, informed me

[1] It is very true that houses having plantains growing near, soon rot; this is due to the dampness caused by loss of sunlight and heat.

8: Bennett D-5 (ca. 1898) 1899 FH9 Fang FH9

266 that a man had been killed and eaten only two days before at the town of Olunda
● 114 two miles below Nenge-nenge. Old king Kelun at Nenge-nenge confirmed the report, and in compliance with my request, loaned me an interpreter to accompany me to the place.

The tide being favourable, I decided to start without telling my boat boys the reason for my hasty departure. Olunda is quite close to the river bank, but upon our arrival the water had fallen so low that the only way to reach the town was by wading knee deep in mud up the bank. The people eyed our boat and myself in particular with marked suspicion, and much talking was indulged in during our landing. The headman was the most villainous looking specimen of a Fang I have ever met; he was well built and very muscular, but his face was extremely ugly and brute-like: he had only one eye, and an evil-looking one it was. He wore on his head an old red worsted trade cap, and smoked a dirty native clay pipe.

The object of my visit was well hidden, and we chatted on various matters in the palaver house. When I expressed a desire to walk through the town and treat any of his sick people, the headman said, "No sick here, people all away, let us talk in the *abeg*" (palaver house). However, without giving him any notice I presently left the palaver house and walked out into the main road, and the crowd followed. The headman repeatedly assured me that the town was not worth seeing; but I strolled leisurely along. Half-way through the town I noticed a quantity of intestines strung out to dry on sticks, and to the great annoyance of the headman and people, I made an examination of them which convinced me that they had been removed quite recently from a human body. I was assured that thay were *entrails from a deer* and were being dried for the purpose of covering gourds to hold gunpowder. I then told the people the reports I had heard, also that I knew the intestines then drying were human, and accused them of cannibalism. They were very indignant, and declared, as all Fangs do, that their tribe never eat men. "Oh no, people in the far bush did, only bad Fang did so." A few moments later I picked up a human clavicle in the palaver house and took it away with me, threatening to report the matter to the Government.

In the palaver house of this same town was a boy of about sixteen years, in
[727] chains, held as a hostage. I arranged to return in a few days and try to bring the lad to our mission station, but upon my return I again stopped at Nengi-Nengi, and then heard that the boy had been killed and eaten shortly after my departure.

I am inclined to believe that the reason for eating human flesh by the Fang
266 is the result of a craving for animal food. The victims are generally males captured either in war, or members of other tribes waylaid and killed while journeying in the bush.

A Fang man told me that once he ate "some man" because he was persuaded to, and that it "passed goat far" (much superior to goat). He added, "I never do

Village and Household

000 Place names (their derivation and explanation). -- Names of fields. -- Plan of the villages. -- Settlement; development of a settlement into a village; village; significance of the name; growth of the village. -- Provisional meeting houses: plan, form -- Permanent meeting houses: scaffolding; roofing (procedure, material used for rafters and covering); side walls (material, erection, appearance); veranda. -- Interior of the meeting houses: posts; benches; fireplaces; furnishings (gun racks, trophies, and the like). -- Life in the meeting house. -- Dwellings: forms; appearance; door part; door; condition. -- Interior of the dwellings: sleeping benches; lofts and larder; frames with drying boards and baskets; hooks; stools; brooms. -- Raffia palm: kinds; names; uses. -- Storage houses; guest houses; field huts; houses for the sick. -- Houses on piles. -- Illumination: hearth fire; torches; lamp; mushroom torches; fire making. -- Village square (appearance, cleanliness). -- Toilet. -- Ornamental plants. -- Trade routes. -- Trade by water. -- Bridges.

101 In the large, jungle-covered Pangwe region /Ed., the author
361 uses Pangwe /Fang/ as the name for a group of tribes in which the Fang are one tribe; the others are the Eton, Mwele /Mvele/, Jaunde /Yaunde/, Bene /Bane/, Bulu, Ntum, Mwai /Mvae/, and Mokuk (Oschfieba)/ the settled areas are scattered like oases in the desert. They are unevenly distributed, and their greatest concen-
[48] tration is along the line of the main trade routes which cross the region for the most part in an east-west direction.

103 The place names are usually connected with either prominent landmarks of the natural environment, objects, events, experiences, or characteristics of the inhabitants. Thus, we have the following names.

(a) From palm trees.

103 824 1. Niescham from a nī = lay, žǎm = swamp, raffia palm, that is to say, the village is located where there are raffia palms, the most important plant for house construction.

2. Mabäscham from a bē = follow, žǎm = swamp, raffia palm.

3. Makoda from akōda (plural, makōda) = swamp palm, Sclerosperma mannii, Mann et Wendl., used like raffia for house construction.

4. Nkan from nkǎn(e) = Ancistrophyllum acutiflorum Becc., climbing palm, used for plaiting.

5. Mekan, the same, plural.

6. Nsamenkan from žǎm (nžǎm) = swamp, swamp of the climbing palm Ancistrophyllum.

7. Alen from alǎn = oil palm.

8. Malen, the same, plural

(b) From cultivated plants.

9. Matumabai from atū (plural, matū) = taro, Colocasia antiquorum (L.) Schott, and mabai = two; thus, two taros. /52/

10. Bekaba from ekǎba (plural, bekǎba) = Xanthosoma violaceum Schott.

11. Emäangon from a mē ngǒn = scatter ngon /a squashlike ground fruit/, that is, for drying in the village square.

(c) From edible wild fruit or fruit trees.

12. Essun from esǔn = fruit of the cardamom, Aframomum alboviolaceum K. Sch.

13. Madschab from madžǎb - oil from Mimusops djave (Lan.) Engl.

14. Fan from fǎ'ne = fruit of the Anacardiacea Sorindeia rubriflora Engl. (afǎ'ne).

15. Abe from abē = kola nut and tree, Cola acuminata (P. Beauv.).

103 824

16. Andok from andǒk = Irvingia barteri Hook. f., Simarubaceae. Mandok.
17. Nkoandok from nkǒk = fallen tree trunk, that is, of the Irvingia.
18. Ngong from ngǒ̄ḿ IV = fruit of the Trichoscypha sp. (engǒ̄d).
19. Alöb from alǒ̄b = Desbordesia glaucescens Engl. (Simarubaceae).
20. Mangame from mangǒ̄me III = Myrianthus arboreus P.B. (Moraceae), perhaps also the symbol of agreement, taken from syncarp.

(d) Derived from other trees.

21. Akak from akǎk = Leptonychia tessmannii Engl., Sterculiacea, the tree of peace, the peace linden.
22. Makak, the same, plural.
23. Nkomakak or Nkolemakak from nkō[l] = hill, that is, hill of Leptonychia trees (makak).
24. Abang (Abanga) from abǎ̄ḿ = species of Ficus, particularly used in the manufacture of bark cloth.
25. Mabang (Mabanga), the same, plural.
26. Akam from akǎm = several species of large Ficus, for instance, F. preussii Warb. and laurentii Warb., striking trees used for the manufacture of cloth.
27. Ajo, Jusch (Ajusch) from ayǎ̄J = Triplochiton tessmannii, used especially for the manufacture of house coverings.
28. Majo (Majusch), the same, plural.
29. Nkolemajo = Nkolajo, from nko[l] = hill of Triplochiton.
30. Owöng from ovǒ̄n = Copaifera tessmannii Harms, famous spirit tree, largest tree of the Fang region.
31. Awöngabai, two Copaifera (abai = two).
31a. Ndschiowöng from ndzǎ̄l = bridge, bridge of Copaifera.
32. Elun from elǔn = Erythrophloeum guineense Don. (Leguminosae), striking because of its red bark, a poisonous tree.
33. Belun, plural.
34. Ejen (Elibengang) from eǰen, elī behgǎh = Distemonanthus benthamianus Baill., striking because of its beautiful violet-red bark; a medicine tree.

103 824 35. Andung from andŭh = Croton welwitschianus Muell. Arg. (Euphorbiac.), beautiful by virtue of its shining silvery leaves.

36. Akom from akǒm = Terminalia superba Engl. and Diels. /53/

37. Makom (Makomo), the same, plural.

38. Nkoakom from nkok = fallen tree trunk, that is, of the Terminalia.

39. Engo from engō', an unidentified tree.

40. Akoga from akǒga = Lophira alata Banks, with beautiful, fragrant blossoms.

41. Makoga, the same, plural.

42. Assam from asǒm = Uapaca guineensis Muell. Arg., with a rich, fragrant cover of blossoms.

43. Massam (Massama), the same, plural.

44. Angok from angǒk = Albizzia brownei Oliv., a beautiful tree.

45. Dum from dum = Ceiba pentandra (L.) Gärtn.

46. Medschimitum from mdezī = roots, and tǔm = Piptadenia africana Hook. f.

47. Asseng or Assöng from asǒń = umbrella tree, Musanga smithii R. Br.

48. Massöng, the same, plural.

49. Nkoassöng from nkok = fallen trunk of the umbrella tree.

(e) From characteristics of the landscape.

103 823 50. Ngbai from ngbǎī = leafless living tree (its winter condition).

51. Mekumu from nkūm I = standing dead tree trunk without a crown.

52. Ndangöng from ndǎngǒń = clearing.

53. Ewöle from eyǒle = clearing.

54. Nko from nkō = hill.

55. Anko = at the hill.

56. Akok from akōk = stone, rock.

57. Makok, the same, plural.

58. Maschok from maǰǒk = rapids, falls.

103 825 (f) Derived from animals or parts of animals.

59. Schok from ǰǒk = elephant.

103 825 60. Mbang, and 61, Mbangschok from mbǎ̰n = ivory, and zǒk from elephant.

62. Mboleschok from ebɔ̄[l] = spoiled, that is, spoiled elephant.

63. Akuleschok from aku[l] = feet of animals, feet of the elephant.

64. Nnoschok = Nloschok from nlɔ̄′, nnɔ̄′ = head, head of the elephant.

65. Abumeschok from abǔm = belly, belly of the elephant, because they had eaten up the village plantation.

66. Bindeme from indɛ̄m V = fruit bat.

67. Böngomo from ongɔ̄mo III = chimpanzee.

68. Akulangomo from akū[l] = feet, claws of the chimpanzee.

69. Ebóloua (1) from ebɔ̄[l] -o-wǭ = spoiled matter of the chimpanzee, spoiled chimpanzee.

1. The official spelling is Ebolowa. For the sake of consistency I write Ebóloua, since by 'w' in German spelling I denote only labial sounds.

70. Akuasö from akū′a = animals' lair, zɔ̄ = leopard.

71. Olamesö from olǎm = trap or snare, zɔ̄ = leopard.

72. Ewes from eyɛ̄s = bone. /54/

73. Bojabúnkulu from boyá = little wives (plural), bo = of, (n)kū[l]u = turtles; thus, the little wives of turtles.

74. Bebass from ebǎ̰s = scale; the inhabitants of this place probably eat a lot of fish.

(g) From objects.

103 75. Ntum from ntǔm = walking stick.

76. Ebai from ebai = strands taken from the stalk of a raffia leaf, used for house construction.

77. Bebai, the same, plural.

78. Ngam from ngǎm = barbed hook on a spear.

79. Bebada from ebǎ̄da = carrying baskets used by men.

(h) Derived from experiences or characteristics of the inhabitants.

80. Bissis from isīs V = he who represents the shadow in the moon cult.

81. Elanga from elǎ'ń actually = the anus or, metaphorically, bad people.

82. Ekekō from a ke ekekǒ = stay away completely, because strangers were seized and killed and they did not come back.

83. Esamedulu from a zǎmǎdǔlú = to carry on shamefully, that is, to have sexual relations with a woman of the same family.

84. Nssälang from nsɛ̄n = village square, and elǎ'n (see under 81); the people committed immoral acts, acts of hostility, whenever a stranger passed through.

85. Bilänemajong from a bɛ̂ne, bigne = not to be afraid of someone, that is, to have no respect, and mayon = families; the people have no respect for the members of other families.

86. Ajaofun from a ńǎ or nja = to feed oneself, and fūn = maize.

87. Akinebetom from a kīne = to converge (by running) upon one place, and etǒm = quarrel; the people come running to one place in order to start a quarrel.

88. Olunemang from olūn = annoyance or anger, and mǎn = coast; the people had been annoyed about the inhabitants of the coast - perhaps Whites; or it was on account of the distance.

89. Ngba from ngbǎ' = quiet, peaceful people (in contrast to 82).

90. Massambe from a sǎ mǎ tǎn = to fish with a net.

91. Nschugebot from nzuge = to talk all at the same time, and ɔ̄t = people; there are many people who talk there.

92. Euuma from a wū'mǎn = to have a relapse in an illness.

93. Awomo from a yǒ'mǒ = to faint; this name, like the previous one, alludes to the entanglements of these frontier villages between Ntum and Bulu.

94. Nnoajong from nnǒ' = the head, and ayǒn = family; thus, the "chief representative" of the kin group.

95. Ajene from a yɛ̄n = to see, referring to the mountains that are visible from the village, "Montevideo."

103 96. Ntedenga from ntĕt = hundred, and ngä = rifle; a hundred, thus, an infinite number, of rifles. /55/

97. Makunanam or Makonanam from akŭn = post, pillar, and nnăm = the locality; that is, a locality which stands as firm as a post.

98. Ndschiabot from ndzĕi = bridge, and bōt = people; that is, a bridge for people.

99. Ejamang from a yăk = to stay the night, and a măn = on the way to the coast; thus, one of the few villages favorable to travel and progress.

100. Ajaamentangan from a yăk = to rest, and mentangan = Whites.

101. Akunekiä from akŭn = post, pillar, stake, and ekiĕi, of iron (compare 98).

102. Ebualebambe from a bŭele = to be broken in pieces, and mbămă III = large village; the houses were extremely dilapidated.

103. Niemajong from a nĭĕ = to put inside, and mayŏn = family unit; that is, the village had been established between villages of other kin groups.

104. Ndschobangon from dzŏb = sky, and ngŏn = moon; thus, moonlit sky.

105. Olŏadzob from olŏi = hole, and dzŏb = sky; a hole in the sky (probably between the clouds).
/Fig. 16. appears here in the original text. /

Aside from place names, the Pangwe also have names for fields. For instance, in the environs of the settlement Alén (Essauong) there are the following: enumepfidi = powder path; nsa[k]-abea = abea swamp forest. There are only a few special names for mountains, for instance, Nemembŏng = good heart (see the map); usually the names of mountains and mountain ranges are borrowed from those of the neighboring settlements. According to the statements of the present inhabitants, the names of rivers for the most part can no longer be explained, because, as the inhabitants claim, these names were taken over from the former inhabitants of the region. The same would seem to apply in part also to the place names.

Fig. 16. Plan of a Village of the Settlement Nssälang (Essauong Family) Fang. Made in 1908.

361 As was mentioned in the previous section /not translated/, the
823 villages are laid out along the roads and always in an east-west direction (cf. Fig. 16). /56/ Curiously enough, the people gave as the reason for this arrangement the fact that the land slopes down to the west (toward the ocean) and that the rain water can run off in this direction. It is true, of course, that this point is an important consideration inasmuch as they are careful to lay out the village in such a way that the rain water will not flood one of the rows of huts. Nevertheless, this cannot be the sole reason for the east-west arrangement. I have observed that even on completely level ground -- which, in other words, does not favor the drainage of water in the direction intended -- the east-west plan was the
[487] preferred one. When, for instance, a route goes south, it will make a turn before reaching the village, cross the latter in an east-west direction, and at the other end will resume its southerly direction (cf. Fig. 16, the Nssälang I-Beniaa route). It is obvious that in this arrangement reasons other than the one mentioned play a part, such as the general trek to the west of which mention has already been made in the previous section (1).

[764] 1. Compare also the predominantly east-west direction of the graves.

361 A Pangwe village consists mostly of two rows of houses running parallel to each other with the road between them (Plate 4 and Fig. 16). More rarely, a village consists of a single row of houses along the road. Furthermore, villages come into being through the combination of two or more individual establishments, and as a result different villages display different stages of development, observable everywhere side by side in the region.

If the father of a family wants to found an establishment, he
361 builds two houses, a dwelling and a meeting house /men's house/.
572 The dwelling is the real domain of the wife, where she works and
61 lives with her children and where the man for the most part stays only at night, very rarely in the daytime. The meeting house, on the other hand, is the usual haunt of the man, where he busies himself during the day, performs his incidental tasks, and receives visitors and where the wife comes only now and then. As the

361 children grow up, their father builds each one a house of his own
572 next to the original dwelling. In the same way, each of his addi-
621 tional wives receives her own house from him. His first wife, how-
ever, remains his favorite wife, and consequently it is her house --
in other words, the one that he built first and which is adjacent to
the meeting house -- which remains his home. He keeps it even
after the death of the wife.

The next step in the development toward a village takes place when, for some reason or other, a second head of a family joins his establishment to that of the first. This happens, for instance, when a member of the same or of another family unit moves in, or when after the death of the father the eldest son inherits his meeting house, dwellings, and wives, and the younger son is unwilling to submit to his older brother who is now also his chief. He or the new arrival, as the case may be, builds the necessary number of houses for himself and his family along the same row. Sometimes he may even build his houses directly /57/ /Fig. 17/ adjacent to the existing houses, and he will likewise finish off his settlement with a meeting house protruding from the line. If the meeting house is a temporary one, it is placed lengthwise in the square (see Fig. 16); if it is a permanent one, it is placed transversely (see Plate 4).

In this way, a "village" arises from the original individual establishment, and because, like a pair of eyes (dźīs; plural, mīs), it consists of two halves (Fig. 18), the village is called dźā, plural mā (see what has been said about the meaning of prefixes /not translated/. There are, thus, two family heads in each village; their rows of houses join somewhere in the middle, with a boundary line which is recognizable, of course, only to the initiated. Everyone, however, can see the two meeting houses (belonging to the two heads of family) located on opposite sides of the village square.

The two family heads are legally equals. Certain conditions, however, which we shall discuss more fully in a later section, give one of the heads a position of slight superiority. Sometimes a third establishment is added to the two individual establishments constituting the village, and it also has adjoining rows of houses as well as a meeting house (see Fig. 18).

361 As has been said, the meeting house is the principal haunt of
621 the chief; in the same way it serves all his sons, male relatives,
344

361
342

Fig. 17. Pangwe Village, Spanish Guinea.

361 and followers who help him with its construction and have a perma-
621 nent right to its use; /58/ /Fig. 18/ hence, the relational prefix
344 a in abā, "meeting house"; hence probably also the Janus head which I saw on the post of a meeting house (cf. Fig. 19). The stem of the word a-bā I derive from ba, "to divide, to share" (1), and I

1. The same stem exists in the numeral two (bai), which is clearly the result of the division of one object.

believe that it was originally intended to designate the place where the game that had been killed was divided. The meeting house is now the place for all public transactions, from the dividing of meat to judicial proceedings, public deliberations, and the reception of strangers.

621 Sometimes the meeting house constructed when the establish-
622 ment was founded remains permanently in a temporary state; it
344 remains unfinished because the people are too lazy -- each one thinks the other should start first -- and the chief lacks the power

/58/

361

Fig. 18. Development of a Village from Individual Establishments.

621 to force his people to complete it. At one time, for instance, the chief
622 of the village Nssälang (Fig. 23 shows one of the temporary meeting
344 houses of that village) made the proposal to me -- a proposal which I, of course, gratefully declined -- that I should either force his people, or make my people available, to build a new meeting house for him. Then, as he put it, everybody would say: "This chief of the Whites is quite a fellow; you can tell that a White lives near his village." At best, the chief's people bring him some roofing mats for the construction and in this way believe they have fulfilled their duty toward the community project. The actual work is always up to the chief. Even so,
[623] the house does not thereby become his property; rather, in each case it is the common property of the men. When the chief says, "It is my meeting house," they are not affected by his statement. The Pangwe
461 avoids anything and everything that might disturb him in his customary
339 peace and comfort; he shies away from work and lets things run their course:

ź̄ǫ[k] e tsídan ebēí-asḗi, a ve oa
Elephant, he frightened away (from) pit-iron-stone, he gave you

até́i, a nī oa adźīt
poverty, he took (from) you heaviness. /59/

That means: The elephant that frightened you away from an iron-stone pit, made you poor, it is true, but at the same time he relieved you of a burden (namely, that of preparing the iron).

344 In some cases, difficulties (such as tree stumps, roots, and
461 the like) were encountered in preparing the building site at the customary place. As a result, the meeting house would be constructed to one side within the row of houses, though in a transverse position (see Fig. 44). Later, "they" frequently did

[532]

Fig. 19. Post from a Meeting House in Malén (Essauong Family), Fang.

not get around to replacing this building by a new one in the right location, however fervently the chief might desire it on behalf of the people. When they did get around to building a new meeting house, the old one was frequently not torn down right away but continued to be used along with the new one.

344 In form, the meeting house (Fig. 20 and 21) has a gabled roof and a square or rectangular ground plan. I have already mentioned the custom of the Pangwe, when they start a new settlement, to content themselves with hastily constructed temporary meeting houses (ongǒ̀n e ngī). Only later, when

344 the economic life of the settlement has attained a certain stability, are the temporary meeting houses replaced by permanent ones (tsĕhană' III) -- although, as we have seen, in some cases they are not replaced. It is this process of gradual settlement which is responsible for certain variations in the forms of the meeting houses, variations which at the same time afford a picture of their development. The simplest houses (see Fig. 110) are basically mere sheltering roofs: a ridgepole is placed on top of two, sometimes three, posts forked at the top (akŭn) and about two meters high. These posts are planted deep in the ground which has first been cleared and then made level and smooth. Raffia stalks, bent in the middle, are placed on top of the ridgepole at varying intervals. These serve as rafters (see Fig. 24 f.), the lower ends of the stalks resting directly on the ground, that is, without any support. The rafters are covered with matting made of raffia pinnae. These mats, eše i (Fig. 22), are made in the following manner. Several sticks are planted in the ground; to these are attached diagonally two long rods of raffia stalk (a), and over these rods is placed a pinna broken in the middle (b). This pinna is clamped together just below the diagonal rods by means of pieces of bark taken from raffia leafstalks. A second pinna (c) is placed alongside the midrib of the first pinna and attached to the latter in the same fashion. Then follows the third pinna, and so forth, until the desired length of several meters has been attained. The mats are attached to the rafters by being placed on top of each other, like tiles on a roof. /60/

A second form of the meeting house (Fig. 23) arose in the following manner from the one described. Because of the rotting of the rafter ends on the moist ground, as well as frequent visits by all kinds of disagreeable reptiles, it was found necessary to raise the rafters somewhat by placing beams under them. These beams are either unhewn trunks and logs or timbers that have been split lengthwise. The latter are usually placed with their cut side turned outward and piled on top of each other between several pairs of vertical posts planted in the ground. The roof lies loosely on the topmost of these timbers. This provides the start for a house wall. In addition to the motives already mentioned, another

344

Fig. 20. Meeting House in Olanga (Essángbuak Family).

consideration plays a role, namely, in case of a sudden enemy attack the walls afford better protection against hostile spears than the simple slanting roofs.

In the case of the better permanent meeting houses, wall and roof are more carefully constructed. The main difference, however, is that these houses never face the village square with the gabled end, but with the long side. It is, accordingly, through this side that one enters the house.

As is the universal practice, they first erect the frame, a task which is accomplished in a comparatively short period of time. This frame corresponds in all its parts to that of the temporary meeting house, except that it is taller and wider (Fig. 24). The ridgepole (mbǔn I) b rests on the main posts (abǔm) a placed along the long axis -- of /61/ which there are from two to five depending on the size of the meeting house. The skeleton of the front and back walls consists of a row of wall posts (mvi IV) c that are sharpened to a point at the top. As a molding (mfǎs I) e, a raffia stalk split down the middle is placed on top of the pointed posts and pressed down on them by hammering or pulling. Then the rafters f, as previously described, are placed over the ridgepole and made to project a certain distance beyond the moldings.

/61/

344

Fig. 21. Meeting House of a Ntum Village in New Cameroons.

The two outermost rafters rest on the posts that form the frame of the side wall (mvi, esu) d. Then the roof is covered (Fig. 26), a project which requires more labor than the frame and is carried out with much greater care than in the case of the temporary meeting houses. First, the rafters (ntu ɛ n I) f are clamped down by means of a bracket made of raffia (obibi) g, the bracket being placed on top of the rafters parallel to the ridgepole and tied to the roof beams. In a similar fashion, displacement of the rafters at the lower ends is prevented by means of two brackets running along their top and under sides. I observed a variant mode of construction of meeting houses by the Fang in the region of the Komo (Fig. 25). There the ridgepole was not supported at its free ends, but had been anchored in the ground by means of liana ropes and had been bent downward by tightening the strings.

At this point the mats are placed on top of each other like tiles. This is done from the top, and the process begins slightly below the ridgepole with mat k /62/ (see Fig. 26) and goes downward or, as the case may be, from below upward. The mats are tied either to every second rafter or to their own supporting ropes (mbɛyá-eɛ i) which run from the ridgepole to the raffia strip

344 that holds together the rafter ends. A less common procedure is to place brackets diagonally on top of the rafters and fasten the mats to them. Finally the ridgepoles itself is covered. For this purpose two roofing mats (obū't, elā̄t-ēsē i) h are sewed together at their upper edges and are placed as the topmost layer /Fig. 22 appears here in the original text/ over the ridgepole. For protection, a special ridgepole mat (ngŭ'm IV) i is placed on top of the other mats; it consists of a mat bent in the middle which is clamped to the double mat by means of pegs made of the bark of raffia stalks l.

In those areas where there is no raffia, rafters are made from the leafstalks of oil palms (as in Yaoundé /Ger., Jaunde/) or from little tree trunks. /Fig. 23 appears here in original text/ /63/ In [B24] place of mats, the leaves of Sarcophrynium velutinum (Bak.) K. Schum. (okĭāikūi) -- see Plate 11 -- and of the swamp palm, Sclerosperma mannii Mann et Wendl. (akō'da), are used, as well as banana leaves to cover the gaps. This substitute for mats is not very durable and is laborious to manufacture since roof laths are continually needed to fasten down the leaves and it is necessary to place Aframomum stalks very closely together from the ridgepole to the edge of the roof; otherwise, the leaves either stretch or are blown off. The durability of a roof covered with swamp palm leaves is so limited that it stays in good condition for only a year, as the people told me, whereas a mat roof holds out for five years before repairs become necessary. /Fig. 24 appears here in the original text. / A roof covered with Sarcophrynium leaves, moreover, looks quite unattractive, especially from the inside where the leaf stems which are cut off near the blade extend into the house.

Once the roof is completed, work on the side walls begins. The material for these is the bark of certain trees whose names are mentioned in the discussion of bark crafts (Section 8, page 213), the leaves of swamp palms and Sarcophrynium, both of which are used more often for the gable walls, and finally strips of raffia pith and mats. The latter, however, are used only sparingly here because of their many small spikes.

344

Fig. 24. Frame of a House.
Drawing 1, from above; drawing 2, from the front; drawing 3, from the side.

374 The pieces of bark, one to two meters long and approximately a half meter wide, are attached to the frame in the following manner. To the inner side of the wall posts longitudinal

Fig. 25. Frame of a Meeting House of the Fang from the Region of Komo (Village of Omvan, French Congo). Cross-Section Lengthwise.

strips of raffia leaf stems (ebat) are /64/ attached by means of boards at certain distances from each other, and to these the bark pieces are fastened by means of raffia strips which run exactly parallel to the boards. The posts, therefore, usually stand outside the house, very rarely within it. The bark pieces
584 and raffia strips are held together by bands of Oncocalamus (nloh I = 824 Oncocalamus and band) (1) -- see Plate 16 -- and they are

[738] 1. The Jaunde buy this "bush rope" from Elandi, the only place in the Jaunde region where bush rope is still available; otherwise they use Dipteropeltis poranoides Hallier f. (atu k)e ndik).

finished by two people working together in the following manner. One of them crouches inside the house, the other outside, and

Fig. 26. Cross-section of the Ridge of a House.

344 [412] they pass the band back and forth through the wall. For drilling holes into the bark pieces, they use an awl (nsoń I). Just as we hammer nails in a straight line, the Pangwe also must fasten the various longitudinal strips in precise lines (see Fig. 35). In the case of raffia mats, because of the little spikes that have been mentioned (the same, incidentally, also frequently applies to the bark pieces), the laths are usually placed so closely one on top of the other that very little or nothing of the mats remains visible (as in Fig. 33). In the same manner as the bark, the pieces of raffia pith are held fast between the boards; strips of pith are placed next to each other from top to bottom, and at longer intervals they are tied to the boards.

The treatment of the walls varies greatly, except that the gable walls are always completely closed. The rear wall, which is never absent, usually has a few window openings, one in the middle in the form of a square or a rectangle and one on each side in the form of a horizontal, longitudinal slit. /Fig. 26 appears here in the original text. / /65/ The central opening is commonly used as both window and door, but it is so small that it requires some skill to squeeze through it. At the same place, however, there may be doors in our sense of the term, which extend to the ground and may or may not have a threshold.

The front wall may be identical with the back wall /Fig. 27 appears here in the original text/ (in other words, it is closed except for window openings on either side and in the middle); it may be only half as high; it may be no more than a parapet or a trellis made of raffia stalks; or, finally, it may be lacking on one side or be completely absent.

The roof is frequently made to project in front to such an extent that /Fig. 27b appears here in the original text/ /66/ a covered veranda is formed, held up by a few posts (omyimyi,); sometimes the front area is closed off in front or at the sides by a parapet or trellis. A wooden beam which serves as a threshold prevents the rain that drips off the roof from running into the house (1).

1. When the house has been completed, the soil inside is usually moistened, and for a few days banana leaves are placed on it so the ground may become "strong," as they say.

Drawing 1 /65/

344 532 The interior of the house (Plate 5, Fig. 27a and 27b) consists of a single empty room, broken only by the isolated posts (the central supports of the ridgepole). In some cases I observed that these posts were handsomely carved, but only in houses with one central post. The carvings showed stylized or modified human figures (Fig. 19) and quite faithful representations of animals. I recall, for instance, a very beautiful post on which was pictured a pig biting the tail of a leopard, which I saw in the village of Bingomo (Abâi family).

344 352 [344] Along the walls there are low benches of which I have seen two different types. The simplest benches, hence the ones designed more often for temporary meeting houses, consist of the trunks of umbrella trees (Musanga) which have been split lengthwise down the middle or of raffia stalks which have simply been placed across two shelves of the same wood (kū'dū III). The same kind of bench is always found in places where there is no raffia and also in huts that serve as lodgings for guests. The second type of bench (see Fig. 28 and 29) is a rectangular frame of raffia stalks (enǒn) split lengthwise down the middle; its narrow side consists in each case of two legs (a = akōkǒ'nǒk) with pointed pins (c = mbǒn -ak. I Fang, ǒn Jaunde) which pierce and hold together four layers, placed on top of each other: the lowest, a wooden ledge, and then three raffia stalks. The wooden ledge (b = ǒmé'ja-enǒn) has a central section cut out for the support of nine or more stalks (e) wedged into it, which constitute the seat of the bench; the three raffia stalks (d = kū'dū -enǒn III) serve to hold down the latter and also as a head and foot rest. Sometimes there is also a back rest (f = ǒ'gebé -enǒn), consisting of a raffia stalk split lengthwise down the middle and simply placed on top of

Fig. 28. Side of a Bench.

344 the lengthened pin of the back legs.
353 In some meeting houses the front legs project to form a semicircle which covers up the narrow sides of the head rests. The
[531] outer surface of these semicircles is either carved to look like a face or else incised and provided with decorative surfaces which are painted red and white (Fig. 29). /Fig. 28 appears here in the original text./ /67/

344 Next to the benches, the most important part of the furnishings
354 of the meeting house consists of a number of logs which are placed together to form a fireplace (see Fig. 27). During the day the fire burns constantly, and during the night the logs are placed together so skillfully that the fire often keeps going until the next morning. /Fig. 29 appears here in the original text./ The importance of the cheering fire in the tropics is greater than one might believe; not only does it serve as a protection against the frequently severe morning chill and warm the room on days when the weather is rainy and cold, but it is also the only means of protection against
[137] the exceedingly annoying sand flies, Culicoides (afi,ge), tiny, scarcely visible insects whose sting causes an unpleasant itch like that of stinging nettles.

344 For the rest, the furnishings of the meeting house consist only
263 of such items as drums (wooden and skin drums), a whetstone, and,
355 suspended from the roof, the large hunting net which the inhabitants use communally on drives. In some cases I also found gun racks (ekob e nga), Figure 30, which are attached to the wall in the same way as we attach clothes hooks. Guns are placed on these racks so they are handy in case of a sudden attack. Another form of this rack (Fig. 31), likewise not common, consists of a board which is pointed at the bottom and provided with a hole at the top. This gun rack (efa[k] -e-nga) is planted in the ground in front of the meeting house. The butt end of the rifle is placed on the ground and the barrel is put in the hole in the board.

344 The skulls of hunted animals are frequently kept in the meeting
353 house as hunting trophies. Either they are held under the roof mats by means of poles, or they can be seen lying around on the roof; only large skulls, like those of elephants, are sometimes placed in front of the house. /Fig. 30 appears here in the original text./

344
352

[531]

Drawing 2

Fig. 29. Painted Socle of a Bench in a Meeting House, Fang Region.
Drawing 1, front view;
Drawing 2, side view.

353
344
325

In many meeting houses, furthermore, one sees /68/ a forge (Fig. 27b, Drawing 1 b) and the tools used by a smith, namely, a bellows suspended from the roof (Fig. 27b, Drawing 1 c) and a smith's stone (Fig. 27b, Drawing 1 e) which at the same time is used as a whetstone and also as a fan for the fire (eyuh e nduan), Figure 32. Finally we must also mention the famous tobacco pipe made from the stem of a banana leaf, which is placed across two hooks in the wall.

[F76]

It goes without saying that in addition to the above-mentioned furnishings there are all kinds of rubbish lying around in the house, such as half-finished baskets, fishing nets, tools, leftover food, and so forth, scarcely designed to give the whole a more attractive appearance. /Fig. 31 appears here in the original text./

344
356

[362]
531]

The meeting houses are very seldom embellished with decorative bark, either on the outside (Fig. 33) or on the inside. More frequently, however, we find the bark walls, especially on the gabled sides,

344
353

covered with charcoal drawings on the inside between the raffia boards. At this point, however, I cannot go into this art work in any greater detail (see Section 9, "Fine Arts"). 344 353 531

If it were not for the people who enliven the house with their handicrafts and activities, /Fig. 32 appears here in the original text/ if the flaring fire did not lend the large, dark rooms a special, almost mysterious quality -- it would be too dreary. It is precisely here that one notices how everywhere only pulsating life, man in his sad and in his happy hours, not the material environment, is capable of attracting us. The same room which we disposed of just now with a disparaging glance is capable of creating a totally different impression in the evenings when the men and young /69/ /Fig. 33 appears here in the original text/ people gradually congregate in the meeting house in order to listen to the old, hunchbacked Njema-Ndongo tell of the mysterious and uncanny creatures of the fabulous world. Indefatigably they listen, however long he may spin out his yarn, motionless they look at him as he restlessly rubs his hands over the fire, wags his finger threateningly, separates or pushes aside the logs when the 344 517 344 517 538 [732]

342

[516]

Fig. 34. Dwelling in Makonanám (Ojek Family), Spanish Guinea.

344 fire gets too hot for him, and wards off the smoke from his face
517 like a person gently but firmly sending a little child away! He
538 looks as though he is talking to the fire and delivering a speech to the logs. Everybody listens in silence, everybody hangs on his words. And then follows a deliberate pause, after which he begins anew with impressive intonation; and at familiar places all the listeners enter into the narrative with a brief choral song in response to the solo part of the old man. Or there may be a
344 bit of gossip to relate, with a hubbub of biting words, an oc-
517 casion for spontaneous gaiety to prevail. On yet another oc-
521 casion a performance by a famous xylophone artist will draw
533 the population to the meeting house. The entire village, women and children included, takes part in these recitals; the children beat out the rhythm with small pieces of wood, while the women, with great dignity, beat together groundnuts and ngon, which represent the "fee" and, softly humming a refrain, cast a meaningful glance in the direction of the tireless player.

342 The dwelling (ndǎ; plural, mandǎ), Figure 34, like the meeting house, /70/ /Fig. 34 appears here in the original text/ has a gabled roof and a rectangular ground plan. Like meeting houses, dwellings have both temporary and permanent forms.

342 Temporary dwellings are situated in the row of houses with their gables facing the village square, while the permanent ones have their long side turned toward it. A further difference between the two lies in the fact that in the temporary dwellings the door is placed on the gabled side and the walls on the two long sides are built up to a height of only about half a meter in order to save time; the roofs correspondingly extend farther down so that they almost touch the ground. The resultant greater steepness of the roof enables the rain water to drain off more rapidly, and thus makes it possible to save building material since it is not necessary to place the mats so closely on top of one another.

The permanent dwellings always have four complete walls and lack windows. A door, whose threshold is half a meter above the ground, thus giving the impression of a window, is made in the middle of the long wall. Most houses, in fact, have a door which is frequently not much wider than our casements in both the front wall and the opposite back wall. By and large, the construction of the dwelling is like that of the meeting house, except that the number of posts for the front wall is often reduced to four. For this reason, these posts are thicker and conspicuous for their careful workmanship. For the side walls in both the dwelling and the meeting house, not tree bark but swamp palms are used -- more rarely Sarcophrynium leaves or strips of raffia pith -- /71/ /Fig. 35 appears here in the original text/ whenever there is a concern for a more tasteful exterior. Sometimes a covered anteroom is formed in front of the house by propping up the overarching roof with posts along its free edge, as is done in the case of the meeting house.

The section of the front wall between the two central posts, where the door opening has been cut out, is frequently worked with great care; at least a number of short longitudinal strips of raffia will be inserted, especially between the ground and the threshold (Fig. 35). The threshold (mpfá dega I) (1), as well as

1. Stem pfa (fa), "to compress, to wedge."

the lintel in many cases, consists of a raffia stalk split lengthwise down the middle and cut out at both ends in the form of a swallow

342
854
291
301
576

Fig. 35. The Door Part of a Dwelling in Olanga (Essángbuak Family), Southern Cameroons.

tail. This is wedged into the door opening in such a fashion that the walls fit into the notches. Sometimes it is given an attractive form by being flattened near the end and having bands of palm plaited around it. Along the sides, on the other hand, the people content themselves with single strips of raffia stalk as door lining. 342

In the interior a thick post or a number of thinner posts (andẽ'i) stands at both sides of the door opening (mbẽi I) (see Figs. 37 b, 38). Between these posts are wedged one or two diagonally placed poles, by means of which the piece of bark that serves as a door (evǐ'n e nda, evǐ'n e mbẽi = house bark or door bark) is held fast. Sliding doors are more rarely encountered. These run between /72/ the wall and a lath at the top and bottom of the door opening; in the daytime they are pushed to the side and at night pulled in front of the opening. We find door posts even where there are sliding doors, since they primarily serve the purpose of preventing strangers from looking into the hut during the daytime. Most doors made of bark close poorly because they warp. Frequently the "door" consists of nothing /Fig. 36 appears here in the original text/ more than a number of narrow bark pieces that are loosely

342

[531]

Fig. 36. Door of a Dwelling in Alén (Essáuong Family). Carved out of wood and painted a light gray with clay.

placed next to each other against the opening from the inside, and naturally there are large cracks between them. It goes without saying that any sudden gust of wind will blow them down and that they also fall down by themselves. I myself have often enough been awakened by this unfamiliar clatter, or the cool night air and the stings of the Anopheles mosquitoes swarming in have given me an unpleasant awakening.

[531] Doors made of wood (Fig. 36) are to be found here and there and are sometimes decorated with simple carved patterns. They are placed or wedged against the door opening from the inside. Frame doors imported by foreign traders and [139] set on hinges made of bands of palm are not very popular, generally speaking.

Exactly as in the case of the meeting houses, the construction and condition of the dwellings vary greatly. Some [356] houses are so clean and attractively built that they look like a doll's house just unpacked; others, however, look dilapidated, unclean, and unattractive, and they make such a revolting impression that -- as I often told my Pangwe -- not even a white man's dog would feel at home in it. The majority of the dwellings, of course, are between these two extremes, that is to say, if one takes the average of several villages -- for the houses of a single village are often of just about the same quality, a fact which doubtless stems from their being equally old. There are villages which appear

342
353
354

Fig. 37. Ground Plan of a Pangwe Dwelling.
a, sleeping benches; b, fireplace (kitchen); c, pot with water; d, grindstone; e, baskets; f, bundle of maize cobs; g, hens' nest; h, door posts.

like the toys of a gigantic child that have just been finished by a giant toy dealer and are placed on the clean earth as though on a gigantic table. There are others in which one actually finds not a single house which does not let in the rain in torrents, not a single house whose walls are still standing straight and which does not provide entry for nocturnal reptiles between its walls and the ground. The reader should consider the significance of the name of the village of Ebualebambe ("tumble-down village") which, indeed, as I saw, did full justice to its name. 342 [103]

Whether the houses are carefully built or not, they always look depressed because they are too low in relation to their length, which seems even greater /73/ /Fig. 37 appears here in the original text/ than it actually is because of the way the houses are arranged in rows. One gets the same impression when one goes inside; on the average it is so low that one can stand in it only in a bent position for fear of coming into painful contact with the roof or the household utensils hanging from it. It is rare indeed that one can stand upright on one of the low sleeping benches without bumping his head.

As in the case of the meeting house, the interior of the dwelling (Fig. 37) has a single room which the Pangwe divides into atüm a nkiai and atüm akui, that is to say, into a western "room" (on a lower level) and an eastern "room" (on a higher level) which are to the left and right of the door. Figure 38 gives a view of the interior of a Fang hut. In this illustration one side wall and the right

342
352
353
354

Fig. 38. A Dwelling of the Fang.
The right half of the front wall and one side wall have been removed for a view of the interior.

342 half of the front wall have been removed in order to provide a full view.

The four corners or at least three of them are occupied by 342 sleeping benches (Fig. 37 a) which are constructed exactly like 352 the benches of the meeting houses. The distance between the 353 head and foot rest, however, is only about three quarters body length, so it is necessary to lie on them with one's legs drawn up. The sleeping benches extend to the door posts and thus take up most of the room in the house. On one of the narrow sides and [354] between two sleeping benches is the fireplace (Figure 37 b), that is, a few logs placed together and serving both as a hearth and a stove. Over the fireplace is attached a device for drying and storing food and dishes which is put together in the following manner (Fig. 39). A frame covered with plaited raffia strips is laid over the door posts (a) and two forked sticks driven into the corners. This is the "pot loft," akǎ́n e mvé (c); one can usually see a number of pots and a clay water bottle on it. Other things, which even for the Negro cannot be designated as "valuable possessions," /74/ /Fig. 38 appears here in the original text/ are also found there, such as banana bowls, maize spindles, to whose use I shall return later, and so forth. Under the pot loft hangs the drying loft or "groundnut loft," akǎ́n owǔnǒ (d). As the name indicates, this loft

342 serves only for the storage of groundnuts and is likewise usually
352 made of plaited raffia strips. Then there is the most important
353 household item for the housewife, the pantry, in the form of a storage box, bū bū, or bū u (e), intended primarily for meat and other delicacies. This box is often very nicely made with raffia pith. In front it usually has a small protruding ledge on which salt, pepper, and spoons may be placed, and thus it serves as a kind of "dumb-waiter"; at the side it has an opening that is closed by means of a sliding door made of pith. The box fills the space between the beds so that it is barely possible to stand there. One or two drying or roasting boards, etǎn (f and g), hang under the box, just above the fire. These boards are used for roasting groundnuts and for drying things.

On the opposite wall at the same level a similar frame is put up, over which drying boards can be placed and from whose front edge the women's long baskets (nkūn I) are hung. There is floor space under this frame, a sleeping bench may be placed there, covered with baskets, grindstones, and other tools, or with the assorted possessions of the head of the household. A person who enters the house for the first time finds himself in the middle of the passage between front and back door, not knowing which way to turn. To make room at all it would be necessary to clear everything out; otherwise a European would find the house uninhabitable. In the north, /75/ especially among the Bulu and in part also among the Ntum, the huts are somewhat more spacious and habitable.

For hanging up baskets, calabashes, satchels, and other objects on the wall, the Pangwe makes use of a natural hook (ekǒb), that is, a piece of a tree trunk which is cut out just above and below a branch. The branch is cut off, the remaining stump is cut more or less to a point, and then the whole piece is inserted, in the same position as it was on the tree, between the longitudinal raffia strips on the inner side of the wall. Objects are very readily attached to the wall by means of raffia stalks stuck between the mats, from whose free ends they are suspended.

An important piece of furniture is the round, three-legged stool
53 (kpā III), Figure 40, carved out of wood and decorated all around its edge with ornamental chip carving.

342 352 353

its edge with ornamental chip carving. It is placed on the ground, often in the vicinity of the door posts, and is considered, so to speak, as a place of honor -- for strangers and the paterfamilias -- like our sofa.

As a final household implement the sweeper should be mentioned. 412 356
It appears in various forms, depending on whether it is used in the dwelling, for the benches of the meeting house, for the meeting house floor, or for the village square.

For the house a broom evū̄ǎ[k], Figure 41 a, is used, made of raffia leaves tied together in the shape of a fan. "More elegant" brooms are used by the Jaunde for the benches of the meeting houses. These are made of pieces of liana stalks, Ertela scandens Benth., [824] Leguminosae, called ntū́ (b), or of the flowers of the oil palm (c). The pieces of liana stalk are slit so that they form something like a brush; these brooms therefore correspond more or less to our dusters. A third form of broom (Fig. 42) consists of two little wooden boards tied with strips to a handle. /Fig. 39 appears here in the original text./ /76/ It resembles our snow shovels, but it is by no means to be found in every village, and even where it is found it is infrequently used.

In the preceding descriptions the reader will have been struck 137 by the frequency with which the raffia palm is mentioned as construction material. 824 It is indeed true that this palm, called "bamboo" in Negro English, is by far the most important and most valuable plant

[342 353]

Fig. 39. Cross-section of a Dwelling from Door to Door: a, door posts; b, sleeping benches; c, pot loft; d, loft for drying groundnuts; e, pantry; f and g, roasting boards.

137
824 for the Pangwe. Where it is scarce, as in Yaoundé /Ger., Jaunde/ it is imported from great distances whenever necessary.

In the Campo-Uelle region there are four species of raffia. Of these, Raffia hookeri M. (esa) is to be found only along the banks of the larger rivers; Raffia regalis M. et Wendl. (andžim), on the other hand, grows only on hilly terrain and even there very sparsely. The following appears in swamps (1) and may

1. Hence, zǎm = swamp and raffia palm (collective name).

[352
531]

Fig. 40. Fang Stool.

be designated as the true raffia palm: Raffia vinifera P.B. (nia dǎǎn = true, authentic raffia), the common species. Finally, there is a species (akō'dō), recognizable by the fact that its leafstalks are tinged with blue, which is frequently found scattered among the above species. The general name for raffia, dǎǎ-h, indicates its importance; it means "the mother of the village," /Fig. 40 appears here in the original text/ dǎa (n, see "Suffixes" /not translated/), because the whole village is made of raffia, and indeed no name would be more fitting considering all that is produced and constructed
824 from it. The following list will give an idea of its multiple uses.

I. Foodstuffs

1. Palm cabbage.
2. Pulp.

824

II. Spices

3. Salt (from the leaves and stalks, together with other plants; see Section 6, p. 133).

III. Oils

4. Hair oil (from the pulp; see Section 7, page 193).

IV. Building Materials

A. Leaf pinnae.

5. Mats (eɛ̄ɛ̄ I) for the roof.

B. Whole leaves.

6. Plaited fences around the cult sites.

C. Whole leafstalks.

7. Molding beams (mfǎ.s I).
8. Rafters (ntū.g'n I).

D. Halved leafstalks.

9. Sleeping and sitting benches (kū'dū III and enǒh).
10. Longitudinal strips for house walls (ebǎɛ̄ Nt., ebǎǎk F.)

E. Pith.

11. House walls. /77/ /Fig. 41 appears here in the original text./

V. Household Implements

12. Groundnuts baskets (angū.n), made of pith.
13. Drying boards (etǎn), made of the bark of leafstalks; the frame, of pith.
14. Drying lofts (akǎn).
15. Bowls for red wood.
16. Combs (made of pieces of stalk bark).
17. Brooms (made of leaves).
18. Corks for powder flasks and for bamboo drinking reeds (pith).
19. Nails, for joining together the pith.
20. Plantain peelers (piece of bark).
21. Ropes for basketwork plates (medullary rays).
22. Needles for taking out sand fleas (bark).
23. Sticks for incising the surface of pottery jugs; furthermore, awls for piercing the nose (bark).

824

[412]

Fig. 41. Sweepers:
a, brooms for dwellings; b and c, dusters for meeting houses.

24. Knife sheathes (pith).
25. Sticks for preparing the clay blast pipe (stalks).
26. Casting molds for founding brass rings (halved stems).
27. Kindling, ekǎ'ba (stalk strips).
28. Ropes (bast).
29. Pipe bowls (made of the fruit kernels); see Section 6, page 164.
30. Needles, sewing needles (pith).
31. Fire fans (pith).

VI. Trapping Implements, Weapons

32. Fish baskets, ayǎ', ngǒ,dĕgo, nsǒ n.
33. Fish weirs, olǎ'm.
34. Noose for spring traps (fiber).
35. Bow trap of the Jaunde for rats (ebǎ'dĕ).
36. "Spears" against sorcery.

VII. Musical Instruments

37. Raffia instrument, myǒt (made of the stalks).
38. Guitar, nǒǒnga (made of the pith, the bridge of stalk strips).

824 39. Plectrum for the musical bow, elém (stalk strips).
40. Strings for the harp (fiber).
41. Sticks for the war drum, ngómo (made of pith).
42. Sticks for the signaling drum, nkú (stalk pieces). /78/
43. Children's zither (halved stalks; plectrum; stalk pieces).

VIII. Toys

44. Children's rattle stick (pith, stalk pieces).
45. Bow and arrows (stalks).
46. Rifle made of pith, newer model (pith).
47. Trigger and upper part of rifles, old model (stalk strips).
48. Pickaxes, knives, tools (pith).
49. Trap for gadflies (pith, stalk pieces).
50. Food stealer (piece of stalk).
51. Memory game, nkúk endélé (pith).
52. Stone game, akúh (stalk pieces).

IX. Clothing, Ornaments

53. Straw hats (pith).
54. Chenille for decorative caps, edóbán (pith).
55. Women's tailpieces (bast).
56. Strips of bast for sewing materials (bast).
57. Head adornment, akút (bast).
58. Arm adornment (bast).
59. Neck adornment (bast).
60. Belts (bast).
61. Ropes for stringing heavy beads (fiber).
62. Walking sticks, better ones made of Raphia hookeri M. (esa).

343 In addition to the meeting and dwelling houses already described, the Pangwe build a number of other huts designed for special purposes, namely, storage houses, houses for strangers, field huts, and houses for the sick.

The storage houses have a variety of forms. Some are merely dwellings from which the furniture has been removed; others are similar to these but have a wooden door, often copied [177] from the European models; still others, like the temporary

343 dwellings, stand with the gabled side facing the village square and look just like them except that they are firm and durable. 536 Storage houses are to be found only in the villages of wealthier chiefs.

344 The houses for strangers (esá'bád) are built following exactly the same pattern and ground plan as the ordinary dwelling, but they are very hastily constructed: the walls are usually only plaited palm leaves; the door extends to the ground with no threshold; and the sleeping benches are those of the simple kind (kū'dū III), often made only of umbrella tree trunks split lengthwise down the middle and placed on top of two casters of the same wood. They are constructed especially on the occasion of the festival for departed souls when greater numbers of strangers are expected; at the conclusion of the festive period they are pulled down.

342 In the forests or on very isolated plantations, refuge huts are frequently built. These are often no more than mere protective roofs (myō e ngī III = gorilla home), while others resemble the simplest temporary meeting houses, that is, huts in which the gabled sides are open and the long walls are either absent or consist only of a few tree trunks (angō'h e ngī = gorilla crown, that is, the strip which juts out like a comb on the top of the gorilla's skull). /79/

314 Special houses are built next to or behind the dwellings or just outside the village for persons with contagious diseases 744 (frambesia, leprosy) (see Fig. 16). Because they are designed for only one person, they are usually smaller than the dwellings; they have the same shape but are carelessly constructed and soon deteriorate because nobody takes the trouble to repair them.

343 Here and there I found stables; in the next section I shall come back to these. /Fig. 42 appears here in the original text./

Finally, it should be mentioned that in some villages 342 especially those close to the coast, there are houses on piles. 177 These are copied from the European settlements and are almost completely useless for the natives since their construction requires greater care and trouble than that of ordinary houses. Consequently, the houses on piles built by the Pangwe are veritable caricatures of human dwellings.

412

354

Fig. 43. Resin Lamp, Fang.

Fig. 42. Dirt Shovel for Cleaning the Meeting House, Ntum.

A few words should be said about lighting. In the houses, which, as we have seen, are windowless and hence quite dark, the hearth fire /Fig. 43 appears here in the original text/ is at the same time a much needed source of light. As the Pangwe relate in their legends, it was Mode-Sama, one of the first human beings, who fetched fire (ndũ̄ǎn) from God (Sama); according to other versions, the fire was given to him by God, and since Mode's time the fire has not been extinguished. This useful element is carried from one house to another and, when worst comes to worst, from one village to another. The Pangwe does not need to rekindle his fire, since it burns all day in the meeting house where it serves as a protection against cold, moisture, and sand flies, while in the dwellings it is kept going day and night for cooking and heating purposes. When the women go to the plantations, the logs are so carefully arranged (for this action alone, there are four different expressions!) that they continue to glow; or the youngest daughter may be given the task of guarding the vestal altar. In case the fire should actually go out in one house, fire is obtained from a neighboring house, and it is only in exceptional cases that a smaller village has no fire. In such an emergency fire is sent for from the nearest settlement.

Better lighting than the hearth fire is provided by the torch light with which /80/ /Fig. 44 appears here in the original text/ the village square is illuminated at night when, for instance, dances are held. The flickering of the torches causes the strange and wild movements of the dancers to appear even more fantastic than they really are. The torches are composed of dried stalks of the cardamom Aframomum alboviolaceum K. Sch. (adźǒm; stalk, ǎb'mõ IV Fang, ǎbǔ'me IV Ntum), Plate 21 in Section 11 /Vol. 2/, or finely spliced raffia stalk strips (ekǎ'ba), which — when they are well dried — burn very brightly but, on the other hand, are rather rapidly consumed.

The finest but an infrequently used source of light at festivities or other events in the village square is the resin lamp (otu = resin), Figure 43, a little tub of bark containing the fragrant resin of the Anacardiacea Canarium schweinfurthii Engl. (1) (abe Ntum, ǎbe Fang; resin = otu).

1. According to the communication of Doctor Mildbraed who has likewise collected this tree.

362

Fig. 44. Olanga Village (Essángbuak Family), South Cameroons. In the village square there is a "memorial," a peculiarly shaped tree root in which the natives see the figure of a horse.

373 obê Fang: resin = otü).

On longer trips, for instance, if an acquaintance is to be visited or medicinal plants are sought in the forest at night in case of sudden sickness, a piece of wood, waved to and fro, is used instead of the torch which would burn down too quickly. When a strong light is not necessary, the people content themselves with little branches that have been covered with the gleaming white mycelium of a mushroom, thereby providing a bright glow in the dark. /81/ /Fig. 45 appears here in the original text/

For more extensive hunting or rubber expeditions in a larger forest area, occasions when nights are spent in wild country, a burning log is taken along. In former times "kindling wood" was also taken along in case the log should go out. Nowadays the Pangwe are no longer able to produce fire in the old manner by twirling. To be sure, an older chief once showed me how fire was formerly "made"; but although he took endless trouble and two men twirled their arms lame, they were unable to produce a single spark. "Theoretically," however, my good chief

501

Fig. 45. Canoes on the Nié (Tributary of the Campo), New Cameroons.

312 knew exactly how to produce sparks. "One" takes two sticks of
124 wood from one of the three Tiliaceae, Triumfettia cordifolia Gullet (okiin) (1). Leptonychia tessmannii Engl. (akăk), or

1. According to one legend, fire is also supposed to have been brought from the heavens in a Triumfettia stick.

Desplatsia dewevrei Burs. (afonŏk), and they are dried over the fire for at least a day. One of the sticks is notched in the middle, placed on the ground, and held down with one's feet; the other stick is placed vertically into the notch and twirled. The spark which is "supposed" to be produced is caught with oakum made of the picked fibers of the Dioclea reflexa Hook. f. (bŏndŏ' III) placed around the notch. Thus instructed, after this one failure I requested elsewhere that this theory be put into practice, but most of the natives assumed a stupid expression or laughed outright at my request. /82/ /Fig. 46 appears here in the original text./

491

Fig. 46. Bridge over the Abéa (Tributary of the Bimfilic) near Makonfim (Ojek Family) During the Dry Season, Spanish Guinea.

000 original text. /

361 Usually the village square remains completely bare. Very rarely a tree is left standing or is planted there, and when that is done, it is because the tree is considered to have medicinal value. More frequently one sees scaffoldings on which the raffia palm oil is prepared (see Plate 4). In one case I encountered a memorial which was supposed to represent a horse (Fig. 44); this was a tree root which had been left standing when the area was being cleared because of its curious resemblance to the animal.

364 The cleanliness of village squares varies greatly. There are very dirty ones, littered with sheep and goat manure, remnants of sugar cane, chewed cane, building materials, and so forth in great quantities. Indeed, in some of these village squares the grass has not even been weeded out. On the other hand, there are very neat squares where the villagers sweep all the rubble and refuse behind the houses. The men who look after the meeting house are especially negligent; they frequently let the rubbish heaps (akôn) accumulate until they clutter up the entrance.

1: Tessmann--46 E-5 (1904-1909) 1913 FH9 Fang FH9 /

Fig. 47. Bridge over the Bimfilie near Ebifomajong (Eufmong Family) During the Rainy Season.

The privy (*ndik*), as Figure 16 shows, is in the plantain grove not very far from the houses. Frequently it is so close that the stench, especially when the wind is unfavorable, may become unbearable. The privy consists of a fairly deep pit with one or two pairs of forked sticks planted in the center; on top of these is placed a layer of tree trunks in such a manner that the middle ones extend from the edge of the pit only as far as the sticks and lie with their free ends in the forks. Thus, a rectangular opening is left uncovered, and /53/ loam is thrown around this over the whole thing. Sometimes the loam covering is not put over it. Instead of toilet paper, dried corn husks are used.

It is worthy of note that the Fangwe also cultivate ornamental plants. These are placed in the village square, along the paths behind or to the side of the houses, or, in case the village consists of only a single row of houses, they are planted where the opposite row of houses would ordinarily stand. Generally the ornamental plants are the following: an attractive Amaranthaceae, *Gomphrena globosa* B. (*ngôñ* IV), which also grows in America and may have been imported from there; and the so-called fever

1: Tessmann--47 E-5 (1904-1909) 1913 FH9 Fang FH9

351 grass, Andropogon schoenanthus L. (olimentŕngan a olím
247 [Ocimum] of the Whites), a plant which has likewise been imported.

487 The roads are often scarcely visible paths which are first trodden by hunters and used by elephants and later become wider through increased traffic. Naturally, however, one must always proceed along them in single file. Wherever small brooks happen to flow in the direction of travel, they are used as trails.

491 For the crossing of larger bodies of water, a few stems of the
499 umbrella tree are tied together to form a raft or dugout (bɛ́, plural, mɛ́; Fig. 45), otherwise employed for fishing purposes, are used. Bridges (ndɔ́ŋ I) are built only in rare cases, primarily in situations where the plantations and the village are situated on opposite banks of a river, thus necessitating regular and rapid passage between them. These bridges consist /94/ (Fig. 46 and 47) of several piers, each made up of two tree trunks planted into the ground in the form of a St. Andrew's cross and firmly tied together. One or more transverse beams are then placed over these piers. To serve as a railing, either ropes are tied to the upper ends of the piers, or sticks split lengthwise down the middle are fastened to them. When a bridge beam decays, a new one is placed on top of it, but no one thinks of restoring the framework which cannot support the greater weight, and for this reason the bridge soon collapses as it gets older.

[777] More recently bridges have been built according to the European model (bɔ́ŋ II), consisting of two rows of supporting piles and transverse beams over which logs are placed very close together, like our corduroy roads. These bridges are even more dangerous to life and limb than the older form, since supporting posts often collapse, the bridge frequently lies to one side, and it is possible to have a bad fall on the slippery log ends. /95/

Section 5

000 Economic Activities

First Part. Agriculture. General matters: tools, preparation of the soil, division of labor. The

000 most important food plants and their significance. The groundnut (varieties, cultivation, pests, medicines, uses), maize. Ngon (description, varieties, importance, origin of the name, cultivation, harvest, drying, pests, medicines, uses). Yams, cassava, sugar cane, taro, and macabo (description, varieties, cultivation, uses). Plantain and banana. Additional cultivated plants.

Second Part. Livestock. Dogs, appearance, importance for the Pangwe, their names; goat and sheep, castration of the goats (manner of castration, purpose); the hen and its importance; the duck; other tame domestic animals.

Third Part. Fishing. Abundance of fish, survey of the fish world of the Pangwe region, the catching of fish (general matters, chief seasons), method: driving the fish, angling, fish poison, scaffolding weir, basket weirs, basket trap, catch baskets, fish channels, fishing nets.

Fourth Part. Trapping. Pitfalls, spring traps, spring plates, spear trap, mares, draw traps, francolin trap, bow traps, alarm trap.

Fifth Part. Hunting. General matters, drives with baskets and nets, division of the meat, accidents, individual hunting expeditions with rifle and crossbow. Crossbow (origin, description, arrows).

I. Agriculture

453 The economic activities of the Pangwe are agriculture, catching fish, and trapping; in comparison with these, hunting and stock keeping play a subordinate role.

195 The curious locutions of the Pangwe language, such as a bə̄ 241 bidzǐ = to plant "food," that is, to plant, and a nyǒn bidzǐ = to take "food," that is, to harvest, seem to indicate that the cultural level of the farmer followed that of the primitive collector. That is to say, the expression suggests that the conscious cultivation of plants developed from the observation and exploitation of edible leaves, fruit, and the like found wild in nature. The Pangwe have wholly risen above the latter stage, and they revert to it only occasionally in periods of distress.

241 Their agriculture is hoe culture, that is, the soil is loosened by means of the hoe and digging stick. The hoe (ebə̄k, Ntum; ebə̄k, Fang), Figure 48, consists of a piece of iron tied to a wooden handle bent in the form of a hook; the digging stick (evīēn Ntum, Fang; tōō, Jaunde) is a wooden stick with the end shaped like an incisor. The hoe is used by the women, the digging stick by the men /86/. Other agricultural implements are the ax (oyū'n), Figure 49, and the bush knife (fā-tī IV), Fig. 50. The latter, which today has been almost completely replaced [111] by the European cutlass, nkpwēdī' I, is used to dig tubers, such as yams, and to level the soil. For the latter purpose I also observed the use of wooden spades attached to a handle.

Tillage begins with the clearing of the ground (a lī tsī). First, the lianas, undergrowth, and thinner trees are cut down with the cutlass. In this way some elbow room is created, and the larger trees can be felled with an ax. /Fig. 48 appears here in the original text. / Ordinarily a whole group of trees is tackled at one time in the following manner. The lianas are severed first so that they can no longer hold up the trees. The majority of the thinner tree trunks are merely notched, and then only one fairly massive tree is cut down. This tree when it falls brings down virtually the entire group of trees, together with its network of lianas. As a result, very little remains to be done. The very large trees are usually left standing to provide shade. They are removed, by setting fire to the roots, only if it is absolutely necessary to do so. Without the help of fire, it would require a number of days to cut down such a giant tree, and the Pangwe rarely have time for this in the brief dry

241
412

Fig. 48. Hoe.

Fig. 49. Ax.

Fig. 50. Bush Knife.

/87/

482
291
301

Fig. 51. Fang Women Bringing Firewood from the Plantations.

season. /Fig. 49 appears here in the original text./ Once the bush is entirely cleared (with the exception of the shade trees), a few days are allowed to elapse until the sun has dried the wood. Then fire is set to it, and the farm is "burned," a dége ti. At the end of the dry season one can see columns of rising smoke throughout the land, and on walking expeditions one often has the dubious pleasure of having to pass such a burning farm. A great number of birds of prey, especially the parasite kite, circle around the new farm, heedless of the heat, in order to catch every crawling thing that flees from the fire. As soon as the rainy season comes, the clearing of the farm comes to an end, and now "the food is laid." The men move the charred and unburned remains of the trees /Fig. 50 appears here in the original text/ /87/ to one side or heap them up on the farm itself as boundary markers (see Plate 7). The women remove the smaller branches, and it is the women who from this time on dominate the picture, sowing or planting the vegetables, pulling out the weeds which during the rainy season soon become rank, and taking in the harvest. All these, incidentally, are lighter

241
241
442

tasks, and from this division of labor it is apparent – this will be pursued further later on – that the work which requires the greater effort is allotted to the men, while the easier work is left to the women. Since by the very nature of the matter the harder work lasts for a shorter period of time, the impression easily arises that the women have to perform considerably more work than the men, but this is not the case, and it is probable that the distribution of work is not much different from that in Germany, say. It is just that the type of work is different. To be sure, upon seeing the large, fully packed baskets which the women bring in daily from the fields (Fig. 51), the uninitiated observer might easily get such an erroneous impression, but the carrying of such disproportionately heavy burdens, which makes the women's bodies so deformed, is partly their own fault. One is reminded of the Low German proverb: "De Fule drägt sich dodt un de Flitige löpt sich dodt /the lazy one carries himself to death, and the industrious one runs himself to death/. The woman likes to rest in the afternoon, and many of them even have quite an aversion for work. Incidentally, this is a further reason for the frequent periods of food shortage (mentioned in the third section /not translated/), which at times develop into real famines. /88/

The most important staple food plants of the Pangwe are the following seven:

Southern Region (Fang)	Northern Region (Jaunde)
1. Camava (manioc)	1. Camava (manioc)
2. Plantain	2. Groundnut
3. Groundnut	3. Plantain
4. Ngon	4. Maize
5. Maize	5. Ngon
6. Taro	6. Taro
7. Yams	7. Yams

It should be understood that the plants are listed here in the order of their importance as food plants, in other words, as "food" in the household, and not according to the extent of field work involved in their cultivation which would completely reverse the

241 order. Sugar cane, important only as a luxury or refreshment item and not as a staple food, would be added to such a list, while the plantain would be withdrawn completely because it thrives without any care and does not require intensive cultivation. Similarly, the cassava would not occupy a significant place in such a list since, even though it requires a certain amount of cultivation, it nevertheless continues to spread as a durable shrub and is not bound to definite seasons with respect to its growth and conditions for cultivation. The groundnut and ngon would now be most important plants. If one distinguishes field agriculture and gardening as different types of cultivation and uses area of cultivation as a yardstick for each of them, one gets the following order of plants.

Field Agriculture

1. Groundnut	Secondary plant, maize
2. Ngon	Secondary plant, yams
3. Cassava	Secondary plant, sugar cane as a luxury item.

Gardening

4. Taro	Secondary plant, macabo
5. Plantain	Secondary plant, banana as fruit

By this list I do not mean to imply that ngon must always be planted with yams, or cassava with sugar cane. There are farms which grow yams exclusively, and others which grow sugar cane exclusively. The list is merely intended to indicate that frequently the cultivation of these secondary plants is linked with that of the most important principal plants, and that above all the conditions of cultivation of he two are the same or at least similar. Thus, I can confine myself, for more precise description, to the cultivation of the five chief plants of the above list. /89/

The Groundnut, Arachis hypogaea L.

(Plate 6)

244 The groundnut (owúnŏ, derived from the stem a wŭno = to set, to plant) occupies the third – with the Jaunde the second – rank in the order of the most important food plants. In the Fang region five different varieties are distinguished, of which one, mŏne owŭnŏ, has again been given up because of its small fruit. Of the remaining four, the following are found together in one and the same field with equal frequency: the upright, more hairy asŏ́mena, which according to Sadebeck (1) is Arachis

[113]

1. R. Sadebeck, Die Kulturgewächse der deutschen Kolonien und ihre Erzeugnisse /The Cultivated Plants of the German Colonies and their Products/ (Jena, 1899), p. 230.

asiatica Lour. (it is illustrated by Plate 6), and the low-growing Arachis africana Lour. or var. glabrata D.C. (ebăn, Ntum; ekắb or engŭs, Fang. The variety eyŏ́lo (Fang) or evŭŏ́le (Ntum), distinguished by fruit that is thicker and not quite so long, and the variety ezŏ́na are likewise sometimes found in the same field.

244 311 Anyone who travels in the land of the Pangwe will immediately recognize how important a role the groundnut has in the agricultural economy of the natives. The only farms that may delight the eye of a European are the groundnut farms. Walking through the cassava and sugar cane plantations, one is afforded no unobstructed over-all view of them, and on the ngon farms one constantly has to climb over tree trunks that have been left lying around. After passing through these or even through a stretch of dense forest or bush and then coming upon a groundnut plantation, one draws a breath of relief. The wanderer will see the plantation lying before him, framed by the darkness of the forest interspersed with the brighter green of the young maize which is usually planted, along with the groundnut, as a border

244 311 against the forest and in the middle along the boundaries of the individual plots (Plate 7). The groundnut plantation with its cleanness and unobstructed view will vividly remind the visitor of European vegetable fields; one groundnut plant next to the other shoots forth its many quadripartite leaves, irrigated by the ample moisture of the tropical rain, and here and there one can see the yellow blossoms shining through the leaves.

244 The planting and harvesting seasons of the groundnut are as follows.

First sowing: planted in September and the beginning of October; harvested towards the end of December.

Second sowing: planted in March and April; harvested in July and August.

The groundnut is thus planted before the rainy season and harvested during the following dry seasons.

244 476 The clearing and burning of farms, accordingly, is undertaken jointly by the men of the village in February, March, and again in July and August. /90/ The field is divided among the men, and they proceed to clear the larger tree trunks and branches out of the way, while the women clean up the farm and then place in the ground the seeds or the nuts which have already sprouted. They do this by digging a small hole with a hoe, throwing the seeds or, as the case may be, the nuts into it, and then pressing the soil down with their feet. The harvest begins when the leaves, with the exception of the topmost ones, are fairly well dried. The soil is loosened, and the women pick out the nuts and put them in plate-shaped baskets (dzap).

244 Three years must elapse before groundnuts can again be grown in the same soil. The women have also noticed that the groundnut — which requires a certain amount of calcium in the soil — does not thrive everywhere, and hence they are in the habit of saying: "Let us not plant groundnuts again in this vicinity, for they do not thrive here." Like the majority of cultivated plants in the tropics, groundnuts draw practically no pests. They are harmed most of all by the following animals which eat their leaves: by the guib, Tragelaphus knutsoni Lemberg (nkɔ̌k); and the dwarf goat, Neotragus batesi Winton (odzap). Furthermore,

244 there is the striped mouse, Mus pulchellus Gray (zǒfǒ III), which gnaws the nuts. A kind of black rot affects the nuts here and there during certain years. A number of caterpillar species which consume the leaves can scarcely be designated as actual pests. It
244 is probable that the black rot has led the women to the belief that
789 other women are capable of making their groundnuts sick and of ruining them by means of "medicine." They try to counter this trick with a medicine consisting of the bones of the turtle, the elephant, the pig, and the guib, which are burned to ashes and then crushed; it is scattered on the seeds before planting. Of the remaining medicines that are supposed to influence favorably the growth of groundnuts, the most important one consists of rubbing
[386 the groundnuts with a specially prepared coloring made from red
824] wood, ba-ayǎ'; accordingly, this medicine is called ba-ayǎ'. This red coloring (see Section 18, "Sexual Life") produces the
[123] desired results and fends off hostile intentions. Red is everywhere the color of joy, growth, and reproduction. On the day the woman plants the groundnuts, she paints a line between her index finger and thumb with the "medicinal red" which will give her a lucky hand; or she draws a similar line on the upper surface of a tree stump and covers the stump with leaves, like a cap. This is to say: "May you groundnuts blossom, grow, and thrive (the red color is for this) under such a protection (referring to the leaves); nobody will be able to do you any harm (referring to the
[833 medicine)." Furthermore, on the eve of sowing, the man usually sets a good example for the groundnuts "assembled" in the basket /91/ by performing coitus for their benefit. With this example he sends them on their way: "Multiply! (1)" Another

[194
834] 1. This is done even when the woman is menstruating, whereas sexual intercourse is otherwise avoided during this period. In this case, as a medicinal act, sexual intercourse with a menstruating woman is supposed to be particularly good for the groundnuts, on condition that the woman "brings good luck (ayǒe)" (see Section 18, "Sexual Life").

Another
244 fertility medicine consists of the following mixture: 1) bark
719 of the Simarubaceae Irvingia barteri Hook. f. (andŏ̂k; 2) bark
[204] bark of the Anacardiaceae Pseudospondias microcarpa (Rich.) Engl.
(ofŏ̂): 3) elephant manure; 4) sand from the Campo or the
Uelle; 5) salt. On the eve of sowing this mixture is added to the
nuts. This, too, must be understood as a direct transfer of power:
the groundnuts are to be as numerous as the fruits of the two
plants named; they are to become as enormous as the pile of
elephant manure; as numerous as sand in the Campo — we would
say, as the sands of the ocean; and as innumerable as the grains
[204] of salt. Finally, certain Liliaceae (ayŏ̂) are planted between
the groundnuts so that their leaves may become as green as the
lilies in the field. As can be seen, there is no lack of friendly
encouragement and good examples.

The fruit, illustrated in cross-section by Plate 6, Draw-
244 ings a and b, usually has two seeds, more rarely three, and still
more rarely one. Something reminiscent of our love feast occurs
when a boy at work finds a fruit with three seeds in his mother's
basket or in the field, calls his friends, and shares the seeds with
[115] them. This is called euphemistically: bi ki̇ kibŏ̂d, "we dissect a
goat." Thus, we have here the doctrine: Do not forget to do good
and to share with your fellow man when you are living in abun-
dance! It is probably more by way of a game that the Fangwe,
especially the children, sometimes eat the nuts raw. Otherwise
[53] raw nuts are prepared principally for soup or compote. It is also
customary to boil the whole fruit and then eat the seeds. The
[267] nuts are stored in large, tall baskets of raffia pith, which are hung
under the roof or placed on a bed, or the nuts may be placed
loose on the groundnut loft, akŏ̂n owŏ̂nd.

As a result of their laziness and indifference, the Fangwe
433 seldom have enough groundnuts, so there is always a period of
435 time when they have to do without them until the next harvest has
244 been brought in and is sufficiently dried. This is the reason that
in the Nsum and Fang regions at these times the price for a "plate"
(2)

[Fn] 2. The flat plate-shaped baskets called bush plates are a unit of measurement.

Fig. 52. Plantation of Groundnuts and Maize near Bibai (Ewong Family), Southern Cameroons.

of groundnuts rises to ten spears (equal to 70 pfennigs) while at other times only five spears (equal to 35 pfennigs) are given for it. In the Jaunde region, it is true, a plate always costs 70 pfennigs (equal to 100 Jaunde spears). The groundnut is eaten simply as soup or compote. /92/ /Fig. 52 appears here in the original text. / The oil content of the nuts is not utilised to any great extent, but the oil released by cooking is rubbed on the skin in order not to waste it. Finally we might mention the riddle:

ongîn	o	nge	bôl	a ŭ		o
(A) bird,	it	lives	give birth to	behind the house		of the
bomîg:	akî	avûm	a	bôlôm	bôn	avûm
mothers:	egg	one;	there	creep out	young ones	ten.

Answer: owûmo a groundnut.

Maize, Zea mays L. (ŭ IV), as we have said, is almost always grown with the groundnut (Fig. 52), usually as a means of marking off the individual plots and as a border against the bush all around the plantation. Farms that grow maize

243 exclusively are comparatively rare. Just like the groundnut, maize is planted in the beginning of October and matures in December. Then it is again planted in March and matures between the middle of May and July. Guess a riddle! = kǐndǐh.

524 I guess = kandǐh.

ma yǐn bǒnēnga, bō mbe ekō-ne, bǒnēnga bete:
I see women, they were on a journey, women meant:

mabum a mabum
bellies – bellies.

I see women who came on a journey (that is, who formerly were not here), and they are all pregnant (the ears in the husks).

Answer: fǐ́h = maize. /93/

244 The Ngon, Cucumeropsis edulis Cogn. (ngǒn IV, Jaunde; ngǒn IV Fang)

(Plate 8)

The ngon is one of the cucurbitaceous plants and has pentagonal leaves (more rarely the leaves have five lobules) with finely serrated edges. The leaves are attached to the nearly round stalk at intervals where, in addition to an occasional offshoot, usually another shoot, one or two male peticles, and occasionally a single female blossom are found. A piece of such a stalk is illustrated by Plate 8. The blossoms, jokingly called adǐne kǐ, "turtle's feet," by the Fang, are not very large and have lemon yellow petals which are turned back. The female blossoms (a-c) are somewhat variable in size and bear a hypogeous ovary; their margin and pistil are green. As for the male blossoms (b-c), on the other hand, the stamens are yellow on top. The fruit is large, longish, and egg-shaped.

In the Fang region three varieties of ngon are distinguished. These varieties are recognizable, however, only by their fruits

284 (Drawings f-h). The variety oal'bome (f) has the largest fruit; it is about 15 centimeters long, a bright yellowish-green with vague, speckled markings, and slightly narrowed toward the middle. In the case of the second variety (g), nia ngon (the real ngon) or nkiline (the dark ngon), the fruit, in contrast to that of the first kind, is usually oviform, twelve centimeters long, and dark green with streaks or strips of a light green color; sometimes the fruit is spotted. This variety appears to be the most common. Finally, mone ngon, the small ngon (h), is considerably smaller, measuring only nine to ten centimeters, rarely more, and it is brighter. Here the speckled marking, which we have already observed in oal'bome, is so blurred that one can speak of bright green specks on a somewhat darker background. As regards the seeds, I counted 190-200 in the case of oal'bome, 224 in the case of nkiline, and only 80 in the case of mone ngon. The seeds are pear-shaped (e) and white, and only the inside is eaten. Frequent crossings appear among the fruit although on one and the same plant fruit of the same variety is usually found, and hence it is possible to speak of genuine species, just as in the case of apples and pears.

284 Among the seven chief food plants, ngon occupies fourth
262 place. Only among the Jaunde does it take fifth place, while maize has moved to fourth. I cannot determine whether it was only the drier climate of Jaunde country that caused maize which thrives in a dry climate to be preferred to ngon which grows more successfully in the rainy southern and western Pangwe region. In any case, ngon is of such importance for the huge Pangwe region and far beyond it that one would think considerable space would be devoted to it in technical books about tropical cultivated plants /94/. As it happens, however, the plant is not mentioned by Sadebeck, Fesca, or anywhere else.

284 Concerning the origin of the name, the Fang tell the fol-
TD lowing little story. At first the name ngon was quite unknown; the plant was simply called by the general name ekiluga (from a kiir, "to crack," because the seeds are opened by being cracked, and this is a general expression for all fruits that are opened by cracking and have an edible interior, for instance, andok = irvingia, etc.). Furthermore, ngon was not yet cultivated as it

244 773 is today; instead, women gathered its fruit in the bush. Once upon a time, there was a man who had no sister he could sell to obtain a wife for himself, nor did he have any other person who could help him to get married. He hit upon the idea of starting a huge ngon farm, and when the ngon was ripe many people came and bought the kernels. In this way he finally earned so much money that he had the purchase price for a girl. When other people, who likewise had no wives, heard about this, they began to imitate him and also married through the aid of the plant. Hence, it is said: "Oh, I see this plant like a girl (ngɔ́'n), and therefore it shall be called ngɔ́n also, for if the man had had no ngon (ngɔ́n), he would not have been able to marry a girl [194] (ngɔ́'n)." It should be noted that the two words differ in pitch; the word for the plant has falling pitch in Fang (ngɔ̂n), rising pitch in Jaunde (ngɔ̌n), whereas the word for girl has only high pitch (ngɔ́'n). A narrative in the creation story is very similar.

244 Ngon is planted only once a year since its cultivation requires the period from April to December. In April, frequently long before, the bush is cut and burned. The ground, however, is not cleared, and everything is left lying just as it fell; at most the largest brushwood is removed from the connecting paths. Walking through a farm, especially along the plantation paths, is therefore quite a gymnastic feat. A ngon farm is often cleared [476 communally by the inhabitants of two neighboring villages who 602] belong to the same kin group. To the uninitiated, however, the boundaries are not discernible. They are indicated by trees that have been left standing or have fallen over and more rarely by lianas tied to the branches of tree trunks lying on the ground. It is astonishing that no boundary disputes arise.

244 462 In April, once the farm area has been burned over, the women go into the fields, and with their universal tool, the hoe, they plant the ngon seeds in the ground. The seeds must first have been soaked in water for a day, and two or three of them are planted in the same hole. Because of the tree trunks and the brush lying about, planting is hard work, and for this reason the men usually assist at the task, at least on the first day, equipped with /95/ /Fig. 53 appears here in the original text/ hoes and digging

244
[262]

sticks. During the planting of groundnuts, on the other hand, "no handsome young man, in fact, no one who by virtue of strength, beauty, and influence is of any account," helps, the only assistance given is provided now and then by a man, ugly or old, who wants to make himself popular with his wife, "so she will not eventually run away and live with somebody else." Once planting is finished, ngon is left to itself and proceeds to climb up the tree trunks and branches. By the middle of May it is already knee high. In June or July the field is weeded once, and later the ngon itself, rising above all else, chokes out the weeds; only some of the larger plants shoot up in spite of it and are occasionally pulled out. In September we already find some of the fruit fully ripened, and at the start of the dry season, in November and December, harvesting can be started. By that time, the leaves and stalks are almost completely dry, and the fruit hangs from the dry stalks in the branches of the trees which served the plant as a prop and are now leafless.

At harvest time an area in the plantation is cleared and carefully covered with leaves. Then the fruit is picked — a job

which is completed in three days in the case of medium-sized plantations -- and heaped up in this area around which a fence of oil palm leaves has been constructed. The fruit is beaten with a stick to open it (Fig. 53), the contents are left in, and for /96/ protection against field mice and rain, it is covered with cardamom leaves. This job is completed in one day. Then the fruit must lie for four days. After this period the seeds are taken out of the fruit, placed in ordinary baskets lined with banana leaves, and left standing in the house for a day. Then they are washed in a river in order to remove the fruit slime clinging to them which has begun to ferment. This somewhat complicated preparation is concluded by the drying process. To this end the seeds, with loam added, are thoroughly kneaded by hand and then spread out in the village square. The reason for kneading them in loam is not clear. Some say -- and this seems to be the most probable explanation -- that the ngon becomes "stronger" by this process, since of course the dark color of the loam causes the sun to have a stronger effect on the seed. Others, especially Jaunde women, give the explanation that otherwise, that is, if the seeds were not mixed with loam, coma or dizziness comes through the eyes when the seeds are cracked open. I am unable to determine whether this is merely a superstition or is based on correct observation. At any rate, the seeds must dry in the sun on the village square for two days or, when bad weather intervenes, for a correspondingly longer period of time. A traveler walking through the villages after the ngon harvest will find quantities of white seeds covered with loam spread out in front of many houses. Children and women guard the treasure from meddlesome dogs and hens and make indignant threats at any trespasser on their harvest. Especially energetic women bombard the intruding animals with stones, small pieces of wood, or other missiles, until finally the anxious husband emerges from the meeting house and by means of a stick or a fly swatter drives away the disturbers of the peace to a respectful distance, where they come to the realization that there are other and better places and pounce upon the nearest, less carefully guarded pile. In my travels I have always enjoyed this time of year especially, since at these times there was at least some life in the village square which is otherwise so quiet. Furthermore, when a black rain cloud indicates the approach of a tornado, the whole community comes to life.

252 Everybody rushes to gather up the seeds; even hobbling old men and little naked children eagerly take part. Great care is taken, however, to get none of the dust which covers the village square in great quantities, no matter how much sweeping is done. Ordinarily, however, the seeds are gathered very quietly and slowly in the late afternoon, all the more slowly since the loam of which I have already spoken is carefully removed from the seeds. The fear of surprise downpours, incidentally, has produced all kinds of preventive medicines which I shall describe in another place (Section 14). /97/

244 136 Ngon suffer from pests more than the groundnut. Among these are beetles and caterpillars, but above all a species of bug which feeds on the leaves and a number of mammals which feed on the fruit. Among these mammals should be mentioned especially the red-tailed monkey, Cercopithecus buccalis Leconte (ołǒk), and, wherever it occurs, the baboon, Maimon planirostris Elliot (esǐge); furthermore, from the family of squirrels there are Sciurus eborivorus Du Chaillu (mvǒk) and Sciurus lemniscatus Leconte (osǒ'n); among the mice, the worst pest is Dendromys messorius Thomas (njaa); and there are also other species, such as Mus pusillulus Ptrs. (okǒb). In places elephants and buffaloes, which likewise eat the fruit, create a great deal of destruction. The guib (nkǒ'k) eats the leaves. Fruit 244 719 rot (ntǔǐ' ngǒn, that is "diarrhea of the ngon"), the result of an overabundant rainfall, likewise reduces the harvest, at times to a considerable extent. Against all these enemies there is not much to be done since they do not pay much attention to preventive medicines; nonetheless, Pangwe women believe that they can influence the seeds and the young plants by all kinds of means, as in the case of the groundnut. One such means, ba-aya, has already been described in connection with the groundnut. A second method consists of sprinkling the seeds themselves in the bush plate where they are kept for sowing with red wood that has been ground to a powder (red wood as a symbol of growth, joy, and reproduction). Another pro- 244 719 824 cedure to encourage the growth of the ngon plants and to make them produce an abundance of fruit is called emǐě ndǒb, that is, squirting of (the medicine in the) banana leaf vessel. For this purpose a vessel made of banana leaves is buried in the middle of the farm or set up there, and the following things are put into it.

1: Tessmann--65 E-5 (1904-1909)1913 F119 Fang F119

244 799 834

1. Fruit of Alchornea cordifolia Muell. Arg. (abui), because of the quantity of its fruit; hence also its name abui from abui, "much" (compare a bue, "break into pieces," for then there are many pieces!).

2. Herb of the Amaranthaceae Aerua lanata (L.) Juss. (angŏ'nzogŏ'ne III, angŏ'ngŏ'ne = assimilated, angŏ'ngŏno), because of its abundant inflorescence.

3. Fruit of the Pseudospondias microcarpa (Rich.) Engl. (ofge), because of its many fruits (cf. groundnut medicines).

4. Fruit of the Euphorbiacea Staphysora duseni Pax. (owŭwŭmu II and III), because of its many flowers; hence the name is derived from a wŭmu, "to put forth," the name being formed by reduplication.

5. Pulverized leaves of the melegueta pepper, Aframomum melegueta K. Schum. (andŏn), likewise because of the luxuriant growth of the plant. /98/

All these items are stirred together in water inside the vessel and are then squirted onto the young ngon plants by means of a piece of stalk of the Cissus (pŭŭŭk IV), so that the ngon may "grow as luxuriantly as the Cissus shoot."

Depending upon the region, the various elements and admixtures of the medicine differ; frequently some of them are used by themselves. For instance, Staphysora mixed with charcoal is scattered on the plants. All the components of the medicine listed above, however, are chosen because they can transfer their power to the ngon plants.

244 834

The economic importance of ngon is indicated by the fact that among the Ntum and Fang the women who planted the ngon are forbidden to have sexual intercourse for three months. The significance of this disproportionately long period of fast, if I may call it such, may be measured by the fact that in the important women's cult Mekang, for instance, the initiates are forced to practice only ten days' sexual abstinence, and in the most important men's cult, the

So of the Jaunde, sexual abstinence effectively lasts only three months. The Fang say that the ngon would not grow if the prohibition were broken, and since with them the belly counts for more than love, this prohibition is generally observed.

Only the softer interior of the ngon kernel can be eaten. The kernels must therefore be cracked open, and this is done by means of a little stick from the tree Microdesmis puberula Hook. f., Euphorbiaceae (ohimyōlō), with which they lightly strike the seed after placing it on end. Old and young, men and women, participate in this task which is carried out inside and in front of the dwelling house, as well as in the meeting house. It is an activity characterised by a peculiar clicking noise not easily forgotten once one has heard it. In spite of its importance in the household, the ngon is not prepared in a great variety of ways; like the groundnut, it is eaten only in the form of a soup or it is pulverized and boiled in a leaf bundle.

In conclusion, patient reader, kīndīō (guess a riddle!); kīndīō (I guess):

akīō	afē,	e	mane	akōlua	ngwī,
spear	one,	he	makes ready	herd-swine.	

Answer:

okīō	ofē,	e	mane	dīīd	e	ngon
beater	one,	he	makes ready	bush plate	(with)	ngon.

Yams, as a secondary crop with ngon, are of two principal kinds: the three-leaved yams, Dioscorea dumetorum (Kunth) Pax (andēā); and the common yams, Dioscorea minutiflora Engl. (emvūā). /99/ Each has four species. In addition, the Pangwe differentiate two more kinds which, however, perhaps belong to Dioscorea minutiflora or are close to it: kōō III Nium, dūō (plural, bōō) Fang; and ebōōōō. In the Jaunde region there is furthermore the Jaunde yam with large tubers, ekōda Jaunde. Finally, the air tuber yam, Dioscorea sativa L. (alōō), is also cultivated, but only in very small quantities. As we said above, the conditions for the growth of the yam resemble those of the ngon; it also climbs up the brush and trees left lying about,

244 and for that reason yams, especially the air tuber yam, are frequently planted with ngon. In general, the only edible part of the yam is the rhizome, and in the case of the air tuber yams, only the air tubers which all fall off at the same time when they are ripe. This has given rise to a symbolic custom practiced when the children eat yams.
[177] For instance, when the three sons of one mother eat yams, the first nudges the second, and the latter nudges the third, as a sign that they wish to die after one another, as is natural, and not all on the same day, like the air tubers.

Considerably less can be said of the third group than of the first and second groups. The chief plant belonging to it is cassava or manioc, Manihot utilissima Pohl (mbiin I). The times for /Fig. 54 appears here in the original text/ the cultivation of cassava are as follows:

Fig. 54. Cassava Shoot.

[178] ŋŋ̄ŋ ésób - long dry season (December to February), felling the trees on the farm;
ŋ̄gō ésób - short rainy season (March to May), planting the shoots;
ońn - the rainy half of the year.

In the following ésób, in other words, from January of the following year on, that is, seven months after transplanting, harvesting may begin, and it may extend over an arbitrary period of time since the plant is a perennial.

[179] There are no medicines for the growth of cassava as there are for the groundnut and ngon. The prayer of the Pangwe -- an ancient one in new guise -- would be: "Dear God, let the groundnut and ngon flourish, cassava grows by itself!" Cassava has comparatively few enemies; only goats and sheep like to eat the leaves. There is a species of grasshopper (mbāsáŋ III) which descends in

244 great numbers on the leaves of all cultivated plants, especially cassava and sugar cane. There are seven varieties of cassava, but it would take us too far afield to enumerate them here. As Figure 54 indicates, cassava is planted by heaping a little soil over the shoot. /100/

249 Similarly, sugar cane, Saccharum officinarum L. (ndó'k I), is "planted" during the rainy season. Its shoots are taken from the upper part of the stalk, called the "arrow" (Fangwe: ngó'k), but it requires a longer period of time to ripen for it is not harvested until after the second subsequent rainy season, in other words, after thirteen months. Cassava and sugar cane are frequently found together in a planted area, often with cultivated plantains also interspersed among them.

Riddles:

524

1. ollé e ne m' ebo, ke a wólé
(A) water, it is to me there, not (to) flow.
--The sap in the sugar cane.

2. bengé-ndá (1) be ne m' ebo, vé mendíbe
wives-father's they are to me there, merely (with) dancing caps.

1. Archaic form; nowadays the usual form is beyé.

mendíbe
dancing caps.
--mekín me ndó'k = blossoms of the sugar cane.

3. me vídin ndó'-a ngó'k, o ke ñíme
I throw-to a little more from the nubbin, it goes hitting
nga ndíó-bíngó ndíó
woman, Ndongkodo, (at the) knee.

The solution to this last riddle will be apparent from the following drawing (Fig. 55). Ndongkodo is a jocular name for sugar cane and alludes to the curvature of its stem; ndíó, ndíóó originally meant

1: Tessmann--69 E-5 (1904-1909) 1913 FH9 Fang FH9

"sun," "sun," and was later carried over for people and used as a /Fig. 55 appears here in the original text/ personal name, and bôt - lord; we would perhaps say: "Your Excellency Von Sun."

I now turn to the second part of the cultivated plants, those that are cultivated in gardens, that is, in small operations and for the most part behind or close to the dwelling. To be sure, the difference between field and garden cultivation is not everywhere sharply defined. For instance, the garden plant taro is often planted at a distance from the village in fields, and plantains are frequently grown on cassava farms and other farms.

Taro, Colocasia antiquorum Schott (atú), and Macabo, Xanthosoma violaceum Schott (ekábe)

The taro or Colocasia is -- as the Latin name indicates -- a cultivated plant of some antiquity even for the Pangwe, hence they have no ready explanation for the name atú. The macabo, on the other hand, which stems from /101/ America, has only recently been introduced and, according to the natives, was

Fig. 55. Sugar Cane Shoot.

taken over by the coastal peoples about thirty years ago (1);

> 1. As soon as one has become familiar with the Negroes' ability to estimate time, one becomes very cautious with respect to the preciseness of historical dates.

hence its name ekábe from a ikób-an, "to hand over, to divide, to take possession of." Both plants belong to the Araceae family. Taro is distinguished from macabo by the fact that its leaves are

only slightly indented near the bottom and the stalk of the leaf is articulated down by the flat part, while the macabo has true arrow-shaped leaves so that the indentation extends down to the stalk. Furthermore, macabo leaves have a slight sheen on the surface, while taro leaves are dull and their veins have an almost bluish tinge. Taro has yellow blossoms; macabo has white, green, and rose tinted ones; both blossom in the rainy season.

Strangely enough, Europeans in the Cameroons tend to prefer macabo to taro; the former is their substitute for the potato in Africa, although the latter, if merely steamed, doubtless has the better taste. At the same time the Pangwe have little love for macabo and have retained taro, their traditional cultivated plant. The explanation for this may be the fact that the Europeans first employed cooks from among the Batanga /Tanga/, one of the coastal peoples. Macabo is more important to them than taro, and their word akabe (plural, makabe) became macabo among the Europeans. Generally speaking, there is little to say about macabo cultivation among the Pangwe. They simply let it grow in the old places between the plantains around the village, just as it was left by departing predecessors. There it stands today -- reverting to the wild state -- and anyone can take as much as he likes. When the Pangwe settle a new region, however, they too plant macabo in the village and occasionally cultivate it. Two species of macabo are distinguished: the green mfü'm ekábe (mfü'm, "white, bright"), whose tubers are white; and a second, mfǔ ekábe (mfǔ, "dark"), whose leafstalks are a dark reddish color and whose tubers are likewise reddish. The white species is indisputably the better one. The dark species is not suited for the preparation of the macabo biscuits that are popular among the Europeans.

Taro, on the other hand, is cultivated, and since, as is well known, it thrives on moist soil, it is planted in the vicinity of swamps or in places with an abundance of water, more rarely near houses, and usually together with macabo. Taro farms are generally not large. There are three species of taro:

1. mfü'm atí: leafstalks green, underside of the leaf smooth;
2. atíde III (from a dzá, "to fill": this species bears so many little tubers that they fill a whole plate): leafstalks bluish, underside of the leaf smooth; /102/

244 3. uwŭnŏŏle III: leafstalk blotch, underside of leaf along each side of the ribs has dark green lichenous excrescences.

Taro is planted twice, in the long and short rainy seasons, and it is harvested twice, in the following long and short dry seasons. All the tubers are removed from the soil, and the farm is thus harvested completely. If any tubers are forgotten, they are picked up during the next dry season, but that is the end; there are never more than two harvests from the same sowing. A piece of land once used for taro is never cultivated a second time since enough swampy soil
[79] is available. There are no medicines to promote the growth of taro.

The tubers and young leaves are eaten as vegetables. Furthermore, the Pangwe are familiar with the fact that insufficiently boiled tubers cause "mefŭl," that is, itching in the neck, and so forth.
[257 278] The tubers are also used as medicine for blood tumors (mvim); the resin-like secretion of the Pachylobus fraxinifolius Engl., Burseraceae (asŭ), is placed on the swelling, and over this is smeared a salve made from the parings of raw taro tubers. This is supposed to make the diseased areas become "ŭŭfgan," that is, weak or soft.

Plantain

245 The shoots of the plantain, as well as of the banana which is cultivated alongside it, are planted around the village or on farms. They thrive without care and ripen during each season of the year. The plantain (1) or Negro banana, Musa paradisiaca L. (ekŏn).

> 1. The /German/ word Plane is derived from "plantain" which in turn comes from the Spanish platano, "banana." Since the plantain is very different from the true banana, I consider the retention of the word "plantain" useful. The French call it banane-cochon.

Figure 56, which in the Pangwe region has 25 different varieties, does not, to be sure, attain the luxuriance of the banana which grows like a weed. Nevertheless, it is very productive, just the plant for a Negro.

1: Tessmann--72 E-5 (1904-1909) 1913 FH9 Fang FH9

285

Fig. 56. Plantains (Negro Bananas) and Bananas near Nkâlong (Eséwong Family)

[G4] Riddle: mɔ̄ɔ̄ŋgə e ne m' ɔ́ɔ́, ə wə̄'lə
woman she is to me there, the many

ə̄ə̄' bə̄ə̄n, bəə nɔ̄m
gives birth to children, no (without) man.

Answer: ɛkə̄'n = plantain.

That is precisely the ideal: reward without labor, fruit without effort, food which without the work of hands grows into one's mouth. In this sense the plantain, like its sister, the banana, is really the most deserving of all the cultivated plants of the name "paradisiaca." Of the banana, Musa paradisiaca var. sapientum L., there are two species: the bush banana (adzə̄ə̄, adzə̄ə̄-ɛkə̄'n); and the noble banana (etə̄t, etə̄t-ɛkə̄'n). As is apparent from /103/ /Fig. 56 appears here in the original text/ the name, even among the Pangwe the banana is regarded as a variety of plantain. The noble banana, the one we know, was introduced from the coast, according to the Pangwe. At first it was called madzə̄ə̄

245
177

[177] mentlîgen, "banana of the Whites." Later it was given the name etît, from the stem a tît, "to moan." "One" ate too much of it; "one" could not digest so much; "one" became weak; "one" could not catch anything during the hunt, which among the Fangwe is always the chief source of worry, and so forth.

I can only give a brief account at this point of the less important vegetables. The sweet potato, Ipomoea batatas L. (dîgî III), is not cultivated; it thrives like a weed in the vicinity of the villages and chokes out every other weed, so that one can speak of miniature potato fields. It is not a very popular food. Other vegetables are sown and planted either in the vicinity of the houses or on the farm. Of these vegetables we should name first Cucurbita maxima Duch. (ebîb), which belongs to the Cucurbitaceae family and of which there are four varieties. The flesh of the fruit is eaten, as is the interior of the seeds, and small unripe fruit is also added whole to the groundnut bundle. Its young leaves are cut into small pieces and eaten as vegetables. The skin of the fruit cannot be removed, otherwise one would be wounded in battle. The men must avoid the [131] seeds if they do not want to lose their virility the /104/ following night; hence it is regarded as taciturn if the women serve the fruit with the seeds to the men at mealtime.

Of the Malvaceae and the Tiliaceae, Hibiscus and Corchorus (tîgî III - fruit, estîtîm) are planted. The name is derived from a tîk, "weak," for the leaves are cooked in a short time on the fire; the fruit is called estîtam from a tîbî etîm, "to stand alone," for they stand alone at the tip of the stalk when the leaves are withered or have been picked off. Both fruit and leaves are eaten. The following varieties are distinguished: Hibiscus moschatus Roxb. (nia tîge - true hibiscus); and the Tiliaceae Corchorus olitorius L. (ngîbelîmo IV). The name esîb includes three plants of different families, namely, Hibiscus sabdariffa L. (engîm-esîb), the Polygonaceae Rumex abessynicus Jacq. (ebîbî-dî-es), and the Melastomataceae Dîmorfa decumbens (P. B.) Triaq. (esîbî-bongîn-b'oyek).

All these plants are sown, and their leaves are eaten.

Other cultivated plants are the following.

244 From the family of the Solanaceae there are: Solanum melongena L. var. inermе Hiern. (ə̌ə̌ʼn); Solanum dinklagei U.D. (ɔ̌ɔ̌ʼla); Solanum lycopersicum L. (ə̌ə̌ʼnə̌ʼngan = ə̌ə̌ʼn, that is, Solanum melongena, of the Whites). The fruit of these three varieties of Solanum is eaten. Furthermore, there is Solanum aethiopicum L. (ə̌ʼm IV, ə̌ə̌ʼm) with three varieties: nil ə̌ʼm = true ə̌ʼm, ntəma I, and nləə̌ʼ -ə̌ʼm, as well as Solanum macrocarpum L. var. thonningii (ə̌ə̌ʼ -ə̌ʼm from ə̌ə̌ʼ - Solanum duplosinuatum U.D., because of the similarity of the fruit). The leaves of the latter two species are eaten. From the family of the Amaranthaceae there are: Celosia argentea L. (ə̌ʼm e mə̌ə̌ʼ, that is, ə̌ʼm of the Mwele); Celosia laxa Schum. et Thonn. (ə̌ə̌ʼm [?], əbə̌ʼnə̌ʼgə̌n); Amaranthus paniculatus L. (ə̌ə̌ʼm IV, ə̌ʼm IV). From the family of the Labiatae there are: Ocimum basilicum L. (əə̌ʼm); Ocimum gratissimum L. (ə̌ə̌ʼn); Plectranthus spec. (ə̌ə̌ʼ), afən; and Aeolanthus edlingeri Gürke (əə̌ʼlə̌ʼnge, Nsom; əə̌ʼngəə̌ʼnge, Fang).

II. Livestock

231 For reasons which I shall mention in a moment, the Pangwe keep domestic animals, but this is not the kind of economic activity that could be called stock farming. The four-footed domestic animals include dogs, goats, and sheep; as for fowl, there are hens and, recently introduced, ducks.

[262] The dog (mgə̌ IV) is kept basically for hunting. It is also eaten, a practice which is especially popular among the Jaunde. In the eyes /105/ of the European this dog is no more than a caricature, a repulsive travesty of a real dog. A glance into their false eyes suffices to make one hate the animals. Usually they are covered with sores; they are thieving and treacherous, disobedient, cowardly, and at the same time quarrelsome. In these characteristics they frequently strike the observer as comparable to their masters. I was struck by their not very highly developed sexual urge, in contrast to European dogs. The Pangwe values his dog all the more highly because of its great usefulness on the hunting drive. Good hunting dogs are very difficult to obtain from their owners and are worth as much

231/435

231 [435] as medium-sized female goats and sheep (14 marks or 200 spears).
231 552 Just as among us, the dogs have their own names which are taken from the list of human names or else allude in jocular fashion to the characteristics of the animals. Frequently, indeed, these swine-snouted curs are given a first name and a patronymic, just like people, or since for obvious reasons it is at times difficult to establish the paternity of the dog, it is given a first name and its mother's name, thus, akut-e-mban.

Among human names applied to dogs I was able to discover the following: ndŏŏo (a very ancient man's name; see pages 68 and 69); asŏn (umbrella tree, man's name); mvŏŏŋ (Satan's ape, Colobus anthracinus Lecomte); ondŏ' (?, man's name); mŏŏe-ahŏ (single otter, woman's name); mfu'me'ŏk (the white of the elephant, that is ivory; woman's name); mbŏ'ŏ (ivory, woman's name).

Other dogs' names are: obŏ'nŏ (from obŏn = bead, one adorned with beads, perhaps also a woman's name); ollŏ'n (the tree Rinorea dentata [P. Beauv.] O. Ktze.); ebŏ'menŏŏ (one who always lies on the bed); ajŏ'ŏk (a ŏ' = to yearn, ŏk = elephant; in other words the one who yearns for elephant meat); anŏ'n (dog's bell); odzŏ'm (dwarf lemur, Hemigalago, because the dog bounds through the bushes like the dwarf lemurs in the trees); akŏ' (the stupid one).

231 Goats and sheep, which the Fang put together under the name
556 kabad, are kept as an investment, as pets, and only in third place as livestock for slaughter. While the economic life is otherwise considered from the viewpoint of "food," this strikingly recedes completely into the background concerning domestic animals where the main point is the joy of possession. We thus have real "savings," the purpose of which is to store up bride money. This has its familiar consequences: thriftiness carried to the point of avarice; a piece of [442] meat allowed only on very rare occasions; and no distaste for the enjoyment of animals that have died.

231 The goats (ekŏ'le) are just as unpleasant as the dogs because of their annoying habit of making a hullabaloo at night and because of other indecent and repulsive characteristics. The only domestic animal that we find congenial is the sheep (nŏma I), Figure 57, but here, too, the bad example of the goats frequently spoils good manners. They "specialize" in producing, especially at night, /106/ /Fig. 57

231

Fig. 57. Sheep, Village of Makonanfam (Ojek Family).

appear here in the original text/ a moan similar to that made by a human being. This moaning is so nerve-racking that it may bring tears to one's eyes. In regions where there are leopards, [417] pens (Fig. 58) are built of logs, and the goats and sheep are driven into them at night.

232 In the Pangwe region castration is practiced only on goats, not sheep; a tŭ̂b miak – to hollow out (the scrotum) (in order) to geld. Goats are castrated "so that they will become enormous and put on much fat." The procedure is very crude. The ex- [304] pert, who frequently circumcises the children at the same time, opens the young animals' scrotum by means of two lateral cuts with a razor blade (okóógŏn) and takes out the testicles. The scrotum is then washed out with warm water several times a day for four days. The water is mixed with a medicine, the sap of [278] the Guttifera Haronga paniculata Pers. (Loid.) (atŭ̂ih), pre- [124] sumably to glue the scrotum together (the tree sweats a sticky yellow sap under the bark, and this is extracted by putting pieces of bark in water).

Fig. 58. Pen for Sheep and Goats in Mendim (Nkong Family). South Cameroons.

This favorable influence on the physical development of the animal increases its value from about 14 marks to 35 marks (500 spean), a capital increase which is certainly desirable to the Fang-e. Even greater, however, is his joy at the beautiful appearance of the castrated animals. /107/ /Fig. 58 appears here in the original text./ The effect of castration is the basis for the comparison between symbolically, not physically, castrated people (see Section 18, "Sexual Life") and the castrated goats and also for designation by the same name; these people -- up to a certain point in time, at least -- are supposed to undergo conspicuous mental development. The fact that the flesh of animals also improves as food through castration plays only a secondary role.

Magnificent old specimens, including uncastrated goats and sheep, sometimes receive a human name, and their owner would never sell such an animal; indeed, he would not even give it away as a marriage portion.

Of other domestic animals there is only the cat (pfd's IV Fang, esf'nÄ), very recently introduced from the coast.

235 As regards poultry, only the hen (bub IV) is native. Only its
242 meat, not the eggs, is used for food, and even that rarely and on special occasions. At the proper place I shall return to the significance of the hen in the religious conceptions of the natives.

235 For the hens, small pens of logs are constructed behind the
417 house. In addition, baskets are hung for them on the outside and inside walls of the house where they can brood. Finally, the brood hen is /108/ not refused a resting place in the house on some unused bed if she should consider it the safest and most suitable place for herself and her chicks. A hole at the bottom of the wall serves as an exit for the hen's family.

235 During the 1880's and 1890's ducks with a red band around
177 the eyes were introduced. Around 1890 they arrived in the Fang region and were called ełŋ (wild duck = ełŋ'); later they were called ełŋ' III.

231 Like other primitive peoples, the Pangwe cannot be called animal lovers. Except for parrots, one sees practically no tamed forest animals, not even monkeys. The Pangwe "tire" (a ŷŋ) of looking after and feeding them, and under such circumstances one cannot blame the freedom-loving quadrupeds and birds for seeking to escape or lying down to die. Gray parrots, which immediately introduce themselves to every stranger by their name, for instance, as eskʌ'skʌ' = kite, are quite common. They usually find their food on the garbage heaps or among the leftovers in the house. Now and then one sees wild boars that were caught when young. Once I was brought a young leopard which a woman had tried to keep alive by feeding it from her breast; the animal badly scratched the helpful woman, and she quickly abandoned her voluntary maternal role.

231 The bee, Apis mellifica L. var. adansoni (myúfůh IV, bʌ̄ʌ' IV
222 Fang), is not kept, but wild honey (wʌ̄ʌ' : plural, mʌ̄ʌ'), which for the most part is to be found in tree trunks, is gathered and consumed raw.

III. Fishing

226 West Africa is one of the areas of the world richest in fish.
136 Hence, the numerous rivers and streams of the Pangwe region possess great quantities of different kinds of fish. Some of the most

1: Tessmann--79 E-S (1904-1909) 1913 F119 Fang FH9

256 outstanding and most typical representatives of the fish world of
136 the Campo-Uelle region are shown on Plate 9. Here the family of the sheatfish (Siluridae) is especially abundantly represented. Of these fish we should mention: Eutropius longuelensis Blgr. (ohi̇da Fang, hi̇da IV Ntum; young = ami̇b); the spiny-finned sheatfish, Auchenoglanis balayi (Sauv.) var. gravoti Pellegr., that is the catfish of the Pangwe, mi̇ I (I); Clarias submarginatus Pzn.

> 1. mi̇ I, the civet cat Genetta, because the fish is spotted in exactly the same way.

(mvá' IV Fang, mvá' IV Ntum); and Clarias walkeri Gthr. (mó' IV), as well as a new Synodontis species, Synodontis tessmanni Papph. (ohi̇'), and a new Clariallabes species, Clariallabes longicaudatus Papph. (ndi̇ge I, ndi̇ge III). Furthermore, species were gathered from the genera Doumea, Parauchenoglanis, and Atopochilus. Of the Mormyridae the following should be mentioned: Gnathonemus moorii (Gthr.), ani̇'n, which is to be found everywhere and is notable because of its peculiar /109/ tail fin equipped with an electrically charged organ; and, secondly, Marcusenius sphekodes (Sauv.), ondi̇'m I. Both of these are smaller species and of no importance for the Pangwe. Of the family of the Characinidae, the following are especially noteworthy: Sarcodaces odoë (Bl.), mó I); Distichodus hypostomatus Pellegr., mbi̇ I; and the newly discovered Alestes tessmanni Papph. (ohi̇da Fang, hi̇da IV Ntum). From the family of the Cyprinidae there are species of Barbus, such as Barbus guirali Thomin (mvá III, endzi̇'ma mvá), and the new Barbus malacanthus Papph., as well as several species of the genus Barilius. In addition, I have collected species from the families Cyprinodontidae, Anabantidae, Cichlidae, and Mastacembelidae, which I shall not describe in detail here.

22/ 50/ The wealth of fish in the larger streams is exploited to a relatively minor degree because the Pangwe feel themselves too unsafe with their ill-made rafts on the many rapids. Moreover, the small number of dugouts, which must also handle the traffic at river crossings, is insufficient for a satisfactory exploitation of the abundance of fish, as well as totally unsuited for a regular fishing industry

226 industry. To these considerations should be added the seclusion of the villages and poor communication facilities. The hydrographic conditions in themselves bring about considerable differentiation even in a fairly small area. In Yaoundé /Ger., Jaunde/, for instance, fishing does not play the large role that it does in the south; the Bawa (a group of the Jaunde), for example, are familiar with only four methods of catching fish aside from fish driving, namely, with basket weirs, using long baskets (mɔ̌ʋ I) and ordinary baskets (nkɔ̌ʋ̌ I), poisoning fish (ngʌ̌m IV), and angling.

To describe the various forms that the fishing industry takes in the different regions would lead me too far afield. Hence, in order to give a general picture of the fishing industry, I shall discuss only the various procedures with which I became acquainted among the central Pangwe in the river region of the Campo with its left tributaries, the Uelle in its central nose, and above all its tributaries, the Bimfille, Abea, etc. The best months for catching fish in these regions are September to February, when the water level in the rivers begins to go down; during the remaining period there is only angling or here and there a basket is set.

[462] Fishing is men's work, with the sole exception of fish driving which is a task for women. The methods are as follows.

1. Fish driving, a ʌ̌ʌ̌k (verb)

In shallow brooks or streams the water is driven downstream by means of flat baskets, the so-called bush plates (dʌ̌ʌ̌ʋ), /110/ after transverse dams of stones or twigs have first been set up at some distance. These prevent the fish from escaping. Then the women fish from the pools that remain with a small-meshed, shallow net [463] tied to a stalk from the plant Scitaminea Trachyphrynium violaceum Radl. (nkɔ̌monkɔ̌mo) that has been bent double. Like the bush plate, this net is actually a piece of kitchen equipment, used to wash cassava.

The catch consists of only little fish, a few fingers or at most a few spans long, a variety of snails, some species of shrimp (1),

1. In the main, species of Palaemon

226 macrobrachyum Herklots (nwǒ i) and
Caridina togoensis Hilgd. (nlǒ IV).

the larvae of dragon flies, and other kinds of lower animals. The total catch, however, is pretty large. Everything is eaten, and fishing is one of the women's chief enjoyments. Accordingly, time and time again one will see all the women of a village, from the oldest grandmother down to the smallest girl, wandering into the forest where they know of a suitable stream, and there they will splash around to their heart's content until late into the night. Frequently the entire company will not return to the village until the first owl causes the silent forest to resound with its eerie call. Then they come tramping home with their rich booty which can scarcely be contained in the women's long baskets (nkun). At a fish drive the women build fiɩ (Fang, pfiɩ (Ntum), or ebǐ̄ɩa, that is, piles of stones, little pieces of branches, or the like thrown into the water close to the bank, under which the fish gather. At the next fish drive they dam off the brook above and below this place and then catch the fish with no trouble at all after the water has run off.

226 476 The Jaunde use this method also in large streams and rivers that are not too deep. They do not construct any dams, however; instead, the fish are driven into shallow inlets or onto flooded forest ground. Of course it must be remembered that such fish drives can be carried out only by the concerted efforts of a number of people. Hence, the chief calls together the women from the neighborhood, goes with them to the place where they want to fish, and stations them in their places. In exchange, he receives a certain share; each woman must give him half of her catch, and an uneven number is rounded off upwards.

2. Fish driving (abǔɩǎ)

226

This corresponds to the procedure of the Jaunde just described, but it takes place only at night and without damming the water in larger rivers.

226
157

3. Children's angling (ngɛ̄k IV)

Ntum and Fang boys catch small fish with tackle made of porcupine quills. The quills are broken off near the top and are held together in the form of a hook by means /111/ of the firm root fibers of the Araceæ Rhectophyllum mirabile N.E. Brown (ndɛ̄ IV, kɛ̄s IV).

227

4. Fishing tackle (nlɔ̄b I)

The Jaunde know tackle similar to ours, consisting of a line, pole, hook, and floater, and according to information provided by my Jaunde, it was in use even before the Whites arrived. The tackle of the Fang and Ntum (Fig. 59) is considerably different; the hook is held down on the river bottom by means of a stone fastened to the line. In former times they also had a floater but more recently this has for the most part been given up as useless. With the line in his hand, the angler crouches on a raft or canoe that lies hidden in the bushes by the bank. Worms are used everywhere for bait.

5. Rope tackle or hanging tackle (ekɛ̄le nlɔ̄b, elɩ̄h nlɔ̄b

This differs from the tackle just mentioned only in that the line is attached to a liana rope stretched across the river. It hangs in the water, held in place by the stone which acts as a sinker.

226

6. Spearing and shooting

The Pangwe spears larger fish from the river bank or from a tree trunk lying in the water, or he shoots them with a gun or a crossbow. By the way of a postscript I shall also mention the fact that in shallow water fish are killed with the cutlass.

CONTINUED
ON
NEXT FICHE

7. Fish poison (ngŭm IV)

276 278 Catching fish by poisoning the water is a practice that is universal throughout the Pangwe region, but it is not done frequently because suitable places are not found everywhere. Such places are basins or inlets closed off by rocks, where the stream flows slowly. The Distichodus hypostomatus Pellegr. /Fig. 59 appears here in the original text/ (mbŭń), Plate 9, finds a habitat especially to its liking between the rocks in these basins and inlets, and it is caught there chiefly by poisoning. The name is derived from an herb (ngŭm) which is supposed to occur in the Jaunde region and is used there for killing fish. Subsequently, the name became a general word for all fish poisons. In the south the following plants are used as poisons.

1. Husks of the Leguminosae Pachyelasma tessmannii Harms (makō'ō III which gives off a terrible stench like that of waste water. /112/
2. Fruit of a Rubiacea (oyŏ'), commonly used with 1 above.
3. Leaves and stalks of the Passifloraceae Ophiocaulon cissampeloides Hook. f. and Adenia lobata (Jacq.) Engl. (their name in common, undŭndŭ or ŭndŏndŏle a ndžik).
4. Leaves of Duvernonia extensa (T. And.) Lieb., Acanthacea (ngŭnekiă,ī'-nya-zăm IV) (1)

[227]

Fig. 59. Fishing Line.

1. The Acanthacea Lankesteria elegans (P.B.) T. And. (ngŭnekiă,ī' IV) also seems to be poisonous for fish. According to information given by the Negroes,

226
278

the leaves are rubbed to a power on rocks lying in the water; the fish (probably stupefied) then come to the surface and are killed with the cutlass.

rubbed into small pieces until foam forms; ordinarily used with 3 above.

5. Pieces of bark of the Piptadenia africana Hook. f., Leguminosae (tŭm IV).
6. Pieces of bark of the Rinorea dentata (P. B.) O. Ktze., Violaceae (olŭ̀h), commonly used with 5 above.
7. Husks of the Leguminosae Tetrapleura thonningii Hook. f. (agbwā′ III, esisē′i) (2), rubbed to a powder.

2. Incidentally, these give off a lovely scent, like that of hot rolls, and in this respect they are just the opposite of Pachyelasma.

8. Leaves of the Leguminosae Tephrosia vogelii Hook. f. (ndăwōlō III) (3), rubbed to a powder.

3. From the stem a wŏlŏ, "to murder"; compare wŏle (Uelle), "the murderer."

7. Fish weir (olă′m)

227

The greatest and most productive installation for catching fish, also the most complicated, is the fish weir (Fig. 60). It blocks the river crosswise and consists of three parts: the main weir (a), and two lateral weirs (b). These are walls made of logs or sticks placed close together, between which leaves or sheets of bark (main weir) are fastened. /Fig. 60 appears here in the original text./ Holes are cut out along the bottom of the lateral weirs, and baskets are placed in them. Just below the surface of the water the main weir extends into from one to four triangular screens (c) which are placed toward the current, slanting from the bottom

227 upwards in such a fashion that their tips just protrude above the water.

It goes without saying that such weirs can be built only when the water level is lowest. As soon as the water in the river rises, it carries many fish with it and /113/ drives those which are not caught in the baskets of the lateral weirs onto the screens where they often remain in large numbers and are simply picked up by the Negroes. They are reached by a special bridge built out from the bank or by climbing along the edge of the lateral weir.

227 423 This kind of fish weir occurs everywhere except in the north. Usually the chief induces a number of people to construct such a weir; these people then have the sole right of ownership to the fish weir and the fish. They do give their relatives and acquaintances, probably for nothing, a part of their catch, either from a sense of solidarity or because they expect that in similar circumstances they will be provided for in the same way. On the other hand they [425] demand payment from strangers, the amount depending on the size

Fig. 60. Diagram of a Fish Weir in the Abea: (a) main weir, (b) lateral weirs, (c) screens of the main weir, (d) a tree growing on the bank and bent over the water.

of the fish, one or two spears (seven or 14 pfennigs) apiece. The major part of the catch is consumed immediately; the rest is dried. Since fish spoil quickly in the tropics, only a very few leave [251 435] the place where they are caught; another reason for this is that the uncertain conditions in the Fang area prevent regular trade (1).

1. There are no markets at all.

227 285 In addition to the contrivance just described, consisting of main and lateral weirs, one also encounters lateral weirs used by themselves

227 285 as independent "basket weirs." They provide a less abundant catch, but on the other hand they are not restricted to a certain water level and for that reason give a regular supply. Three different kinds of basket are used in this kind of weir:

8. nkǒ,ḗ I = ordinary baskets,

9. ayǎ′ = short fish baskets (Fig. 61),

10. nsǒ,ń I = long fish baskets (Fig. 62),

and usually two such kinds are used together.

227 226 In smaller rivers or streams, such as the Miemie, a tributary of the Kje, nsǒ,ń and ayǎ′ are laid, and in large rivers, a larger form of the ayǎ′ and nkǒ,ḗ. These two types of baskets are always used in one weir since experience has shown that one species of fish is more readily caught in one type of basket, while another species is more readily caught in the other. Only rarely is just one type of basket, such as the nsǒ,ń, used exclusively. These long baskets, nsǒ,ṅ, which may have a diameter up to 30 centimeters, are used with special frequency among the Jaunde, but also occur in the south. Usually from three to four baskets are placed in one weir, say, two ayǎ′ and two nsǒ,ń (Fig. 63). At the same time it should be noted that the long baskets, nsǒ,ṅ, lie with the opening towards the source, while the ayǎ′ (like the nkǒ,ḗ) are placed with the opening facing the river mouth, so the fish that are swimming upstream will also be caught. The weir that consists of ayǎ′ and nsǒ,ń is designed for the following /114/ /Figs. 61 and 62 appear here in the original text/ creatures: spiny-finned sheatfish (collective name, kõ′mĕšúm IV) (1); Clarias walkeri (ngõ′); Synodontis

1. kõ(s)-a-mašúm, that is, fish with spines on its back.

tessmanni Papph. (ngõ′ṅ, nwõ′ṅ I); furthermore, Marcusenius sphekodes (Saus.) (ntõtõ′m); Gnathonemus moorii (Gthr.) (anĕ′n); crawfish; common crabs; Palaemon shrimps (nwõs); etc. Finally, Clariallabes longicaudatus Papph. (ndõna I) are also caught in it.

227
285

Fig. 61. Short Fish Basket.

Fig. 62. Long fish Basket Weirs.

Fig. 63. Diagram of a Basket Weir.

227 The baskets, nkǒ.ḗ, are the same size as the baskets of the
226 same name used by the women in field work. They have a funnel through which the fish passes into the interior without being able to turn back. In these baskets mainly the following creatures are caught: Sarcodaces odoe (nsó I), Plate 9; Clarias walkeri, spiny-finned sheatfish; Xenocharax spilurus Gthr. (mfí'gǎ, mfí'nga I); Anabas pleurostigma Blgr. (awǔn); Parauchenoglanis guttatus (Lönnbg.) (ebū', evū̃s); Eutropius banguelensis Blgr. (nkǎ'de III; younger specimens = okiḗ III); and common crabs. On the other hand, they do not catch Barbus guirali Thomin. (mvǎǎ III).

11. Basket trap (ngūǎ IV)

The basket trap (Fig. 64) is a longish basket with a lid in front of the opening. The lid is pulled over the opening by means of a device set up on the river bank, following the pattern of spring traps, when a fish releases the lever system attached at the farther end of the basket. A snail is placed as bait inside the basket which is anchored to the bottom of the stream in water not too deep. This trap is principally designed to catch Clarias walkeri (ngǒ') and common crabs (kā'da).

12. Catch basket (ngǔ.děgō III)

/Fig. 63 appears here in the original text./ This is a small basket with a funnel over the opening (Fig. 65), designed for the Clarias walkeri. It is placed in a river, baited with pieces of an ant nest (called dzā'k, ndzāk IV), /115/ together with ants of the species Cremastogaster striatula Em. (esǒn, osǒn), or with pieces of tree termite nests (likewise called dzā'k).

The fish baskets, ayǎ', are placed individually in the river in the same way. These are baited with cassava (1) or with twigs (without

1. Whole roots of dried cassava (ndžāǎ mbǔn), boiled (agbwǎ.ma mbǔn) and cut into small pieces.

227
285

Fig. 65. Catch Basket for Fish.

227
226 leaves) of the Oxystigma buchholzii Harms, Leguminosae (pfū̱n IV). In this case the baskets are called ewū̱a-aya' (from a wū̱a, "to throw out"). /Fig. 64 appears here in the original text./

13. Giant fish baskets (edū̱gǎ, adū̱ǎ)

Baskets from three to four meters long and from one to two meters wide, in other words, so large that they would hold from four to five people, are lowered into deep water where they are left for four days the first time and afterwards three days in each case. The entire basket is loosely filled with twigs of the Leguminosae Millettia thonningii Bak. (onĕmežok), the Impatiens dichroa Hook. f. (eję̂s), and especially the Euphorbiacea Cleistanthus angolensis M. Arg. (ngbǎ́de I); all are plants whose slime or leaves are eaten by the fish. Further, the baskets are filled with the leafy stalks of the cardamom, Aframomum albo-violaceum K. Sch. (adžŏm), or of the related Scitaminea Renealmia albo-rosea K. Sch. (adžŏm-mekūm), whose smell the fish love. Finally, also, they put into the baskets roots of the cassava and of the Euphorbiacea Uapaca guineensis Muell. Arg. (asǎ́m), around which the fish like to swim. The basket is open in front and is pulled out of the water open side first, so that the fish -- already hampered and confused by the tangle of roots and twigs -- cannot escape so readily. /Fig. 65 appears here in the original text./

14. Giant fish boxes (esĭ̱ē, bū̱u III)

Boxes are sometimes used instead of the giant baskets. These are constructed of bark and are from three to four meters long, a meter and a half tall. Aside from their shape, they are distinguished from the baskets by a lid which is open in the water and is pulled shut when the box is drawn out of the water.

The giant fish boxes and baskets are not easy to construct or to manipulate, and for this reason they are not often seen.

226
227

15. Fish ditches (mvēǐ IV., mvě)

Perpendicular to the direction of the river, a ditch (Fig. 66) is dug out and closed off from the river by a wall of bark (a) with a trap door in the middle. The ditch is furnished with bait, nests of the above-mentioned species of ants (c). Across the ditch a foot bridge is constructed (b). After the door has been left open for a number of days, it is closed one night from the foot bridge, and the fish are then taken from the ditch with a net. Again, the fish are chiefly Clarias walkeri and secondarily Marcusenius (ntotom). This method of catching fish is practiced only in the southern region.

Round fishing nets that are thrown and spread out like parachutes as they sink into the water, such as are used everywhere along the coast, are unknown to the Pangwe. The small round net which the women use for washing the cassava as well as for catching fish has already been mentioned. There remains to be discussed only one more fishing device.

16. Net trap (olǎń)

This is a combination of a net with a scaffolding. The scaffolding is shown from the rear in Figure 67. It consists of three individual parts: the front gallows (a) with two cross beams (d); the back gallows (b) with the supporting lath (c); and the center piece. The latter is composed of the net hoop (f), the net attached to it (in the illustration it has not yet been fastened on), and three long raffia stalks fastened at (x): one free (g); and two others (e) which are tied to the net hoop at y and z and rest on top of the crossbeam (c). A person sitting on the front gallows can manipulate the net with the stick (g); by this means he can lower the net (Fig. 68) or, if it is not needed, he can raise it, push it between the poles (d), and then place it (g) back on c (Fig. 69). The scaffolding is erected in a stream in such fashion that the net will lie on the bottom. The stream itself is dammed off on both sides so the fish are driven into the net by the current. They are unable to escape from the net's sharply pointed bag /117/ (see Fig. 69). The net is called etǐtǎne. For obvious reasons, only smaller fish are caught in the net trap which, if only because of its shape, cannot be called exceedingly practical.

226
227

/Fig. 66 appears here in the original text. /

IV. Trapping

224
[462]

After agriculture and fishing, the third most important economic activity is trapping which is exclusively carried out by the male part of the population. The various traps constructed by the Pangwe can be classified as follows:

A. Traps into which the prey falls
   1. Pitfalls (ebēi, ndǎn I)

B. Traps which work by dropping a beam, a plate, or a piece of iron
   2. Spring traps (ekūidí)
   3. Spring plates (akui)
   4. Spear trap (elǔn)

C. Traps that consist of a draw noose
   5. Simple noose (asǐma, etc.)
   6. Draw traps (olǎ'm)
      (a) Ground draw traps (olǎ'm) (1)

      1. Not to be confused with the alǎ'm (fish weir).

      (b) Tree draw trap (nkpwǎs I)
      (c) Lemur trap (mbǔn I)
   7. Francolin trap (ndǒn IV)
   8. Bow traps (ekīe'le)

D. Traps that sound an alarm
   9. Civet cat trap (nlǐn I)

224

1. Pitfalls (ebēi, ndǎn I)

The simplest kind of trap, the pit, is to be found throughout the entire region. Everywhere along the paths through the forest there are narrow, rectangular pits, many of which are three meters deep. They are so close to the path that at times they can be a source of danger -- carefully covered as they are -- to pedestrians who are not paying close attention. Near the bottom they become so narrow that a person falling into them remains hanging wedged between the walls halfway /118/ /Fig. 67 appears here in the original text/ and cannot get out again by himself. Pits having pointed [726] posts at the bottom are not for wild animals; they are used only in war. The pits are usually constructed by two people, the owners, of whom one digs while the other carries away the dirt. The person [834 who has done the digging may not have any sexual intercourse for 831] five days after this work, for the pit is a hole like the female sex organ; thus, if he were to defile himself through sexual intercourse with a woman, he would not catch anything in the pit.

2. Spring traps (ekūidí)

The Pangwe distinguish seven types of spring traps, that is to say, traps in which the animal is killed either by a tree trunk suspended over a passage and released by means of a trigger device or by a freely balanced, weighted plate, raised above the ground.

A. True spring traps for wild animals
   1. ekūidi-osǎb or osǎb
   2. ekūidi-esōdō
   3. ekūidi-nkɔ̄k
   4. alǔna-ekūidi
B. Rat spring traps
   5. ekūidi-o-si
   6. ekūidi-o-job
C. Spring plates
   7. akūi

/119/ /Figs. 68 and 69 appear here in the original text./

Fig. 67. Framework of a Net Trap for Fish.

Figs. 68 and 69. Fishing with a Net attached to Scaffolding.

224 The most profitable and hence most frequently used spring trap for wild animals is the osab, which is set up in conjunction with a game fence. It is illustrated in Figure 70, Drawings 1 and 2. The fence frequently extends through the whole wooded area, usually along the paths. It has various openings and consists of sticks driven into the ground side by side. The sticks are either placed very close together or at longer intervals, and then they 224 are intertwined with leaves of Sarcophrynium velutinum (okiaikui), raffia palm, or swamp palm. As a result, the majority of smaller animals have to run along the fence and can find no way out other than through these openings. At these points the actual traps are constructed. A corridor is erected at right angles to the fence by driving into the ground two rows of sticks (i) closely adjoining each other. The end one or one of the end ones (in the illustration the one on the left-hand side) is forked at the top. Inside the corridor a tree trunk (g) is placed in such a way that one end lies on the ground and the other end -- weighted by other trunks (h) -- is held suspended by a lever (e) resting on the forked stick (k). In turn, the lever (e) is held by a trigger device which is a uniform feature of all trap and draw springs and hence will be described here once and for all. The device consists of a trap spring (a) planted in the ground at either end and a vice (b) which is pressed against the trap spring by means of a small piece of wood (c), the clamp. This releasing device is connected with the lever by means of a string (d) tied to the clamp. The string is fastened to the free (left-hand) arm of the lever and thus holds up the tree trunk, which is tied to the other arm of the lever. The vice (b) extends through the fence poles into the corridor where it is covered by leaves placed over sticks that have been bent in the shape of a gable.

Now, when an animal enters the corridor and steps on the vice, the latter is pressed down and thereby the clamp is released, so that the left arm of the lever flies up and the tree trunk falls down.

In spite of the great amount of work involved in constructing the long fence, this spring trap is usually not made jointly by all inhabitants of a village, but -- like the fish weir -- by two men.

224 The trap catches the following animals in particular: the hamster rat, Cricetomys dissimilis Rochebrune (kui); the porcupine, Atherura africana Gray (ngúm); squirrels; the duikerbok, Cephalophus melanorheus (ogbwŭ,n); in the vicinity of water, the dwarf musk deer, Hyemoschus aquaticus Ogilby. (viŏn; plural, lŏn); a number of bird species that live on the ground, such as doves, guinea fowl, francolins (Francolinus squamatus Cass.; ogbwǎ'), thrushes (Turdus saturatus Cab.; etĭtŏ'), and night rails, Himantornis /121/ /Fig. 70 appears here in the original text/ haematopus (Tem.) Hartl. (nkū'lungū'), whose striking call is associated with the spring trap (1). Finally, monitor lizards are also trapped in these divices now and again.

1. The rail calls:

ma kbwŏl' ekūi,d'
I fall (in the) spring trap,

o sī, – kū,
right in, it falls shut (imitation of sound.).

or:
ma kbwŏl' ekūidi ma kūi.
I fall in the trap -- I escape.

The ekŭidi-esō'dō differs from the osă,b only in that there is no fence, and hence it is necessary to attach bait. In it are placed /122/ bananas for lemurs and spotted palm civets, dead rats for the genet, fruit of the Tiliacea Desplatsia dewevrei Burset (fruit = ngŏk IV) for hamster rats and porcupines, and cassava for the latter as well as for squirrels and field mice.

A similar trap is constructed next to fallen tree trunks (nkō̱k) where game trails run beside them. Such a trap is then called ekūidi-nkō̱k. Here of course there is no bait.

The aluna-ekūidi (Fig. 70, Drawing 3) is a combination of two spring traps. A small quadrangular area is fenced in, with the exception of two openings, where the traps are placed in such a manner that one trap opens at the front and the other one at the back.

224

Fig. 70. Spring Traps

Drawings 1 and 2. Spring trap for game, osab, front view and groundplan. Drawing 3. Double spring trap, aluṅa-ekūidi, groundplan. Drawing 4. Rat spring trap, ekūidi-o-si, groundplan. Drawing 4a. Releasing device.

224 In the center of this area fruit of the Guttifera, nsǎ'ngǒmǒ III, is placed as bait. The animals, hamster rats, porcupines, striped squirrels, and mice, see the fruit through the fencing, look for an entrance, and land in the traps.

The rat trap, ekǖidi-o-si (o si, "below"), is also a spring trap, like the osą̌b, and is constructed from the outside against the rat holes at the corners of houses (Fig. 70, Drawings 4 and 4a). Bait is tied to the tip of the vice which extends into the corridor, as Drawing 4a indicates; when the rat gnaws on the bait, the vice is pushed out from under the clamp, and the trap closes.

While the spring traps that we have discussed so far are all very similar, we now come to a trap, the ekǖidi-o-jō'b (o jō'b, "above"), which from the outside looks quite different although it belongs to the same type. For we have here -- see Figure 71, Drawings 1 and 2 -- a combination of two lever systems which together support a spring beam and which are set up some distance above the ground. A raffia stalk, split in two lengthwise with the flat side (x) upward, is tied to the house wall either horizontally or vertically and fastened to it so that it extends into the room. Along its upper edge are placed two rows of raffia leafstalk strips (i), which represent the fence of the other spring traps, flanked by two forked props (k) on the side toward the interior of the house. The levers (e) rest on these forked props. Only one lever is held by the clamp whose releasing device is attached on the side to the raffia stick (see Drawing 2). The free end of the other lever is placed under the first. Both levers support a spring beam (g) which, therefore, in contrast to the other spring traps, is balanced over the corridor in such a way that the rat has access from both sides. This spring beam is pulled down by a beam (h) which is attached to it on either side by strings and suspended below the raffia stalk; this happens when the clamp device is released. Bait is attached to the device as in the case of the ekǖidi-o-si. Usually /123/ /Fig. 71 appears here in the original text/ the trap is left standing awhile before the trigger device is installed, and cassava is sprinkled along the corridor so the rats will become accustomed to running over the trap. For the same reason it is not used for a time after it has caught a number of rats (1). /124/

1. The technical expressions of the

224

Fig. 71. Rat Trap, ekŭidi-o-job.
Drawing 1. Side view. Drawing 2. Front view.

Pangwe for the various parts of the spring traps are:

(a) trap spring = ekŭ'leyǎ Ntum, ekuluga Fang, from a kulu = to bend;

(b) vice = mvō'negan Fang, from mvō'negan = the younger, that is, the trap spring is the older because it is the first that one has to plant in the ground and only then comes the vice;

(c) clamp = asŭń, from asŭń = the tooth;

(d) clamp string = nkō-asŭń, from nkō = string, asŭń = tooth, clamp;

(e) lever = mbī'meyǎ I Fang, from a bīme = to strike, to close, also called mbō'n I;

(f) spring beam string = nkō-ekŭidi, from nkō = string, ekŭidi = spring trap;

(g) spring beam = mvō'k IV;

(h) weight beam = etsī'dega Fang, tsī'deja IV Ntum, from a tsīde = press down, weight down;

224

(i) spring beam fence = nzǎbega
Fang, sǎbejǎ IV Ntum, from
a sǎb = to string together;
(k) lever prop = ata[k]-ekūidi, from
atak = forked stick;
(l) trap fence = ndsibega-osǎb, from
a dsīb = to shut, osǎb = fence
spring trap;
(m) bridge in the corridor = akǎn, from
akǎn = floor;
(n) corridor = abōk, from abōk = lair.

3. Spring plates

The spring plate, akui, is a very simple trap. Instead of the corridor and the spring beams, it has only a raised plate (nka-akui) weighted down with lumps of lime or stones. The plate is made of rattan palm, Ancistrophyllum acutiflorum (nhāne), and falls down on the animals (smaller rodents) when they touch the vice which extends under the plate and is baited (cassava).

4. Spear trap (elǔn)

The spear trap is constructed for elephants in those places where the elephant spoor runs between two suitable trees. The trap consists of a heavy iron spear connected directly with the clamp by means of a rope and hanging over a branch in such a way that it strikes the elephant in the back of the neck when the latter touches the rope which is stretched out as an extension of the vice. Usually, the spear does not wound the elephant mortally; then the animal runs and frequently evades the trapper.

5. Simple noose snares

The following noose snares are distinguished.

1. Free noose
   (a) Ground noose (ašīmǎ-o-sī)
   (b) Tree noose (ašīmǎ-o-jo'b)

223 2. Hand noose or draw noose (nsŭm)

The ground noose, (ašima-o-si) (o-si = below), Figure 72, is set especially on the trails of the dwarf buck, Neotragus batesi Winton (odžŭle). It is fastened to a cross beam (a) resting on two well-concealed forked props (b). Other victims of the ground noose are gallinaceous birds (guinea fowl, francolins) and the night rail (Himantornis).

With great skill a whole number of noose snares are set in trees whose fruit is a popular food of birds, especially the Afzelia africana Smith (ovŏn). Such snares are called ašima-o-jō'b (o jō'b = above) and draw tight by themselves. Hornbills and the blue touraco, Corythaeola cristata Vieill. (kŭ'nŭk IV) are the main victims of this trap. Now and then a long-tailed monkey is also caught in it. /125/

The hand noose for parrots (nsŭm I), which is made of rattan string, is quite different from the previous two snares. It consists of a loop around a branch to which one end is tied while the other end extends down to the ground where a man holds on to it and pulls as soon as an animal sticks its head through the loop. The parrot is pressed against the branch and /Fig. 72 appears here in the original text/ can be seized. This parrot noose is especially used in the dense foliage of the Myrianthus trees (mangă'me III Fang, engŭkō'm Ntum, Jaunde), which are perfectly suited for hiding and whose fruit is favored by parrots. Catching parrots is mainly [85] an occupation for boys, but adults also amuse themselves at it.

6. Draw traps

(a) Ground draw traps

224

The Pangwe distinguish no less than nine types of these, namely, the following.

I. Traps constructed over a pit

1. ešima
2. nsō bō I Ntum, nsō k Fang, nsō bogō Fang
3. ngă'[k] -olăm

224

II. Traps without pits

4. ndǎkiē, III
5. olǎme-zē̂
6. viē̃n Fang
7. olame-nsǐ ń
8. efūga, apfū,ǎ
9. ewuǎ,s

Fig. 72. Ground Noose, asima-o-si.

All these ground draw traps, just like the tree draw trap and the lemur trap, are distinguished by the fact that a short elastic stalk planted in the ground, the draw stick (miāge Fang), is held fast by the clamp, and as soon as it is released, it draws the noose tight as it springs up. The ground draw traps are, generally speaking, designed for larger game, like antelope, and differ from one another by slight variations in form and construction, by the presence or absence of a covered pit, which makes it more difficult for the animal to free itself, and so forth. The first three forms, eśūma, nsṓbo, and ngǎ́[k] -olǎm, are closely related; each of them has a pit. /126/ /Fig. 74 appears here in the original, also Fig. 73/. As an example, we shall describe here in greater detail the eśūma (Fig. 73). It consists of a strong, elastic stalk (f), to the top of which are attached a clamp (c) -- by means of a rope (d) -- and a noose (g), which in the case of these large traps is made of twisted raffia piassava. The clamp holds fast the draw stick, which is bent down when the trap is set up, by means of the releasing device already familiar from the spring traps (in the illustration it is attached on the side). The noose is set in front of the pit between the props (k) and is connected by a rope (h) to the trap spring which in many cases is double. Then sticks are laid across the pit onto the vice. The entire apparatus, especially the pit with the sticks and the part of the noose which is lying on the ground, is carefully covered up with dry leaves, etc. Furthermore,

224

Fig. 74. Antelope Trap, nsobogo.

Fig. 73. Antelope Trap, esuma.

a special dry leaf is tied over the end of the draw stick at the point where the clamp rope and noose are attached to it. In short, the entire trap is skillfully made as invisible as possible to the game. Now, if an animal steps on the leaves, the sticks (e) press down the vice (b), the clamp (c) snaps up, and the draw stick with the noose, which tightens, springs up as far as the rope (h) permits. The trapped animal is thereby pressed against the trap stick and asphyxiated, especially since it is left hanging halfway down in the pit. Depending on its strength, the trap is suited for antelopes, boars, small leopards (Felis servalina Puch., ebǐó), civet cats, and genets.

The nsǒ'bogō (Fig. 74) differs from the above-mentioned trap only in that the noose is tied to the clamp rope near the clamp and is made to run under /127/ a prop (h), but moreover it is placed directly on the ground. For this reason, the animal is usually caught by its front legs in this kind of a trap.

The ngǎ'[k] -olam is -- so one might say -- a small nsǒ'bogo designed only for porcupines, and it is set by boys when they want to obtain quills for their little fishing hooks (ngǎ'k);

224 hence, its name. In it, however, duikerbok and guinea fowl are also caught.

We encounter another method of releasing the spring in the draw traps called ndakiē (Fig. 75) and the potamogale trap, olame-zē (Fig. 76). In these traps, the animal -- as in the spear trap for elephants -- pushes against a string which constitutes an extension of the vice (ndakiē), or it pushes against the vice itself (olǎme zê). In place of the trap string, a gallows is frequently erected, as in Figure 75. The name ndakiē' signifies an iron house, i.e., a very firm house (ndǎ = house, ekiēi = iron); at the same time, the use of the name varies, and in some regions it is extended to similar traps, such as the viē'n, for example. The olǎme zê is designed solely for the peculiar potamogale (zê) Potamogale velox Du Chaillu. From the drawing (Fig. 76) the mode of construction will doubtless be apparent even without a description. /Figs. 75, 76 and 77 appear here in the original text./ A noteworthy feature, however, is the use made of the potamogale's characteristic habit of leaving its droppings at quite specific points along the river bank. These areas are surrounded by a semicircular fence (e), while the noose and the extension of the vice behind it close off the open side.

The trap viē'n (Fig. 77) is distinguished from the previous ones by the fact that the animal has to walk under the releasing device which is set up in the form of a tall gallows. As it walks through, it touches the string which is stretched from the /128/ /Fig. 78 appears here in the original text/ middle of the vice (at the top) to a post stuck in the ground (e) and in so doing releases the clamp device. In the case of this trap the ropes (h) again prevent the noose from springing all the way back. As regards the animals to be trapped, the viē'n is exactly like the eǎuma, the nsōbogo, and the ndakie; this doubtless explains why the name ndakie can be extended to these "antelope traps."

The olame-nsǐ'n (Fig. 78) is constructed on the model of the viē'n, except that it is always set up on a small rise of ground which is hollowed out under it. On the floor of the little hollow a rat is placed as bait. The noose is lowered into the hollow through a hole in the top, along with the rope attached to the vice and tied around the rat.

224

Fig. 75. Antelope Trap, ndakie.

Fig. 76. Potamogale Trap, olam e ze.

Fig. 77. Draw Trap for Antelopes, vien.

224 The olame-nsǐ'n, as the name indicates (nsǐ'n = genet), is used above all for catching the genet, Genetta aubryana Pucheran, whose skin is a popular ornament. In addition, it serves to catch the spotted palm civet Nandinia binotata Reinwardt (mvā i'), the linsang Poiana poensis Waterhouse (ojǎn), and the civet Viverra civetta (žöę'). The place is made familiar to the animal by putting rats first in front and then inside the hollow, if the animal's cave itself cannot be used.

Finally we have to mention two smaller draw traps for field mice and birds, respectively. These are the efǔga and ewuǎs, where the noose is placed around the trap spring (a) with the help of a stick (i), so that the animal is jammed against the trap spring (see Fig. 79. The efǔga is designed for mice and other small rodents and, like the potamogale trap is set up in front of a fenced-in area with bait (cassava) inside. Furthermore, this trap is used to get rid of the troublesome Dryotriorchis batesi Sharpe (ngbǎwuǎ III Ntum) which steals chickens. "When the bird has caught a chicken and then drops it again as people rush toward it, the trap is quickly set up and the hen placed inside it; then the robber frequently comes back to get the hen and in the process gets caught in the trap." /129/

223 Fig. 78. Genet Trap, olam e nsin.

The bird trap ewuǎs (wuǎs = an imitation of the sound of the noose snapping shut), Figure 79, is constructed in exactly the same way, except that it lacks a fence and is designed for doves, guinea fowl, francolins, and night rails. /Fig. 79 appears here in the original text. /

223

Fig. 79. Gressor Trap, ẽwuas.

(b) Tree draw trap

The most frequently used trap for smaller birds is the tree draw trap, nkpwą̌s (nkpwą̌s = an imitation of the sound of a trap slamming shut or of the hand seizing the prey); Figure 80. It is set up in trees, and hence the trap spring (a) is tied to a twig (x). A novelty here is the fact that what is usually the free end of the vice, the extension (as we have called it), is clamped inside the fork of a holding pin (i) (ntẽbe-oš̄ū III, from a tebe = to stand, oš̄ū = before; thus, projection). Another innovation is the arrangement of the noose which is made [283 824] from two ropes of the stalks of the Sarcophrynium velutinum K. Sch. (okiaikui; stalk = ndẽnan). The two ropes are tied together at one end and fastened to a twig which takes the place of the draw stick (f); then a string (h) is slung around the branch (x) and tied loosely to the noose (g) (in y) so that it can be moved along it. The ends of the sling are now laid around the extension of the vice; the bait is tied on it at z, and the trap is ready. The bird that sits down on the vice at z

223

Fig. 80. Bird Draw Trap, nkpwas.

pushes it out from under the clamp; then the noose tightens, and the bird is held fast with its feet at y. Thus, it is usually caught alive.

[857] This bird trap is set up mainly by boys, since it brings in only smaller birds. As bait for honey suckers (Nectariniidae), they use, in addition to the blossoms of the Canna bidentata Bertol. (ekonežok), those of the Aframomum hanburyi K. Sch. (obǎ'[s]-adžom; blossoms = atsǎ[k]) and also of other Scitamineae. For weaver birds, Ploceus cucullatus (St. Müll.) (ngā'á), Spermospiza guttata Vieill. (kū-o-si), Spermestes poensis Fras., and Estrilda varieties (edžǒ'le), they use grasses like Panicum sulcatum Aubl. (ekǫk) and /130/ /Fig. 80 appears here in the original text/ Panicum ovalifolium Poir. (obūtebedzǒ'le); for species of Andropadus (otǭk) and other Haarvögel /Ger., ?/, like Phyllastrephus leucopleurus Cass. (ngǭ'medźā') and the bulbul Pycnonotus gabonensis Sharpe (nkō'gělū'n), they use pepper Capsicum (okǎlǎn) and Heckeria subpeltata (Wild.) Kunth. (abǭ'medzǎ'n). Among other birds caught in the tree draw traps we should mention: barbets (Capitonidae), for example, Gymnobucco bonapartei Verr. Hartl. (ovǭ Ntum), Buccanodon duchaillui Cass. (eji'le), Barbatula species (omvǭg), and Trachylaemus purpuratus Verr. (ekū'kū'). Furthermore, in addition to the above-mentioned

223 Haarvögel /Ger.,?/, there are the Ixonotus guttatus Verr. (esǎ́sa, Fang, edžǎndžǎ Ntum); the doves, Chalcopelia afra L. (odū́) and Turtur semitorquatus Rüpp. (žūm); glossy starlings, species of Lamprocolius (kpǎ́ū); and hornbills, Lophocerus fasciatus Shaw. (okǒgbwā́i) and camurus Cass. (nkūkūe I, Ntum). The bait for all these birds is the fruit of the Euphorbiacea Alchornea cordifolia Muell. Arg. (abúi Ntum, abuí Fang), the Guttifera Haronga paniculata (Pers.) Lodd. (atüí), the Euphorbiaceae Antidesma laciniatum Muell. Arg. (okǒbezǒ) and Hasskarlia didymostemon Baill. (efüö́le), the Ficus preussii Warb. and laurentii Warb., and other types of Ficus (etōb-o-jōb Fang, ejḗi, Ntum). One can see traps set up everywhere in the Alchornea bushes or in clearings where the above-mentioned trees grow. If a boy takes a lot of trouble and watches over his trap, he can catch up to ten birds a day in one trap. He takes the prey home to his mother who keeps the larger birds, such as the doves, and lets the children have the smaller ones. /131/ /Fig. 81 appears here in the original text./

(c) Lemur trap

224 A very ingenious and well-contrived trap is the lemur trap, mbū́n I, ebǎ́s I (from bū = to lie, mbuh = cross beam, that is, a beam that lies on top of another), so named because the trap is set up against a trunk laid over a clearing (Fig. 81). It (Fig. 82) is a genuine draw trap, with the draw stick (f), the clamp (c) and the clamp rope (d), and two nooses (g) attached to the draw stick. The device attached to the horizontal trunk (x), however, requires explanation. It consists of a piece of raffia leafstalk, one end of which is planted in the ground and the other end split and pushed under the branch in such a manner that the latter rests in the crack. As Drawing 2 shows, both halves are later tied together (y). Above the stem each of the two forked ends is cut in such a way as to form five prongs (Fig. 82, 1-5) of which the middle one (3) is left considerably longer than the others. Both center prongs (see Drawing 2) are connected with each other by a stick and thus form the gallows

224

[291]

Fig. 81. Lemur Trap.

for the clamping device. Transverse sticks (n) are squeezed between the upper ends of the prongs and firmly tied down. The releasing device (Drawing 2, z) is then tied to the rope (y); this device is a network connecting (y) with the vice (b). The arrangement of the trap can be seen in Drawing 2. The clamp (c) goes around behind the gallows (a) and clamps in front between (a) and the vice; then a noose in each case passes in front between the cross sticks n 1 and n 2 and in the back between n 3 and n 4 (see Drawing 1) and is placed in the opening. A considerable amount of dry leaves covers up the trap. The animal climbs over the branch /132/ /Fig. 82 appears here in the original text/ in order to get from one side of the clearing to the other and lands in the trap which often works so well that the animal is seized by both nooses at once and pressed with great force against the little sticks.

This trap is set up primarily for nocturnal lemurs (1) and for

1. Potto, Perodicticus batesi

224

Fig. 82. Lemur Trap.
Drawing 1: Side view. Drawing 2. Front view.

Winton (awu'n); Arctocebus aureus Winton (masatši'di I and III); Spitznagelmaki /Ed., sharp-clawed lemur?/ Euoticus elegantulus Leconte (nsē'i, I); Stumpfnagelmaki /Ed., blunt-clawed lemur?/ Sciurucheirus gabonensis Gray (emǎm); and dwarf lemur Hemigalago demidoffi Fischer (ozǎm, odžǎm).

the spotted palm civet, Nandinia binotata Reinw. (mvā'l' Fang, mvē'i' Ntum) in a somewhat open area, for instance, a strip of

224 bushes along the trail where the animals go through them. A breach is made in the strip of brush and over it is placed the branch needed for the construction of the trap. Usually from three to seven traps are set up next to each other.

In addition, large traps of the same kind are used for long-tailed monkeys, and these are likewise set up in the forest only over paths or clearings.

7. Francolin trap

223 The francolin trap, ndǒn (Fig. 83), like the traps of the previous class, includes a draw stick, but the clamping device is a completely different type. The part of the trap on the ground is nothing more than a round, not very deep hole; in the wall of the hole and over against each other are stuck two horizontal raffia sticks (a) under which is pushed the clamp (c) with the noose rope (2)

2. In this case the same rope that is tied around the clamp is again used.

directly attached to it, like the trap nsǭbogō. The noose is laid around the hole. A few kernels of maize /133/ or groundnuts are scattered as bait around and in the hole. The francolin sticks its head into the hole and in so doing touches the clamp which flies up and at the same time draws the noose over the bird's head. Aside from the field francolin, Francolinus squamatus Cass. (ogbwǎ'), doves also are caught in this trap which is as simple as it is effective. /Fig. 83 appears here in the original text./

In passing I may mention that chickens, if they cannot be seized, are also caught by means of such a trap, erected ad hoc, or by a leaf bag in which a kernel of maize is placed. To get at the maize, the chicken puts its head inside the bag and is caught before it can free itself (1).

223 224 1. Aside from those mentioned in connection with the spring trap, the technical expressions for the parts of the

Fig. 83. Francolin Trap, ndon.

223
224

draw traps are as follows:
(a) Trap spring = trap gallows (see under spring traps);
(b) Vice (see under spring traps);
(c) Clamp (see under spring traps);
(d) Clamp rope (see under spring traps);
(e) Clamp-stick poles or clamp-stick rope = ndā'nejǎ IV, ndē'mejǎ' IV;
(f) Draw stick = miâge Fang, mēē,jǎ III Ntum;
(g) Noose = ekǒ'ē, Ntum, ekbwē, Fang, nkīb I;
(h) Noose holder = mbē'le-ekbwē, Fang;
(i) Noose prop = sū'ǎ-ekǒ'e, Ntum;
(k) Peg = engǒn;
(l) Fenced-in area (with efuga, and so forth) = ndzī,b I, from a dzī,b = to close.

For the lemur trap:
224
(m) Trap stick = atǎk;
(n) Cross sticks = olī Ntum, evê Fang;

224

(o) Bait.

For the tree draw trap:
Branch on which the trap is built = obǒmega;
(b) Clamp stick with its extension = otɛ̌mejá;
(i) Clamp-stick holder = ntɛ̌be-osū III;
(d) and (c) Clamp rope with clamp = okōlejǎ.

8. Bow traps

They have a form of the bow which draws a noose tight as it springs back. There are three kinds of such traps: /134/

1. ekiɛ̄́le;
2. bǒgǒ III;
3. bow trap of the Jaunde, ebāʉē.

The ekiɛ̄́le is the most widely known of these traps (Fig. 84, Drawing 1). The bow (b) is tied to a horizontal piece of liana or to a branch (a); two ropes are fastened to the lower end of the bow at (c), the clamp rope (d) with the clamp (e) and the noose rope which is tied in a slip knot to the other arm of the bow at (h). The clamp (e) presses a short vice (f) against the upper end of the bow and the clamp rope, and thus the bow is held up. On the lower end of the bow cassava is placed as bait, and a leaf bag is put over the whole thing. Additional cassava placed upon the liana is designed to familiarize the animal with the path leading up to the trap. If then an animal runs from there through the loop, it will touch the vice, the bow will be released, and this loop will be pulled tight. The trap is set up mainly in the forest for mice and other small rodents, and otherwise it is used in the house to catch rats.

The second bow trap of the Fang, bǒgǒ, is used for the same animals (Fig. 84, Drawing 2, a-c). It is even simpler than the ekiɛ̄́le. A leaf bag (b) is attached to one end of the bow; the ropes (c) and (d), which are tied to the other end of the bow, are run through this bag at various points. The foremost rope (b) is

224 placed as a noose around the opening of the bag; the back rope (c), which is supposed to bend the bow, is run through the hole drilled in the end of the bow for this purpose and is secured in back by means of a knot. Behind this rope -- if one looks from the front into the bag -- there is a piece of cassava (e) attached to a little stick. The animal gnaws through the rope in order to get at the bait; the bow springs back, and the noose is drawn tight so that the rat is pressed against the upper part of the solid leaf bag and strangled.

A very attractive and skillful invention is the bow trap of the Jaunde, ebǎ́dě (Fig. 84, Drawing 3). It is basically different from the previous traps mentioned. Here we see the clamp rope (b) attached to a bent strip of raffia (a) like a bowstring. As in the case of the francolin trap, the clamp rope is fastened with a knot in the middle of the clamp (c) and then extends beyond that into the noose. The latter ends in a knot to which is tied, in turn, the holding rope (e), which is slung around the bow. When the trap is set up, the tip of the clamp is pushed under the knot, while on the other side it is prevented from slipping back by means of a second holding rope (f) and by the pressure on the inside of the bow. As soon as a rat runs through the noose, the latter is pulled down slightly, the tip of the clamp slides out from under the /135/ /Fig. 84 appears here in the original text/ knot as well as from under the holding rope (f), and the noose draws tight around the rat.

The trap is set up in the house behind the beds or in other places where the rats like to run.

9. Civet trap (nlíne-žǒ́ǝ́)

The traveler in the Pangwe region will frequently encounter in the villages a rope stretched across the square. From the middle of this rope hangs a wooden dog bell or a bundle of empty snail shells. This is not, as one might think, a charm against evil spirits or a signaling device, but an alarm trap for civets, Viverra civetta poortmannii Pucher. (žǒ́ǝ́ IV). At one end the rope is tied to an isolated pole; at the other it is fastened to a tree stump behind the owner's house. Suspended from it just a little above the ground is

224

Fig. 84. Bow Traps

Drawing 1. ekiele. Drawing 2. bogo (a, the entire trap; b, side view of the lower part; c, the same from the front). Drawing 3. Bow trap, ebade.

/136/ a number of dead rats. When at night the civet snatches at a rat and in so doing pulls at the rope, the bell rings or the snail shells rattle and awakens the master of the house.

V. Hunting

Skillful as the Pangwe are as trappers they cut a poor figure when it comes to skill as hunters. They can never be called a hunting people; indeed, compared with the coastal peoples or even with the Pygmies, they are like pitiful Sunday hunters.

224 Only where there is great profit to be had, namely, in the hunting of elephants, do they take more trouble and hence achieve results
[411] that are notable in view of the simplicity of their hunting weapons (flintlock with pieces of iron or a spear, Figure 85, as ammunition). For the rest, the Pangwe do not accomplish much even with better hunting rifles. For example, of the many Fang hunters equipped with modern rifles whom I had in my service in the course of three years, only one ever shot an antelope. Later, on the other hand, a Pygmy shot five antelopes in one week, and on one occasion two were shot in one day. The beautiful crown eagle, Lophoaetus
[136] occipitalis Daud. (abǎ'jěk), and many other animals which because of their shy nature require a real huntsman were never laid low by my gentlemen hunters. Usually too easygoing to go into the forest alone, they love to carry on a loud, uninhibited conversation and laugh gaily on a hunting expedition, which of course soon gives them away to the game. Not just once, but many times it happened that my hunting companions, at the sight of the game that I was plainly observing, shouted with a voice that could be heard far and wide: "e ne nie!" = "he be him!" there he is!). Even today I still recall with amusement how my faithful Ajong Boka roused an unsuspecting long-tailed monkey -- I was just waiting for it to move into a position where I could get a better shot at it -- with a shout: "Massa, osok, osok!" (osok = red-tailed monkey), and how the frightened animal raced off in mad leaps.

Completely unaffected as the Pangwe are by principles of sportsmanship, their lack of success in hunting is of course the fault of the rifle or -- the woman (see Section 18, "Sexual Life"). Innumerable hunting and rifle medicines, to which I shall return in Section 13, force themselves upon us in confusing abundance. In addition to the major medicines (malǎn, aṅguṅgu) /Fig. 85 appears here in the original text/ associated with cult activities and carried out by the entire village, /137/ I have recorded about 100 minor medicines intended to put the individual man back on his "hunter's feet."

Among the various forms of the hunt to be discussed here, the lowest, the hunting drive, which after all entails nothing more than chasing the prey into traps, is the most highly developed. We must distinguish:

224 1. Drive of lower animals into baskets;

2. Drive of big game into nets.

In the drive for lower game living in caves, especially porcu-
285 pines (ngǔm), elongated baskets (nkǒ,e'-ngǔm) made of the stalks
824] of the Sarcophrynium velutinum K. Sch. (okiaikui) are used (Fig. 86, Drawing 1). The baskets are placed at the various exits of the cave; at one of them the hunter stations himself and either sends a dog into the passage or beats the ground with a stick. The frightened animal flees to one of the remaining exits and lands in the basket where it gets stuck and, because of its quills, is unable to retreat rapidly. A man then rushes to the spot and kills the animal with his spear.

A second kind of basket, but correspondingly narrower (Fig. 86, Drawing 2), is placed outside ratholes. The animals are chased into the basket in a regular drive in which the entire youth of the village takes part, and there they are killed. These baskets are called nsǎn.

These rat drives, carried out with a great hullabaloo, are for the young what the drive of wild animals (nšǔ,m I, abim) is for the adults. Game nets, frequently 16 meters long, are attached to one another and set up at suitable places in the bush to form what are often very extensive snares. The beaters chase the animals into these nets with the help of dogs that
[534] carry wooden bells (nkōle-mvū I, mvū,ṅo IV, angǔ,ṅ e mvū, edū,ṅ e mvū, ongō,lǎ'-mvū, ekbwēle), Figure 87, around their necks. The animals get tangled up in the meshes and are shot by the hunters stationed there. It should be added that this drive is a great undertaking and a general popular festivity, the details of which, however, I must forbear to describe. I shall only observe that in this manner a considerable number of antelopes and other game are caught, and
[441] the Pangwe deserve commendation for carrying out this undertaking with splendid success, since it is indeed not an easy job in the rough and impassable forest region. Even the driving of elephants into large

Fig. 85. Elephant Spear (fired from a rifle).

224
285

Fig. 86. Basket Traps.

224 fenced-in areas is not unknown to the Fang and is supposed to have been practiced more frequently in former times when the region was more abundant in these pachyderms.

The distribution of meat from the animals caught on the drives is regulated. If a huntsman, for instance, kills a wild animal in such a way that it dies on the spot, /138/ /Fig. 86 appears here in the original text/ he must give the meat of one forefoot to the first of his companions who appears on the scene. On the other hand, if the animal runs on, the first comer can lay claim to the entire forefoot, the second to the shoulder pieces (abá') (1) of one

1. From the stem bǎ, "to divide"; these pieces are usually divided first because the animal falls down to the ground (which, after all, is also common property) with its shoulders first.

side, the third to the outside of the shank (ebú'n). Finally, the one who carries off the animal can claim the neck bones with some flesh (ebǒǒ) (2).

[482]

2. For he also carries the animal around his neck (placed over his shoulders); abǒ(g)e, bǒǒ = to carry.

224 In view of the excitable and stormy character of the Pangwe,
672 it is no wonder that many of them on such a hunting expedition,
682 where the coveted, delectable tit (tit, "flesh" and "game") jumps

224 out from the bushes everywhere, completely lose their heads and
672 start shooting blindly at anything that moves. On such occasions
682 it very frequently happens that a wild Nimrod shoots a hunting companion or a beater. Hunting accidents are the order of the day and make the unfortunate huntsman responsible to the family of the person killed. In order to mitigate the situation, one excuses himself by hiding behind the belief that some "evil" people or sorcerers can transform themselves into antelopes and, weary of living, let themselves be shot in this way in order, even at the end, to place their enemy in an embarrassing position. The hunter declares that this was actually the case at the moment of shooting, that he saw an antelope, fired at it, and that then a person was lying there; he therefore is not guilty. This excuse is of little help to him in the matter since the victim's way of acting by no means releases the unlucky person from the obligation of paying blood money in the amount required for the person he has killed or wounded. Nonetheless, it does reduce his guilt.

224 Individual animals are also driven into the nets when the dog finds their fresh trail. The animal's location is determined by closing in on it in a circle (a kiñ e tit), and with the help of the remaining villagers it is chased into the net. /139/

On a solitary hunting expedition (elõ ñá), the Pangwe -- as was mentioned in the beginning -- more or less break down. There is no special word for "hunter"; nyũ a ngá III "he who fires a flintlock," has to substitute for it. On the other hand, nsũ me III is one who "catches" animals and fish. Only a negligible number of the enormous quantity of animals to be hunted in this forested land is killed without the help of traps, nets, and beaters. Of larger animals killed without such help -- aside from elephants -- the most common are boars and leopards (1) because of their value. In former

[435]

1. Formerly a leopard was worth as much as a woman.

times buffaloes, found only along the large rivers (the Campo, etc.), were also hunted, and the hide was used for the well-known shields. Since the latter have become worthless with the introduction of the

224

flintlock, this motive for hunting buffaloes has disappeared, and the chase is too dangerous to hunt them only for the meat. The hunting of gorillas and chimpanzees is just as unprofitable, and with very few exceptions the people are unacquainted with hunting as pure sport. The Pangwe find it too difficult and onerous to stalk antelopes without fixed nets. Long-tailed monkeys, squirrels, and smaller birds are shot with the crossbow. Hunting long-tailed monkeys is an undertaking filled with variety, not too difficult -- even though many of the monkeys have very sharp eyes and ears -- and profitable (2).

Fig. 87. Dog Bell.

2. The monkeys are lured by blowing on a perforated fruit, the monkey lure (elǒ́ń, elǒ́ɛ̃), Figure 88, b; birds are lured with an instrument like a reed pipe, Figure 88, a, called zǒle IV, zǒ.

I consider it a mistake to assume that the crossbow is an imitation of European models. How would a Negro hit upon the idea of transforming the model to such an extent and furthermore, as is done by the Bassá along the Sanaga, of continuing the front end into a shaft-like extension and at times putting on it a genuine spear head with a socket? I incline to the notion that the natives combined spear and bow and in this way independently created a new weapon. Finally, it is impossible to prove, except for the last decades of the nineteenth century, that any European influence 411 177

411
177 at all penetrated as far as the Pangwe from the west coast of Africa. /140/

411
824

[224
534] Fig. 88. Lure Pipes: (a) for monkeys (instrument like a reed pipe); (b) for birds (drilled seed)

The crossbow (mbǎn I), Figure 89, consists of two parts, the shaft (ngpwǎ(s)-mbǎn) (1) and the bow (endźiá-mbǎn) (2)

1. For the shaft the wood of the following three Anonaceae are preferred: Mesocarpidium lepidotum Engl. and Diels (amvǐm); Xylopia striata Engl. (mvǔ'ma IV); and Hexalobus salicifolius Engl. (mepfǎ'ne III).

2. For the bow, because of their strong wood, the following are used: (1) Olax tessmannii Engl., Icacinaceae (elǒ'm); (2) Sapindaceae, Pancovia pedicellaris Radlk. and Gilg and Placodiscus opacus Radlk. (zǒk); (3) Violaceae Rinorea longisepala Engl. (zǒk-o-si) and R. welwitschii (Oliv.) O. Kze. (enǒ'ezǒk); (4) Rubiaceae Randia acuminata Bth. and micrantha K. Sch. (ají'ɛ); (5) Anacardiacea Trichoscypha spec. (źǒk e mekum); (6) Rubiacea Gardenia lateriflora K. Sch. (ebǎm) does not seem to be as suitable; (7) Polygalacea Carpolobia alba Don. (onǒn); (9) a Rubiacea (oyǒ'). /(8) is omitted by the author. /

411 with the bowstring. The shaft is a piece of wood between one and one and a half meters long, ovoid in cross-section. At the

411 upper end it thickens out into the shape of a duck's head and is provided with a square hole all the way through the wood for the bow. The remaining part of the shaft is divided into two leaves by a longitudinal cut down the side; of these leaves, the upper one, about a hand's breadth below the thicker end of the shaft, has a cruciform incision such that the transverse arm of the cross goes through only half the thickness of the wood and thus forms a notch, while the vertical arm of the cross goes through the entire thickness of the wood and thus forms a hole. A peg of the lower leaf, shaped to match, is fitted into this hole. The notch is designed for the bowstring. In front of it, a longitudinal groove from six to eight centimeters long is cut into the shaft; this is filled with beeswax and is where the arrow rests.

In order to draw the crossbow, one takes the shaft under his right arm, plants the knee firmly against the bow, grasps the bowstring with his hand, and draws it into the notch. In so doing, the peg, and with it the entire lower leaf, is pressed slightly downwards.

In the shooting position (Fig. 90) one raises the crossbow to shoulder level, supports it approximately in the middle with the left hand, and with the right hand presses the two shaft leaves together in the back. In this way, the peg moves into the hole and forces the bowstring out, propelling the missile with great force. /141/

/Fig. 89 appears here in the original text./

411 824 The short arrows (ebeí), Figure 89 g, which are carried in attractive quivers (kū,lǎ IV) made of animal hide (Figure 89 f) or in little bark boxes, are made of the bark of raffia leafstalks and split just before the lower end, so that /142/ /Fig. 90 appears here in the original text/ a triangular piece of leaf (ndū-mbǎn IV) from the Menispermacea Penianthus longifolius Miers. (ndū-mbǎn), more rarely from the Flacourtiacea Lindackeria dentata (Oliv.) Gilg (nǔm e ndū) (1) and, in case of extreme need, from the Sarcophrynium,

1. nǔm = man, that is, male ndū (mban).

[278] can be pushed into it to give it balance in flight. The tip is poisoned with a salve made of pulverized Strophanthus seeds (2).

2. Probably Strophanthus kombe Oliv. (enpe).

411

411
291

Fig. 90. Hunter with a Crossbow.

411 Although this weapon is much more dangerous in the hands of the natives than a muzzle loader, it is nonetheless never used in war, and even before the introduction of the rifle is not supposed to have been a military weapon. /143/

Section 6

000

Staple Foods and Indulgents

1. Staple foods. Raw materials: meat diet (human flesh, edible higher and lower animals); plant diet (wild plants with edible leaves, fruit); spices (pepper, salt and methods of obtaining it); oil;

000 arrangement of the kitchen. Kitchen and cooking implements (grindstone, grinding board, plantain peeler, basket-work plate, stirring spoons and other spoons used by the women, cooking pots). Preparation: 1) cassava (cassava rolls, cassava cutlets, boiled cassava roots, pulverized cassava boiled in a leaf bent in the shape of a stirrup, steamed cassava); 2) plantain; 3) groundnut (groundnut sauce, groundnut bundle, groundnut mush, groundnut soup); 4) ngon; 5) maize (corn on the cob, maize soup, maize bread, maize mush). Other vegetables and meat. Meals. Eating. Tableware, eating spoon and its forms.

2. Beverages and indulgents. Beverages: water, drinking vessels, water liana. Indulgents: sugarcane juice, banana wine, palm wine (distribution of the palms used for making palm wine, quality of palm wine, appearance and taste, methods of obtaining it and keeping its quality). Indulgence. Tobacco (varieties of the tobacco plant, smoking, tobacco pipes, care of the tobacco plant, treatment of the leaves).

262 One of the greatest physical pleasures for the Pangwe is to eat meat (tit; "boiled meat," nniǎ man e tit, from a niǎm, "to boil"). From man down to the smallest termite, scarcely anything seems inedible to him.

266 184 It is considered a fact that the southern Pangwe occasionally eat human flesh (Fig. 91). The Pangwe as a whole, however, cannot be called anthropophagous. Among the northern subgroups there is nowhere any report of cannibalism, and the natives maintain that even in former times cannibalism was unknown among them. Among the central Fang in Spanish Guinea and in the French region, on

266
184

[673]

the other hand, fallen enemies are consumed by some of them on exceptional occasions. The accounts have it that this form of cannibalism does not by any means for religious reasons, but rather represents an act of revenge carried to its extreme; the enemy is degraded to the level of an animal and is consumed like an animal. I have never heard it said that relatives or members of the same kin group are killed and eaten; indeed, in the eyes of the Fang this would constitute an incredible crime. Far to the south, especially toward the southeast where the Pangwe have been fundamentally modified through mixture with neighboring tribes, anthropophagy may be somewhat more

[412] Fig. 91. Spearhead Knife for cutting up a Slain Person.

[177] frequent. It is most likely, in any case, that the practice /144/ /Fig. 91 appears here in the original text/ was taken over in the first place from the eastern border tribes, especially the Njem who are notorious in this respect.

262 Thus, meat is principally supplied by animals, and here the Pangwe does not even stop at the thick skin of the elephant; he finds almost everything edible. Among mammals, only the shrew, house rat, and the dwarf squirrel Sciurus pumilio Leconte (mvūkesŏn) are not eaten. Also, the following are not eaten: among reptiles, the chameleon, the lizard Lygosoma fernandi Burt. (ebŭmekūkūī), and the Agama colonorum Daud. (ngŏdŏ III); similarly, among amphibians, the toads Bufo superciliaris Blgr. (mvŭn IV) and Bufo latifrons Blgr. (dzŭn; plural, biŭn, mŭn), as well as the frog Rana mascareniensis D. and B. (nkŏ'n I). The reasons why these animals are never eaten I shall discuss in conjunction with the general food prohibitions in Section 13 /Ed., Vol. II/.

262 The names for the various parts of the slaughtered animal (goat) can be seen in Figure 92.

Among invertebrate animals, the following are eaten: the larvae (fǒs IV) of the palm weevil Rhynchophorus phoenicis Fabr. and of the rhinoceros beetle Angosoma centaurus F. Pl. (larva = akū̂m); even the large elephant dung beetle Copris (ejā̂'ẓok, Jaunde) by the Jaunde; 21 different kinds of caterpillars, mostly Saturnidae (nkū̂ṅ I = edible caterpillar); dragonfly larvae and termites (sū̂me IV Ntum, kǎp Jaunde); common crabs and shrimp; snails, with the exception of Limacidae; and a river mussel.

Of the lower animals mentioned, the rhinoceros beetle larvae, which live in the leafstalks of the raffia palm, deserve to be noticed by Europeans. They taste very good fried and may indeed almost be regarded as a delicacy (one recalls the cossus /Ed., a kind of larvae under the bark of trees/ of the Romans!). Even the termites might be a tasty dish if the unpleasant long wings could be removed. In the Mwele region near Simekoa I saw termite nests of the variety called kǎp carefully fenced inside the plantations. As they fly out in great numbers, they are caught in baskets; some of them are eaten alive with the wings, and some of them are prepared by the women. They taste like raw eggs, and if they were baked into some kind of bread, they would not be at all bad, if it were not for the fact, as I mentioned earlier, that the wings are an undesirable accompaniment.

If the Pangwe were not so deficient in hunting skill, if they did not have a genuine horror of slaughtering their domestic animals, and if they were to set traps somewhat more industriously and regularly, /145/ they would not suffer any dearth of fresh meat in view of the abundance of game in their land, but as it is, plants chiefly make up their diet.

222 262 The cultivated vegetables have already been mentioned in the previous section. /Fig. 92 appears here in the original text./ Under ordinary circumstances wild vegetables are only a part of the regular fare, but during periods of famine or on other occasions when food has become scarce, these plants frequently serve as staples for the Pangwe.

192
262

Fig. 92. Names of the Cuts of Meat in a Slaughtered Animal:
(1) head = nlo; (2) neck = kiñ; (3) breast = ekokob; (4) lower neck = engut; (5) joint = aba; (6) blade and front leg = enam; (7) back piece = epfa-ebok; (8) rump = oduk; (9) flank = mvõbe; (10) belly = abum; (11) pieces above the genitals = ekila; (12) shank and hind leg = abo.

272 Among palms, we should mention especially the oil palm, the raffia palm, and above all Ancistrophyllum, whose innermost leaves (palm cabbage) are eaten; of Begoniaceae we should mention Begonia poggei Wrbg. (esǎn e kõ̧ě Ntum) and Begonia ciliobracteata Wrbg. (esǎ́ń e kā́ʼja); of Amaranthaceae Celosia argentea L. (num engǒ́n, num afụ́n), Celosia laxa Schum., etc. (num e fõʼlõʼm), and Pupalia lappacea L. (num e kõlõʼt); of Acanthaceae Justicia insularis T. And. (fȩ̃i), Endosiphon obliquus Clke. (num ndzȩ̃i, masǎmengǔmo III), and Pseuderanthemum nigritianum (T. And.) Radlk. (ndzȩ̃i I); of Urticaceae Urera laurentii de Willd. (mfõs I) and Fleurya aestuans (L.) Gand. (ngǔkǔ́n IV); of Euphorbiaceae Micrococca mercurialis (L.) Benth. (otȩ̌k); of Tiliaceae Corchorus olitorius L. (ngbǎbe-lõʼmo IV); of Melastomataceae Dinophora spenneroides Bth. (esǎn-eli) and Dissotis decumbens (P.B.) Tr. (osisǎn-bongõʼn-bʼojȩ̌k); of Moraceae Myrianthus arboreus P.B. (mangǎʼme III Fang, engukõʼm Ntum, Jaunde); of Araceae Rhektophyllum mirabile N.E. Brown (ndȩ̌ʼs IV, klẽs IV); of Dioscoreaceae Dioscorea prehensilis Bth. (esǎʼn); and finally, of ferns (zõʼn IV), in particular Dryopteris

222 tomentella C. Chr., Dryopteris megaphylla (Met.) C. Chr. (mejā
262 m'abǒk), Dryopteris parasitica (L.) O. Ktz. (undūndu akō), Dryopteris gongylodes (Kuhn) O. Ktz. (engǎs), Stenochlaena guineensis (Kuhn) (nkǎdenā' III), Alsophila camerunensis Diels (ezīzō'n-ošū,e), and Diplazium silvaticum (Borg.) Sw. (esē't).

245 Fruits are cultivated very little. In this category the
262 banana is the only native of any antiquity. The following have been recently introduced: the pineapple (nkōkajǎ'ń I Fang, ekańemvē'lē Ntum) (1), which is scattered over the entire territory

1. nkōk = sugar, ajǎń = Liliaceae, Cyperaceae; ekǎń sedge (from the Mwele), because of the leaves which are similar to those of the Cyperaceae.

although planted only in small numbers; the papaya Carica papaya (pō'pō' Jaunde, adžǎbentǎńgan Ntum, Fang) (2), which has scarcely

2. adžǎb – Mimusops djave (Lan.) Engl.; e ntǎńgǎn = of the Whites.

passed beyond a narrow coastal strip and whose little trees can be counted; small, bitter lemons, Citrus /146/ limonum Risso (olōs Fang, alōs Ntum, ngǒambǎ'ń IV); and oranges that are almost inedible for Europeans.

Coconut palms (mbǎń I, njǒ,mō I, Ntum, Fang; myū'ndē' IV Jaunde) are to be found only along the coast and even there only in small numbers.

The native "bush plum," Pachylobus edulis E. Don., var. mubafo Engl., Burseracea (asǎ' Ntum, ošū,ńǎ Fang), which is found only in or near villages, may be cultivated. The attractive lilac-
[252] blue or beautiful rose-colored fruits are roasted on the fire, and the yellow, quite tasty meat of the fruit is eaten warm.

222 All the other fruits eaten by the Pangwe grow wild. Related
262 to the bush plum in shape and in the taste of its fruit is Pachylobus fraxinifolius Engl. (asē,ǎ; fruit, sēǎ IV); the fruit is prepared in the

222 same manner. The fruit of the Sapotacea Mimusops djave (Lan.)
262 Engl. (adžǎ'b; fruit, ebǒn), which contains oil, is very important. It resembles a large apple; the jelly in which the two to four seeds are imbedded is very sticky, but quite tasty. The seeds are used in the preparation of oil. Next to these, Irvingia barteri Hook. f., Simarubacea (andǒ'k; fruit, ndǒ'k IV) is of great importance. Strangely enough, the Pangwe do not value the juice of the fruit's yellow meat, which is extraordinarily fragrant and refreshing, on the condition, to be sure, that the fruit is just at the right state of ripeness. Indeed, in contrast to the coastal tribes, they attach little importance to many forest fruits (for instance, the fruit of the cardamom, of the palm Podococcus barteri, and others) and do not know how to make use of them. The nourishing contents of the
[252] kernel of the Irvingia barteri are eaten after being dried or worked into a kind of mush. The Pangwe are incapable of preparing as tasty a sauce from the fruit as that made by the Bassá; the nut bread of the Mpongwe is also unknown to them. Other important edible nuts are Coula edulis Baill., Olacinacea (ewūǒ'mō, Fang; ewūē'me, Ntum; fruit, kō'mō or kūē'me); Panda oleosa Pierre (afǎ'ne[k] ;fruit,fǎne[k] and a variety unknown to me (andō' ; fruit, ndō' IV). Very tasty and refreshing fruit is supplied by the following trees: Burseracea Pachylobus macrophyllus (Oliv.) (andŏtǒ'm Ntum, atǒ'm Fang; fruit, ndŏtǒ'm IV Ntum, tǒ'm IV Fang); Anacardiaceae Trichoscypha spec. (amyūt, fruit myūt IV; and engǫ̌ń, fruit ngǫ̌ń); the pulp of various Landolphia varieties, namely, Landolphia ochracea K. Sch. (ayǔ'm), Landolphia piriformis Stapf (dzǎ III), and two other varieties (efōfǒ'do Fang and kǒ'mo III), in which the seeds are imbedded, is somewhat sour but quite refreshing. All the remaining fruits -- insofar as I have tasted them -- have scarcely any special charm for the European; indeed some, like Laccodiscus and Pseudospondias, have a downright horrible taste and are -- as they say in West Africa -- "good for blackmen, no good for whitemen." Their names are: Parinarium tessmannii Engl., Rosaceae (efō't); Chrysophyllum tessmannii Engl., Sapotaceae (mbǎ'm I); Pachylobus tessmannii Engl., Burseraceae (nga-angǫ̌lǒngǒ'); Laccodiscus spinulosus dentatus Radlk., Sapindaceae (atū'lǔń); Pseudospondias microcarpa

222 (Rich.) Engl., Anacardiaceae (ofǒs); Pseudospondias tessmannii
262 Engl., likewise (angǒkǒn); /147/ Pentaclethra macrophylla Benth., Leguminosae (ebǎ'i); Cola acuminata (P.B.) R. Br., Sterculiaceae (abē); Carpolobia alba Don., Polygalaceae (onǒn, tōmok); Ricinodendron africanum Muell. Arg., Euphorbiaceae (ezisǎ'n); Myrianthus arboreus P.B., Moraceae (mangǎ'me III Fang, engǔkǒ'm Ntum, Jaunde); Desbordesia glaucescens Engl., Simarubaceae (alǒ'b); Duboscia macrocarpa (?) Bocq., Tiliaceae (akǎk e sǎ'n); Oncinotis glandulosa Stapf, Apocynaceae, and Tylostemon minutiflorus Stapf, Lauraceae (dzǎ-odzǐ dzǐk or bodzǎbodzǐ dzǐk); Tristemma hirtum Vent., Melastomataceae (abē-osū); Cnestis aurantiaca Gilg, Connaraceae (abǐn e ndzǐk); Vitex bipindensis Gürke, Verbenaceae (apfǒ'n); Anonidium mannii Oliv., Anonaceae (ebǒm eli); Sarcocephalus sambucinus K. Sch. (alū'mǎ, alū'ma, and akūndū m); the palm Podococcus barteri M. and W. (niamvine); as well as various varieties of Aframomum, such as the Aframomum alboviolaceum K. Sch. (adzǒm; fruit, esū n) illustrated in Volume II.

Finally, mushrooms, of which the Fang distinguish twenty edible varieties, play an important role in the household. With the exception of a foul-smelling morel which is covered with a kind of veil, poisonous ground mushrooms do not seem to occur.

263 Of spices, pepper and salt are known, and both are found in-
249 dispensable by the Pangwe for the preparation of meals. Three varieties and many subvarieties of pepper, Capsicum (okǎlǎn IV, undǔndū III), are sown behind the houses or close to the village, and it is to be found growing wild everywhere in the vicinity of human settlements, where its green fruit -- red when ripe -- is picked whenever it is needed; it is added to the food either whole or pulverized on a stone.

263 Salt is more difficult to obtain. Although salt imported from
436 Europe now floods almost the entire region and, in conjunction with
258 tobacco, constitutes a regular standard of value, in remote areas of the interior the laborious extraction of salt from swamp plants is still carried out in the old manner.

258 The two chief salt-producing plants are those illustrated by
824 Plate 10: Halopegia acurea K. Sch., Marantaceae (nkǒn I) and

258 Cyrtosperma senegalense (Schott) Engl., Araceae (ebǎngabǎnga).
824 Furthermore, the fronds of the raffia palm are used to a lesser extent. In the Fang region Halopegia and Cyrtosperma are always used together, never one exclusively; in other areas, for instance in the Ntum region, the following swamp plants are also used: the Loganiacea Anthocleista zenkeri Gilg (ají́nebe-nzǎ́m III); the Zingiberacea Renealmia alborosea K. Sch. (adžǔmmekūm); the Urticacea Boehmeria platyphylla D. Don. (sǎ́[s]-džǎ́m); the Acanthacea Brillantaisia vogeliana Bth. (ebūgebǫ́n); the Aracea Anubias heterophylla Engl. (andǎ́k); a Composita (elō[k]-ošūe); the Commelinaceae Palisota schweinfurthii C.B. Cl. (epfūpfū́i-zǎ́m) and Pollia condensata C.B.Cl. (ajǎ́n-ošūe); and in addition, where swamp plants are absent, the Marantacea Phrynium confertum (Benth.) K. Sch. (nkǒn afǎ́n I) and the climbing Aracea Rhektophyllum mirabile N.E. Brown (ndé́s). /148/

258 To get salt the men go into the swamp (zǎ́m), cut down the
462 salt-producing plants, and let them lie in the sun for a month to dry. Then they are brought under a shelter erected in the vicinity; the leaves and leafstalks are burned in an open fire. The plant ashes, dirtied with the remains of the logs, are carried into the village and kept on the loft above the fireplace in the house for three weeks to dry. The men's last job here is the making of a large
[285] funnel which they crudely plait (ngǎ́n nkū́ IV) from the stalks of the Marantacea Trachyphrynium violaceum Radlk. (nkǭmokǫ́mo I). All further work is done by the women. The latter set up the funnel, which they prop up with poles inside or outside the house, and line it with leaves of Sarcophrynium in such a way that the lowest leaf -- folded together in the form of a funnel -- fits just into the tip and the other leaves cover the funnel wall like roof tiles. The funnel is
[824] closed off below by a filter consisting of a ball of grass, Paspalum (obū́t), or leaves of the Phytolacca dodecandra C. Her. (atǒt) (1);

1. From the stem tǒ, "run through, drip through," because the brine has to drip through the herbs.

then the ashes are put inside the filter, water is poured on them, and

258 this drips fairly rapidly through the filter into a vessel placed under it. The whole thing is left standing one night; in the morning a little fresh water is added in order to draw out the last of the salt, and then the yellowish-brown brine so obtained is dried until all the salt (nkū I) is out (2). /149/

263
146

2. An examination of the salt, on which Mr. W. Lenz of the Pharmaceutical Institute of the University of Berlin gives us a report, yielded the following results: "The bush salt itself had a brown color and a moist, granular appearance. It had a strong salty taste; its solution reacted strongly alkaline. The chemical analysis carried out by Mr. Regenstein yielded the following composition:

43.33% KC1 (potassium chloride)
27.50% K_2 SO_4 (potassium sulphate)
16.26% K_2 CO_3 (potassium carbonate)
0.85% NaC1 (sodium chloride)
8.72% H_2 O (evaporation at 180° Centigrade)
3.34% insoluble (difference)
100.00%

The potassium was separated from the sodium as potassium platinic chloride. In the insoluble residue the following were detected: calcium, magnesium, iron, aluminum, manganese, phosphates, silicates, and carbonates, and 0.7% of the salt SiO_2 (silicon dioxide) was determined.

The high content of chlorides and sulphates in the bush salt is striking, as well as the use of the salt mixture consisting predominately of potassium salts, for spicing the food, in other words, its use in place of cooking salt."

262 In addition to the spices, the Pangwe use oil as an additive for their food. The oil is obtained from the oil palm Elaeis guineensis L. (alěn) and the Mimusops djave (Lan.) Engl. (adźăb), but it is extracted so rarely that its use in the kitchen is far secondary to its use for the care of the skin. For this reason I shall discuss the extraction of oil when I come to speak of skin care.

354 The kitchen of the Pangwe woman is located, as we have already seen, in the house under the suspension loft. There is no actual hearth in it; among the Mwai this is represented by three rocks, but for the rest the pot which is always without legs is placed on a potsherd or on the skillfully arranged logs of the fire. If at any time there is more than usual to be cooked, for instance, after a successful elephant hunt, the daily fireplace is too small, and a second one is built behind the house.

313 For cooking -- as every little Pangwe girl knows -- three things are necessary: wood, water, and fire. There is never any shortage of wood; every day the housewife brings the necessary logs from the plantation (Fig. 51). Water is likewise available in great quantities; 312 it merely has to be taken from the river in calabashes (ndŏk IV) or -- 415 among the Ntum and Okak -- in earthenware water flasks (Fig. 92a), Pangwe esŭ,gă (hence the name sŭ,k, an imitation of the gurgling sound made by the water as it is poured in; hence also a-šōk "waterfall"). We discussed the fire in the previous section.

412 The kitchen utensils of the woman are very simple. The grindstone (akŏk) and the little round rubbing stone (ngŏk IV) that goes 252 with it are found everywhere. The grindstone is irregularly flat, scoured smooth by the rubbing done on it, and it usually lies on the ground on which the woman kneels in front of the stone she works. Among the Mwai, who are somewhat more advanced in the art of cooking anyway, the stone is placed on four small posts like a table, a fact which considerably "raises" it in appearance. Groundnuts, ngon, and so forth are rubbed to a powder by rolling the rubbing stone back and forth on the grindstone. The same purpose is served by an almost round wooden plate which has the shape of a stemmed leaf with raised edges (evin-ndŏk, efeĭ-ndŏk); it is used for the kernels of the Irvingia barteri Hook. f. (andŏ'k; fruit, ndŏ'k IV), Figure 93; the grinder used with this plate is a hard fruit (ašŏ'k), round as a ball.

415 The Pangwe woman very tidily removes the remains of the
252 pulverized nuts or kernels from the grindstone by means of half the shoulder blade bone of some animal, such as a monkey (Fig. 94 a), a piece of raffia stalk, or a tree mushroom (Fig. 94b). Only rarely does she do this by hand.

412 For pounding cassava leaves and other vegetables, as well as
252 for removing the meat from the fruit of the oil palm, a pestle is used in a wooden trough. The pestle (ntú'm e mbǒk) has a knobby enlargement either at both ends or at only one end /150/, and the trough (mbǒk I) usually has the shape of a canoe with one or, more rarely, two handles (Fig. 95). In the Mwai and southern Fang region one can find larger wooden troughs of a quadrangular shape and small wooden troughs with or without /Fig. 92 a appears here in the original text/ handles (Fig. 96), endǒn.

Plantains are peeled with a plantain peeler (mbǒb I), Figure 97, with which the skin is chipped into pieces and scraped off. The peeler consists of a narrow piece of raffia leafstalk, and it is often attractively decorated with carved patterns.

415 The shallow basketwork plate (džǎd; plural, biǎd) -- see Section 8 -- which we have already discussed among the agricultural and fishing tools, also plays an important role in the house and kitchen, where it serves simultaneously as bowl, dish, plate, and so forth. The women have a large selection of the bigger plates (džǎd) and smaller plates (ovǒk) of this kind on hand. Sometimes one also sees wooden plates or, more accurately, wooden bowls of the same shape as the basket plates (1).

[824] 1. Made from the wood of the Alstonia congensis Engl. (ekūk), Apocynacea, or of the Ceiba pentandra (L.) Gärtn. (dum).

The kitchen spoon or stirring spoon (mbǒb I, ebǒm), which must be strictly differentiated from the eating spoon, /Figs. 93 and 94 appear here in the original text/ is carved out of wood (Fig. 98) and is used for stirring food, mixing vegetables, and dividing the mush.

/150/

415

Fig. 92 a. Clay Water Flasks.

Fig. 93. Wooden Plate for Pulverizing Irvingia Kernels.

Fig. 94. Shoulder Blade of a Monkey. (a) and a Tree Mushroom (b) for Cleaning the Grindstone.

415 The eating or serving spoons, with which the woman tastes the food during cooking and ladles it out of the pot at mealtime, are kept above the fireplace. /151/ /Fig. 95 appears here in the original text./ Such spoons have various shapes; the simplest is a Sarcophrynium leaf folded in the form of a spoon and used only once. This leaf spoon is called ntǒ́ńo I. The calabash spoon (egbwǎ́s) represents a higher stage of spoon, as does the snail spoon (ebǒ́ńa, ekǒkǒ́e), Figure 101. The calabash spoon is made from a small fruit of the calabash gourd (Fig. 99 and 100) which has been cut in half through the middle; the snail spoon is made from the [321] large Achatina marginata Sw. (kōĩ́) by cutting out a piece of its shell. These are the women's spoons for everyday use, and as such they correspond to the men's wooden eating spoon (tōk). Women never use ladling spoons made of wood.

The most important kitchen utensil is the cooking pot (mye̋ I, yĩǒk; plural, lōk) made of clay (yĩǒk), of which each woman keeps a number of larger ones (mye̋, yĩǒk) and smaller ones (obǎ́bḗ) on the pot loft (akǎ́n e mye̋). Through the trading companies, iron pots [177] with three feet (mēkǒ́ne III) have already spread throughout the land. /Fig. 96 appears here in the original text./

262 After these general preliminary /152/ observations, I shall go on to a description of the methods of preparing /Fig. 97 appears here in the original text/ the principal food plants. Those of greatest importance as staple foods will once more be listed here in order: cassava, plantain, groundnut, ngon, maize, taro, yams (1) (Fang region).

1. Smaller repetitions cannot be entirely avoided for the sake of clarity in the individual sections. The reader will be so kind as to excuse them.

1. Cassava

252 Aside from insignificant variations, the cassava root is prepared in five different ways. Two of these are chiefly women's food: pulverized cassava, cooked in a leaf roll bent into the shape of a stirrup

/153/

4/2

Fig. 95. Wooden Troughs with Pestles.

Fig. 96. Wooden Trough with Pestle.

412
531

Fig. 97. Plantain Peelers.

252 (nkŭ́ha-mbŭ̀n), and steamed cassava (amā́ ńā-mbŭ́ń), neither of them very tasty or very carefully prepared. The three remaining ways of preparing cassava are in the main designed for men, namely: cassava rolls, the so-called "kanks" (2) (ebɔbǭ), the

2. The origin of this word is not clear to me; I do not know whether it was taken from Negro languages or whether it is a European word corrupted in coastal English.

exclusive food on journeys because of their handy shape; cassava cutlets (osā-mbŭ́ń); and finally, boiled cassava roots (agbwā́ ma-mbŭ́ń). In the entire region there is uniformity in the matter of cassava dishes, with the sole exception that the stirrup-shaped leaf rolls are also now and then eaten by men among the Ntum and Fang.

Because of its strong smell, cassava -- which could perhaps replace our potato -- has no great appeal to European taste, especially in the forms in which the Negroes prepare it. The sausage-shaped cassava rolls in the north, where the roots are first placed in clean, running water, most readily please our palates, in spite of their pasty odor. To make them tasty, one has to cut them into slices in the European fashion or pulverize them, mix with an egg, and fry them in butter. The kanks in the south are very bad, because there the roots are placed in the swamp for a while prior to preparation and hence take on a quite repulsive muddy odor.

252 (a) Cassava rolls or cassava loaves (mbǒm I-mbǒm, ebǒbǒ).

These require more time to prepare, from four to five days. The roots are placed in water holes just as they come from the plantation, that is, with the rind and without being cut into pieces (with the exception of very large roots which are cut in two). /Fig. 98 appears here in the original text./ /154/ /Figs. 99, 100, and 101 appear here in the original text./ This is done in order to draw the poison out of them. Ntum and Fang women attach no importance to the kind of water in which they place the roots; indeed, they seem to prefer swampy areas, such as raffia swamps. In those places one often sees the remains of the cassava on the thoroughly muddy water and along the edge of the puddle; over [156] the remains an enormous number of butterflies floats like a cloud, especially blue and white Pieridae, varieties of Papilio, among them the large blue Zalmoxis. These holes, which have a strong odor of both mud and cassava, are valuable places of discovery for the collector. In the northern region, on the other hand, among the Jaunde, Bene, and many Bulu, cassava is not placed in the swamp but on the sandy bottom of clear, flowing streams, near the bank where the water flows more slowly. Also they take the trouble to block off a stream so that only a little water can run through. Then the roots are placed on the bottom downstream from the dam. Perhaps the reason for placing the cassava roots in clear, running [33] water in the northern region is that there are few raffia swamps in that area. The cassava has to lie in the still or very gently flowing water for a period of from three to four days, three days in the case of younger roots and four days in the case of older, strong roots. After this period the woman takes the roots out and by hand pulls off the bark together with the firmer fibrous layer underneath. This job presents no difficulties. Then she lightly washes the roots on the spot and pulls out the center rib. With both hands she presses the cassava into a ball in the water -- during this process it exudes a whitish sap -- and places the balls in a basket lined with leaves. 253 Further preparation is done in the house; there the cassava is pul- 254 verized on the grindstone, and the powder is poured on leaves which the woman picked on her return from the swamp. In the south these

Fig. 101. Snail Spoon.

are the leaves of the previously often mentioned Marantacea Sarcophrynium velutinum (Baks) K. Sch. (okiǎǐkuī, okiǎǐ) (1), Plate 11, with the species glabrius Laes. /155/ (andū́ma); in the north (Jaunde), the leaves of the Clinogyne schweinfurthiana K. Sch. (embūǒ) are used. Every day the women bring large bundles of such leaves from the field since they use them not only for wrapping cassava and maize loaves, but also as trays and plates.

1. okiǎǐ = leaf; a kūī = to envelop; stem kū. Compare kū[1], the turtle, because of its armor, and a kū-t = to knock, to open by knocking, that is, to cause something to uncover itself.

252 The mass of cassava is gently kneaded in these leaves into the shape of a sausage; then a leaf is wrapped around it and folded over at the ends like a parcel; finally, there is tied around it a string made from the stalks of the same plant which supplied the leaf cover (the stalks of the plant are called ndǎn IV, ndǎnan IV). These rolls are boiled with some water for an hour in a covered pot, and they are then put to one side to cool off. Only in rare cases are they eaten warm immediately after being cooked (Fig. 102). They keep for three days this way. Usually they are 35 centimeters long, somewhat longer in the Jaunde region, and five centimeters thick; they are in all somewhat larger in the Bulu region.

252 435 484 Throughout the region such a "kank"[1] is equal in value to a tobacco leaf (commercial tobacco) or a spoonful of salt. This is equal to a piece of spear money or seven pfennigs. They are generally used as provisions for bearers and employees of the Whites because of their convenience and availability, their unlimited supply, and their popularity with the natives.

Dried cassava rolls (engū'nǎ-mbǒm).

252 484 257 As was mentioned before, the ordinary rolls do not keep longer than three days. Hence a special procedure is used in their preparation for longer journeys or for situations when one cannot or does not want to make the rolls again and again. In this procedure, the cassava balls are placed on the drying loft for a month after they have been washed; only then are they processed, that is, pulverized on stones, wrapped in leaves, and boiled. Sometimes the balls themselves are carried along on the journey. They are softened in water when they are wanted, boiled, and consumed cold. Both kinds of cassava rolls are called engū'nǎ-mbǒń.

(b) Cassava cutlets (osā, -mbǒń, ngǒ-mbǒń IV).

252 A very bitter and at the same time poisonous species of cassava is made into cassava cutlets. For this purpose, the pieces of root are peeled with a cutlass, halved lengthwise or quartered, and boiled with one and a half liters of water for an hour in a pot lined with plantain leaves. Then the roots are taken out, cut like a loaf into slices, and hung for a day in running water inside a basket lined with leaves. After that, they are thoroughly washed on the net described under "Fishing" on page 80, and they are then eaten cold. /156/

Dried cassava cutlets (dʒǎ[s] -mbǒń).

[252] 484 These are dried after the boiling and before being hung in the water, in the same way as engū'na-mbǒń. They are used in the same situations.

[1] [i.e. cassava roll. — Analyst.]

252 (c) Boiled cassava roots (agbwǎ ma-mbǔń).

A species of our plant, one which has comparatively little poison and which for that reason does not require a long period of leaching in water, is cut to size like the above and boiled for an hour. Its very insipid and fibrous root is eaten hot.

(d) Ground cassava boiled in a leaf bent into a stirrup shape (nkǔ́nă-mbǔń I).

A strip of bark is split off from the root with the cutlass, and the interior is scraped out with a rough piece of stalk taken from [124] the trunk of the rattan palms Ancistrophyllum acutiflorum Becc.

Fig. 102. Cassava Roll.

(nkǎne) or Calamus deerratus M. et W. (edžǐn). The slivers fall onto a leaf placed underneath and are then ground on the grindstone. The pulp is then thoroughly kneaded with a stirring spoon

Fig. 103. Leaf Bent into the Shape of a Stirrup.

in a basketwork plate or wooden plate lined with a leaf. Water, which first runs over a charred piece of plantain bark in a leaf funnel, is added to it as it is kneaded. In this way, the water and thus also the cassava pulp acquire a blackish tinge, supposedly because the women do not like the white color of the cassava. The pulp /Figs. 102 and 103 appear here in the original text/ is then placed inside a rolled leaf bent into the shape of a stirrup (Fig. 103); like the cassava rolls it is set on the fire with very little water and boiled for an hour.

This dish is glutinously tough and blackish; it has an ugly appearance and a rather unpleasant taste.

(e) Steamed cassava (amā'hǎ-mbǔn).

252 Ground pulp, such as is used for cassava rolls, or boiled roots are placed between two leaves which have been tied above a pot. Macabo leaves are boiled in the pot itself, and the cassava is steamed at the same time (for an hour).

In addition to the roots, the leaves of the cassava plant (mandžāā, plural) are frequently eaten, mainly by women. The leaves are pounded thoroughly in a wooden trough (Fig. 104), placed with some water in an open pot /157/ on the fire, and left to boil for not less than three and a half hours, more water being added during the boiling. Then they are stirred while salt or pepper is added, and they are served. In this form the vegetable is called mbǎb I. Although it does not taste bad, it is nonetheless regarded as inferior food and is eaten by the men only when nothing else is available.

2. Plantain

The plantain is eaten in five different forms; for three of these forms, unripe fruit is used, and for the remaining two, ripe fruit.

(a) Plantains roasted in ashes (ngpó-ekō'n I).

An unripe, peeled plantain is wrapped in a leaf and placed next to the fire in ashes which are lightly piled on top of it. After half an hour it is ready. On the outside the plantain is a whitish yellow; inside, a dark yellow. It has a rather dry taste.

(b) Boiled plantains (mbē,ē ekō'n I).

The unripe plantains are peeled, the ribs and small particles of skin are cleaned off, and the plantains are then boiled in water for 20 minutes.

(c) Pounded plantains (ntsǐmǎ ekō'n I).

These are prepared like the previous ones, but they are eaten after being pounded to a mash.

(d) Boiled ripe plantains (mfõ,k-ekõ'n I, mfõ,-nšã I).

The skins of ripe plantains are removed with the plantain peeler and placed in a pot. On top of these is placed the fruit, whole or cut into pieces; on top of the fruit in turn are placed more skins. Then water is added to cover everything and boiled for half an hour. The plantains are eaten either whole or ground to a mash with cold water.

(e) Raw ripe plantains (nšã III).

The ripe fruit is eaten raw or roasted in ashes.

3. Groundnut

Sometimes the groundnut is eaten roasted whole (kõk IV-ewu,no, etõle-ewu,no). Otherwise it is prepared in four different ways, in part as mush. In all these forms of preparation it is first necessary to break open the groundnuts by hand (Plate 12), a task in which the entire family takes part; then the woman lightly roasts the nuts for a few minutes over the fire on the groundnut roasting board and grinds them twice on the grindstone. After the second grinding the mass is called ebǎ,[s] -ewu,no (bǎ, "to divide," hence e-bǎ -b "that which has separated off," for instance, /158/ /Fig. 104 appears here in the original text/ small pieces of bark that stand out from the tree, and e-bǎ,-s, "the scale"), because the ground material tends to stick together and falls like scales from the stone. The following dishes are prepared from this base.

(a) Groundnut sauce (esǎ,ngǎne).

Water is heated in a pot, and the hot water, except for a small amount, is poured off into a little shell. Then the pot is taken off the fire, and the groundnut substance is poured into it. The whole is thoroughly stirred with a kitchen spoon while hot water is added

252
415
516
342

Fig. 104. Ntum Woman Pounding Cassava Leaves in a Trough for Spinach.

252 three or four times, and salt is added. Everything is given another good stirring, and the dish is ready. Sometimes the material is also boiled with a little water in the pot itself.

(b) Groundnut bundle (nnǎm-ewu,no I).

As in the case of (a), water is put on the fire in a pot. After the pot has been taken off the fire, the groundnut material is poured into it and stirred up as water is added. Then the mush is put inside a plantain leaf that has been drawn through the fire to make it flexible; the leaf is tied together into a bundle and placed on the fire in a pot of cold water. The pot must be closed at the top with leaves. If the groundnuts are not stirred up with hot water, but, as in this case, are placed on the fire cold, they always have to boil from half an hour to an hour. /159/

(c) Groundnut mush (atõ,o).

The mass of groundnuts -- prepared as indicated above -- is poured into a pot of boiling water and stirred around. Then it is

252 placed on the fire for a brief period -- two minutes -- and salt is added to it.

(d) Groundnut soup (mpfiǎ̌n I-ewu no).

This differs from the foregoing only by the addition of a larger amount of water so that it becomes a soup. It is served as a gravy for meat, etc., and is never eaten by itself.

4. Ngon

Ngon is prepared in only two forms, as a bundle (nuǎ̌m ngôn) and as a soup (nšǎ̌-ngôn I). These two forms correspond to those described in connection with the groundnut.

5. Maize

Maize is eaten in four different forms. Either the entire ear is roasted (nkpǒ-fun I), or it is consumed as maize soup (nšǎ̌-fun I), as maize mush (ngbwět), and as maize bread (bǔmō III).

(a) The entire ear.

Like plantains, fresh ears are roasted in ashes.

(b) Maize soup (nšǎ̌-fun I).

The kernels are broken out of the spindles of old ears and boiled until they are soft (half an hour) in a pot half full of water. Then they are ground up and boiled for an hour with minced leaves of the cassava and the Amaranthus (endǒn-abǒ'k). When they are done, cold water is added, the whole mixture is stirred, and the soup is served.

(c) Maize bread (bǔmō III).

The kernels are removed from old ears of maize and poured into a pot of water so they will swell slightly. Then the woman spoons them out a few at a time, places them on the grindstone, and,

252 frequently pouring on water, grinds them to flour (half a basket of ears produces a heaping basketwork plate of flour from which three loaves are made). The flour in a basketwork plate lined with leaves is stirred with water to form a batter; salt, pepper, and frequently [262] also shrimp and dragonfly larvae are added. This batter, as in the case of the women's cassava nkǔ'na mbǔn, is placed in a Sarcophrynium leaf folded in the shape of a stirrup, and it is boiled for an hour in a pot with a little water. The end result is a dish which, while it is rather heavy, tastes quite good. /160/

(d) Maize mush (ngbwět).

Maize mush is made of fresh maize flour which, when boiled, makes a white pulpy soup. Since I have not closely observed its preparation, I am unable to give any details.

The remaining plants, such as taro, macabo, yams, and so forth, are not sufficiently important to be discussed in relation to the various ways of preparing them. The reader will, I think, from the information given so far, derive a clear enough picture of the multiple uses made by the Pangwe of their vegetable foodstuffs.

Meat is boiled in pots by itself -- just like fish, which, as among us, are dressed and scaled -- or it is boiled in a leaf bundle with groundnuts and ngon. As for other ways of preparation, the [267] Pangwe are familiar with roasting, but they use this method only in order to make the food keep and to preserve it.

264 Meals are quite irregular and poorly distributed:

"kikitase afǒk anū, hamoš ebań e nkǒk,
[539] In the morning a little bit for the mouth, (mid) day a loan for the jaw,

alu bepfǔm"
at night, quite full.

In the morning, soon after getting up, they usually eat a small amount of a cold cassava dish or something similar, which the women have cooked the night before since they usually have to go to the plantations early. In the course of the forenoon they content themselves with a little snack of cassava bread, bananas, and the like.

264 Then follows the warm midday meal which takes place between twelve and five o'clock, depending on when the woman returns from the plantation. The main meal, which is fairly substantial, occurs in the evening. This is not just one meal, however; the women have to cook two or three times and, indeed, even in the middle of the night in order to appease the hungry stomachs. They frequently deviate from this "rule," to be sure. If the store of provisions is ample and there is little work to do, they eat the whole day long; on the other hand, if anything comes up, they just as readily omit meals or fast an entire day.

In the main, meals consist of cassava and plantains. In addition to these, any of the other foods mentioned may be eaten, whatever is on hand.

Men and women usually eat separately. The woman takes care of herself as she is cooking and helps herself even to the men's food which is not meant for her, or she eats with her daughters and younger sons after she has sent the midday meal to her husband in the meeting house where the older boys also gather for food. /161/ On the other hand, the husband habitually goes home to take the late evening meal in the family circle, since by then it has become too cold or lonesome in the meeting house.

At all times, the Pangwe man eats quietly and with dignity, not without appreciative smacking of the lips and constant talking, however. Greedy eating (a šu̍ban a dži) seems ridiculous and un-
[577] becoming to the Pangwe and is interpreted by him as a sign of bad rearing. Many of the precepts which the father gives his son make
[867 this point, and in proverbs and fairy tales (for instance, in the nice
538] fairy tale of Bömme's gluttony, in the story of the greedy pig, and so forth) the same idea recurs.

264 Tableware is very sparse, as one would expect. In the case of
415 liquid dishes, the cooking pot, if it is small, is placed in the midst of the company straight from the fire; if it is large, its contents are poured into a smaller pot. Everyone takes his spoon and eats from the common vessel. In the evening when the man eats at home, he usually has a pot of his own placed before him. Solid foods, for instance, plantains and cassava cutlets, are served on a banana leaf, and everyone takes them by hand. It is considered more refined to

264
415 put the leaf on a basketwork plate or to serve the food on such a plate with nothing under it.

The men's spoon is made of wood (tǭk; plural, IV or, irregular, matǭk), Figure 105, and occurs in four different forms, each with two subvarieties. The first form resembles our salad spoons; it has either a circular or broad egg-shaped bowl and a flat handle which begins just below its outer surface (a-c). This first form
[177] has come from the north, perhaps from the Jaunde and Bene, among whom it is very widespread and popular, and perhaps from tribes located even farther north; in the south it is to be seen quite frequently among the Bulu, quite a lot among the Ntum, and rather more rarely among the Fang. The spoon may have (d) a pear-shaped bowl and a wider handle which starts farther down (I have seen this only among the Fang).

The second form (e-f) consists of a more or less circular, deep bowl and a broad handle attached to the edge of the bowl and bent in the shape of a gable. The handle usually broadens out at the end and is decorated with carved patterns or covered with stamped brass plate. The latter is to be found only among the Fang and, because of the circular shape of the bowl, is called dū ma-gǭdǭvǭ'dō, "nest of the bulbuls (Pycnonotus)."

A form representing a transition between the first and second forms is exemplified by g where the narrow, unadorned handle of the first form is bent in the form of a gable like the second form. This is found only among the Jaunde. /162/

/Fig. 105 appears here in the original text./ The third form (h-k) has a narrow, oval, shallow bowl which more or less gradually extends into the short, usually flat, more rarely round handle; this form is to be found only among the Fang.

A fourth form (l-n) really consists only of a trough-shaped bowl on which the handle is indicated merely by a gradual depression (accordingly, the form is called kiāi-adžăb = leaf of the Mimusops djave (Lan.) Engl.); it is found only among the Fang.

The women's spoons, that is, leaf spoons, calabash spoons, and snail spoons, have been mentioned above. It may be added at this point that the man also uses these spoons on occasion, especially when he has no wooden spoon at hand or when he is on a journey.

415
531

Fig. 105. Men's Ladling Spoons.

264 As a rule, to be sure, every man carries one or two of these useful
415 utensils in his shoulder bag made of pineapple fibers (mfǒk). /163/

Beverages and Indulgents

271 The usual beverage of the Pangwe is water. He drinks it from
415 little bowls, into which the water is poured from a clay water flask,
or from calabashes (ndǒk IV) which, in addition to the clay water
484 flasks, are also used for fetching water. He also drinks water from
special drinking calabashes cut in half through the middle (Mwele)
or provided with a hole (Jaunde). On a journey, he uses one or

271 more leaves folded together in the form of a bag, like the leaf
415 spoon, or his right hand with which he scoops up the water and
484 throws it into his mouth with rapid swinging motions.

In dense forest where no stream is known to be nearby -- this,
271 to be sure, is a rare occurrence, for instance, when they have lost
137 the way or if suddenly somebody falls ill from thirst, or the like --
824 one can, at times, open a hidden source of water in the water liana Dichapetalum holosericeum Engl. (angũngũ'ĩ-ndžĩk III Ntum, ngũ'ĩ-ndžĩk III Fang). Unfortunately, however, this plant does not occur everywhere; it grows straight up from the ground to the highest tree tops and can attain the thickness of the upper thigh, but usually it measures only 40 centimeters in circumference. In order to get water, one only needs to cut off the liana as high as one can reach, something that can be done with one blow, and then cut off a piece from the lower half. This is held vertically so that the water cannot run out, and it is then gradually inclined over a drinking vessel, for instance, leaves folded together in the form of a bag. The water, which -- as the Negroes assert -- is supposed to be good for the stomach, now flows out of the stem in a strong stream, hissing all the while. It is quite astonishing what quantities of water the liana contains. A piece as long as one's arm suffices to quench the most violent thirst and, according to my estimates contains one and a half liters. If one needs more, he simply cuts off additional pieces, and since the water cannot flow out of the cut liana because of the air pressure, one always has enough, even for large caravans.

272 As regards indulgents, the Pangwe have sugarcane sap, banana
273 wine, palm wine, and tobacco. In their use of these they are, on the whole, quite moderate. In this respect, the importation of rum would certainly have created a change for the worse if in 1906 the prohibition against the sale of intoxicating liquors had not intervened.

1. Sugarcane sap.

272 The sap contained in sugarcane is extracted in the following manner. The bark of the sugarcane is splintered off with a knife, and its meat is sucked out, or one presses out the sap and then drinks it as "sugar wine (mayǒ[k] me nkõ'k)." The latter method of

272 extraction occurs only in the southern Pangwe region and /164/ in two forms. The first is as follows. The cane is cut into pieces from six to eight centimeters long; the meat of the cane is removed by sticking the spiked stalk of Trachyphrynium danckelmanianum Braun et K. Schn. (nsō' I) through it and scraping back and forth for a while (Fig. 104). A leaf is placed underneath to catch the scrapings, and later they are put in a basketwork plate and pressed out by hand. A second, more refined procedure consists of removing the bark from the cane with a knife and pounding it in a wooden trough. The pulp thus obtained is put in a sugar press (ojám), a crude piece of basketwork in rectangular form, made of Ancistrophyllum (nkāne), whose narrow sides end in loops through which two sticks are pushed. One of these is stuck through two poles planted in the ground, each with a hole drilled through the middle; the other stick is placed on top of the two poles. When the press is to be used, /Fig. 106 appears here in the original text/ a vessel (pot) is placed under it, the upper stick is taken off, the sugarcane pulp is placed in the plaited container, the stick is turned with both hands, and in this way the [888 757] press is wrung dry. The sap, which can be drunk right away, is made primarily for elderly people who are no longer able to chew sugarcane meat; it is also made for medicinal purposes. /165/

2. Banana wine.

273 This wine is obtained from ripe bananas or plantains. They are peeled, cut in half, and then placed in a pot filled with water. The pot is covered with a perforated leaf and set in the sun for a day. The fluid is then carefully poured off, put in a calabash, and again set in the sun for a brief period of time. This banana wine or plantain wine (the latter is supposed to taste even better) is known only in the northern Pangwe region. Among the Jaunde it is valued very highly, as much as palm wine, which is attested to, among other things, by its special popularity with the older chiefs who are known as connoisseurs. This beverage, indeed, is not at all bad, and it is, incidentally, also popular with the Whites.

273

3. Palm wine.

The Pangwe make palm wine primarily from the oil palm Elaeis guineensis L. (alɛ́n). In very rare cases they make it from the raffia palm, while in the extreme north it is also made from

[272 342]

Fig. 106. A Ntum Man Using a Spiked Stalk to Scrape Sections of Sugarcane in Order to Press Sugar Wine out of it.

the Deleb palm. As a result, its abundance and quality depend upon the range of the oil palm, that is to say, actually only the northern Pangwe region, especially the Mwele, Jaunde, and Bene areas and to a lesser extent the Bulu area, come into consideration here. In the south, on the other hand, the making of palm wine is practically unknown; there oil palms are so sparse that they give their name to nearby localities (Alén, Malén) because they

273 are regarded as a curiosity. Wine made from the raffia palm, supposed to have a bitter and not very pleasant taste, is known by hearsay to the southern Pangwe. It may even be that they produce it in isolated places, but I never saw or drank it. On the other hand, the [137] wine made from the Deleb palm, Borassus flabellifer var. aethiopum Mart. (Mwele, awui), which in very isolated patches extends into the northernmost part of the Pangwe region (I have observed it myself between Elandi and Abandakudi) has a superb taste and is justifiably valued very highly even though it does not possess the characteristic bouquet of oil palm wine. On my journey through Mwele territory I was told that the palm tree dies if one cuts off its blossoms to make wine, and indeed I saw a whole number of gigantic trunks reaching into the sky, leafless as masts. At the same time I must confess that when I was able to refresh my thirsty throat with this beverage in Simekoa, I hardly considered the price -- the dead palm tree -- too high.

For the Pangwe Yaoundé /Ger., Jaunde/ is the classical land of palm wine or mimbu, as it is called in pidgin English. If one travels through the Jaunde region at the right time of year, he will find a number of calabashes hanging from almost every oil palm, which indicates: "There is palm wine here." /166/

The quality of the wine depends on various circumstances. One very rarely finds the really first-rate wine, which can well stand comparison with inferior champagnes.

Aside from the method of obtaining the wine, the age of the tree plays a certain role. One cannot get good wine from the flowers of young palms. Similarly, only old calabashes, in which palm wine has often been kept, may be used to catch the wine. I am unable to say what other factors determine the superior or inferior taste of their wine. It is certain that, as in the case of our wines, soil and climate are important. My Jaunde in the south, for instance, took all kinds of trouble to serve me with good "stuff," but it was all -- as they themselves admitted -- a beverage of which one could but say: "It looks like wine, but it isn't; it doesn't make you sing, it doesn't make you happy." In any case a person who, after the first trial of a perhaps only moderately successful wine, condemns palm juice in general does it an injustice. One must first get used

273 to its peculiar taste, and anyone who, like myself, has drunk his way from Duala through Bakoko /Koko/ and Bassá country, through the Jaunde and Mwele areas up to the northeastern boundary of the Pangwe region to Kombokotto, knows that one only has to look for a really good drop to find it, and that this is one of the best things available in the Pangwe territory in the way of culinary pleasures.

Usually palm wine is yellowish-white, either dry or more or less sweet, the best being almost transparent in the glass, bubbling like sparkling wine, slightly sweet, and extremely intoxicating. Inferior wine is more opaque, while a very indifferent variety, obtained -- as will be described below -- from the trunk, is not transparent and is covered with foam like soapy water, which it resembles somewhat in taste. All of them, however, have a characteristic and fine bouquet to which, as I have said, one must first become accustomed, but which afterwards he never forgets. When I read through the pages of my diary telling of the days of travel in Yaoundé, the wine bouquet seems to stream forth from them and to embody everything beautiful and characteristic that tropical West Africa offers to the memory.

There are three methods of obtaining the wine. The first two involve cutting down a palm tree about five years old, and for that reason such methods are not very common in the Pangwe region (1).

1. These methods are more frequently used in the Bassá area where the palm trees are so numerous that they can be wasted in this manner.

The first method, which produces the best wine and which in Jaunde is called mayǒ̄t k] me mbŭm, is carried out in the following manner. The leaves of the palm tree that has been cut down, the upper leaves in particular, are cut off, and the calabash is put over the cut at the heart of the palm.

In the second method -- mayǒ̄t k] me nkǒ̄k, "palm wine from the felled trunk" -- a rectangular hole is cut in the middle of the trunk /167/ down to the pith, about 15 centimeters deep. This is not done, however, until the trunk has lain for a day and has been

273 covered with old leaf sheath which look like bark and are in turn weighted down with leafstalk ends and the like as a protection against insects. The palm wine gathers in this hole and is scooped out daily. This process lasts from four to five days and produces in all five or more bottles of inferior wine.

Most common is the third method of obtaining wine, namely, from the male or female inflorescences of fully grown trees, that is, ten years old or older (simply: mayǒ[k] m'alěn, "wine from the oil palm"). This procedure, to be sure, is not nearly as simple [481] as the two previous ones since the man must climb up the palm tree and work for quite a long time hanging in a supporting rope, in particular lopping off the leaves. It frequently happens that in his eagerness the man cuts through the supporting rope and falls to the ground; to do this he does not even need to have looked too deeply into a calabash filled with palm wine.

At least two, usually three or four, and more rarely up to six inflorescences on a palm are tapped at the same time since some produce more juice, others less or no juice at all. With four inflorescences, for instance, only two produce juice; with six, only four.

The next step is to remove from below all the leaves of the crown with the exception of the leaf in whose axil the inflorescence is inserted. This is now partly removed, but its lower edge and the part of the lower end of the stalk which is turned away from the inflorescence are left on; otherwise the inflorescence would break off and fall down. A stick is clamped between the inflorescence on the one hand and the leaf that was left standing and the neighboring leaf on the other to prop up the inflorescence which has been deprived of its support. Not until the next day is the work continued. With a two-edged knife a rectangular cutout about six centimeters above the base is excised (in a downward direction) from the husk. The stalk of the inflorescence is cut through here and is taken out, so that on all sides only the husks are left standing. Now the stick can be removed since a prop is no longer needed. After two days the palm wine can be collected. For this purpose, a thin layer of the remaining stalk of the inflorescence is cut off, and the empty husks are stopped up at the tip with old dry husks that have been

273 crumpled up. Then a long-stemmed, fife-like bag is made of five leaf pinnae of the oil palm; this bag is placed at the lower part of the cutout with its "head" down and the tip outward. The bag is pressed to the cutout by means of a little stick made from the bark of an oil palm leafstalk and stuck through the husk on either side /168/. The entire arrangement is designed to prevent insects, such as giant beetles, palm weevils, rose beetles, bees, flies, etc., from penetrating the husk. Furthermore, in order to prevent the wine from running past the bag, the slits at those points where the bag rests against the husks are closed off with the down of oil palm leaf sheaths. On the little stick which holds the bag, a calabash, on which a small leaf funnel is placed, is suspended in such a way that the lower end of the bag extends into the funnel so that here, too, the way will be blocked to uninvited guests from the insect world.

It is necessary to remove the palm wine from the calabash morning, noon, and night, since otherwise it would spoil. Each time, also, a thin layer of the stalk of the inflorescence must again be cut off, and a new bag, as well as a new funnel, must be made. /Fig. 107 appears here in the original text./ In each case, the tapping of a tree lasts for three days and, if there are four tapping places, for instance, yields from six to eight bottles of wine. After this period, the tree is left alone for at least half a year so that it can recuperate; indeed, it is left to itself even longer if enough other palm trees are available.

To improve the wine -- according to the Jaunde -- to make it worse in my opinion -- the Jaunde frequently put the bark of a tree called eyū'ma (Jaunde) in the calabashes. Fortunately, this tree grows only in the Mwele region, and the Jaunde get it from there. This bark /Fig. 108 appears here in the original text/ makes the palm wine "strong," as they say; that is, it gives the wine intoxicating qualities. Possibly a very small amount of the bark is a beneficial addition, but the excessive amount that the Jaunde add
273 to it harms the pleasant taste of the palm wine. I remember par-
522 ticularly a trick played on me by my boys who had poured together the wine from a number of calabashes, each about a quarter full, for my meal. In each calabash the wine had already been four

276

Fig. 107. Wooden Tobacco Pipes.

[53]

Fig. 108. Bowls for Tobacco Pipe of Banana Leafstalks.
(a) Brass plate with a piece of banana leaf stalk; (b-d) clay.

273 times as powerful as usual, and the entire mixture was so strong
522 that it caused violent dizziness and headache.

273 The palm wine which is obtained from the pith of a tree trunk that is cut down /169/ (mayõ[k] -nkõk) keeps for 24 hours in the house. On the other hand, the wine made from the inflorescences keeps at most half a day, and in great heat it spoils very rapidly, as I observed; it does the same if one takes it along on a trip. For this reason I followed the rule in the palm wine region of always finishing a good wine immediately or at least as soon as possible.

As I have said, the Pangwe are, generally speaking, moderate drinkers, but among them there are also heavy drinkers who regu-
[164] larly get drunk on palm wine. I shall leave undecided the question as to whether the widespread epilepsy (okũ bũk) in the northern Pangwe region is a *phenomenon resulting from excessive indulgence* in palm wine on the part of the parents.

4. Tobacco.

276 Four varieties of tobacco, Nicotiana tabaccum L. (tãã III) (1)
249

1. The native term may have arisen from tabaco.

are found in the Pangwe region. Formerly there was a fifth variety, but its cultivation has been given up. /Fig. 109 appears here in the original text./ With the exception of two that are very similar, the tobacco varieties are easily distinguished by their leaves. The key for determining each is as follows.

A. Leaves are not alated, and the leafstalk is long and clearly defined: esõ̃h (esã̃h because of the similarity of the leaves to those of the Hibiscus sabdariffa L.)

B. Leaves are alated

(a) Leaves are narrow, lanceolated: sõmõ IV

(b) Leaves are broad, ovate

1. Blossoms are a bright pink, almost whitish, the leaves being comparatively wider than in the case of the following: nsõdebõno I

2. Blossoms are dark pink to red, and the plants grow closer to the ground: mbɔ̄ʼmekūnă I 276 249

Originally, the Pangwe were not passionate smokers, as a rule, although in every village one encounters old people who cannot live without their pipes. Over the whole region, especially in the north where the influence of the Whites is more predominant (for instance, among the Jaunde), the use of tobacco is rapidly increasing. The quality of imported tobacco and the great variety of pleasing shapes of the pipes for sale in the trading posts may be strong /170/ /Fig. 110 appears here in the original text/ contributing factors. 276 [77]

Fig. 109. Clay Tobacco Pipes.

Next to salt, "trade tobacco" is one of the principal trade articles. [439]

Tobacco is exclusively smoked in pipes; chewing or taking snuff is unknown. The Pangwe distinguish three forms of pipes. First there are short wooden pipes carved out of one piece (only among the Fang), ekūk-myiðk (Fig. 107), and secondly, banana leafstalk types (ntón I; bowl, obă'k). The latter consist of a piece of banana leafstalk or leaf ribbing, more than a meter long, and a bowl stuck on top of it which is made of the kernel of the raffia fruit, brass plate, or clay (Fig. 108). The stalk needs to be replaced from time to time. In almost every meeting house this form of pipe can be seen on the wall resting on two hooks, and it frequently goes the rounds among the men, on which occasion the chief is the first to draw from one to three deep puffs and then passes it on to his neighbor. The last man puts the pipe back on its rack. The third type of pipe

Fig. 110. Tobacco Planted in a Village Square.

276 (myō-taa) consists of a clay bowl and a wooden stem about 30 centimeters long, part of which has brass wire neatly wound around it (Fig. 109). Formerly, this pipe is supposed to have been as long as an arm among the Jaunde.

249 Proportionate to the indifferent habit of smoking is the indifferent care and affection with which the tobacco plant and its leaves are treated. Wherever a great deal of tobacco is imported by the trading houses, tobacco cultivation is completely neglected. /171/

Tobacco seeds are sown in whatever planting area happens to be convenient at the same time as the principal crop of the field is planted. Accordingly, the tobacco may be sown, for instance, with groundnuts twice a year. Frequently a small tobacco bed is laid out close to the village, or the seeds are planted next to the houses and sometimes on the village square (Fig. 110).

As soon as the plants attain a certain height, all the leaves except those on top are picked off. The top leaves are left so that the plant can continue to grow and bring forth blossoms and fruit. Then the leaves are harvested for the second time, and the fruit

1: Tessmann--166 E-5 (1904-1909) 1913 FH9 Fang FH9

249 intended for the next sowing are taken off. Since the principal crop of the field has meanwhile been harvested and the field therefore has been abandoned, the young tobacco plants which have developed from prematurely ripened seeds are taken home and planted in the vicinity of the house.

Further treatment of the leaves consists simply of drying them in the house, either on the drying lofts (one or two days) or under the roof, underneath the mats into which the stalks are pushed so that the leaves hang down freely (depending on the distance from the fire, three to five days). Naturally, the Pangwe know nothing about the fermentation process; it may once in a while take place accidentally when the leaves are kept tied together in a basket. Usually, however, so many brothers, friends, and members of the kin group appear on the scene that the entire harvest is distributed. [422] Tobacco is regarded as communal property, so to speak; just as the pipe in the meeting house is used by everyone in common, so are the tobacco leaves considered common property, and it is the custom to share them with the members of the village at each harvest.

In spite of the crude treatment of the tobacco leaf, native tobacco is supposed to be not at all bad, as I was assured by smokers. /172/ /Fig. 111 appears here in the original text./

1. Dress.

291 The native dress of the men is a strip of material drawn between the legs and folded in the back and the front over a belt. The strip is about 90 centimeters long, 70 centimeters wide, and made of the bark of various fig /173/ trees (Fig. 111). The bark cloth is left either in its natural color and in that case shows all gradations from almost pure white to a dark reddish brown, or it [386] is dyed a resplendent red by means of red wood and is often so magnificently prepared that one can distinguish it from European cloth only by looking at it closely.

291 177 Nowadays European cloth is to be found everywhere as a result of trade, and it is supplanting the original dress which is so becoming. European cloth is sometimes worn just like the bark cloth, but usually it is wrapped smoothly around the loins with or without a belt (see Fig. 111).

291 281 Only once did I see in place of the bark cloth a narrow loin apron made of monkey skin, which at the upper end was drawn over the hip string and the rest fell down in long strips (etõ'b-mabǎ,s).

291 The belt (kǎ'na IV) consists of fiber strings with or without beads, a braided palm band (Fig. 112), or hide. The simple strings are to be seen only on boys or people who pay little attention to their appearance; the beaded belts, in contrast to those of the /Figs. 112 and 113 appear here in the original text/ women,

are single strings. The braided belts, Figure 113 (bǎ'b IV, Fang), apparently occur only in the south. The hide belts are either narrow bands, usually made of monkey hide, or broad bands of antelope hide whose hairy side is first shaved smooth and then incised with all kinds of patterns. Belts made of the stalks of the bindweed (abōdembē, that is, "those who dress poorly," from bōt, "to dress," and mbē, "the poor, the bad") are regarded as the most inferior. They are worn only by people who are very negligent about their appearance.

Fig. 112. Fiber Belts.
(b) Decorated with cowrie shells.

Both in form and material, the women's dress is fundamentally different from that of the men. It consists of two pieces, the front apron and the back apron, both being held against the body by a hip band made of hide strips, fiber, bead strings, or European material. The front apron in its simplest form (which is found among the northern Pangwe) consists of a long, narrow, dry banana leaf which covers the pudendum and the perineum between the legs and is folded in front to form a triangular flap which is wrapped over the hip string. Otherwise, it is made either of bark cloth or a piece of hide. The back apron among the Fang is a small, modest piece of bark cloth which occurs in two forms. The first type is a band three and a half meters long and 23 centimeters wide sewed together out of many (eight to nine) pieces, /174/ which by means of pleating is shortened to a small apron 24 centimeters long and 13 to 27 centimeters wide. A string drawn through the upper edge gathers it in, like a fan. The second form consists of from two to eight small, quadrangular pieces of bark which are gathered

Fig. 113. Braided Belt.

291 in at the top, like a fan, and stuck one after another into a clamp (abǎs) (Fig. 114). This clamp consists of from five to eight short sticks of wood which are wrapped with brass wire or brass plate at one end, are placed next to each other like a grating, and are then tied together with a strip of palm.

Fig. 114. Fang Woman's Back Apron of Bark Cloth.

Among the other Pangwe, the back apron is made of raffia fiber and hangs down like a horse's docked tail (Fig. 115). It is called mfǒk I, mfǒɔ̄-zǎm (zǎm, "raffia palm"), etǔ,ǎ, azǒ,m, azǒn, ebū'ī, ekǔ'm.

When at work in the fields, fishing, and so forth, the women take off their raffia tailpieces and bark aprons in order to spare

Fig. 115. Ntum Woman's Back Apron of Raffia Fiber.

them and as a substitute put an herb with soft leaves, if possible the Brillantaisia (ebūgebǒ'n), or ferns under their belts. One also often sees them in this working dress on the way home to the village while their raffia tailpiece or bark apron splendidly adorns the top of the basket filled with fruits of the field or firewood. Men never wear leaves, not even while they are fishing.

302

Fig. 116. Hair Styles.

291 During the first years of their lives, small children usually go around naked, girls up to the age of five, boys up to their seventh [304] year. The boys' circumcision does not mark a definite limit in this matter since one sees uncircumcised boys clothed and circumcised boys naked, /Fig. 115 appears here in the original text/ but they do not like to wait long after this occasion. Children, especially girls, may also be clad in a piece of cloth as soon as they start to walk.

302 Nowadays, the Pangwe do not have a uniform hair style. We find an abundance of different forms among them -- even within the same village -- which shows that, like all Negroes, the Pangwe loves to give rein to his mode in dressing his hair for ornamental purposes.

Children usually have their heads shaved at an early age, either completely smooth or /175/ /Fig. 116 appears here in the original text/ retaining a tuft of hair either in the back or the front or a fringe. Half-grown boys wear their hair long or shaved in patterns.

Among adults the hair is either quite long and neglected (Plate 13) or it is shaved quite smooth. In other cases, it is cut

302 to half length and carefully dressed, or it is cut short, either uniformly (see Fig. 6) or in such a way that a tuft, asik, in front, or a fringe, ongón, over the crown remains standing. Still others cut their hair short and shave it in all kinds of patterns (see Fig. 3), called pfēē, III (a tūb bopfēē, "to shave in ornamental patterns"). These would fill an entire book if one were to note them all down. I have illustrated a small number of them in Figure 116.

The hair style in the shape of a helmet, richly adorned with beads, cowrie shells, buttons, and brass nails, constitutes the ne plus ultra of all these types of hair styles. It is this hair style which distinguishes the Pangwe from all other peoples of tropical West Africa (Fig. 117). In the north where this fashion never reached the same perfection it had in the south, it has been given up as a result of European influence. Among the Ntum and Fang, on the other hand, the art of fashioning the helmet hair style blooms luxuriantly (Fig. 118). In this process the hair is made to stand on end by placing under it props made of raffia pith or palm strips; the curls are transformed into pigtails by means of bark strips plaited in with them. The pigtails in turn are braided together to form a pad of uniform thickness. Since the creation of such a hairdo requires ample time, a month and longer, the natives walk about for a long time with /176/ /Figs. 117 and 118/ /177/ /Fig. 119 appears here in the original text/ hairdos that have just been begun or that are more or less unfinished, so that one has the impression at first that he is observing many different kinds of hair styles. Figures 8 and 13, for example, show two different stages in the development of one and the same hairdo.

292 302 In addition to these styles contrived with the hair of the head, there are removable caps. These are made in precisely the same way and in precisely the same shapes (Fig. 119) as the hair styles just described, so that only upon close inspection can one decide whether the hair has been dressed or has been covered with a cap. These caps, however, are not common and are made only by the Ntum and by a few Fang (Okak). Dressing the hair itself decidedly predominates, a fact which we should mention since from the evidence of the museum material one might arrive at a different conclusion. The illustrations given here all show hairdos.

294
352
516

Fig. 118. Ntum Preparing Ornamental Helmet Crests, Akonangí, South Cameroons.

292

Fig. 119. Helmet Caps.

Of 25 different forms, which are given individual names, about half are worn by both sexes indiscriminately; the rest are worn only by men or only by women. Among the Fang the men's ornaments are more frequently the same as those of the women than is the case among the Ntum, and for this reason they are more frequently the butt of ridicule. 302 301

Helmet crests and ornamental caps are worn constantly; only as a sign of mourning are both taken off -- the former is sometimes also taken off before a hunting expedition. /178/ 292 765

To make his ornamental caps (edõ'ban, etũ,e'), the Ntum takes a hide from a long-tailed monkey, dwarf antelope, young goat, or sheep. The hide is cleaned of its fat, turned inside out, and drawn over the arch of a plantain rootstock that has been cut to a semi-spherical shape. It is tied with a string at the base, and along the edge it is fastened by pegs to the ground. Stretched in this way, the hide must be dried in the sun and later over the fire. 294 281

Furthermore, blackened bast strips of the Triumfetta are needed. These are colored in the following manner: the bark of certain 294 386 824

294
386 plants (1) is cut up into small pieces and placed in a cooking pot
824

1. Combretacea Terminalia superba Engl. et Diels (akŏ'm), Euphorbiaceae Bridelia zenkeri Pax. (ewō'lŏ'k), Alchornea cordifolia Muell. Arg. (abŭī, Ntum), Megabarea trillesii Pierre (abŭī-žăm), Leguminosa Mucuna flagellipes Vogel (kŏndō'o'-žăm), Borraginacea Cordia odorata Gürke (ébē, Fang, ebăī, Ntum), Anacardiacea Pseudospondias tessmannii Engl. (angŏkŏń), Flacourtiacea Petersia minor Niedenzu (abiń).

in such a way that at the bottom there is a layer of bark, then the bast strips, and on top of these bark pieces again. The whole is boiled for an hour in order to draw certain materials out of the bark; then the pot is carried to the river, and the bast strips are kneaded alternately in the loam of the bank and in the bark extract from five to seven times, one after another. The strips now have a blackish color which during the drying in the house darkens to the deepest black.

294 Proceeding to the actual making of the cap, the dried hide is taken off the block and propped up on the inner surface by three stirrups underneath placed crosswise. The stirrups consist of eight palm strips laid lengthwise next to each other and braided together with Triumfetta fiber. To wear the sharp-edged stirrups and the heavy gear can scarcely be pleasant, but the Negro's thick woolly skull probably does not feel it.

On the outer surface, on both sides of the crest line, 14 holes are drilled into the hide in two parallel longitudinal rows for the seven pineapple strings, half a meter long, which are drawn through two holes apiece. These strings are braided with the pigtails, each of which was made from three of the black bast strips mentioned above. They start from the middle, run in the sagittal direction to the front and back edge, extend somewhat beyond them, and

294 end in a knot (2). Twelve such longitudinal braids are placed

2. In braiding, one frequently greases
his fingers and twists the strips slightly.

close to one another. The space between these and the edge of the cap is filled by pigtails made in the same way but running at right angles to the others; at the edge they are covered by three rows of pigtails all the way around and are sewed to the hide. /179/ For this one requires a needle made of bark, whose tip has been hardened in the fire and whose other end has a slit for the fiber thread. The pigtails jutting out over the edge are cut off. A fringe (mbǭm), made of a piece of raffia pith, is put over the crown of the cap. The piece of pith is cut into on both its narrow sides so that it will bend more readily, and over it is sewn a piece of material on which is set a stirrup of the same width, made of palm strips and studded with brass nails -- these stirrups have been described above in connection with the inner surface of the cap. On either side of the fringe there are a few longitudinal rows of red beads strung on raffia fiber. Another decoration on the caps consists of pieces of leather sewn on at the sides, which have cowrie shells or white buttons stitched on them and from which are hung tassels of pineapple strings strung with beads (see Fig. 118, foreground).

The ornamental caps of the Fang are not made of hides but of palm strips, parallel to each other, which are braided with blackened Triumfetta fiber in such a way that one strip is always skipped, and thus a chessboard pattern is created.

302 Older people for the most part do not wear bead ornaments in their hair -- insofar as they still have any -- but on the contrary wear simpler hair arrangements which, incidentally, are supposed to have been more fashionable at one time.

291 Among head coverings we need only mention caps made from the hide of monkeys, civet cats, or of the ichneumon, Bdeogale [294] nigripes Puch., as well as imported red caps which are worn by chiefs 291 and other elderly "notables." Hats made from leaves of grass 177 (Paspalum) sewn together resemble our ordinary straw hats in shape

291 177 and, according to one informant, are supposed to be imitations of European models.

302 Dressing the beard is rare among the Pangwe, since most of them -- like many other Negroes -- pluck out such hair. In isolated instances there are men with beautiful full beards (Fig. 11) or with pointed beards whose tip has been twisted into a little pigtail and covered with cowrie shells or beads. Still others make two or quite a number of pigtails from their beards (Fig. 12); mustaches are rarely to be seen and are quite insignificant.

2. Ornaments.

301 Among the Pangwe the urge to beautify oneself dominates man and woman equally to a considerable degree. All kinds of ornamental pendants are attached to every possible part of the body. In their hair (Fig. 120) they stick a feather which is often cut out in patterns (a, b), a porcupine's tail (c), a wooden arrow, bones /180/ /Fig. 120 appears here in the original text/ (d), brass coiled in a spiral (e), a comb (see Fig. 139), and also, in rare cases -- usually on the occasion of a dance -- flowers, for instance, those of Costus (miĕn), and attractive or fragrant leaves, such as those of the Leguminosa Cryptosepalum aff. staudtii Harms (andūṇ) and of the herb called afuṅ. The latter two are worn only by women and usually in two bundles behind the ear. The ear lobe is pierced and provided with an ornament only among a few Mwai. [304]

301 304 Nose ornaments (Fig. 121), on the other hand, enjoy great popularity; they are attached in a hole pierced through the septum and not to the side of the nose. The requisite operation is carried out on children between six and eight years of age. /Fig. 121 appears here in the original text. / First the person concerned presses the leaves of the Aframomum (adžǫm), which have been warmed in the fire, to the septum in order to make it softer. Then the medicine man takes a stick of raffia stalk, a quill from the porcupine, or any other pointed tool and drills a hole through the septum with it after he has picked out the right place with the index finger of his other hand. He now pushes a small piece of stalk [304]

301
[531]

/180/

Fig. 120. Hair Ornaments

Fig. 121. Nose Ornaments.

301 of the Trachyphrynium violaceum (stalk, nkómkǒ'mo I; leaves,
304 dzĕdekiai IV Ntum) onto the tip of the quill and pulls both back together until the stalk comes to rest in the septum. The stalk is supposed to keep the hole open for the later ornaments. The subsequent treatment serves the same purpose; every two days the wound is washed out and the stalk is renewed. /181/ After ten days the stalk is finally removed and replaced by the permanent
301 ornaments. The objects used for ornaments can scarcely all be enumerated: /Figs. 122 and 123 appear here in the original text/ stalks, leaves, blossoms of the Gomphrena globosa L. (ngǒ'n), with which we are already familiar as an ornamental plant, feathers (1),

1. The red tail feathers of the gray parrot and the crescent feathers of the cock are especially popular; both animals play an important role in the religion.

paper rolls, wooden rods strung with beads, raffia rods, rods or bones wrapped with brass wire, brass rings with a large bead that hangs down as far as the upper lip (see Fig. 132), and especially strings of beads, the ends of which are tied to the hairdo behind the ears, thus forming a cheek ornament at the same time. /Fig. 124 appears here in the original text./

Forehead ornaments are to be found in the following forms: strings of beads; bands of beads, which in the southern part of the Fang region often have very attractice patterns (Fig. 122); strips of black sheepskin (tū̧t IV); and sometimes among women nicely braided bast bands with tassels.

The neck, which one rarely sees without some kind of band or string, is amply provided with ornaments. In former times the fruit of the grass Coix lacryma L. (mvǎ̧andú III), the well-known Job's-tears (Fig. 123), used as a decoration in so many parts of the world, /182/ /Figs. 125 and 126 appear here in the original text/ was very popular, as were strung stalk pieces of the fern Lygodium smithianum Presl. (ozǒ̧k), whose name ozǒ̧k was subsequently

301 transferred to the oblong red beads. Nowadays, however, since the introduction of glass beads which now predominate, they have long been out of favor as not elegant enough. Among other neck [84] ornaments we find among the women the fruit of the Mucuna flagellipes Vogel (kǒndǒ/ɔ'-zǎm III); they are a symbol of faithfulness, although they are probably worn without the definite intention of winning faithfulness or keeping it (1). Other neck

1. This liana is the symbol of faithfulness because it twines around a single tree and does not, like the majority of tropical lianas and climbing plants, overrun all the trees and shrubs within its reach.

ornaments are: the strung incisors of long-tailed monkeys and dogs (Fig. 124 and 125); also used as pendants, the strung incisors of leopards and the tusks of boars (Fig. 127); simulated teeth made of the white, slightly pointed seeds of the palm Podococcus barteri Mann et Wendl. (niamvǐne), Figure 126, or from pieces of bone, as pendants; simulated horn made of /Fig. 127 appears here in the original text/ appropriately carved pieces of ebony (Diospyros varieties) and wound with brass wire, Figure 128; and finally a talon of the large fighting eagle Spizaetus (ndü ī' IV), Figure 129 (2). Neck bands, as attractive as they are simple to produce,

[77] 2. European trinkets are also to be found as pendants among the Pangwe. These include cartridges, keys, and padlocks.

are made from strips of Oncocalamus mannii Wendl. (nlon) or Trachyphrynium violaceum (nkǒmokǒ/mo), held together by a graceful braid of Rhectophyllum threads. /Figs. 128 and 129 appear here in the original text./ There is a noteworthy neck ornament made of the fragrant roots of the Urticacea Trymatococcus africanus H. Baillon (ngǒ/na IV), which among the Ntum is worn

301

Fig. 127. Pendant of a Neck Ornament (Tusk of a Wild Boar).

301 only by women but among the Fang by members of either sex. It is called /183/ egbwē̌ī, ngṓna IV Fang, or azǭm-e-sī, Ntum (see Plate 12). Halved lengthwise and dried, the roots are bound by a double string to form a neckband (Fig. 131, a) or are twined together to form a tassel-shaped pendant (Figure 131, b), the whole being dyed usually with red wood. A neck ruff made of bast and worn by members of either sex is not very common. Because of its appearance, the ruff is called etū́ga-nnǫ́ma, "sheep's mane" (Fig. 131, c). Similarly, a bast neck ornament for little girls (ngōne) is rarely worn. /Figs. 130 and 131 appear here in the original text. /

301 326 Iron neck rings are very rare nowadays; correspondingly, neck rings made of brass (mvǭt I) are all the more frequent. These are cast in heavy and light varieties. The former, that is, the heavy brass rings, have two different forms. The first has edges that project like a cornice and no ornamentation (Fig. 132). The other one is triangular in cross-section and in the middle of the two front surfaces, as well as frequently along the upper edge, is provided with engraved patterns (mvǭte zǎh; see Fig. 14). The manufacture of these rings will be described in connection with brass founding. It is not easy to wear such a ring, which weighs up to three pounds, nor is it easy to put it on, for it is softened anew in the fire and bent apart so that its lucky owner can force his neck into it, and then it is tapped together again on the anvil. It is even harder to take the ring off. To do this, the person concerned lies down on his back; one end of the ring is secured to a tree stump while the other end is connected to a lever by means of a liana, and the ring is forced off with the lever. Prior to this, one must not forget to rub the neck thoroughly with oil or with sap from the leaves of the Clerodendron /184/ /Fig. 132 appears here in the original text/ bǖttmeri Gürke (mayǖlu-ndźīk III). By way of a popular, quick, and cheap substitute, servants of Europeans use tin cans which they transform into a neck ring by taking off the lid and the bottom. Similarly, European collars are to them an extremely welcome cultural acquisition which they make their own, frequently before they acquire trousers and shirts.

301

Fig. 131. Neck Ornaments.

301
142
291

Fig. 132. Fang (Omwang Family), Spanish Guinea.

301 Breast ornaments are to be found chiefly among women in the form of strings of beads and rough brass chains that hang very low. As one might imagine, these can be recommended only for older ladies.

Especially among women, the arms and legs are just as profusely covered with ornaments. The upper and lower arm or both are adorned with spirals of imported brass wire or with hoops from imported brass tubing (Fig. 133). For the upper arm, the spirals are shorter, while for the lower arm they are usually so long that they completely cover it. The less common upper arm rings made of strips of Laccosperma or Trachyphrynium are placed close together and joined by a pretty braid of Rhectophyllum (Fig. 134). Only men wear strips of black sheepskin on their upper arms; these match the forehead bands of the same material. Rings or bands around the /185/ wrist are among the most popular ornaments. Even children put the stalks of the Rubiacea Megalopus mannii K. Sch. (ngône III) in spirals around their arms. Adults -- men and women -- wear rings made from liana stalks, braided palm bands (Fig. 135), the hairs of an elephant's tail, cast brass or brass wire whose

Fig. 136. Bloom Woman from Akonangf
Akonangf (Ennandum Family).

ends are entwined like two tendrils (nkī̃b I, Fig. 136, a), or fine brass wire wound around itself (Fig. 136, b). They also wear bands braided from Oncocalamus and thick rings made of ivory or elephant bones (ekū̃m e ḿ̃ŋ) or an imitation made from the wood of the Alstonia (ekūk) called ŋ̃[k] ekūk, "elephant" (that is, ivory from the Alstonia). All three varieties are expecially worn by chiefs. Among the Jaunde there are attractively worked, thin arm hoops made of ivory.

Finger rings (Fig. 137) are made of ivory (a), horn(1) (b) blackened in saffia palm oil, and brass. Of the latter there are spirals (c-d), simple thin rings whose ends are slightly entwined (e), bands, and thicker, often slightly ornamented hoops (f).

1. Of the black-rumped duikerbok, Cephalophus callipygus Pirs. (mvin IV).

By and large, leg ornaments are similar to those for the arm; here too, shorter brass spirals worn above the knee are the most frequent. Women also wear them just below the knee and, again, they alone wear longer ones which extend from the middle of the calf down to the ankle. In addition, both sexes wear massive or hollow brass rings as well as the peculiar, finely decorated brass foot covers (ebat, ngō̃b IV). /186/

301

Fig. 134. Arm Band of Palm Strips.

Fig. 135. Braided Arm Band.

Fig. 136. Brass Bracelets.

Fig. 137. Finger Rings.

Rings are put on the toes, frequently on all five of them, just as they are worn on the fingers.

[48] Because of all these adornments the women look overburdened and unattractive (Fig. 138, see also Fig. 133), especially since the ornaments give them a walk even more ungainly and heavy than they already have. As a consequence of the heavy burdens that they must carry, they have a waddling walk which announces itself from afar by a rhythmic clatter. In short, the native beauties would not be exactly pleasing to the divine Muse, Terpsichore. In addition, the ornaments are troublesome beyond just their weight; the ankle rings, for instance, rub the skin until it is raw and are then tied with a string to the rings worn above the calves.

3. Care of the body.

515 539 By and large, the Pangwe may be called a very clean people, cleaner than many European peoples. The majority wash and bathe very frequently, and the following proverb shows how a person who does not wash is judged:

otũ[k] -mfõõ	a	dzõõnã:	kã	mvõõn
Old pocket (1)	she	said thus:	if now there is	rain

[M5] 1. A common term of abuse for men, similar to our "old hag" for women.

a	bõ'de	ma,	ngbãna	a	wõ'ban	e	madzi'm	a
it	wets	me,	time	to	wash	in the	water,	it

bõ	ma	anã
was	for me	just!

That is: "The rain came just in time, it was high time for a bath."

164 515 The many skin diseases, from which younger people suffer with special frequency, seem to have causes other than uncleanliness, /187/ although it must be admitted that among many Negroes there is an incredible indifference with respect to the care of the body, treatment of wounds, and parasites. In general, however, one can only praise the Pangwe for their cleanliness.

515 319 324 Formerly, even soap, made from a Rubiacea (ogbwã'm Fang, ogbwõ'mõ Ntum), was customarily used for washing bark cloth.

515 278 324 There are no fleas, but on the other hand there are vast numbers of lice which are picked off and killed by biting them -- the women swallow them at the same time. They are also killed by special medicines. These medicines are made with raffia palm oil which is rubbed on the skin and which the lice do not like to begin with. To the oil is added charred and ground plantain skins or the ground and subsequently dried roots of the Apocynacea Dogcanga diplochlamys K. Sch. (oõ metõõ Ntum), ground leaves and blossoms of the Simarubacea Quassia africana Baill. (tõõ-eõ'), and ground leaves of the Malpigiacea Heteropteris africana A. Juss.

515 (mfím-e-ndzík IV) and the Simarubacea Odyendea gabunensis
278 (Pierre) Engl. (ozǒk). Furthermore, the Leguminosa Tephrosia
824 vogelii H. f. (ndǎwólō III) and the Ochnacea Lophira alata Banks (akō'ga) are put on the hair. /Fig. 138 appears here in the original text. /

In the helmet hairdo, under whose thick pads the lice cannot be reached by hand, they are killed by a special procedure. "Lice caps" made of plantain leaves and tightly fitted are placed

[301
291]

Fig. 138. Ntum Woman from the Campo Region.

on the head after the bark of the Flacourtiacea Caloncoba welwitschii (Oliv.) Gilg (mié megūmo III) has been put in it, the bark having first been scraped off and moistened.

302 The hairdos are always greased with oil; also short hair is
824 tended very carefully, moistened with oil and combed out. There are two /188/ kinds of comb (mvǎs IV), those carved entirely out

302 824 of wood (Fig. 139, b-d) and those put together from short sticks of raffia leafstalk bark (Fig. 139, a). Frequently a fragrant hair powder (akūt), used by members of either sex but made only by women, is added to the oil. In preparing it, the roots of the following four plants are mixed together:

1. Cyperacea Cyperus articulatus L. (andǎk);
2. Moracea Dorstenia scabra (Bureau) Engl. (azǒ'm Fang);
3. Urticacea Trymatococcus africanus H. Baillon (ngō'nǎ III);
4. An undetermined grass called niasǎda.

/Figs. 139 and 140 appear here in the original text./ /189/ /Fig. 141 appears here in the original text./ In any case, they mix two or three of these roots if they cannot get all four of them. The roots have to dry for two months in the hut and are then completely ground to a powder -- in the case of the Trymatococcus this is done only with the bark -- and they are then sifted through a basketwork plate by tapping it with a knife (a kūt, "to tap"). The roots produce an agreeably scented yellowish powder.

302 827 The Pangwe dislike hair on the rest of the body as much as they dislike it on the face. Underarm hair is shaved off with a razor (Fig. 140) "because of the bad smell"; pubic hair is shaved off -- again by both sexes -- because it is believed to cause itching. /Fig. 142 appears here in the original text./ There are, of course, always people, like good old Otu-Mfǒǒ, who will not bother with this kind of attention to the body.

412 Just as we use pocket knives, the native uses /190/ one-edged or two-edged knives (okǒń), Figures 141 and 142, which he forges himself and carries in sheaths made of brass, leather, hide, etc. at his belt.

515 164 The farther north one goes in the region, the more industriously do the Pangwe brush their teeth. This is done with a stick spliced at the top (Fig. 143) which at times is attractively wound with brass and wire and often serves as a walking stick. Nevertheless the Pangwe do not have nearly such good teeth as one might imagine. Among the Fang at least I never once saw an immaculate set of teeth among adults. The molars are often astonishingly poor, but the front teeth, on the other hand, which are commonly chipped to a point, are better preserved, perhaps because they alone are properly brushed.

515
302

The most important toilet article of both sexes is unquestionably the small oil pot. As often as possible, the Pangwe rub themselves with oil from head to toe, but above all they take care of their hair or, as the case may be, their hairdo. One reason for this, as they say, is that they find the smell of the oil pleasant; a second is that the skin becomes more supple and resistant, in other words, it is a hygienic reason. Add to this the fact -- as was mentioned above --

412

515
302 that raffia palm oil is evidently offensive to lice /Fig. 143 appears here in the original text/ and prevents them from becoming too intimate with their "host." In the case of skin diseases
757 (Krokro /Ed.,?/ and scabies) and of sand flea wounds, it is even used as a remedy.

Oil (mbǒn) is obtained mainly from palms: in the north, only from the oil palm; in the south, rarely from this tree and mainly from the raffia palm. At times it is also produced from the kernels of Mimusops djave (Lan.) Engl. (adžǎ'b; fruit, ebǒn; kernels, ngǒ'n IV-ebǒn), from the kernels of the Carapa procera D. C. (engǎ'n), and only very rarely from groundnuts (see page 58).

The oil of the raffia palm is used exclusively for the care of the skin, while that of the oil palm is used for the same purpose

Fig. 143. Toothbrush.

for the greater part, only from one-sixth to one-fifth being consumed as food.

(a) Raffia palm oil.

249 The fruit (ažũ,i'), not yet fully ripe, is carried in baskets from
303 the swamp to the village where they are kept for six days under banana leaves and pieces of banana stalks. Then the scaly shell, insofar as it has not fallen in of its own accord, is removed, and the layer rich in oil, which is located between the armor and the seed, is peeled off by hand or with the help of a scale from the shell. The following riddle refers to the latter procedure. /191/
249 /Fig. 144 appears here in the original text./

"With the knife that he had below at his belly, I shall divide him for you."

249
303

A little water is added to the pulp which contains the oil; it is stirred and then placed on a piece of bark to lie in the sun for a few days. It is then put on a frame (Fig. 144, left) and, by means of a fire laid under it, is thoroughly heated for half an hour to an hour. Afterwards it is placed in a little basket, [445] specifically made for this purpose (ekūt ažū,ī) from the Ancistrophyllum (nkāne), which is squeezed out on the oil press (ekǎ'le-mažū,ī, efǎ'ī-ažū,ī). Although this press is made *by one man alone, it may be used by all the villagers.* In most villages it is set up near the meeting house and consists of a frame -- two posts planted in the ground at some distance from each other with two cross-sticks tied to them -- and of a board cut to a point near the bottom and attached sideways to the frame, that is to say, it is simply tied to the upper cross-stick (as seen in Fig. 144), or it may be held by means of a pole set at an angle in the ground and passing through a hole drilled in the board at the upper end. In order to hold it tight,

249 303 the board is tied to the /192/ lower cross-stick. Sometimes in place of the board one sees sticks oriented in the same direction and placed close to each other, which are then, of course, tied to the frame at the top and at the bottom.

The pressing itself (a kīle mažūī) is shown in Figure 144. The little basket with the pulp is hung either over the stick that is set at an angle or over the upper end of the board (Fig. 144), so that it rests in front of the board. Then it is squeezed out with sticks. In squeezing, one stick after another is placed diagonally over the basket (in a top to bottom direction); one end of the stick is placed behind the corresponding frame post while the other end is drawn up to the other post and fastened to it with string. In this way the basket is squeezed, and the contents are pressed downwards.

Prior to this, a vessel has been placed under the board down which the oil runs during the pressing. A leaf filter or an old basket over the vessel strains out the larger impurities. During the rainy season the fruit yields a more watery oil, while during the dry season it yields an oil that becomes solid very soon after being pressed out.

(b) Oil palm oil.

249 252 Corresponding to the more infrequent occurrence of the oil palm from north to south, oil from the oil palm is of much greater importance in the north than in the south. In the former region it is better prepared -- if at this point I may speak of it as a food -- even if it is not prepared as well as among the coastal tribes -- while in the lower region it is less well prepared. Furthermore, while in the south there are only three methods of obtaining the oil, in the north there are four and an equal number of varieties of oil corresponding to the methods of extraction. These are as follows: /193/ /Fig. 145 appears here in the original text/

1. Pressed palm oil (mowǔ, plural), for rubbing on the skin and food;
2. Boiled palm oil (nnyǎman e mbǒn), only for rubbing on the skin;
3. Washed palm oil (ǎoh), Jaunde and Mwele, used for rubbing on the skin and for food;

249
252

4. Palm seed oil (mbǒn e mbań, maniańga Jaunde), used only for the skin.

In the order given, from 1) to 4), the frequency of production decreases. In other words, pressed oil is made most frequently, palm seed oil is made most rarely. The order is the same for the southern Pangwe, except that washed oil is completely absent.

1) Pressed oil.

The stalks bearing the ripe fruit are taken off the tree, cut apart by means of axe and cutlass, and left to lie for a couple of days under a blanket of banana leaves. Then the fruit itself is taken off and boiled with a little water for about half an hour in a pot covered with leaves. Afterwards, it is pounded in a trough with a wooden pestle, and the seeds are picked out (Fig. 145). The pulp is then pressed out on the oil press. The oil has the familiar yellowish-red color, and among Europeans it appears on the dinner table as "palm oil chop" with meat and the tubers of macabo or taro; however, only a small proportion of the natives eat it (one-quarter, in the south even less).

[262]

249
252
415
301

Fig. 145. Extraction of Oil from the Fruit of the Oil Palm.

2) Boiled oil.

249 The pressed oil is boiled until it becomes quite clear, a
252 stage which can best be recognized by letting a few drops of oil
824 fall onto a piece of raffia pith. During the boiling, a number of leaves of the feverweed Andropogon schoenanthus (ǒsim e ntangan), which has a peculiar smell, tied in a bundle and dipped into the pot for about a minute. When the oil has boiled long enough, the pot is taken from the fire, leaves and pieces of bark of the bush plum Pachylobus edulis E. Don. (asǎ' Ntum, ǒsǔ'nga Fang) are put in it for about three minutes -- supposedly because they have a pleasant smell -- and then the translucent, dirty-white oil is poured off.

3) Washed oil.

249 The oil is first treated like the pressed oil. After the pound-
252 ing, water is poured into the trough, and the meat of the fruit is thoroughly kneaded, the kernels being removed at the same time. The water is then carefully poured off. This process of kneading the meat in the water is repeated two more times; then the meat is removed, and the oil floating on the water in the trough is ladled off. The oil has the same characteristics as the pressed oil; it is also yellowish-red and is used in the same manner. This oil may likewise be boiled, and when this is done, it is identical with the boiled pressed oil. /194/

4) Palm seed oil.

The palm nuts are broken open on a stone (Fig. 146), and the seeds are heated over a fire in a pot without water. Then the seeds are set on fire, which forces out the oil that they contain. The seeds with the oil are then poured onto a potsherd with two holes in it, and the oil drips into a vessel placed underneath. Palm seed oil is quite dark and opaque.

Finally, we might mention that children -- adults only if
302 there happens to be no oil available -- sometimes simply place the palm fruit between the logs of the fire and then rub the warm fruit back and forth in their hands. The oil which is forced out in this way is then immediately rubbed onto the skin.

302 822 Aside from rubbing his skin with oil, the Pangwe likes to smear his body with dyes on certain occasions. For this purpose he uses red chiefly, more rarely white, and only exceptionally black. There are no other colors. Red is the color for joy,

[415 249 252 516]

Fig. 146. Nuts of the oil palm are cracked open to extract the oil.

and white is the color for death and evil. From this, the occasions on which the colors are used will be apparent. On festive occasions, that is, dances, weddings, and birth celebrations, red is used, a color which sometimes (for instance, in the love dance) is enlivened by white suns and circles, which seldom

302 822 appear in black. The natives also put lozenge-shaped /195/ spots (bendö[k] be ba, "lozenges from the redwood") on the skin, or they leave lozenge-shaped areas uncolored when they paint themselves red, in both cases with the help of a stencil, that is, a /Fig. 147 appears here in the original text/ leaf from which a lozenge-shaped piece has been cut out. On occasions of mourning and cult activities dedicated to the "Evil One," on the other hand, they wear white.

386 Red dye (bā III, esī) is obtained from the heart of the redwood tree Pterocarpus soyauxii Taub. (mvō' IV Fang, mvē IV Ntum), a Leguminosa. They prefer old trees that have fallen down and are already rotten on the outside. A piece of convenient size is knocked off, and using it as a scraper (niāk-esī IV) they rub it on the rubbing block (niē-esī), which is the trunk, going back and forth and sprinkling fine sand on it from time to time. Once I saw the husk of the Leguminosa Pentaclethra macrophylla Benth. (ebāi), Figure 147, used as a scraper. When the nearest redwood tree is at so great a distance that it is impracticable to run to it whenever dye is needed, a small log and a scraper is taken to the hut in order to be able to produce the favored red dye at all times without any trouble. Very charming little vessels in [415] the form of pots, troughs, plates, or stools are used as containers for the dye (Fig. 148). /Fig. 148 appears here in the original text./

White dye(vūok IV) is obtained from the white clay of the same name, a kind of pottery clay which usually is darker. It is applied after being mixed with water. Black dye is prepared from crushed charcoal to which water is added (dye and charcoal, pfī'di III).

4. Decoration of the body.

302 304 We recognized the adornment of the body with different objects as the expression of a purely esthetic urge; we recognized the desire to express personal moods as the motive for painting the body. /196/ On the other hand, religious reasons doubtless originally played a role in the constant alterations made on the body. This seems clear, for instance, with respect to the custom of making the teeth pointed and incising the body. These very

386

386
415

Fig. 148. Vessels for Red Wood.

302
304

ancient notions have of course been forgotten today, and the idea of decoration for the most part has completely overshadowed the religious background.

In the Pangwe region four kinds of actual body decoration are to be encountered. These are burned scars, decorative scars, painting, and tattooing. This sequence is also to be understood in a temporal sense, from the point of view of their historical development. I consider the burned scars to be of the greatest antiquity. We may presume that they first came about accidentally as a result of the use of fire; then, at a later date, they were produced intentionally through dabbing with red-hot coals. These burned scars were later replaced by "cut" scars, that is, by decorative scars produced with a knife, since the knife allowed a finer and more artistic tracing of the line. It may be that at this point younger people, out of fear of the pain, simulated the burned scars by drawing corresponding points or lines on their body with coals that had cooled off. In this way the painting of the body may have started, and this was then further developed with other and better materials. A link between the decorative scars and painting is provided by tattooing; in this process the wounds are rubbed with charred resin.

In my opinion, accordingly, all the varieties of body decoration derive from a common root, fire. In this connection a brief linguistic consideration may be of value. As I already indicated on page 8 /not translated/, kǎ is the original stem used to designate hostile motion to and fro, pain and danger, cold and heat (for the effect of both is the same), and consequently also fire whenever its effect is to be emphasized. Thus, for example, we have n-kǎ-bǎ = the flame; e-kǎ'ha = what is needed for a flame, a torch; a kǎ'-d-an = to set fire with a red-hot coal (an); -k-ad? = red-hot charcoal (see Meinhof, Grundriss einer Lautlehre der Bantusprachen /Outline of a Phonology of the Bantu Languages/, page 160, not known to me in Pangwe); me-kǎ ellǎ = the name of a tree which supplies charcoal, literally: "charcoal tree"; a kǎ-ń = to draw with charcoal, to draw, to write, to brand, to paint (with black); e-kǎ'-ń = tattooing; n-kǎ'-ń = the one who has been drawn, the guinea hen (also sacred, Class I of prefixes; see the Mekang cult).

304 Nowadays only children and half-grown boys or girls make simple burned scars (ndǔtǒ'lǒ III) arranged in rows on their lower arm, more rarely on other parts of the body. A small, slightly charred splinter of bark from a raffia leafstalk is pressed with its tip against the skin /197/ and set on fire at the top; it then slowly burns a hole into the hand, which leaves behind it a slightly raised, roundish scar smooth at the top.

Decorative scars among the Fang, where they are found most frequently and in the most artistic forms, seem to be of great antiquity. At the same time, they do not seem to have spread [184] very far north. They are still found quite frequently among the Ntum, but only rarely among the Bulu, among the Bene only on some older people, and not at all among the Jaunde. More [177] recently, they have also begun to disappear in the southern Pangwe region since people prefer to undergo the recently introduced and far less painful tattooing process. The decorative scars are called /Fig. 149 appears here in the original text/ mvǎn̂ (plural) by the Ntum, endǒ'n̂ by the Fang, and they occur on members of either sex. To make them, a small iron hook (tsǎǎ̂ III Ntum, endǒ'n̂ Fang) is needed; with it the skin is pulled slightly upwards, and then the raised fold of skin is incised with a knife, Figure 149 (okǒn̂ e mvǎn̂), held at right angles to the hook (Fig. 150 and 151). The wound is left to heal without anything being rubbed into it or any bandage being placed on it. These decorative scars are to be found only on the body and on the upper arm, rarely on the face and then only on the forehead.

305 306 [184] Body painting is confined to the Ntum and Fang region and is completely absent in the Jaunde region, supposedly because the tree from which the dye is obtained does not occur there. This tree is the Randia malleifera (Hook) Benth. which among the Fang is called obǒ'ndǒ'm (1) or f'na IV (2), as well as mf'na; among

1. Derived from abǒ, Cola acuminata P.B., and ndǒm, "long, swaying," because of the slenderness of the tree.

2. From the stem yǐn, "dark, black"; e-yǐn-di mǒt, "Black (man), Negro."

386 302 the Ntum it is called abĕndĕm or kūdemǎ'n IV.

The names fĭna (mfĭ'na) and kūdemǎ'n also designate the painting of the body itself. /Fig. 150 appears here in the original text./

The Randia is a slender tree belonging to the Rubiaceae and grows especially in the vicinity of rivers. Its large whitish blossoms hang from the ends of the twigs or from the forks in the

[412 304]

Fig. 149. Knife for Making Decorative Scars.

branches; its fruit is a berry covered with a number of protuberances running from top to bottom. To obtain the dye a short stick of bark from a raffia leafstalk is drilled into the base of the fruit and stirred about in the contents of the fruit. When the stick is pulled out, a whitish, fairly thick juice sticks to its tip, and with the same stick this is painted directly onto the body in the desired patterns; /198/ after a brief period of time the dye

[304]

Fig. 150. Making the Incision for a Decorative Scar.

takes on a deep blue-black coloring. The paint stays on the skin from three to four days; in cases of more frequent washing, only two. Afterwards it simply disappears.

302 178 Nowadays only small or half-grown boys paint themselves for sport. In former times, however, young people of both sexes did it in order to be conspicuous and in this way to make an impression upon the opposite sex. In those days, therefore, great care was taken with the patterns. Today, only smeared patterns result from the children's lack of skill. /Fig. 151 appears here in the original text./

304 Tattooing, which was introduced about 20 years ago, replaced body painting; from it tattooing derived its names, fĭ'na and kūdemăn, and among the Fang it also received the name for decorative scars, myăh. Among the Ntum, furthermore, it is called ekă'n (see above), and among the Jaunde,

Fig. 151. Decorative Scar Artist at Work, Bébai, Spanish Guinea.

ofŭ (from ofŭ, "resin," which is rubbed into the wounds and brings out the permanent pattern). According to the Fang, 304 tattooing came to them from the north between the early and 177 middle 1890's. Among the Bene, who probably acquired tattooing from the east, only younger people are tattooed. It follows from this that the art must have spread throughout the

304 177 entire Pangwe region with extraordinary rapidity. In part, this spread may have been facilitated by the influence of military events. It is related that the /199/ Ntum, in their battles with the Bulu, saw tattooing on the corpses of dead enemies and made their prisoners show them the art.

304 852 Tattooing occurs among members of both sexes, but especially among males. It serves very much the same purposes that were formerly served by body painting. The young people adorn themselves with it in order to outstrip others in courtship. Ornaments and courtship are one, "one and the same" (a ne dzém eda eda), as the Pangwe says. It is certainly true that attractive patterns can charm the eyes so much that one involuntarily comes to find its (male or female) owner more attractive than would have been the case without such an influence upon the sense of beauty.

304 Even small boys have themselves tattooed. Usually a half-moon pattern is made on their foreheads, but for the most part it is only faintly scratched in and therefore fades again so that scarcely anything remains visible under the patterns later applied. From the period of puberty on, the Pangwe have themselves tattooed more frequently, and at the age of 25 years, by which time this decoration has just about reached its climax, the number of patterns is quite considerable. Normally, face, shoulder, chest, and the belly down to the navel are tattooed. Frequently, tattoos are also applied to the back -- usually only on the upper half -- and to the arm down to below the elbow joint, rarely to the hands and lower arm or to the belly below the navel (1).

1. On the neck only among the Jaunde and infrequently among them.

304 577 For reasons of modesty, the seat and upper thigh remain free of tattooed adornment, since it would, after all, be too indecent to draw attention by means of the patterns to these parts of the body which, with the original mode of dress, "unfortunately" often remain uncovered. Only in exceptional cases does one see women among the Jaunde, Bulu, and coastal Mwai who have tattooed

1: Tessmann--206 E-5 (1904-1909) 1913 FH9 Fang FH9

304 upper thighs, a custom which was imported by the morally
577 loose Jaunde. The people generally regard the custom as shameful, and they excuse it by saying: "After all they are only women; men would be ashamed to go around this way" (similarly, as among us, only women go around "décolleté").

304 Among the Pangwe the division of labor and specialization in all areas of artistic and intellectual endeavor are extreme, and this also appears in the art of tattooing which is mastered by perhaps only one in a hundred. The operation, which, incidentally, is quite unpleasant although not nearly as painful as the decorative scars, is performed in the meeting house without any kind of formalities. The "patient" sits or lies down during the process (Fig. 152). First of all, soot is made by burning some resin (otu), see page 42, and letting the smoke deposit the soot on a potsherd. The artist first traces the pattern on the body by /200/ /Fig. 152 appears here in the original text/ impressing the curved lines with a flexible, moist leaf of grass that has first been placed in ashes and the straight lines with a similarly treated raffia stick. The lines that project too far are carefully wiped away with a wet finger. For the "cobweb pattern" the artist makes use of a pistil of the hand-shaped leaf of the umbella tree (Musanga), whose ribs are broken off one centimeter above the base after the removal of the leafy part. On the lines he has drawn, he uses his knife to make little diagonal incisions very close to one another, wipes away the blood that seeps out if it is in the way, and rubs the wounds with the resin soot, carefully pressing it in with his thumb or index finger. In other cases, the resin itself, after it has been rubbed to a powder, is put into the wounds, but in that case only resin from the Anonacea Xylopia aethiopica (Dun.) V. Rich. (ojiin). The surface of the tattooed part of the body is now /Figs. 153, 154, and 155 appear here in the original text/ washed to get rid of the blood and soot. Later, rubbing with resin is repeated once more. It sometimes happens that /201/ small swellings form on the wounds which diminish the beauty of the pattern; usually, however, the wounds heal smoothly in a very short period of time.

304 Two types of tattooing are distinguished. There is the wide-
413 spread ekut, and secondly there is the endzig, the customary one

1: Tessmann--207 E-5 (1904-1909) 1913 FH9 Fang FH9

304

304
413

Figs. 153 and 154. Knives without Handles for Tattooing (ekut).

Fig. 155. Knife for Tattooing (bendolo).

304 413 among the Fang. The first type is performed with a narrow knife with no handle (mɔ̃ɔ́-bekɔ̃ʔt I). Figure 153, and, depending upon the depth of the parallel incisions, shows lines composed of clearly raised cuts or, less distinctly, uniformly dark lines. For endʒio tattooing, an ordinary razor (okɔ̃ŋgɔ̃ʔ), see Figure 140, or a special scalpel-like knife (ɔ̃kɔ̃ŋ e mɔ̃ʔ), Figure 155, is used. Its patterns are characterized by the crisscrossing of its cuts; in later years, however, they can scarcely be distinguished from the bekɔ̃ʔt, especially since both pale with age.

304 465 Tattoo artists are usually not paid when members of their own kin group are concerned, but from strangers they frequently demand shamelessly high prices. Thus, the man represented in Figure 218, Drawing (c), was thoroughly swindled, as will be apparent from the figures given here in the footnote (1). At the

304 same time, it should be noted that because of his tattooing
#65 mania some people considered him "as not quite normal." In true Negro fashion, the absence of a charge for tattooing is explained by saying that the tattooed person does not feel the pain so strongly if he does not have to pay. These conditions, however, vary greatly from place to place. Among the Jaunde payment is customary, and often it is comparatively steep.

304 Mutilation of the teeth occurs everywhere among members
#65 of both sexes. It is done mainly to the four upper incisors. Aside from decorative considerations, this mutilation doubtless also has a deeper religious basis which is very ancient and still alive in the Negroes. They -- as I was once told -- do not want their teeth to look like animal teeth (2). Since it is indeed a fact that

[71] 2. See also the same attitude among the Malays and the Negroes of the Sudan (according to Frobenius).

no /202/ large mammals have pointed front teeth (for it is with these that we are concerned)(1), this reason seems credible even

[72] 1. See the expressions for tooth chipping below, in which the expression for tooth is always ɛ́ɛ́ɔ́ "front tooth." There is no word for teeth in general; on the other hand there are terms for canines, incisors of animals (ɛ̀ɛ̀ ɔ̀ɔ̀), and molars (ɛ́kɔ́ɔ́).

though to us pointed teeth look precisely like animal teeth since when we think of the gaping jaw of an animal, the prominent incisors are the dominant feature. The Pangwe thinks first of the animal's front teeth, and, especially in the case of horned animals, he finds a surprising similarity to his own. In making this comparison, he is not disturbed by the fact that the similarity extends only to the front teeth of the lower jaw, which resemble the front teeth of his lower jaw, since ruminants usually have no

304 925 teeth in their upper jaw. A glance at the animal caricatures in our own comic papers shows how human, almost too human even, the front teeth of our cattle, for instance, appear to us. It 304 should be remembered that horned animals, tame (goats and 925 sheep) as well as wild (antelopes), play an important role in the 194 religion of the Fangwe since they are linked with the moon because of their horns. The cult of the moon, however, is the cult /Figs. 156 and 157 appear here in the original text/ of the Evil One. Accordingly, mutilation of the teeth is a symbol of turning

Fig. 156.
Mutilation of a Front Tooth.
The shaded part is chipped off.

Fig. 157
Chisel used on Front Teeth.

away from the Evil One, of destroying any similarity to him. On the other hand, it simultaneously points to an increased similarity to the Good, that is, the sun (or God [e-sɔ̄-mbe], who manifests himself in the sun), and the teeth are shaped to be like its rays. The deformation of teeth, therefore, is not to form a real "point," which to the contrary, would be something unpleasant and bad (the root sɔ̄ is in n-sɔ̄-ŋ I, "point?). (It may be that this is the reason some people knock out all or some of their front teeth.) Rather, the deformation only narrows the teeth and gives them the shape illustrated in Figure 156. The teeth are, so to speak, "stretched" and made to resemble a sun beam; from this comes the expression a sɔ̄-m-ʒo mesɔ̄ from a sɔ̄-m, "to stretch" (n-sɔ̄'-m-ha, "the row, the line," actually, "ray"). The widely current expression "to shape the teeth to a point" is accurate only if one does not take it too literally: the cutting edge is merely narrowed, not brought to a point. The expression "filing the 304 teeth," which one also encounters frequently, is inaccurate since

304 the teeth are splintered off and not filed. In Pangwe another expression, aside from a sîman /203/ masǫ́, is a sɨ̂-ń masǫ́, which is derived from a sɨ̂-ń, "to carve, to chip, to adorn"; sɨ̂-ń IV means "carving, carving patterns," from the root sɨ (1).

1. On the other hand, to put a point on a stick (as an example, etc. is a sɨ̂ŋo (Fang) and a sɨ̂ŋe, a sɨ̂ŋe (Ntum): the root is sɨ!

The operation is performed in the following manner. The "patient" lies down on his back and bites firmly into a wooden roll with his front teeth. The artix places a small iron chisel (sɨ̂ń e masǫ́ IV, Fig. 157) on the tooth, takes a piece of wood for a hammer, and splinters off the edges in small pieces. The pain of this operation is not inconsiderable, and for that reason the old custom is being abandoned here and there. This is a development which is speeding up under European influence. /204/

[111]

Section 8

Craftmanship and Tools

General observations.

First Part. Bark work. (a) Raw bark. Utilization: bark for house construction, decorative barks, bark containers (their production, significance of names), coffin. (b) Bark cloth. Beaters -- Types of trees supplying bark for cloth. -- Manufacture.

Second Part. (a) Thread and sewing. Fibers of the Sacchophyllum, of the pineapple. (b) Ropes and knotting. Ropes made from pineapple and banana fibers, raffia fiber and its

1: Tessmann--212 E-5 (1904-1909) 1913 FH9 Fang FH9

manufacture, raffia fiber ropes, Gärtnera fiber ropes, Triumfetta fiber ropes. -- Knots. (c) Bands and braiding. General observations. 1) Pigtails made of fiber. 2) Carrying straps and plaited mats. 3) Drying boards and boxes. 4) Storage baskets. 5) Baskets (types, material, rattan palms and their importance). 6) Basketwork bowls of the Mwele. 7) Basketwork plates. 8) Belts. Baskets (materials, types of baskets, prices), knife sheaths.

Third Part. Woodworking. General observations. -- Products of woodcarving. -- Manufacture of cutlass sheaths, stools, stirring spoons, eating spoons, powder flasks. -- Other kinds of woodworking.

Fourth Part. Metalworking. (a) Iron extraction. Areas with iron, frequency. -- Smelting medicine. -- Abstention rule and medicines. -- Ironstone. -- Foundry. -- Smelting: preparation, workers and their tools, erection of the furnace, preparation of the furnace, working the bellows and the work of the medicine man. -- Pulling down the furnace. -- Distribution of pig iron. -- Yields. (b) Processing the iron. Location of the smith and the smithy and the arrangement of the workshop, medicine, tools, charcoal, the smith's work. (c) Brass founding. Source of the brass, smelting, founding and manufacture of neck rings.

000 Fifth Part. Pottery. General observations, products, price and manufacture of the pots. Decoration. Manufacture of blast pipes.

463 Crafts in our sense are nonexistent among the Pangwe. All the manual skills are only practiced on the side and are strictly secondary to the economic activities of agriculture, catching fish, and trapping. The very simple skills are familiar to and practiced by everyone. Beyond that, specialization begins, and among the Pangwe it is developed to the utmost. Indeed, this specialization goes so far that, for example, not even the carrying straps for children -- which only consist of two leather strips sewn together -- can be made by all household heads; furthermore, a person who manufactures eating spoons cannot make any other wood product, not even a stirring spoon. A stool maker knows only how to make stools, a crossbow carver can only make crossbows, one who makes men's carrying baskets (ebɔ̄de) can only make men's carrying baskets. Since in one village there are often no more than one or two people who know a craft, the inhabitants of the village have to purchase the objects not manufactured by these craftsmen from all corners of the compass. It may happen that they have to go some distance or even make a journey to obtain a stool, a crossbow, or the like /205/

1. Bark work.

B4 3/4 Tree bark is used in many ways in the Pangwe household, either in raw form or made into cloth.

(a) Raw bark.

It is used for the following purposes.

1. To cover the house wall and as a door (1).

1. For house construction use is made of the bark of about 15 trees whose scientific names, insofar as I could

314

determine them, are enumerated here:
Flacourtiaceae Homalium buchholzii Warb. (ovǒn-e-sǎ'k); Sterculiaceae Sterculia tragacantha Lindl. (edzǒ'le); Borraginaceae Cordia odorata Gürke (ebǒ, Fang, ebǒl, Ntum);
Bignoniaceae Markhamia tomentosa K. Sch. (edzǒdzǒh);
Rhamnaceae Maesopsis tessmannii Engl. (nkǎhǒ' I);
Bombacaceae Ceiba pentandra (L) Gärtn. (dǔm IV);
Anonaceae Xylopia aethiopica (Dun.) A. Rich. (ojǒ);
Anonaceae Cleistopholis staudtii Engl. et Diels (avǒn, yǒmǒ III);
Anonaceae Isoloma spec. (ovǒ'k);
Sterculiaceae Sterculia tragacantha Lindl. (edzǒb, edzǒ);
Triplochitonaceae Triplochiton tessmannii (ajǒ).

2. Decorative barks.
3. Containers.
4. The coffin or as a lining for the body in the grave.
5. To string the sounding board of the harp (see "Musical Instruments," Section 20 /Ed., this section of Vol. II is not translated/.

314 The required pieces of bark /Fig. 157a appears here in the original text/ are obtained in the following manner. The tree is girdled at the top and bottom, and in between a zigzag line is cut with criscross blows of the cutlass. Starting with this zigzag line, the bark mantle is easily lifted off and removed (Fig. 157a). The criscross cuts often accidentally cross in such a way that lozenges are formed. These lozenges subsequently serve as an important ornament, to which I shall return later.

3/4 For the house walls the bark plates that have been removed
3/2 are in part used without further ado. That is, they are used either completely raw or after the outermost layer has been peeled off -- the practice of the Jaunde, but the Ntum and Fang do this best with the Xylopia aethiopica (ojɛ̄h). /206/ Otherwise, the Ntum and Fang prefer to dry the bark pieces for five or more days over the fire in the meeting house or in the sun, for otherwise they quickly warp or develop cracks and holes.

Ornamental barks are treated in the same way and dried especially well because, unlike the house walls, they are not held by boards on both sides. To obtain ornamental bark, all the trees

Fig. 157a. Removal of Tree Bark for House Construction.

mentioned in the footnote on page 214 can be used, but Cordia odorata Gürke (ebɔ̄, Fang) and Triplochiton tessmannii (abɔ̄) are especially suitable since various layers can be drawn off from their bark after drying, each one of which can be used by itself. This means a saving of labor which is as valuable to the Negro as it is to us. The bark is made into rectangular plates painted
3/4 with figures and scenic representations or patterned in colorful
3/2 rectangular, triangular, or arc-shaped fields. The frames of
401 the rectangular fields consist mostly of raffia leaflstalk strips running diagonally; those of the arc-shaped fields consist of

314 strips of rattan palm. Both frames are drawn through holes made
342 with an awl (nsɔ̄ñ), Figure 174, c; they are sewn on with fine
91 palm bands. In the next section I shall speak of the patterns.

To obtain bark for houses and decoration a whole number of
314 trees are available, as we have seen. On the other hand, containers
415 -- at least in the southern region -- are made from the bark of
322 only a single tree, a Tiliacea (ekɔ̄ñ). They are carefully worked, and when new they look very nice because of their even yellow-gray color which later, as a result of the smoke in the hut and through age, becomes dark brown to black. They are manufactured in the following manner. The requisite piece of bark is cut off to the desired size, and its outermost layer is scorched over the fire so that it can be scraped off with a knife. It is then bent into the shape of a cylinder so that the edges lie over one another in a narrow strip. The edges are clamped between the halves of a stick that has been split down the middle, the halves being pressed together again at the top and bottom by means of a string. At this point the edges are sewn one on top of the other with two seams. The stitching is done with palm bands, for which holes are made with an awl. The projecting edge is cut off. The lid consists of a hoop similarly constructed from the same bark and a plate made of the wood of the umbrella tree, which is also used for the bottom of the vessel.

415 Bark containers of all sizes are manufactured, from the most
761 charming little boxes to the gigantic barrel. In one respect, however, they are identical, that is, only important things are kept in them, such as the poisoned arrows for the crossbow, skulls of ancestors, and, above all, medicines, in short, all things /201/ connected with death; hence they are called nɔ̄k I (1), since

1. In addition, we find nɔ̄k I from which is derived the name of the tree, ekɔ̄ñ.

ə-sɔ̄-k -- derived from ə-sə-sk -- contains the root sɔ̄ which designates death in the religious sense. Thus, one puts something associated with death (sɔ̄) in the bark container (action is involved

since they first sought a container, e.g., for the skull of the dead, in order to preserve it; hence, the suffix aka). A bark vessel is also, as it were, the grave (n-so-n), for the body of the dead person lies in it in a trough made of bark, which sometimes is closed off with a lid of the same material (passive, since first the place where the body happened to be lying, whether in the house or out in the open, n sɔ́d, was named; hence, the passive suffix ń).

(b) Bark cloth.

Bark is made into cloth by pounding it with a beater (Fig. 159) made from the end of an elephant's tooth (d), half an elephant's rib (b, c), the horn of a white-backed duikerbok Cephalophus longiceps Gray (mvū IV), or the wood of the Leguminosa Eurypetalum tessmannii Harms (andzīts) (a). For this purpose, they do not take the wood of a freshly cut trunk, but rather the harder red wood /Fig. 158 appears here in the original text/ of old trees that have been felled a long time ago. The wooden beater has about the same shape as the mallets used by our carpenters and consists of a straight handle with a roller-shaped head which is grooved around half or all of its circumference.

The only suitable bark for bark cloth is that of fig trees (ɛ́ɛ́b = fig tree [Ficus] and cloth, clothing) (2). /208/

2. The following varieties are used in the Pangwe region:
Ficus globicarpa Warb. var. (ɛmbɔ́ɔ́b);
Ficus cfr. wildemaniana Warb. (adɛ́ɛb-ɛɛ́b);
Ficus bubu Warb. (akū-ɛɛ́b);
Ficus stellulata Warb. (ɛɛ́ɛ́, root ɛɛb) reduplicated);
Ficus preussii Warb. and laurentii Warb. (ɛɛ́b, ɛɛ́b-o-ɛɛb, ɛɛ́ɛ́, akɛm);
Ficus barteri Sprague (asɛ́mɛ́ɛ́mo Fang, asɛ́mɛ́ɛ́mo Nsum);

287
B4
314

and furthermore the varieties the Pangwe call abǎ́ń, andǔ́m, undǔ́m, and ngus.

/Fig. 159 appears here in the original text./ The most widespread varieties are Ficus globicarpa, stellulata, preussii and laurentii, barteri, abǎ́ń, and andǔ́m. The best cloth -- it is almost pure white -- is provided by Ficus globicarpa Warb. [345] (embiǒ́n) which in former times was planted near the villages. This tree is preferred by the women, who "attach more importance to clothing" than men.

287
314

Whenever possible, smooth young tree trunks, no more than eight to ten centimeters thick, are chosen. A piece is cut out

[412]

Fig. 158. Beaters for Bark Cloth.
(a) of wood, (b) and (c) of elephant's rib,
(d) from an elephant's tooth.

of the trunk and left lying in the open for half a day or a whole day. Then it is scorched evenly over a small fire, whereupon the outer bark is removed by scraping until the bast layer is completely exposed. Then this layer is cut up lengthwise, loosened by tapping it with the beater, and taken off with the fingers or by means of a stick pushed under it. The bast layer thus taken off is then pounded on some kind of support, for instance, on a tree trunk or a wooden drum. The pounding is

287
314
516

Fig. 159. Manufacture of Bark Cloth by Beating the Bast Layer of a Ficus Trunk, Uelleburg, Spanish Guinea.

287
314

done along the entire length from left to right, and the beater must not be turned (that is, the direction of the grooves) Figure 159. Then the material is folded, beaten on the opposite side, folded once more and tapped, and finally, folded diagonally, it is worked in the same manner. Through this treatment, the piece has been made about twice as long, while in breadth it has remained unchanged. At this point it is unfolded, drawn through water a few times, and then pressed out. /209/ Materials prepared from the varieties Ficus bubu, andum, and undum need not be washed.

The individual pieces of material manufactured in the manner described are narrow. Hence, several of them must be sewn together along their long edges if one wants to make a loincloth, for instance. For men this requires six pieces; for boys four.

2. Fiber work.

462
463

With few exceptions, fiber work is one of the occupations carried out by men. Indeed, it is one of their most frequent and

462 favorite activities. This explains their skill in sewing, patching,
463 and so forth, which the European discovers to his joy in his Black servants.

(a) Thread and sewing.

283 The simplest material for fiber work is thread (kiʃ IV, ndɛ̄'s,
284 IV) from the climbing Aracea Rhectophyllum mirabile N.E. Brown (kiʃ IV, ndɛ̄'s IV). The threads are obtained by cutting off the aerial roots and drawing out the fiber bundles which are extremely durable and frequently quite long. /Fig. 160 appears here in the original text./ They are used for sewing, for children's fishing rods (ngɔ̄k), and, secondarily, as binding material for combs made of strips of raffia leafstalks and neck bands made of bands of rattan palm (or Marantacea strips).

Fig. 160. Bobbin with String.

The raw leaf fibers of the pineapple are also used to sew pieces of bark cloth together, etc.

(b) Ropes and knotting.

283 Plant fibers are used more frequently in the form of strings (Fig. 160) than as thread. Just like the shoemaker's thread in Europe, the strings are twisted together by rolling them with the flat of the hand on the upper thigh. The plants used for this purpose are pineapple, plantain, raffia, Gnetnesa, and Triumfetta.

From the pineapple, the fiber bundles of the leaves are used; its strings are quite durable -- but not in water, and therefore fishing lines cannot be made from them -- and fairly fine, so they are especially suitable as strings for beads. A charming effect is created by the shoulder bags tied with them (nɔ̄ʃ̄ I), into which are put all kinds of little personal belongings, medicines, and so forth. These bags are taken along on journeys, chiefly by men.

1: Tessmann--221 E-5 (1904-1909) 1913 FH9 Fang FH9

2/3

Fig. 161. Preparation of Bast from a Young Raffia Palm Leaf, Nkolentogen, Spanish Guinea.

Very attractive white fibers (mbil[i] -ekʼh) are obtained from plantain trees by cutting down the trunk, removing the leaves and outer sheaths, and /210/ /Fig. 161 appears here in the original text/ drawing the fiber bundles out of the inner leaf sheaths. The fibers are braided into strings which are thin but not very durable and hence little used.

The bast of the leaves from the raffia palm is worked into ropes (Fig. 161). A very young, still closed leaf (because of its pointed shape, the natives use ngin, "horn," in its name, ngil ni ndengi, that is, a young, horn-like raffia leaf) is cut off and thrown on the ground so that the pinnae are loosened and can easily be torn off. The folded laminae of the pinnae are yellowish, with green only at the bent edges which in the case of a closed leaf are the only part visible from the outside. The latter are not used and are torn off. Then a lamina is pulled off from the top to just above the bottom; at this point it is bent towards, turned up, and while the fold is held in place, it is torn away underneath. Now its lower end is folded against the vein of the leaf so that the bast layer -- which is the only usable part and which grows

Fig. 162. Manufacture of Strings from Gaertnera paniculata.

together with the epidermis -- of the upper surface is loosened from the mesophyll, then the lamina is pulled off. The bast is left to dry, and after it has been hastily twisted or turned into regular strings, it is used for various purposes (for sewing bark cloth, stringing pearls, and so forth).

The most durable ropes (Fig. 162) are made from the bast of the Rubiaceae Gaertnera paniculata Benth. (ngɔ̄ma Fang, ngɔ̄ŋme Ntum, ngɔ̄n Ntum, Bulu). The shoots /211/ (Fig. 162 appears here in the original text/ of this tree are cut off, and their bark is shaved off by means of a strip of raffia math (ngɔ̄ŋ). Then a section at one end is quartered lengthwise, and the shoots are dried for a day. The upper four tips are then bent, which releases the bast layer from the wood, and it is now pulled off in four strips. The layer consists of a fine soft web of fibers which can be processed without further ado. The product is a brownish-colored rope which because of its strength is used for angling lines, game and fish nets, crossbow strings, and stringing decorative cowrie shells.

Triumfetta cordifolia Guill. et Perr. (var. tomentosa.), ɔkɔ́ɔ́, is a shrub-like growth which sometimes grows taller than a man. It is readily recognizable by its dark-green leaves, which have a shimmering silvery-white and softly haired underside, and its yellowish blossom panicles. Although not exactly common everywhere, it occurs in open

284

Fig. 163. Pangwe Knots.

287 places in the vicinity of villages and in areas where formerly there were villages. The ready accessibility of this plant has the consequence that its bast is used more frequently for ropes than that of other plants. In order to obtain the bast, the stalk is cut off at the height of one meter, and four incisions are made in it at the upper end. The outer layers are pulled off the wood, and only then is the bark separated from the bast layer. Finally, the bast layer is relieved of its cells by being pulled under the edge of a knife firmly pressed against it (in so doing the Negro sits on the ground and uses one heel as a support). The bast obtained in this way is dried and worked into ropes which are used in the same manner as the Geerrnera ropes. /212/

288 /Fig. 163 appears here in the original text./ As a note in conjunction with Figure 163, we shall list the names and uses of the knots found in the Pangwe region.

Drawing 1: <u>solufumo</u>, "contracted"; <u>solumo</u> from a <u>lulla</u> = to dissolve, <u>fim</u> = into nothing. Since pulling at the long end the knot is immediately untied, it is used in the

284

house to hang up things that one frequently needs, as well as for neck bands.

Drawing 2: [illegible] e [illegible] from [illegible] = knot, [illegible] = firm, strong. The knot is attached -- as among us -- to the end of a thread to prevent it from pulling out (as, for example, in baskets) or to prevent beads from sliding off a string.

Drawing 3: [illegible] e [illegible] from [illegible] = holding rope, used for climbing trees, for tying together two ropes, especially for the holding ropes.

Drawing 4: [illegible] e [illegible] ([illegible] = firm, strong?), used in the same way as the previous one, as well as for neck and forehead bands that are to be used for a longer period of time.

Drawing 5: [illegible] -[illegible]; [illegible] = eye, [illegible] = fixed net. These knots are used for fixed nets and hammocks. Drawing 5 shows the knot loosely tied.

Drawing 6: [illegible] e [illegible] ([illegible] = tree draw trap for birds), used for bird traps, fish weirs, and probably also for other purposes.

Drawing 7: [illegible] [illegible] = correct, true knot. Drawing 7a, loosely tied; Drawing 7b, drawn tight.

Drawing 8: [illegible] ([illegible] = back, [illegible] = turtle; thus, turtle's back), used only to tie net meshes. /213/

(c) Bands and braids.

283 In contrast to ropemaking which combines twined plant fibers into strings, braiding combines strips of fibers lying next to each other, which I call bands. They come arranged this way in nature, in leaves, bark, bast, or wood, which are cut into strips. /Fig. 164 appears here in the original text. /

(1) Pigtails of bast.

One takes two bast strips, folds one double and places the second between the folds so that the upper half remains outside and can later serve as a fastening. This provides three braiding

/213/

284
415

Fig. 164. Mwele Device for Hanging Cooking Pots.

285
415
251

Fig. 165. Storage for Groundnuts.

283 elements of the same kind, and these are braided together into a pigtail (helmet cape and helmet hairdo; see also device of the Mwele for hanging pots, Fig. 164). /Fig. 165 appears here in the original text./

(2) Carrying bands and braided mats.

[282] The carrying bands are braided from Triumfetta bast strips (two under, two over). The braided mats are made from leaf strips of the screw pine Pandanus (awŭ'be, kŭbuga; contracted form, abŭ̃) which intertwine like a chessboard. Mats are found only in the [285 497] southern border region and are probably imported. There is a boat-like satchel for the novices of the Jaunde moon cult (see Section 11 /Ed., this section in Vol. II is not translated/), which is braided like the mats and made of the same material.

(3) Drying boards and boxes.

283 The floors of the drying boards are made by braiding raffia 285 stalk strips (four under, three over). The bottoms and parts of the 416 side walls of the boxes are made from braided palm bands (three under, three over). /214/

(4) Storage baskets.

285 The storage basket (angŭn Jaunde, angunda Mwele) is a 251 transitional form between the box and the basket insofar as its 415 basic material is raffia pith boards (Fig. 165) placed next to each other and held together by stalk strips of Sarcophrynium tied around them. The storage baskets are used in the house for storing foodstuffs, such as groundnuts, ears of corn, and so forth.

(5) Baskets.

285 Basketwork is done either with one material or with a combina- 415 tion of two different materials. The former is the case with the following.

1. Women's hanging baskets (nkún I). Unlike most other baskets, these are also manufactured by women. They are made from strips of the stalk bark of Sarcophrynium velutinum K. Sch. (stalk, ndɛ́c, ndɛ́nǎn IV). They display considerable variation, both in size and pattern (Fig. 166). /Fig. 166 appears here in the original text. /

2. Carrying baskets (nkɔ́ɔ́' I), which are used only once, are woven in wide meshes from stalks of the Sarcophrynium by men and women whenever their regular baskets are not available or not available in sufficient numbers, or if they want to spare the baskets. Thus, they would use the carrying baskets, for instance, in

Fig. 166. Women's Hanging Baskets.

order to transport the bloody flesh of a freshly killed elephant into the village and for similar purposes.

3. Baskets for the oil press and for carrying earth (ekút, ekút-akɔ́ɔ́' = oil press baskets, ekút-ebɛ̂ = earth baskets). The first is used to squeeze out oil from the pulp of the fruit (akɔ́ɔ́') of the oil palm or raffia palm; the second, to remove the earth that is dug out when pits (ebɛ̂) are made. Both baskets are braided from Ancistrophyllum acutiflorum Becc. (nkɪ̂ne) (1).

1. I once saw a knife sheath woven entirely from bush rope (Oncocalamus). Figure 167.

285 The second class of baskets displays a variety of braiding elements: one that is flexible and active (braiding strips) (2), forms

[113]

2. See the discussion in J. Lehmann, Systematik und geographische Verbreitung der Geflechtsarten /System and Geographic Distribution of Types of Braiding/, Leipzig, 1907.

the bottom of the basket, and, ascending upward, is tied around the second, stiffer, passive one (braiding strand). /215/ Placed in the form of a spiral, this second element forms the wall of the basket. The sources of the braiding elements are as follows.

285 824 The active elements are taken from Sarcophrynium stalk strips, Pandanus leaves, or -- this is the predominant source -- the outermost wood layer of the rattan palms. The term for these current today is the collective name nlɔ́ñ I, a word derived from the root a lɔ́n "to braid, to twine" (compare a lɔ́n ndɪ̄, "to weave a house together, to build"; a lɔ́n nlɔ̄ɛ̄', "to weave baskets"), and used at the same time for the "bush rope" obtained from the rattan palms. Formerly, nlɔ́ñ designated only the Eremospatha macrocarpa M. et W., which occurs only in the coastal strip west of 11 degrees longitude and in the north or northeast of the Pangwe region. Later, when the Pangwe came south, the term was transferred to the two rattan palms occurring there which are used for the same purpose, namely, Eremospatha tessmannii Becc. (ongɪ́m) and especially Oncocalamus mannii Wendl. (ebɔ̄'/'ɛ̄gɔ̄ Fang, ebɔ̄'dɔ̄k Ntum; young, akɔ̄'lɔ̄ɣ), Plate 16, Drawing 1, which is important there (1).

342 824

1. The rattan palms mentioned, aside from being used in weaving, are also used in the following ways.

1. In house construction: as rough bands, to tie together the framework of the house; as finer bands, to tie together the lathes of the side walls and the raffia leafstalks of which the sleeping

1: Tessmann--229 E-5 (1904-1909) 1913 F119 Fang F119

372
824

benches are made; and -- in the form of very fine bands -- to tie roof mats together.

824

2. In bridge construction, as railing ropes.

3. To wind around worn or bad wooden handles (cutlass and knives) and handles of fly swatters and brooms.

4. As a band, for example, to hold together damaged rifle butts and wooden plates, to tie down the bark stretched over the sounding board of the harp, and so forth.

5. As the main strand for the woman's back apron made of bast; the bast bundles are fastened to it.

6. As string for the musical bow (eŋ̄m).

7. As bird snares.

8. In making bark containers (see above).

9. As decorative strips for arm and neck bands (ekǎr).

10. As a stamp to make a pattern on pottery.

285
824

The passive element mainly comes from the rattan palm Ancistrophyllum acutiflorum Becc. (ukǒne, more rarely ekǒ). Plate 16, Drawing 2, which differs from the Oncocalamus mannii in having large spikes on the upper side of the main leaf vein and finer spikes on the center vein and along the sides of the pinnae, a terminal inflorescence, and differently colored fruit (2). As

2. Aside from weaving, this is used in the following ways.

1. Decorative strips for arm and neck bands (ekǎr).

2. Walking sticks.

3. Sugar press.

4. Tension ropes for drumheads.

5. Bands, a substitute for bush rope.
6. Scraping sticks for cassava.

The related Ancistrophyllum opacum M. et W. (ngbwɛ̃) supplies tension ropes for drumheads, net hoops, and snares.

/216/ a substitute, Calamus deerratus Mann et Wendl. (ndɛ̃ʔ) (1).

1. This is also used for flutes (ndɛ̃ʔ I) and sticks for scraping cassava (ekɔ̃-ndɛ̃ʔ).

is used for some kinds of baskets (women's large carrying baskets and men's small carrying baskets).

The following kinds of baskets are made with various types of weaving.

1. Covered basket of the Jaunde (ɛ̃ʔ) made chiefly by women. Braiding strand of palm bend, braiding strips of Pandanus leaf strips, braided like a checkerboard (one over, one under).

2. Large carrying baskets for permanent use (ɔkɔ̃ʔ I, ɔkɔ̃ʔ I Fang), in which the women /Fig. 167 appears here in the original text/ carry home wood and produce. Braiding strand of Ancistrophyllum (ɔkɔ̃ɔ), more rarely of Calamus deerratus, braiding strips of Oncocalamus (ɔlɔ̃ɔ).

3. Small carrying baskets (ɔkɔ̃kɔ̃ʔ, "small carrying basket," and engɔ̃ʔɔ). Figure 168, made of the same material as the previous ones, only smaller, frequently with a more finely braided edge whose active part may consist not only of bands but also of strings. Usually, moreover, the main braiding strand is replaced for a short distance in the middle of the basket by a blackened one, called ekɔ̃ɔ nɔ̃ʔ (b). These baskets are considered especially elegant; the women takes them with her on journeys and packs food in them. In the house, raffia aprons and other objects are kept in them, and in the fields they are used to hold groundnuts and other things. /Fig. 168 appears here in the original text. /

4. Men's carrying baskets (ebɔ̃ʔdɔ). Figure 169. In the case of these baskets, the braiding strand is made either of Calamus or

Anciomphalum. In the latter case, I found them strengthened from the outside by little sticks of the same material braided in diagonally.

5. Bamba baskets (ngili). /217/ These appear in two forms: the first and larger one consists of the same material as the carrying basket, the second and smaller one has the same reinforcing sticks in its wall as the previous baskets and a piece of calabash shell for the bottom (concerning their use, see Section 20 /Ed., this section in Vol. II is not translated/ and the illustration there).

(8) Basketwork bowls of the Mwele (ekiti).

For these (Fig. 170), there are likewise active braiding strips and one passive /Fig. 169 appears here in the original text/ braiding strand wound in a spiral, as in the true baskets of the second series. In contrast to the latter, however, the spiral begins in the middle of the bottom and thus forms the bottom and the wall, and it is held together by braiding strips woven in at right angles. These bowls, which perhaps are the result of northern influence (Itsumá /Itsuma/?), are used by the Mwele to store maize meal and as plates for finer foods.

(7) Basketwork plates (dĩã.d; plural bĩã.ɔ).

Here (Fig. 171) we have, in place of a braiding strand that runs in a spiral, numerous braiding strands made of strips of the Ancistrophyllum acutiflorum Becc. (nkãne) or of the Marantaceae Trachypharynium violaceum Redlk. (nkãmonkãmo Fang), which form the quadrangular bottom surface and the basic material of the edge (or, as one might prefer to say, of the wall). In order to make the edge tight and to hold it together, a braiding strip is woven into it, this being a band from the stalks of the Oncocalamus mannii Wendl. (nkĩ̃ã), the Orchidaceae Mymacidium productum Kranzl. (nkã̃-o-ɔ̃ɔ̃ (1), anĩ̃ãma), the Apocynaceae Motandra spec. (nkã̃-e-ni) (1), or from a raffia pith strip (nkã̃-ekõõ). The position

> 1. nkã̃ from the root kã̃ = band, rope; o ɔ̃ɔ̃ = above, because the orchid is a parasitic plant growing on trees; o ni, = below, because the Apocynaceae grow on the ground.

of the braiding elements with respect to each other is thus precisely the reverse of that in the true baskets of the second series. /218/

/Fig. 170 appears here in the original text./

285
445

They are manufactured in the following manner. Four strips are placed close to each other lengthwise on the ground and held down with one foot; at some distance from these and parallel to them four more strips are laid down, and so on ten times, so that in all there are forty strips. These are diagonally interwoven with 36 strips likewise arranged in fours, so that each of these diagonal strips always runs alternately over and under three of the longitudinal strips, but so that there are different longitudinal strips at each diagonal plait, for instance:

Diagonal strip 1 lies under longitudinal strips 2-4, over 5-7, under 8-10, and so forth;

Diagonal strip 2 lies under longitudinal strips 3-5, over 6-8, under 9-11, and so forth.

I: Tessmann--234 E-5 (1904-1909) 1913 F319 Fang F319

285
445

Fig. 170. Basketwork Bowls of the Mwele.

When all the strips have been woven, they are pushed tightly against each other. In this way, a firm quadrangular surface is created, which is held together by one or two bands tied over it in a cross, and the ends of the strips that have not yet been woven protrude from the sides of this surface. These become the braiding strands of the edge of the plate by being bent upward to a greater or lesser degree -- depending on whether the plate is to be deep or shallow -- and interwoven in a spiral form with a braiding strip that always skips one to three of them. /Fig. 171 appears here in the original text. / /219/ In the process, patterns are created through variations in the weaving. Finally, the braiding strip is pulled tight. Gaps at the corners are filled in with independent, short braiding strands that have been bent double. The edge is closed off at the top with a hoop of Ancistrophyllum (nkâw). The braiding

Fig. 171. Basketwork Plates.

1: Tessmann--235 E-5 (1904-1909) 1913 F109 Fang F109

287 strands are placed like hoops around its outside edge, and they are
415 fastened to it with Triumfetta bast or a string.

Depending on their size, the basketwork plates have various names. The small ones are called ñ̄ ñ̄ Fang (a, b), the somewhat larger ones ŋ̄ŋ̄, the ordinary large ones dīkā, and dīkā - real, true basketwork plates (c).

Concerning their use, see page 127.

(f) Belts (bab IV).

283 These are braided from a number of superimposed strips of Ancistrophyllum (nkāne) interwoven with bush rope Oncocalamus (see "Dress and Ornaments," page 166).

3. Woodworking.

222 Despite the considerable importance accorded to it in the
517 Fangwe household, wood carving has remained on a comparatively
532 low level of development and bears no comparison with the achievements of other primitive peoples, such as the Melanesians. Its forms display a certain sober utilitarianism, a stiffness and uniformity from which all movement and playfulness are excluded. Only rarely does it rise to the level of representational sculpture. Representations of whole human beings are to be found primarily in the ancestral figures, rarely on chiefs' sticks; heads, moreover, are to be seen only on the posts of meeting houses (seen only in one case), on bench posts in the meeting house, in the memory game, and in the masks used for the moon cult (Sao).

322 The number of objects made of wood is very large, as will be apparent from the list that follows:

1. Digging sticks
2. Shovels
3. Hoe and axe handles
4. Posts for the meeting house
5. Bench posts for the meeting house

322 6. House doors
7. Dugouts
8. Oar blade
9. Troughs
10. Pestles
11. Rubbing board for Irvingia kernels
12. Stirring spoons
13. Eating spoons
14. Wooden pieces
15. Pots for oil
16. Flasks for powder
17. Bowls for red wood
18. Chiefs' sticks
19. Walking sticks
20. Rifle stands
21. Bark tapper /220/
22. Pipes
23. Cutlass sheaths (antiquated)
24. Bellows
25. Dog bells
26. Stools
27. Crossbows
28. Spear handles
29. Shields
30. Talking drums
31. Hide drums
32. Harps
33. Wooden musical pipes
34. Wooden flutes
35. Xylophone keys
36. Whistles
37. Jaunde playing counters
38. Wooden Phallii
39. Stilts
40. Memory games
41. Arm rings
42. Ancestral figures
43. Masks for the moon cult

To describe in detail the manner in which all these objects are manufactured is impossible within the scope of this account. Hence, as examples, I shall merely touch on the making of cutlass sheaths, stools, and stirring and eating spoons.

322 412 The now obsolete cutlass sheaths -- called such by the natives; in reality, they do not encase the cutter but only form a pouch in which it is carried -- are rectangular in shape, with concave longitudinal sides. They are made in the following manner. A longish board about one centimeter thick is cut from the wood of the umbrella tree; this board is cut up into two equal rectangles. With a red-hot cutlass the narrow sides are made smooth and the long sides are rounded inward and also made smooth. On one surface the boards are hollowed out in the form of a rectangle, and at the corners holes are drilled through them with a red-hot gun rod. Then the two boards are placed one on top of the other, with the hollowed surfaces facing each other, and tied together with bush rope. The outer surfaces frequently are decorated with simple patterns burned into them. Finally, the sheath is provided with a carrying strap of animal hide.

The stool is a valuable piece of household furniture, a luxury object, for which the natives are willing to spend some money. For this reason its manufacture is an important branch of wood carving, and the makers of well-finished, artistically decorated stools are famous persons, much in demand. If they wanted to, they could make a considerable amount of money with their art, and they also could elevate the art itself, but with their congenital laziness, a special inducement is always required before they will take the trouble to start a new project. For example, a guest in the house of such an artist sees a beautifully carved stool there and says: "Oh, what a beautiful stool; you could make me one like that." Perhaps others have uttered the same wish, and so the artist finally pulls himself together, goes into the jungle, and cuts down a trunk of the Apocynaceae Alstonia congensis Engl. (ekôk), the only tree suitable for the manufacture of stools. He must choose a trunk which -- after the bark has been pulled off -- has the same diameter as the proposed stool /221/ (Fig. 172). He takes the trunk with him to the village and cuts it into about five to seven disks as thick as the stool is intended to be tall. Then with his cutlass he draws a line around approximately the middle, and this line indicates the lower edge of the seat. From there he cuts three radial grooves downward, deepens them with an ada (ngbwâk IV), Figure 173, and in this way forms three legs. Then the seat is made smooth and held over the fire until it becomes nice and brown. The edge is rubbed clean with the rough leaves of the Ficus exasperata Vahl (ekôk' Fang, ekô Nsum) (1). The edge and the

1. Root kô, "to rub"; compare a-kô-k, "grindstone."

legs are colored with redwood and dried for an hour in the sun; finally they are decorated with carved patterns, an artistic addition which is not everywhere uniformly successful. /Fig. 172 appears here in the original text./

Ordinarily a stool maker finishes from two to three pieces in one day. The price is so low (two spean, the equivalent of 14 pfennigs, apiece) that it is difficult to conceive how the man can work for it.

1: Tsunoda--238 E-5 (1904-1909) 1913 FH9 Fang FH9

Fig. 172. Stages in Making a Stool.

The explanation lies in a kind of principle of reciprocity, a principle clearly stated in the educational precepts to be discussed in a later section /Ed., Vol II/, that is, the seller counts upon the fact that later he will need his client who is in turn a specialist in the manufacture of some kind of article (basketwork plates, for instance), and he then expects to be treated in the same lenient manner. As a result of the excessive division of labor, everyone is dependent upon everyone else, and this dependence keeps the prices down. Wherever this dependence is absent, the prices go up. Europeans, for instance, with whom such a silent agreement does not exist, pay considerably more, ten or twenty times more, and at the same time they have to put up with inferior work as well.

Moreover, the sale of objects manufactured for household use is not regarded as an enterprise for profit. When I asked a stool maker whom I befriended what his business brought in, he first

Fig. 173. Adz.

had to ponder for a long time and finally said that every month he made about ten stools for two spears (14 pfennigs) apiece, and that he therefore earned 20 spears (1.40 marks); with this income, he said, he had /Fig. 173 appears here in the original text/ bought brass ornaments for himself, and the rest he had put aside as marriage money, but that did not bother him since he considered his art a matter of humor. /222/

The manufacture of stirring spoons (mbēlē) is, like their form, fairly simple. From a tree trunk (1) a flat piece of wood is cut out

1. The following three trees are used: Alchornea calomeura Pax (ndimabā, III); Hanhartia didymostemon Baill. (ebēlē Ntum, dē III, eyēlē III); and Kickxia elastica Preuss (emvila).

and crudely cut to shape with a bush knife. Then the spoon is hollowed out in the following manner. A chisel (ojōn), Figure 174, and a simple heavy piece of wood for a hammer are used to make a transverse groove between bowl and handle, and the wood is removed piece by piece by blows aimed at it. The more delicate work is done by shaving with a chisel or knife. The finished spoon is usually rubbed with redwood. The people themselves do not know why this is done. In answer to my question, my friend Ntoldangs offered the following remark by way of an answer: "Look here, I am a Black myself, but the Blacks have no sense. I have long asked myself why the stirring spoons are rubbed with redwood because that way dirt (that is, the redwood) gets into the food!" The various forms of the stirring spoon are shown in Figure 98.

Somewhat more effort is required to make the ladling spoons (ndik), Figure 175. They are made primarily from the wood of the Carpodinus tessmannii Gilg (ebēlēn), more rarely from the Kickxia elastica Preuss (emvila). A block of wood in the shape of a cylinder halved lengthwise is taken from the timber and cut into the shape of the spoon by means of careful, layer by layer removal of the wood (see Fig. 176), first with the cutlass (a), then with the adz (b). The bowl is then further hollowed out with the spoon scraper (ēnege-ndik), Figure 177.

302 415 Figure 177. Finally, the bowl and the handle are rubbed smooth with the rough leaves of the Ficus exasperata.

The powder flasks (ndik e pfidi) are very laboriously manufactured from the wood of the Alstonia congensis (ekik) and the Kickxia elastica, Figure 178. First a massive flask is shaped and nicely smoothed on the outside; this shape is then split into two halves by a longitudinal cut. Each half is hollowed out on the inside with the adz, and the neck is cut off at the desired length. Finally, both halves are fitted together again and are held together by means of an animal's skin, usually of the monitor lizard, sewn over it.

Plates from the wood of the Alstonia congensis or Ceiba pentandra are also very difficult to make because even during the work the edges tend to split rather easily. When they do, the plates are nevertheless finished and repaired afterwards with bush rope.

Dog bells are made from Alstonia congensis, Alchornea coloneura, and Pterocarpus soyauxii Taub (mgb' IV Nsum); bellows are manufactured from the Alstonia congensis and Musanga smithii R. Br. (ekik); dugouts from Musanga, Ceiba pentandra (dum), and the Combretacea /223/ /Fig. 174 appears here in the original text/ Terminalia superba Engl. et Diels (akim); talking drums from Cordia odorata Gürke (ebil) and Rinorea dentata; hide drums from Alstonia, Cordia, Rinorea, and Musanga.

Spear handles are made from the easily split stems of an Annonacea (?), otunge, and of a Flacourtiacea, ekijbij (1). The

1. ki = to split, bij = fingernails; tree which can be split with the fingernails.

wood is split /Fig. 175 appears here in the original text/ into as many parts as one wants to make spear handles. First the edges created by the splitting are roughly taken off with the cutlass, and then each individual part is worked with the drawknife until a round stick the thickness of the spear handle remains. The drawknife (awin), Figures 179 and 180, consists of a piece of wood (branch fork) bent in the form of a hook, whose sides have a short slit cut

one of them in the middle. Into these slits is much either an ordinary knife (see Fig. 179) or -- and this is more frequently the case -- a special blade /Fig. 176 appears here in the original text/ with two cutting edges of which one is like that of a knife and the other like that of a saw (Fig. 180). This very practical combination permits /724/ the craftsman to dig the longitudinal furrows in the shaft of the spear with the same tool. The blade is simply /Fig. 177 appears here in the original text/ taken out and reversed, that is, is is set in again with the toothed edge downward.

1: Tessmann--343 E-6 (1904-1909) 1913 F119 Fang F119

4. Metalworking.

(a) Iron extraction.

325 The extraction of iron, surely one of the most admirable achievements of the Negro, is carried on in the Pangwe region only south of the Campo by the Fang and a small number of Ntum kin groups. Traces of old smelting works, on the other hand, indicate that in former times iron extraction extended farther northward. /Fig. 178 appears here in the original text/. Nowadays the Bulu buy iron from the Ntum in the south, and the Jaunde and Bene buy it from the Eton. The principal places where iron is extracted are located in the Wodda and Kje regions, as well as along the upper Dsele, but compared with the places where ironstone is found, they are few in number. Although for the most part people are familiar with the technique of iron extraction, only a few really engage in it. In part the reason for this may be the laboriousness of the enterprise, but in the main it must be sought in the superstitious notions connected with the preparation of iron. These notions require the cooperation of the medicine man, the purchase of expensive medicines, and the strict observance of the rules of abstinence. The rare and difficult art of extracting it from the rocks and then forging it into tools and weapons has given iron a special importance, perhaps also because both techniques require fire, the sacred element which /125/ /Figs. 179 and 180 appear here in the original text/ the Pangwe worship in the Ngi cult. The smelting of ironstone is therefore carried out under the guidance and supervision of the medicine man. Exactly as in the case of the cults, it is he alone who, by means of his medicine, can transfer to others the influence over the process with which he is endowed, or, more accurately, the others can obtain from the medicine man the ability to smelt iron only by purchasing a medicine from him. This smelting medicine (bĕ̄ĕ̄ akŭ̄, abŭ̄b-akŭ̄) (1) costs five sheep.

325
329
325

1. bĕ̄ĕ̄ = medicine, akŭ̄ = iron smelting, abŭ̄b = spider, which plays a role in the acquisition medicines and is usually -- not always -- present in the smelting medicine.

I: Tessmann--244 E-5 (1904-1909) 1913 F119 Fang F119

Fig. 179. Drawknife for Spear Handles.

Fig. 180. Drawknife (also Scraper) for Spear Handles.

322
413

five hens, and five pieces of brass wire, which altogether correspond approximately to a value of 120 marks in our money. The medicine is kept in a small wooden or clay pot lined with the soft leaves of the Triumfetta (okpit) or in a little basket. It consists of a bundle of leaves with the brain matter of an ancestor, a few pieces of skull from the ancestors placed around it, and pieces of the shaved bark of the Leguminosa Macrolobium straussianum Harms (abǒm, bǒme IV) or of the fern Marattia fraxinea Sm. (ex[illegible]), and poison (ndi). The skull and the brain as the seat of knowledge are supposed to make the smelting process successful; the Macrolobium is supposed to cause the lump iron to lie as firmly and solidly in the smelting pit (ehisi a bǒme o si, = the iron is firm [as though stamped down] under there) as this tree stands without buttress roots (hence the name abǒm from a bǒm, "to stamp in firmly, to pound in, and to be firmly stamped in"); the fern is supposed to cause the iron to agglomerate as beautifully as the young fern leaves.

325
789
[425]
[824]
[826]

Unfortunately, it is impossible to make iron with this medicine alone. For better or for worse, actual work will have to be done, and for this workers are needed. These are not so difficult to obtain since they get a share of the profit, but the abstinence rules which we have already mentioned, especially those of a sexual nature, deter many of them. These rules enjoin abstinence for two months before and during the period of work, and if they are violated, the iron will

325
834

325 not be good. This extremely unpleasant prescription, in conjunc-
329 tion with the expensive medicine, stands in the way of a greater distribution of smelting enterprises. Even in places where a hut for iron smelting is already in existence, people prefer to buy iron from others if their own has been a failure several times, for this misfortune is attributed to the failure of the fire as a result of the sexual /226/ impurity of one or a number of the participants. The
[239] importation of European iron in recent years is dealing a death blow to the native industry. The fear of bringing anything impure
326 (and all sexual matters are pre-eminently regarded as such) into
783 contact with pure fire goes so far that a medicine is made by those
841 participants whose wives menstruate during the smelting. This consists of a diamond-shape piece cut out of the bark on the supporting beam of the smelting hut on the side facing the furnace, and it is supposed to represent the female sex organ. The symbol is rubbed with redwood which has been pulverized by the woman concerned and represents her blood flow; it is covered with a leaf of the
[204] Myrianthus arboreus P.B. (mangĕme III Fang) to indicate that one wants everything impure to be hidden and therefore harmless. At the same time the plant is supposed to cause the iron to coalesce to the same degree as the individual fruits are united in a syncarp. In Plate 17 one can see a piece of the leaf on the supporting post (top left), as well as (somewhat lower down) a bark container which holds fragments of ancestors' skulls, a number of antelopes' horns, and a great variety of other medicines that are used later. That the
325 people concerned with the ancestor cult are regarded as particular-
769 ly suited to bring the work to a successful conclusion is apparent from the fact that they alone may tend the fire (see Fig. 183).

The smelting of iron is thus above all under the aegis of the fire cult, but it is also closely linked with the worship of the ancestors who contribute to the success of the enterprise insofar as it lies in their power to do so.

316 Iron crops out in the form of brown iron ore (sɛ̄ IV) (1) and is
325

1. The analysis carried out by Mr. Du Bois at the suggestion of Professor Pufahl (Königliche Bergakademie in Berlin)

316
325

> showed that the ore "exhibits a not inconsiderable titanium content, some sulphur, traces of phosphoric acid, a small calcium content, as well as a small magnesium content, in addition to the usual components, such as silicic acid, iron oxide, aluminum oxide, water, and small quantities of manganese."

simply collected and carried off. The iron ore pits (ebê-asêi from
[423] asêi, "rock containing iron") have no special significance for the Pangwe; they are common or rather ownerless property that could be claimed by anyone. The smelting of the iron ore, on the other
325 hand, takes place in special smelting huts which are usually the
423 common property of several fellow villagers; they alone may produce the iron from the ironstone which they themselves have extracted from the pits. The other people in the village may not use the smelting hut and must buy iron from them. Because of the difficulties involved in the enterprise, smelting is done only at /227/ widely separated intervals of time. On each occasion the furnace is loaded rapidly as many times in succession as there are hut owners on hand. Each owner, therefore, has a claim to the iron obtained from one loading of the furnace.

325 The smelting hut (ndǎ-akūǎ, ndžī-akūǎ), Figures 181 and 182,
343 is a simple lean-to, three to four meters high, whose ridge pole is supported by two beams. A pit (Fig. 182, Drawing 5, c), 78 centimeters deep and 1.86 meters in diameter, is dug into the ground in the center of the hut and the furnace is built over it. Another shaft (Drawing 5, b), about 60 centimeters deep, goes down from the floor of the pit, and it is on the bottom of this shaft that the above-mentioned pot with the smelting medicine is placed (Drawing 5, a). The medicine is covered with rotten leaf sheaths from the plantain so that the skulls will stay nice and cool, and then the entire shaft is filled with leaves.

325 If smelting is contemplated, all the participants, that is, the
372 medicine man, the hut owner or owners, and the hired workers, must, as was mentioned, abstain for two months from sexual

325 intercourse. During this period, the ore is carried to the hut in
372 baskets and piled up there, and charcoal (miē, mēi) is obtained. The charcoal must be especially "strong," and for that reason it is obtained only from the following five trees: 1) Pentaclethra
[824] macrophylla Benth., Leguminosae (ebā'ī); 2) Erythrophloeum guineense Don., Leguminosae (elǔn); 3) Cylicodiscus gabunensis Harms, Leguminosae (edūm); 4) Eurypetalum tessmannii Harms, Leguminosae (andzītsiń); 5) Irvingia grandifolia Engl., Simarubaceae (ngǘn IV). The wood is heaped up in small piles near the village, set on fire, and, when it is charred, extinguished while still glowing. The water with which it is extinguished is skillfully squirted out of the mouth like a shower.

325 In Bebai, among the Schumu family (Woddo region) where I
343 saw the smelting, a smaller hut stood next to the smelting hut
834 (Fig. 182, Drawing 2); this hut contained nothing but a sleeping bench (p), a poker hook (q), and a number of spare blast pipes (r) for the furnace. The hut owner for whom the smelting was to be done the next day spent the last night in it in order not to succumb to the temptation of violating the above-mentioned rule at the last moment. This precautionary measure shows how steadfastly the Pangwe actually observe the many commandments.

325 In the morning the workers appear with their tools, the blast pipes (žǒ,ń IV), and bellows.

The bellows without valve -- but in contrast, it does not have wooden sticks used as handles. It is made of soft wood (see page 240); from its two bowl-shaped enlargements (Pangwe: alǒ-nkǔ,m, "bellows ears") separate shafts lead /228/ /Fig. 181 appears here in the original text/ into the tip (Pangwe: ndžū i'-nkǔ,m, "bellows nose"). The bowls are covered with animal hide with the hairy side
[281] inward, or (only among the Jaunde) with leaf sheaths of the banana tied together in a tuft. Since the hides are moved directly by hand and not by means of sticks, only soft hides can be used, such as those of the long-tailed monkeys, the potto, the civet cat, and the African dwarf buck Neotragus batesi Winton.

The pit in the smelting hut is stuffed full to the rim with leaves of the umbrella tree, so that after the completion of the smelting process it can be cleaned of the charcoal remains without any

325
343

Fig. 181. Smelting Hut in Bébai (Schumu Family), Spanish Guinea.

325 difficulty and so that the medicine lying below will not be dirtied. Then plantain or banana stems (d) as tall as a man are planted close to each other in a circle around the pit; by means of transverse pegs made of raffia leafstalk bark they are joined to each other and with ropes and stakes are fastened to thick posts driven into the ground outside. The whole arrangement is held together above and below with ropes of Cissus runners, called ntū, and carefully plugged with smaller plantain stems (Drawing 4, f) or pieces of the same. By notching two neighboring plantain stems, holes are cut a little above the ground -- in Bebai there were 17 such holes -- for the blast pipes. Provisionally, the holes are filled up with a guide rod 1.25 meters long and corresponding in thickness to the blast pipe /229/ (ntú'm e zōṅ, really blast-pipe

325 stick), Drawing 4, h; at the bottom this guide rod is propped up by a piece of plantain stem (Drawing 4, g), and at the top it is covered by a piece of plantain leaf sheath, called ngób "shoe" (Drawing 4, i). Later one merely needs to take out the stick and push in the blast pipe in its place. When the furnace has been prepared this far, it is loaded. A man climbs into it from the top, has charcoal handed to him, and piles a layer of it over the pit in such a way that the center remains clear. He must fill the space between the floor and the guide rods; he arranges the latter so that they radiate around a common center (Drawing 1, k), and then he adds more charcoal, at the same time covering the inner wall with leaf sheaths of the plantain so that the fire will not penetrate too rapidly to the stems and through the cracks outward (Drawing 3). The leaf sheaths lie in two layers: vertically in the outer layer (ngoo, "lattice wall," Drawing 3, l); horizontally in the inner layer (mvom, "giant snake"), Drawing 3, m. The charcoal is piled up to a height from 60 to 70 centimeters; on top of this is placed the iron ore which meanwhile had been cut up by other people and calcined for four hours on a strong fire (1). Furthermore,

1. "It yielded the following values:

Humidity (at 100 degrees centigrade)	0.51 per cent
Heat loss	2.36 per cent
Silicic acid	8.21 per cent
Titanic acid	6.97 per cent
Iron oxide	67.98 per cent
Aluminum oxide	11.82 per cent
Manganese protoxide	1.03 per cent
Calcium	traces
Magnesium	0.17 per cent
Phosphoric acid	0.05 per cent
Sulphur	0.19 per cent
Alkalies	Rest

The quite considerable titanic acid content is striking here. The smelting process is unpleasantly influenced by it, since a slag is produced that is hardly fusible. (According to Du Bois.)

1: Tessmann--250 E-5 (1904-1909) 1913 FH9 Fang FH9

Fig. 182. Sketch of a Smelting Works in Bebai. Drawing 1. Smelting hut and adjacent blast pipe hut (Drawing 2). Drawing 3. Cross-section of part of the wall of the furnace. Drawing 4. A section of the wall where the blast-pipe stick is introduced. Drawing 5. Longitudinal cross-section of the smelting furnace.

325 the larger pieces of the iron ore are once more pounded to fragments before they are put in the furnace. The ore is piled up in such a way that, as Drawing 5 n shows, a funnel remains clear in the middle and also it does not touch the plantains but remains separated from them by a gap that is filled with charcoal. Finally, the iron ore is covered to the rim of the furnace with charcoal (2).

2. O. Zenker describes a very different smelting furnace among the Jaunde. "The smelting huts," he says, "in which the iron is also directly forged, are conspicuous by their tall pointed roofs and wooden planking, as well as by the ironstone and slag lying in front of them. In the center of these large huts are the smelting furnace and four large wooden columns. The smelting furnace is quadrangular and is constructed anew for each smelting. Its outer walls consist of pieces of plantain trunks. The furnace is about one meter high and covers a floor area of approximately one and a half square meters. On the floor, in the center, there is a hollow smeared with clay, in which the liquid iron gathers during the smelting. The entire enclosure is filled with charcoal, but the center is filled with a mixture of ironstone and charcoal. Prior to its being loaded, a funnel-shaped clay pipe is stuck into it on each side; these are used to blow air into it by means of a hand bellows of the shape that is also current in other parts of western Africa. Those who perform this work, usually half-grown persons, are seated on the columns already mentioned which are wooden and about two meters high. To protect the roof a strong wooden

325

trellis is constructed over the smelting box. Smelting requires a number of hours. The very soft iron obtained is pounded to pieces and then forged."

[113]

(From Mitteilungen von Forschungsreisenden und Gelehrten aus den deutschen Schutzgebieten /Reports by Explorers and Scholars from the German Protectorates/ by Friedrich von Danckelman, 1895, page 63.

/230/ /Fig. 182 appears here in the original text./

/231/ Now the bellows workers (nšūĕ,-nkŭm) put their two tools, which they have brought with them, into position, and in the manner already indicated stick the blast pipe into the furnace in place of the guide rod, so that the funnel-shaped end juts outward about ten to twelve centimeters. Then they arrange the bellows (Drawing 1, o) in such a way that its mouth is from two to three centimeters from the blast pipe and clamp it between two pairs of sticks, called mvāk (see Fig. 183), which are planted in the ground. This simple arrangement has given rise to the following proverb:

[539]

bokui bo vōde akūā o mvāk =

The Pygmies, they despaired of smelting because (of the) the holding sticks (which they did not know how to attach).
This proverb is said whenever some great enterprise fails because of a trifle.

325 461 791

Now everybody sits down on tree trunks around the furnace. A piece of red-hot charcoal is introduced into the furnace through one of the blast pipes, and then the working of the bellows begins (Fig. 184). This is done in the following manner. First one and then the other hide are alternately pulled up and down by hand, or, if one wants to work at high pressure, both hides are pulled together. This is a strenuous and monotonous job which the natives try to alleviate as much as possible by singing, which is led by the medicine man (in Plate 17, the gentleman to the right with folded arms), by shouting, laughing, talking, and telling stories. Above all, the

325 461 791 natives like to hiss rhythmically during the work; this gives them greater strength, as they say. Regular whistling, however, is strictly forbidden, for in the opinion of the natives it is something evil (see prefixes, page 28 /Ed., not translated/). In all this noise the medicine man takes a prominent part; every other moment he rings an iron bell, blows on an antelope horn, /232/ sings, shouts, and dashes about frantically. In short, he makes every possible effort to spur on the people, and perhaps he also means to fend off evil beings of one kind or another by his activities. Now and then he strikes between the bellows with a bundle [824] of the Violacea Rinorea gracilipes Engl. or the Leguminosa Bandeiraea tenuiflora Benth. (both ovṍn e ndžīk) (1) in order to

1. Called ovṍn e ndžīk (ndžīk, "liana") because of the similarity of the leaves with those of the Copaifera tessmannii Harms. (ovṍn), [775] the tree in which the souls live in the intermediate realm; used when there is a shortage of Copaifera.

eliminate all noxious influences through the power of the ancestors. If the zeal of the workers nevertheless flags, there follows a redoubled clamor, and after a short period of time the crew recuperates and pushes the hides with renewed vigor and almost convulsive rapidity amidst violent hissing and rhythmic rocking up and down of the upper part of the body. In the evening when they are tired, hide drums and wooden drums are called in to encourage them with a regular concert; songs are sung in which the medicine man strikes the keynote. At the end of the work, which in Bebai, for instance, lasted from one o'clock in the afternoon to 9:30 in the evening, the medicine man steps up to the furnace and by each bellows worker he makes a movement as though placing something up into the furnace and down into the funnel; his assistant walks behind him, carrying a closed medicine horn provided with a porcupine's tail. Its purpose is unknown.

325 791 [411] The next day the furnace, which has burned out down to the pit, is torn down, and the iron slag (eśum), which lies on the top and has not burned out, is gathered together; broken into pieces, it serves as rifle ammunition (2). Then the medicine man calls

2. According to Du Bois it is "a poorly molten, porous slag with a high iron and titanium content and also includes charcoal fragments."

the bellows workers to the pit, and with his forging iron he knocks off the pieces of iron (obā'-ekiēi) (3) that are loosely attached to the

3. bā = to divide, e-bā'-s = scale, ekiēi - iron.

ore bloom. The larger pieces he takes for himself, the smaller ones he divides among the men so that each receives a small powder keg of them, which is his reward for the work. The medicine man, on the other hand, keeps almost twice as much for himself. On the floor of the pit is the ore bloom, a large, firm, round to oblong iron lump (mpafǎn-ekiēi I) (4); it belongs to the hut owner for whom 325 791 422

4. From the root pfa Ntum (fa Fang), "to narrow inward and to be narrowed in," here, "to be contracted, to be agglomerated." Compare pfa-n, "narrow strait"; a pfa-n, "to narrow"; pfa-k (active), "narrowed path or place," in particular between the house and plantains in the village; a pfa-ń, "to wrap around, to put a string around." The ore bloom is, according to Du Bois, "to be regarded as a malleable wrought iron heavily mixed with charcoal fragments and with a low carbon content, which can be transformed into a usable

325 material only through forging."

791

422 the /233/ smelting has taken place, with the exception of a piece about the size of a head, which he must give to the medicine man. The ore bloom is pounded into little bits by the workmen right on the spot (Fig. 185). The workmen have the right to take home the splinters that fall off, and the owner does nothing further with it.

438 These pieces (epfus-ekiē) (1) are the end result of the iron smelting

1. pfū-ī, "to knock off (piecemeal)."

and constitute a regular article of trade wherever European trade is not yet too highly developed. /Fig. 183 appears here in the original text./

325 A few more figures about the expenses and the net profit. In
435 giving these -- as for Bebai -- I assume a smelting period consisting
434 of five smeltings with five owners of the smelting hut. The workers can buy the bellows for ten spears (= 70 pfennigs) from the bellows maker, or they can get them for nothing if they bring the necessary block of wood to the man's house. So far as I know, they must obtain the hide for themselves in each case. The clay blast pipe likewise costs ten spears (= 70 pfennigs), so each bellows worker has 20 spears (= 1.40 marks) in expenses. The owner or owners of the smelting huts have a single expenditure of about 120 marks for the medicine, not including the labor for the construction of the hut and the transportation of the ore. From the iron left to him as wages, each bellows worker earns at one smelting only 15 to 20 spears (= 1.05 to 1.40 marks); hence, from five smeltings he makes a profit of from five to seven marks from which the single expenditure /234/ /Fig. 184 appears here in the original text/ of 1.40 marks should be subtracted. The medicine man does better. From his share of loose iron he can earn 30 spears (= 2.10 marks) and from his share of core iron 50 spears (= 3.50 marks), so altogether he can earn 5.60 marks. From the five smeltings, therefore, he can earn a total of 28 marks. As regards the owner, the ore bloom for him amounts to 500 spears (= 35 marks). Altogether, the yield of one smelting period would amount to: (17 X 17 spears + 80 spears + 500 spears) X 5, 17 workers at 17 spears + medicine man + owner in five

325

Fig. 183. Bellows workers and the medicine man's assistant who stirs the fire. Iron smelting in Bébai (Schumu Family), Spanish Guinea.

325 smeltings; or in German currency, which of course cannot repro-
435 duce exactly the value of the spears for the natives: (20.23
434 marks + 5.60 marks) 5 = 304.15 marks.

These figures fluctuate in the various regions. Nonetheless they do convey an idea of the size and distribution of the profit.

(b) Ironworking.

326 From the tales of the creation story it is evident that the Pangwe, as descendants of Mode-Sama, have known how to forge iron since ancient times, even if they were surpassed in the art by other Negro peoples, the descendants of Ngomwenio (perhaps the progenitor of the Okande?), the second son of Sama. /235/

325

Fig. 184. Extracted iron (bloom) after the smelting furnace has been torn down, Bébai (Schumu Family).

326 554 The Pangwe do not accord the smith an exceptional social position. He is neither despised, as he is by many tribes, nor does he enjoy any kind of privileges or respect beyond the regard for his abilities. His skill (akǒ"n) is recognized and placed above that of other artisans, but nothing more than that. The smith, like the wood carvers, works only now and then at his trade, and only when there is a need for him to do so; he never works to build up a stock. In other words, he does not carry on a regular trade; instead, he works by commission and is paid for the work performed, not for the finished product (everybody must bring the smith the iron needed for the desired objects). At the time I was in the country, the smith received, for example, for the manufacture of spear money, ten per cent of its value.

325

Fig. 185. Extracted iron (bloom) after the smelting furnace has been torn down, Bébai (Schumu Family).

326 348 The smith (nlū̄ī III from a lū̄ī' "to forge") most often has his workshop in the meeting house, the scene of most of the enterprises of the men. In this case a T-shaped pit is dug into the ground in the meeting house (see Fig. 27b, b) at the place where there would ordinarily be a sleeping bench. The bellows hangs above the pit and sometimes also its blast pipe; only occasionally is it hung in special huts (abā-lū̄ī'). The latter are either simple lean-tos open all around or provided with sidewalls made of logs, like the temporary meeting houses. A smith's hut of the first form is depicted in Plate 18; the groundplan of a hut of the second /236/ kind -- from the Ntum village Okō (south of the Campo) -- is shown in Figure 186. The latter contains a tree trunk (m) and a wooden drum (k) placed along the walls and intended to serve as seats for the spectators; also it contains a stone anvil (b), and in a T-shaped pit (ejě, lū̄ī') the smithy fire with the bellows (e-g). The smith (a) is always seated to the right of the fire and just in front of the bellows worker (d), so that he can conveniently reach the red-hot iron with his left hand, take it out of the pit, and work it on the anvil (b) before him.

325 789 824 Even the job of forging cannot be performed without medicines. Just as a medicine is buried under the furnace in the smelting hut, one is also buried under the anvil when the smithy is constructed, although this is not always the case. The medicine consists of cock's feathers, blossom panicles of the Labiata Plectranthus (kōlṓt IV Fang, kǒt IV Ntum), and leaves and stalks of the Commelinacea Aneilema aequinoctiale Kth. (nlǎt I) (1). The

> a lǎ-t, "unite," hence nlǎt, the Aneilema (compare also a-lǎ-t, "the duck," because ducks live in pairs).

two plants are burdocks and are meant to symbolize the fact that the iron particles are to be joined together as firmly in the forging as the fruit of the Plectranthus and the stalks or leaves of the Aneilema cling together -- frequently one also sees the smith throwing a few Plectranthus fruits into the blast pipe while forging. The cock belongs to the cult of the Good, or the fire, and for that reason its feathers are the most important component of the medicine. To heighten its effectiveness, the cock is also killed, and its flesh boiled together with the leaves of the Acanthacea Asystasia macrophylla (T. And.) (elǒbokūi), the Connaracea Manotes zenkeri Gilg (nkǎ-ndžīk I), the Ebenacea Diospyros fragrans Gürke (myīfī'n IV Fang, myīpfī'm IV Ntum), and the Tiliacea Desplatsia dewevrei Burset (afǒnǒk). This concoction is eaten by the smith. The plants mentioned have strong and flexible stalks or twigs (nkīb, "rod, whip"), and the implied wish is that the iron, in particular the spear money, will be just as strong and flexible.

325 435 Lastly it should be mentioned that in a newly constructed smithy hut the first thing to be melted down must not be crude iron but only worked iron.

The smith's tools include:

325 1. Large forging iron (ngǒ p[d]ǒ III) of the form shown in Figure 187, Drawing 1; for cruder work it is used as a hammer, for finer work as an anvil, in which case it is pushed into the ground with its pointed end. It is worth 1,000 spears or 70 marks.

435

Fig. 186. Groundplan of a Smithy in the Village Okö, Ntum Region.

(a) Smith's seat; (b) smithy stone, anvil; (c) smithy pit; (d) bellows worker's seat; (e) bellows; (f) sticks to hold the bellows; (g) blast pipe; (h) charcoal; (i) handle; (k) talking drum used as seat; (l) stone, mainly for whetting the cutlass; (m) trunk, seat for spectators; (n) ridgepole.

325 2. Small forging iron (edū), Figure 187, Drawing 2, used for spear blades, and so forth. (Value, 50 spears or 3.50 marks.)

3. Handle (abí from bí, "to grasp"), a simple iron rod widened toward the end to a slightly spatulate form, attached to a wooden grip. It is held against the iron glowing in the fire and welded with it so that both /237/ /Fig. 186 appears here in the original text/ can be taken out together. While the iron is being worked, the end of this handle merges with the forged object and must therefore be made anew each time after it is used, that is, it must be widened by pounding it at the end.

325 4. Chisel (zǎńe), Figure 188, which is stuck into a slit cardamom stalk and driven in with a hammer in order to burst thin connections, to chisel off superfluous edges, to make grooves, and so forth.

5. File (ewǎ́s), used for smoothing.

6. Tongs (abǎs), Figure 189, Drawing 2, made from a cardamom stalk split at the end.

7. Squirter (amǒ́m, amě́m), Figure 189, Drawing 1, made from a cardamom stalk (1) split at the end, and used -- as among

1. Cardamom (Aframomum) as torch, see page 42, as sacred plant of fire, see Section 11 /Ed., this section of Vol. II is not translated/.

us -- to moisten the coal from time to time.

325 372 313 If anything is to be forged, the blast pipe of the bellows is placed in the center of the smithy pit, charcoal is heaped over it -- the charcoal is produced in the way described on page 247 (2) --

2. From the following trees:
Leguminosae Dialium guineense Willd. (ogbǔ́ń-elǐ); Leguminosae Platysepalum tessmannii Harms (ogbǔ́ń-elǐ);
Olacaceae Aptandra zenkeri Engl. (ogbǔ́ń-elǐ);
Ochnaceae Ouratea tessmannii Gilg (osǒ);
Euphorbiaceae Sapium oblongifolium Muell. Arg. (osǒ);
Ochnaceae Ouratea brachybotrys Gilg (osǒ, kǔń-osǒ, okǐě);
Euphorbiaceae Plagiostyles klainei Pierre (esǔlǎ');
Guttiferae Garcinia punctata Oliv. (nsā-elǐ III);

325
372
313

Euphorbiaceae Uapaca guineensis Muell. Arg. (asǎ'm);
Simarubaceae Irvingia grandifolia Engl. (ngǔn IV);
Sapotaceae Mimusops djave (Lan.) (adžǎ'b);
Leguminosae Distemonanthus benthamianus Baill. (ejěn, eli'běngǎń);
Burseraceae Pachylobus fraxinifolius Engl. (ase̅ǎ');
Burseraceae Pachylobus macrophyllus (Oliv.) (atǒ'm Fang, andǒtǒ'm Ntum);
Flacourtiaceae Petersia minor Niedenzu (abiń).

and on the charcoal, the iron pieces to be forged. Then /238/ the charcoal is set on fire with a red-hot coal thrown into the blast pipe. Thereupon the assistant sets the bellows going (see page 252). If the charcoal catches fire, the smith places the handle (Figure 186, i) into the side arm of the pit, heaps the charcoal (h) over the iron pieces, waits until the iron is red-hot, takes it out with the handle, and forges it on the anvil. Once the iron is ready in its crude form, it is knocked free from the handle with the chisel, seized with the tongs, and subjected to further working.

(c) Brass founding.

325 Brass (ngǔs IV, mvǒt IV) has been coming into the Pangwe region from the coast in the form of tubes and wire for a long time. Because of its softness and its brilliant color, it has almost completely replaced iron insofar as it was used for ornaments. The tubes are not altered; the wire, on the other hand, is worked into neck, arm, and finger rings, into foot covers and leg rings.

The wire is cut into small pieces about three centimeters long and placed in a potsherd or in a clay vessel specially prepared for the purpose (Fig. 190). Then it is placed on the smithy fire and

325 entirely covered with charcoal and melted with the help of the bellows. As soon as the blue flames appear, the smith removes the coals from the top of the pot, seizes the latter with his tongs, and pours the liquid metal into molds. These are halved raffia leafstalks in whose pith a suitable negative form is cut (Fig. 191). Then he cleans out the coal fragments that might have fallen into it and pours on water. After it has cooled, the brass is taken out of the mold and, heated, it is again worked, that is to say, the coarser roughness is beaten down with the large forging iron. In the case of the engraved neck rings (see Fig. 14), the two ends are now /239/ /Fig. 187 appears here in the original text/ beaten out with the tapper and rolled with light blows over the surface which is then carefully smoothed with the tapper. This is a rather laborious job, since the rod must time and time again be placed in the fire for a time. Now the ring is bent by skillfully hammering the inner surface on the edge of the anvil, and it is hammered completely together on the large forging iron placed over two props. Finally it is filed smooth, whereby the brilliant yellow brass color appears in place of the hitherto black color; then various patterns are engraved on it with the help of three different strong chisels (Fig. 192) and other tools (Fig. 193).

5. Pottery.

323 [462] Unlike the crafts mentioned so far, pottery is in the hands of the women. Only tobacco pipes and blast pipes are made by men. Pottery is not very highly developed; its forms are poor and decoration is rare. /Fig. 188 appears here in the original text./ The main products of pottery are assembled in Figure 194.

1. Water flasks (eŝũgǎ);
2. Large and small cooking pots (mvé IV and obébé);
3. Smithy funnels (žǒ̀ IV);

in addition, the following are also made,

4. Tobacco pipes, and
5. Brass smelting pots.

This is the extent of the use of clay objects. /Fig. 189 appears here in the original text./ /240/

1: Tessmann--264 E-5 (1904-1909) 1913 FH9 Fang FH9

(1)

(2)

Fig. 189. Smith's Squirter and Tongs.

323 The women, of whom about a fourth (among the Jaunde about a half) understands the art of pottery, carry on their craft mostly as housework. They make the flasks and pots for their own household or for those of acquaintances and relatives who from indolence or lack of skill have not taken up pottery. In addition, they sell their products to other women who cannot or do not want to make pottery. The prices for pots fluctuate, de-
323 435 pending on the size, between two and four spears (14-28 pfennigs), among the Jaunde between five and thirty Jaunde spears (5 to 30 pfennigs); /Fig. 190 appears here in the original text/ very large Jaunde pots, unknown among the Fang, cost 40 Jaunde spears (= 40 pfennigs). The clay bottles which are limited to the Fang and are scarcely found north of the Campo cost ten spears (= 70 pfennigs). By and large, the Jaunde women are better and more industrious potters; they produce more, which, to be sure, causes the price to go down, and they make more attractive pots than the
[531] Ntum and Fang women who decorate perhaps only a third to a fourth of all their cooking pots. Water bottles are decorated only in exceptional cases. /Fig. 191 appears here in the original text./

323 The manufacture of pots proceeds as follows. White pottery clay (ekǒn, vū-ǒk; plural lǒ'k), either dry or mixed with water if necessary, is pounded for awhile on a piece of bark with a pestle (ntum e vū-ǒk). Then the potter rolls the clay into sausages and places two or three of them together in her hand in snake-like coils. These form the bottom of the future pot. Then she places the whole thing /Fig. 192 appears here in the original text/ in a plate, either of basketwork or wood. Now she builds up the wall of the pot by joining the remaining sausages in a spiral fashion as she turns the plate which serves as a potter's wheel. She makes it smooth with a moist raffia stick, indents it by applying light pressure just below the edge, and smooths the indentation itself (mbě I) with a fine leaf of grass, rubs it off with a wet leaf, and takes it off with the little stick. The finished pots have to dry for five days on the pottery loft (akǎn e mvě) and are then fired. The firing is done in the village square. /241/ /Fig. 193 appears here in the original text./ Under and around the pot firewood or twigs are simply heaped up and set on fire.

/240/

Fig. 192. Chisels for the Patterns on Brass Neck Rings.

325

Fig. 193. Brass Smith Decorating a Brass Neck Ring, Akonangi, South Cameroons.

While the pots are drying, the decorations are put on. The 323
pots are slightly moistened with water, and then the pattern is scratched on with a pointed raffia leafstalk splinter. A certain pattern, obügeli, is obtained by rolling a carefully braided four- [531]
edged stamp up and down (Fig. 195).

The clay blast pipe of the bellows is manufactured by the [462]
men in the following manner. The bark of a raffia leafstalk is removed in strips down to just short of one end; the strips are then tied together again in their natural position at the other end, so it looks as though the bark had burst apart in the middle into so many strips. Then the leafstalk is stuck vertically into the ground on the end from which the strips had been completely removed and tied together again. The clay is placed around the stick in the form of a funnel, the upper edge being bent outward, and so the whole thing is left to dry in the sun for three days. Then the strings are untied, the bark strips are completely removed, being pulled off one by one, and the blast pipe is taken down to dry for a little while longer in the house. The blast pipes are never decorated; only once when I /242/ /Fig. 194 appears here in the original text/ witnessed the making of a blast pipe in Bebai, the

C. Plastic art. General observations. Wood carvings. -- Clay figures.

A. Ornamentation

531 All creations of ornamental art that we encounter among the Pangwe can be reduced to a small number of formal configurations. Directly connected with technical processes, these have arisen from them and even now yield to the same ineluctable necessity day by day. At one time or another, an esthetic impression was created by these configurations; they were grasped as independent forms and in that very moment became models which -- freed from their original, basically practical significance -- were imitated intentionally, at first in a playful manner and subsequently recreated in order to employ them as ornamental accessories. They became artistic motifs. So long as the models were taken over unchanged into the system of ornamentation, patterns arose that betrayed their origin at all times and at a glance. These I shall therefore designate as basic patterns. They have names which, with one single exception (Varanus /monitor lizard/), the people are unable to explain or to explain with certainty, that is, insofar as they do not simply designate the material. Gradually, under the influence of frequent repetitions and changing materials, the distinctness of these simple basic patterns was obscured; the elements split up, became shifted in relation to each other, were grouped into double arrangements or into new combinations. In this way, modified patterns arose. /244/ /Fig. 196 appears here in the original text./ The Pangwe later read into the patterns concrete things of his environment, and he named them after these things. This process seems to have occurred with the change of material, with the sole exception of the animal figures which had already been read into the pattern of the original material, that is, the material on to which the model was transferred for the first time. In this way they became permanent patterns of ornamentation. I distinguish among them two forms, homologous and nonhomologous, depending on whether they constitute a modification of the same pattern or arose from a combination of different patterns. Combinations of patterns, on the other hand, whose parts have preserved the names and meanings originally attached to them, I shall call composite patterns.

531

Fig. 196. Basic Patterns of the Art of Decorating Bark.

The type and development of the patterns vary with the material, which may be bark, wood, raffia stalk, clay, metal, and human skin. At the same time there seems to be a certain connection between bark and wood on the one hand and between metal and human skin (decorative scars) on the other -- a connection which finds expression in similar patterns. The detailed description of the patterns will, therefore, proceed from the point of view of the material.

1. Bark patterns.

In the Pangwe region there are peculiar bark plates with painted areas framed by raffia leafstalk strips or palm bands. The plates are attached to the outer or inner walls of meeting houses and more rarely to the outer wall of dwellings. These decorative bark pieces are widespread, but they do not occur frequently and by no means in every village for even the artistic sense for bark ornamentation is a specialty, and the artists concerned are thinly distributed over the land. Concerning the manufacture of these plates, I have already said everything necessary on page 215, and I shall only reiterate here that everywhere among the Pangwe the colors used (see pages 198-199) are red, white, and black. Only in one single case did I [386] observe a bright blue-gray, which was derived from an argillaceous earth of that color. /245/

The division into areas /Ed., in German, Felderung/ displays a series of patterns that correspond to the material used in house construction. They are:

531 Quadrangle = bark,
Triangle = raffia leafstalk strips,
Line = palm band,
Fish bone = palm leaves.

The quadrangle is to be found in three forms: as a rectangle; as a diamond; and as a monitor lizard.

The rectangle results automatically from the natural shape of the bark mantle (Figure 196, a).

The diamond arose, and it still arises daily, in the process of removing the bark from the tree, as has already been discussed in connection with bark work (page 213). I here remind the reader of the fact that in this process the tree trunk is girdled at the top and the bottom and the bark is cut through in a zigzag line which, as observation taught, facilitates the removal of the bark. From the crisscross blows of the cutlass there arises the figure of the diamond when the cuts meet, as Figure 157a shows. If they cut across each other once, this produces the beginnings of new diamonds, and these are drawn out in a playful manner. In this way groups /Fig. 197 appears here in the original text/ of diamonds placed across and next to each other are created. Later such diamonds were cut into the bark in intentional playfulness which is still very popular today, and the individual diamond areas were emphasized by removing the bark down to the wood in checkerboard fashion.

From here it was no great step to the transference of the pattern to bark plates (Fig. 196, b).

The monitor lizard motif (nkaak III) comes into being when two large diamonds are accidentally formed one on top of the other in the process of removing bark; in these one sees the head and body of the monitor lizard, Varanus niloticus. Just like the diamond, the lizard is playfully cut into the bark of trees, and then by means of simple strokes legs and a tail are added. At a later time the lizard motif was transferred to the independent decorative barks (Figs. 196 c, 197).

531 925 The similarity to this animal was noted because the monitor lizard was seen daily crawling across the bark of the trees; in doing so it displayed -- like many lizards -- approximately angular outlines.

Above all, however, the origin of the lizard pattern is to be sought, I suspect, in the fact that at one time the Varanus played as important a role in the religion of the Pangwe as it did among the ancient Egyptians who worshipped it because it ate crocodile eggs. The crocodile in turn, it appears, was regarded as a representative of the principle of evil -- since it lived in swamps or in water /246/ (see Section 11 /Ed., not translated/) and was dangerous to man. /Fig. 198 appears here in the original text. / As a

Fig. 197. Lizard Pattern on Decorative Bark Plates.

result, the destroyer of crocodiles, the monitor lizard -- which lived in the air, that is, on trees -- was probably regarded as a representative of the good. It is probably also for this reason that among the Pangwe the monitor lizard was promoted to the class of human beings, just like the Sciurus wilsoni (küe III) which likewise devours the eggs of animals living in swamps. A contrast to these two animals is the ichneumon, which consumes hen's eggs, and since the hen is a sacred animal because it symbolizes the principle of good (compare Section 11, /Ed., not translated/), it is flatly called a "criminal," nsǒm I.

The triangle is to be found in two forms, as isosceles triangles and as right-angled triangles. The former are the most frequent, occur everywhere on bark plates, and come

531

Fig. 198. Leaf of the Swamp Palm, Sclerosperma mannii.

about when, during house construction, two diagonally-crossed raffia leafstalk strips are stuck into the ground or under the boards in order to clamp down the bark pieces serving as the door or to stop up holes, a kind of fastening which was probably more frequent in former times and applied to the house walls themselves (Figure 196, d). As in the case of the diamond, here too the transition from the technical configurations to the permanent ornament can still be observed. Frequently, as ornamentation, crosses made of short stalk strips are placed singly or in a larger number next to each other under the slats of the house walls.

Whenever only one diagonal strip, instead of the two crossed ones, was laid over the bark plate, the right-angled triangle was formed (Figure 196, e).

The line occurs in the form of parallel lines, as snake-like lines, and as an arc.

Parallel lines are derived from the palm stems Oncocalamus (nlɔ́'n I) which are carried in bundles from the forest to the site of house construction; when the bundles are loosened on the site, the smooth and elastic stems sometimes come to lie in more or less wavy lines parallel to each other (Figure 196, f). The same kind of arrangement arises with the bands from the palm stems, except that these are less elastic and hence form straight lines

Fig. 199.
Box Pattern on a Decorative Bark Plate.

531 (Figure 196, g). /Fig. 199 appears here in the original text./ Both kinds of parallel lines, the wavy as well as the straight, were transferred from here to the decorative barks. /247/

I imagine that the snake-like lines resulted from observing the seam where the slats and bark plates of the house walls are sewn together when these slats lie on top of each other. (See Fig. 35.) In this case, the rope is drawn around the slats in such a way that it forms a single, coherent line which, seen from the side, is quite wavy because of the natural rounding of the raffia leaf stalks halved lengthwise down the middle (Figure 196, h).

The arc appears as a part of the snake-like line formed by the string tied around the individual boards, especially at those points where these are not attached closely on top of each other (as in the previous case) but at wide intervals (Plate 12). The arc also appears as a segment of the snake-like line which has already been transferred as an ornament to the decorative bark (Figure 196, i).

The fishbone motif (Fig. 196, k) is reproduced by the attractive leaves, symmetrical both in structure and form, of the swamp palm Sclerosperma mannii M. et Wendl. (akō'da), Figure 198, which, braided like mats, are used instead of bark pieces for house walls, etc. (see Fig. 106, Plate 24 /Ed., this plate is in Vol. II/).

The basic patterns mentioned do not occur with the same frequency on the present-day decorative bark pieces. The rectangle by itself does not occur at all, the right-angled triangle and fishbone only once, and the snake-like line rarely. Also, the basic patterns do not occur throughout with the same distinctness any more. Instead, they have been changed in part, that is, they are homologous modified patterns.

I saw the rectangle modified only once, and in that case several rectangles of different size had been placed inside each other (Fig. 200, Series a; Fig. 199). It was called a box pattern (ezima, "box"). It was observed only once, and in conjunction with the imperfect execution this proves to me that the development arose, not with the decorative barks, but with wood carving, and later it was experimentally, as it were, transferred to the former.

531 With the isosceles triangles it may happen that the point of intersection is omitted or is, as it were, drawn apart into two points; perhaps for lack of material each diagonal was composed of two pieces (Fig. 200, Series b). From this comes a pattern whose name was given to me as the cutlass sheath pattern (abǎ'm nkpwē,da) in the case of stool ornamentation, where it also occurs. Indeed, the pattern does resemble a cutlass sheath (see Section 17 /Ed., Vol. II/), but it occurs only rarely.

The simple acute-angled triangle occurs first due to the division of the isosceles triangles at the point of intersection (Fig. 200, Series c), secondly through the juxtaposition of two diagonally divided rectangles (Fig. 200, Series d) from which the common longitudinal side has been left out. /248/

/Fig. 200 appears here in the original text./

All triangles, both isosceles triangles and the simple acute-angled triangle, as well as the right-angled triangle, are usually designated as etǔn akǒn, "half a spear," that is, spear head.

Parallel lines are modified in the following manner. In fastening the palm bands to the bark, sharp nicks arise whereby the wavy lines become broken lines (Figure 200, e). In some cases they are then designated as angular braiding patterns, in Pangwe benīge be nkū́n or mabū́ge me nkū́n, that is, angles (nicks) of the women's storage basket, by which is meant the similar braiding pattern (see Fig. 166).

The snake-like line is transformed into a modified pattern by reduplication, in which case the two lines intersect (Fig. 200,f), and also into the stylized image of a leopard (zō), Figure 200 g, in which case the psychological process corresponds to that described in connection with the lizard pattern (Fig. 201). The peculiar, otherwise unintelligible drawing next to the tail /249/ in Figure 201, left, permits one to recognize the development. This is the starting point for a series of other animal motifs in Pangwe ornamentation, such as Figure 201, bottom, which probably represents a chameleon (dǐīngbwǒ').

The arc likewise appears in a doubled form, either with the curves placed against each other (epfoa = mask used in the Sso cult), Figure 200, Series h, or lying against the base line. In that case a

531

Fig. 200. Developmental Series of Modified Patterns on Decorative Bark.

circle is formed by the disappearance of the common base line (Fig. 200, Series i). Finally, we may get two arcs erected on the same base /Fig. 201 appears here in the original text/, so that between them there is a half-moon area (epfa ngomendan, "half-moon"), Figure 200, Series k. Several of such half-moons are placed on top of each other and painted alternately red and white; combined into rows of two or more placed next to each other, these produce a popular and attractive pattern.

The composite patterns -- as we have already said -- result from the combination of basic patterns or modified patterns. For the forms actually produced, I refer the reader to Figure 202 and shall merely remark that the most frequent combination is that of the isosceles triangle with the arc, which usually stands on the base of the acute-angled triangle and more rarely on that of the obtuse-angled triangle.

531

Fig. 201. Leopard Pattern (below Chameleon Pattern) on Decorative Bark Plates.

The pattern consisting of a head with two horns, Figure 204, has remained an isolated phenomenon on the decorative barks. It is a stylized reproduction of the mask (epfoa) used in the moon cult, whose details are indicated by arc-like or snake-like windings of palm bands. /250/

/Fig. 202 appears here in the original text. /

2. Carving patterns.

The stools, the containers for red wood worked like stools, the handles of many stirring spoons and some ladling spoons, and, finally, the hide drums are decorated with carving.

The patterns on the stools are probably the oldest. They are applied all around the edge of the stool in such a way that it is surrounded by a band of from eight to twelve rectangular or square areas placed next to each other. Each of these areas

531

Fig. 202. Composite Patterns of Bark Decoration and their Origin.

n - Combined with Fig. 200, i_4

531 constitutes a pattern of its own, sharply separated from the neighboring one. As we saw in our discussion of manufacturing techniques, the edge of the stool corresponds to the round tree trunk from which it was made; similarly, the decoration that was originally applied to the bark was later transferred to the wood, and in this case, as in the case of bark, we encounter the same basic patterns, namely, the rectangle, the diamond, the lizard, the isosceles triangle, the scalene triangle, the parallel lines -- with the reservation that the pattern of parallel lines does not occur in the wavy form but only in the straight form, although as such, in a number of variations (Fig. 205) -- the arc, and the fishbone. /251/ /Fig. 203 appears here in the original text./ The snake-like line has been given up, but in its place new forms appear: the checkerboard, the spear with barbs, and finally an ellipsis pattern that cannot be designated more precisely.

In the checkerboard pattern (abǒ'n nkoo, "segments of a sugar cane stalk") we encounter the first basic pattern which was not invented in connection with house construction but with braiding (Fig. 206). Both activities, however, are closely related and in a certain sense are two different forms of one technique, namely, of braiding in the extended sense: house "braiding," a lǒń ndǎ, is the older and simpler; basket (or mat) braiding, a lǒn nkǒǵ, the more recent, more /252/ advanced. The same material is generally used for both, namely, palm bands (nlǒ'n). The simplest type of braiding consists of running the braiding strips of one direction first under and then over those of the other direction (the two exactly at right angles to each other), alternating from row to row. /Fig. 204 appears here in the original text./ In this way a cube pattern is created which, if only one kind of material is used, is all of one color (mats, Sso baskets). If dissimilar materials are used, the pattern is varicolored, like our checkerboards (storage baskets of the Jaunde women, Figure 207, frames for helmet caps). The alternating sequence of darker and brighter squares in the individual rows is compared with the sugarcane stalk whose segments tend to be brighter in the upper half than in the lower half (Fig. 208). /Figs. 205 and 206 appears here in the original text./

Fig. 206.

Checkerboard Pattern.

Fig. 208. Pieces of Sugarcane Stalk.

531 In contrast to the previous patterns, the spear with barbs (ngam akǒń) cannot be explained in terms of technology, nor do I believe for a moment that it was originally a carved pattern, especially since it rarely occurs on the stools (Fig. 40). /Fig. 207 appears here in the original text./ Instead, I suspect that this pattern first made its appearance with the decorative scar incising, and that later it gained a place also among the carved patterns because of its pleasing shape. /Fig. 208 appears here in the original text./

A single pattern consisting of ellipses could not be explained by any stool carver. I was told that only the specialist who knew how to prepare the patterns would know. I did not meet this person, however, and therefore must leave it to later research to provide enlightenment in this respect (Fig. 212, Drawing 27). /253/

Even among the stool patterns there is a discernible development of the basic patterns into modified patterns. /Fig. 209 appears here in the original text./ To some extent the development remained at the level of the decorative barks and displays exactly the same forms as they do, but for the greater part it progressed considerably and produced a rich abundance of new forms.

The following motifs recur: the box pattern (eǰima) -- plain or in variations (Fig. 209, a) -- the checkerboard surface (ndǒk) composed of juxtaposed diamonds, the cutlass sheath pattern (abá'm nkpwē da) -- plain and in a variation (Fig. 209, b) -- the acute-angled triangle, spearhead patterns (etǔn akǒń), the angular braiding patterns (benīge be nkǔn), Fig. 209, c, and the mask pattern (epfoa).

Concerning homologous modified patterns, there are the following new ones.

1) The file pattern (zaṅe wǫ̂s, from zaṅe = engraving, wǫ̂s = file) consists of juxtaposed small diamonds that are not emphasized (Fig. 211, a). The artist does not see the background, but the outlines and therefore compares these with the engraved lines of the roughened file which intersect regularly.

531 831 2) The strand of cowrie shells pattern (nlǒń e mvama): every second row of the diamonds, placed one above the other, is halved on the surface of the diamonds by a longitudinal stripe, originally

531

a_1 a_2 b c

Fig. 209. Patterns on Stools.

a combination of the patterns of a diamond and a parallel 531
line (Fig. 211, b), and this suggested a string of cowrie 831
shells. The similarity of the two is shown by Figure 210. It seems possible to me that in this case a further relationship between the cowrie shell and the diamond pattern plays a role. The Togo Negroes, for instance (according [171]
to an oral communication from the missionary, C. Spiess), recognize in the cowrie shell an image of the vulva; since ancient times the diamond pattern has been viewed in the same way by the Pangwe. After the introduction of the cowrie shell, the Pangwe immediately recognized its similarity to the diamond and transferred to the former the symbolism of the latter. As in Togo, the cowrie shell [171]
is regarded among the Pangwe as a symbol that brings good fortune, and, as such, it is applied to medicine horns or hung on anchored nets as a hunting medicine. Another symbol that likewise /Fig. 210 appears here in the original text/ brings good luck is the diamond which they paint onto their skins with redwood (a color that brings luck!) or tattoo onto their skins as a permanent pattern. We find

Fig. 210. Strings of Cowrie Shells.

here a remarkable contradiction in their conceptions. As we have seen, the sexual act was performed in connection

531

Fig. 211. Developmental Series of Modified Patterns of the Art of Carving.

531 with the sowing of ngon as a process furthering fertility; /254/ /Fig.
831 211 appears here in the original text/ in the case of iron smelting, on the other hand, the sexual act is strictly prohibited as something disturbing. The significance of everything sexual as bringing misfortune predominates throughout, and I therefore believe that we are dealing here with two temporally different conceptions: one, now recognizable only in remnants, which is older and concerns the influence and the influencing of fertility; another which arose later or was added later and concerns the sinfulness of sexual intercourse.

531 3) The arrow-leaf pattern (esõgele ndu = leaf on crossbow arrows to balance the flight).

4) The spike pattern (mesõ'n = spike, or mesõ'n m'egbwẽle = spikes of the iron money).

Both consist of a number of triangles which have come about either as final members of the development of Series c (Fig. 211).

531 starting from the isosceles triangles, or of Series d, starting from the right-angled triangle. If the triangles have a broad base and are either empty or filled with triangles placed inside each other and erected on the same base, they are called "arrow /255/ leaves"; if they have a narrow base, they are called "spikes." The latter form especially is also designated as "spearheads" (etŭn akŏń) when the triangles are large and as a result are placed next to each other and not in rows over each other.

5) The scaly anteater tail pattern (ngĕ'm e kă') developed from the broad-based, acute-angled triangle through placing several parallel rows of smaller triangles over each other (Fig. 211, e).

6) The carving pattern (zǎń e myŏt, from zań = carving, notch, and myŏt = raffia instrument whose cross piece is notched) develops from the diagonally divided rectangle through the juxtaposition of several rows of such rectangles with similarly directed diagonals, in which the removal of one half emphasizes the corresponding triangles (Fig. 211, f).

7) The rainbow pattern (metū'tŭ'm, "rainbows"). Two rainbows are placed with their arches against each other; in each one additional arcs are inserted concentrically, and the interstices are usually accentuated alternately (Fig. 211, g).

8) The fishbone pattern (okǎń eŏ ks) arises from the leaf pattern of the swamp palm through simplification of the bands to lines (Fig. 211, h).

Among the nonhomologous modified patterns there are: the triangle spear (mbǎ[s] -akŏń), a composite of isosceles triangles and lines, as the result of a development illustrated in Figure 211, Series i; and the spider web pattern (ndǎnebŭbo), a composite of the isosceles triangle and a circle (see Figure 211, Series k).

As on the decorative barks, patterns are also combined into composite patterns in carving, but much more frequently so. Either two are juxtaposed (for instance, rainbow and fishbone patterns, Fig. 212, Drawing 9, and swamp palm leaf and diamond patterns, Fig. 212, Drawing 26), or they are placed inside each other. Thus, Figure 212, Drawing 16, shows the box pattern and in it a composite tattoo pattern (isosceles triangles and a line); Drawing 8 shows the same with an animal in it which was usually explained to me as a cat; Drawing 40, the same with a triangle spear in it. The

531 combination of triangle and arc occurs very frequently and in such a way that the arc is placed inside the triangle and on its base line (the triangle usually is long and drawn out with acute angles), Figure 212, Drawings 3 and 45; or it is the other way around, the triangle being placed inside the arc so that its tip falls in the middle of the arc base and its base is on the arc line (Fig. 212, Drawing 45).

The natives like to fill a triangle or a shallow arc with the fishbone pattern (Fig. 212, Drawings 11, 13) or to combine two of the latter with each other. A popular practice also is to divide a pattern into two halves and to push a second / 256 and 257/ /Figs. 212 and 213 appear here in the original text/ /258/ in between, as in Figure 212, Drawing 44, where the pattern of a string of cowrie shells is pushed into another, and Drawing 43, where a swamp palm leaf pattern is pushed into a checkerboard pattern. Especially in the last example one can clearly recognize that the one pattern was actually inserted and that it is not a matter, say, of two other patterns being joined at the top and the bottom of the first.

All the patterns mentioned, aside from their use on stools, are also applied to the handles of the stirring spoons -- except that in the adaptation to the available space they are smaller and less neatly executed -- but they are very rarely applied to the ladling spoons. On the other hand, many hide drums are decorated in a 531 superbly artistic fashion; one might say that the first area of Draw- 534 ing 1, Figure 213, represents a triumph of carving. As with this one, all the large hide drums of the Pangwe have carving patterns applied on triangular areas in relief between the upper and lower drum ring (which frequently is decorated in the same fashion). Among the Ntum and Fang these areas extend over the entire mantle of the drum cylinder so that their base lies at the top and their tip at the bottom. Among the Mwai the mantle surface is divided by a ring into two halves which are filled in with triangles pointed towards the center (Fig. 214). The decoration itself is much simpler among them.

531 Furthermore, among the Mwai I saw a house post which was carved with similar patterns in the same arrangement as the drums.

531

(a) Decorative scars.

531
304 /Fig. 214 appears here in the original text. /

The patterns of the decorative scars made by incision are not very numerous. There are only about a dozen of them. They constantly recur in the same form, and there is no inclination toward any essential modification.

Of the original basic patterns, the following have been transferred for the decorative scars: the triangle with a diagonal drawn through it (called in this case esa[s]-myǎh, "half-pattern"), Figure 215, Drawing 9; the straight parallel lines (in this case called mekön, "guide rods"), Figure 215, Drawing 10, frequently simplified to a simple line, 1; and the arc a (in this case called makǒs, "arcs").

[534]

Fig. 214. Mwai Drum from Malén (Sebō Family), New Cameroons.

Of the homologous modified patterns there are the acute-angled triangle b (ndŭ-mbǎn, "arrow leaf") and the circle c (in this case called atōk, "whirlpool"). Of the non-homologous modified patterns there is the triangle spear d (mbǎ[s]-akǒń). We are also familiar with the barbed spear e (ngam-akǒń), of which I have already said that it originated with decorative scars, in all probability from a /259/ /Fig. 215 appears here in the original text/ /260/ combination of the line (of the modified straight parallel line) with the figure of the arc set inside a triangle (see Figure 212, Drawing 3), the base of which is lacking.

531
304

The following are new:

among the homologous modified patterns, the incomplete arc f (evū'da, "bending");

among the nonhomologous modified patterns, the blast pipe g = zǒṅ (triangle with a line), the ray h = nsǎm (angle made by the barbed spear by omitting the handle, with a line attached at the top), and the hook i = kǒb (half an angle with a line).

The five patterns -- sticks, blast pipe, hook, ray, and whirlpool -- have a close relationship, as their names show, to iron technology and to fire. The line was imagined to be the guide rod which during the setting up of the smelting furnace keeps the openings free for the blast pipes. In the triangle with line -- accidentally juxtaposed in a corresponding arrangement -- they thought they recognized the blast pipe. The same process is repeated with the hook (kǒb), by which is meant the poker hook (okǒb) used in iron smelting; and it is again repeated with the whirlpool (atōk), which was observed when the hot metal was dipped in water to cool off: the water would bubble up (a tōk, "to bubble") and hiss and flow outward in rings. Finally, this process took place with the ray (nsǎm), the most obvious manifestation of the life of fire as well as of the sun, which is represented as an arm, exactly as among the ancient Egyptians, because the arm is the symbol of the manifestation of life (see Fig. 215, Drawing 8 h, and also Adolf Erman, Die ägyptische Religion /Egyptian Religion/, image of the sun god, p. 78).

A pattern described to me as that of a tobacco pipe (myō-taa), a pattern which probably developed just like the blast pipe pattern from triangle and line, remained an isolated instance.

A pattern that was not explained to me was one representing an angle (k); it is connected with the triangle.

The decorative scar patterns seldom occur singly, say, in such a way that one adorns the upper arm, a second the chest, and the like. Instead, they usually occur in extensive combinations in which, however, the individual parts are always seen as independent units and keep their original name. Only twice did I encounter a special term for such a combination of patterns, but even this designation was not connected with the content of what

531
304

Fig. 216. Basic Patterns of Tattooing.

was represented, but with the place on the body to which the pattern was applied. One was called navel division (osa-dǫ̆b) (1)

1. a sa, "to split, to divide";
dǫ̆b, "navel."

and was applied above the navel (see Fig. 215, Drawing 6). It consisted of a cross-stick which had attached to it, at the top and the bottom, hooks, triangle spears, sticks, and arcs -- in former times it had evidently been located lower down around the navel in such a way that the cross-stick passed through the navel and /261/ /Fig. 216 appears here in the original text/ "divided it." The other combination (zǎ̀ne abǎ̀m) consisted mainly of half-patterns (diagonally divided rectangles) and bore its name only for the reason that it is preferred for the sheaths of swords and two-edged knives (Fig. 215, Drawing 9).

531
304

The Fang consider the decorative scars an elegant adornment. Indeed, even considered with the eyes of a European, they may be called attractive and dignified, especially when they are arranged with such extraordinary regularity as is shown in Figure 215, Drawing 5.

(b) Tattooing.

The development of ornamentation advanced further in tattooing in that the basic patterns become rarer, whereas the modified patterns become more frequent and more diverse.

By way of basic patterns (Fig. 216) we again find the following: the diamond (here as a single diamond, bendŏ be bā, "diamond made with redwood," compare Fig. 218, c); the monitor lizard (nkaak); straight parallel lines (here likewise called melŏ́ń, "palm bands," or mekŏn, "sticks," /262/ /Fig. 217 appears here in the original text/ and also mekŏn akŏń, "spear handles," or mekŏn e mvǎń, "sticks of the decorative scars"), a; bows /Ed., or "arcs"/ (here called ēkŭluga-nkpwǎ́s, "trap bow of the bird trap"), b; fishbone (okǎń e kŏs, "fishbone," here in part with a bow-shaped formation of the branches, c. Among the homologous modified patterns there are: the box pattern (ežima); the arrow-leaf pattern (esŏgele ndu), d; the spike pattern (mesŏń), e; basket-edge pattern (mebŭge me nkŭn, "basket edges," or melŏń, "palm /263/ bands"), with retrogressive metamorphosis to the angle, f; parallel bows (here likewise called ekŭluga nkpwǎ́s, "trap bows," or melŏ́ń, "palm bands," or bewŏ[k] be nkŏ́ǎ'), g; incomplete parallel bows (eyū'da), h; half-moons (efangŏmendǎn, compare bark patterns), i; circle (here called ndži,ge ngŏmendǎn, "full moon"), k; and whirlpool (atōk), l. Among the nonhomologous modified patterns, the barbed spear (ngam akŏń) and pipe (mvō taa), m.

New patterns that appear are (Fig. 217) the following.

1) The bird tail in three varieties: the kite tail (ngǎb-obǎ'm), a, 1-3; the drongo tail (ngǎb obǎ'mŏke) (1), b, 1 and 2; and the

1. Dircanurus coracinus Verr.

531
304

531/304 swallow tail (ebō'no e kŭlejē'me) (2), c, which has arisen from

2. Psalidoprocne tessmannii Rchw.

the arc without a base set inside a triangle. We have already encountered this figure with the base as a composite pattern in connection with carving, and with the base omitted it is connected with a line as a barbed spear among the nonhomologous modified patterns of the decorative scars.

2) Tears of a beautiful woman (mīlĭge me mbŏń), a single line or parallel lines with short strokes attached at right angles to one side, d. This pattern is preferably applied to the cheeks.

3) Fork (ebāi), developed from the previous one by adding one or more sticks, e, 1-3.

4) Scorpion (kā'dĕlĕne), like the previous one, with a gap in the middle of the "row of tears," f, 1-3.

5) Monkey tail (ngĕ'm avŏ'm) (3), consisting of a stick con-

3. avŏ'm = Cercopithecus laglaizei Pocock, white-nosed long-tailed monkey.

nected with an arc or angle, g, 1-21. This example in particular clearly shows how the Negro's eye seizes just the essential part of the animal, here the tail and hindparts, for, indeed, when the long-tailed monkeys are at rest one sees only their tails hanging from the branches. This fact supplies the clue to the following [524] riddle:

esŭ'ma gbwé e bĕle ma mată'[k] m'ovŏ'n.
Yellow-bellied long-tailed monkey (4), it is sitting in the

4. esŭ'ma = Cercopithecus grayi Fraser.

branches of the Copaifera.

Answer: nkō-etōb = rope (aerial roots) of the fig tree (Ficus).

531
304 The situation was exactly the same with the swallow whose characteristic forked tail gave rise to the pattern, and we shall observe the same with the leopard whose spots have given the pattern its name, as well as with the hornbill whose beak did the same. /264/

6) Leopard spots (zö), Fang, or parrot claws (biẽ'ĩ, be kŭs), Ntum, a number of half-moons placed over and next to each other, h, 1-2.

7) Hornbill beak (ngŭ̃ń, "hornbill," Ceratogymna atrata Temm.), a curve (incomplete arc) with a triangle attached to it, i, 1-4.

8) Frog's legs (enăm edžǫ́) (1), a series of juxtaposed arcs

1. edžǫ́ - Rana zenkeri Ndn.

with vertical lines between them, k, 1-7.

9) Fish, Barbus guirali Thomin (mvǎ), developed from arc and triangle, as row 1, 1-4, shows, but observed only once in its perfect form.

10. Spider (abŭb), originated from isosceles triangles set inside a circle. As in the case of the corresponding stool patterns, the triangles are in part halved lengthwise, m, 1-4.

Among patterns which I only observed once each we should mention the following.

The double iron bell (nkŏn) consists of an arc with two triangles attached to it (Fig. 219, a). I saw this pattern on a coastal Mwai, [177] and it is probably a borrowed one, since a double bell does not occur among the Pangwe.

The knife (okŏń) probably originated from the rectangle (box pattern), perhaps together with the triangle. It is possible that the pattern is intentionally made to resemble a European knife (Fig. 218, b).

The sea fish (kŏ[s] a măń) originated from a circle and lines. It is probably meant to portray a sea fish, a sea turtle, or the like. The artist here has placed it inside a whirlpool consisting of concentric circles (Fig. 219, c).

531 304 It seems significant that these three last designs deal with objects that are foreign to the land or to the culture of the Pangwe. Indeed, I believe that, besides the play on familiar patterns, the conscious intention of capturing a remembered image is added here. In other words, we have, as it were, a transition from conventional patterns to purely free hand drawing.

A similar process perhaps underlies the "chameleon" (dǰīngbwō'), which I saw twice. In the first case, it was quite obvious that it had arisen from the rectangle attached to a half-moon, because the arch of the half-moon was on the wrong side (Fig. 218, d). In the second case, the animal had been captured in good realistic detail as regards its body and head (Fig. 218, e).

The composite patterns, which -- as I have mentioned -- are extraordinarily frequent in tattooing, are so diverse that they cannot all be mentioned here. We frequently find the half-moon combined with a line and tears, triangles and sticks, and so forth (Fig. 220). /265 and 266/ /Figs. 218 and 219 appear here in the original text. / /267/ /Fig. 220 appears here in the original text. /

(c) Decoration of raffia stalks, etc.

531 I myself have not seen the technique of decorating raffia stalks, since I did not succeed in meeting anyone who was a master at it. It is supposed to be carried out with a tool which, by drilling or scraping, takes off the upper layer of the raffia bark.

In this branch of ornamentation, we again encounter types of all the patterns developed in the various crafts and specialized arts (Fig. 221). The following occur.

Among basic patterns: rectangle (engraving pattern); single diamond (smearing of the body); monitor lizard (bark pattern), Drawing 5; isosceles triangles, in this case not quite completed (bark or carving patterns); parallel lines; straight or wavy (bark patterns); arc (bark, carving, or tattooing pattern).

Among homologous modified patterns: box (carving pattern); arrow leaf (carving or tattooing pattern); scaly anteater tail, in this case not completed (carving pattern); spearhead (bark

531

531
304

Fig. 220. Composite Tattooing Patterns.

or carving pattern); moon (tattooing pattern); parallel arcs (tattooing pattern). 531

Among nonhomologous modified patterns: kite tail (tattooing pattern); barbed spear (decorative scars or tattooing pattern); sun (painting); chameleon (bark or tattooing patterns), Drawing 4 b, Drawing 2a.

Among composite patterns: two lines with triangles (tattooing pattern); tears and arc (tattooing pattern); double barbed spear (tattooing pattern); line with two arcs (decorative scar pattern); three-fold parallel arcs (tattooing pattern).

New patterns that appear are: a composite of squares into which a bow is set on opposite sides, Drawing 2 a (single square with bows; carving or engraving pattern); a figure eight with circles (bands) drawn inside it, Drawing 4 a. Furthermore, there are a number of figures which were probably taken over from painting, /268/ /Fig. 221 appears here in the original text / /269/ namely, a man (quadrangle, lines, an arc), Drawing b; a fish (triangles, lines), Drawing 2a, c; a rifle (triangles, lines), Drawing 3 a; a monkey (moon, circle, hook, line), Drawing 3 b; a cat (bow, circle, lines), Drawing 2a, d.

4. Engraving patterns.

Neck rings, foot covers (more rarely, foot and finger rings), sword blades, and battle axes are decorated with engraved patterns.

Among the neck rings only the three-edged ones are decorated and then in the middle of the front surfaces in three square or

531/
415

Fig. 221. Incised Patterns.

Drawing 1. Ornamental calabash. Drawing 1a. Patterns on this calabash, spread out. Drawings 2 and 2a. Patterns on a walking stick made from a stalk of Raphia vinifera (spread out). Drawing 3. Pattern on a walking stick made from a stalk of the Raphia Hookeri. Drawing 4 and 5. Patterns of raffia sticks on a bench in a meeting house.

rectangular areas next to each other (Fig. 222a, Drawings 1-10). 53/
The two center areas display throughout four arcs, one placed at each border, which in part are chiseled into the surface in deep notches. An arc worked in the same manner is set on each of the outer edges of the lateral areas. The lateral areas themselves are engraved with different patterns, that is, almost exclusively in "basic patterns," namely, the rectangle (Drawing 10), the diamond (Drawing 6, Drawing 10), the rectangle bisected by a diagonal (Drawing 9), the double parallel lines (Drawing 1), the arc (Drawings 1-10), and the fishbone (Drawing 2). Among homologous modified patterns only the circle occurs (Drawing 8). /Fig. 222a appears here in the original text./ /270/

The decorations on the foot cover are related to those of the neck rings as the carved patterns are to the bark patterns, that is to say, they display more highly developed forms (Figure 222b, Drawings 11-13). Basic patterns also occur, but only in combinations, such as the arc (here called nkǒdo, "bending") with the

Fig. 222a. Decorations on Brass Neck Rings.

531 triangle (Drawing 11, 2), the arc with the fishbone (Drawing 11, 1), the arc and parallel lines (Drawing 11, 4 and 5), the fishbone and fishbone (Drawing 11, 3), spikes with parallel lines (Drawing 13, 2), and the triangle with the rectangle.

As a new pattern the male centipede (nǔm e ngū̄ẓ'n) appears (Drawing 13, 1), a double loop formed by parallel lines, which further develops into the patterns shown in Drawing 11, 6, and Drawing 12, b and d, but keeps the same name.

531 411 In the case of the swords (Fig. 223, Drawings 1-12), the patterns are applied only to the lower end of the blade and cover a more or less square field which directly adjoins the handle. Concerning the arrangement of patterns in this area, the Pangwe distinguish two kinds. In one, the area is patterned regularly over the

531 entire surface; in the /Fig. 22b appears here in the original text/
411 /271/ /Fig. 223 appears here in the original text/ /272/ /Fig. 224 appears here in the original text/ second, a longish segment remains free (Drawings 9 and 12), by virtue of the fact that the narrow blood groove (which is usually present) is widened towards one side.

The patterns themselves are almost exclusively basic patterns in all kinds of combinations.

A selection of patterns on battle ax blades is illustrated in Figure 223, Drawings 13-17.

As a note we must mention the decoration of the brass sheaths for swords and two-edged knives. The lines of these decorations are composed of a great number of little bosses punched out to the outside with a piece of iron (see Fig. 141). Almost always the patterning consists of half-patterns (rectangles divided by a diagonal) strung together in a series, which is familiar to us from the decorative scars.

531 A conception of the development of the pottery patterns is conveyed by Figure 224.

/273/

532

Drawing 14. Caravan of two Whites on horseback, accompanied by soldiers.

B. Drawing and Painting.

532 353 Drawings are scribbled on the exterior bark walls of the houses especially by children or adolescents. More rarely drawings are made on special bark strips that are attached to the inside walls of the meeting houses.

532 177 The drawing motifs are taken from secular life and frequently from a foreign culture (Fig. 225). Most frequently, tobacco pipes, /273/ /Fig. 225 appears here in the original text/ smoking men, and riders on horseback are represented in the drawings. The riders are regularly placed with both feet on their horses in the manner of Buffalo Bill. The horses themselves are always badly drawn; they might as well belong to the family of lizards (Drawing 6), or for that matter they might be identified as cats or centipedes (Drawing 9). At best they are equipped with a long, fishbone-shaped tail (Drawings 11 and 14), so that one immediately suspects that the artist has never seen a horse. This suspicion is strengthened when one observes a preponderant number of drawings of horses even in the remotest villages where it is certain that none of the inhabitants has as yet been to the coast. /274/ /Fig. 226 appears here in the original text. / It is therefore probable that the an-
[174] cestors of the present-day draftsmen saw horses among the equestrian peoples of Adamawa or other African peoples in an earlier era before the Pangwe moved to their present location. The knowledge of this animal would then have been transmitted to their descendants by means of pictures that were copied again and again.

In villages affected by European culture -- primarily those along the caravan routes -- we frequently find drawings of Europeans. Often, to correspond with their skin color, these are painted white; some drawings show them by themselves, others have them being carried in a hammock and accompanied by servants; others again show them on horseback riding ahead of the soldiers who are accentuated by red caps. The rider's legs are drawn behind the animal (Drawing 14), just as in the drawings of our children.

531 Otherwise we find people frequently represented with spears or rifles, but that is about the extent of artistic ideas. Drawings of

532

Fig. 226. Drawings by a Servant of the Author. Drawings 1-3. The author. Left, with a whip; right, with a walking stick. Drawing 4. Pocket watch belonging to the author. Drawing 5. Raffia palm. domestic or wild animals are very rare, there are none of plants, and as to tools, only the most striking ones (for instance, the large forging iron). Besides, most of the drawings are only scribbling anyway, in which only the author -- and perhaps not always even he -- had any idea of what he was doing. Obscene pictures, such as the one shown [831] in Drawing 10, Figure 225, are a great /275/ rarity; in the majority of drawings representing persons the sex organs are completely omitted. The sheet of pictures which my black boy gave to me as a farewell present, which he also adorned with my picture (Fig. 226), is of significance only for the "modern trend in art" and perhaps also for the

general conceptual ability of the natives; 532
for the rest, however, it has no ethnographic
value since such a creation would never have come
about without external influence.

C. Plastic arts.

The plastic arts are still wholly 537
rooted in religion and hence derive their motifs from 769
the conceptual realm of ancestor worship and of the
great cults.

The ancestral figures are heads carved out of wood
or full figures in the African style, that is, with
a recurrent lack of expression which, despite all the
superficiality of the given forms, nonetheless seems
to me to reflect a certain amiable naiveté and a quiet

Fig. 227
Top of a Chief's Stick with a Human Figure.

humor. To be sure, this effect hardly makes itself felt in the cold museum cases, but it does so in the native environment, especially when the natives carry the figures about at their cult festivals and make them dance. At any rate, the figures never bear the distorted, animalistic traits that distinguish Papuan art.

The large figures associated with celebrations for the ancestors are striking exceptions among the ordinary ancestral figures which are carved out of a single piece of wood. These large figures have attached arms which are slightly movable, legs, and sex organs.

In the same category as the ancestral figures we should place 532
the following which probably have a primarily religious significance: human figures at the ends of a number of chief's sticks (Fig. 227); furthermore, human heads on the center pillars and on the posts of the benches in the meeting houses, on the harps, and on the box musical pipe. On the other hand, the carving on the memory game is probably purely secular; at one end this carving forms a head. The same applies perhaps to the animal

532 representations on the posts of the meeting house (for instance, the leopard biting a pig's tail).

532 704 The masks used for the moon cult have a purely religious significance, as do the clay figures of the various cults. Indeed, especially in the latter the plastic art of the native rises to achievements of significant, one might even say monumental, proportions, both in the actual physical sense of the word (I saw figures eight meters long) and in the sense that they represented the idea symbolically expressed in a striking manner.

Geleitwort.

Wenn ein Völkerkunde-Museum, das über ein im Vergleich zu anderen Sammlungen fast verschwindend kleines Budget von einigen hundert Mark verfügt, seine nächstliegende Aufgabe, die geographische und ethnographische Lehranstalt seiner Stadt zu sein, erfüllen will, so muß es alle seine Kräfte zusammennehmen und wird es nur bei größter Anspannung erreichen, daß von der richtig ausgebauten, praktisch angeordneten, anschaulich aufgestellten, durch Wort und Bild belebten Sammlung der nötige Einfluß ausgeht. Ein Einfluß, der sich nicht auf allgemeine Unterhaltung, Anregung und Belehrung beschränken soll, sondern heute mehr denn je und bei uns in Deutschland mehr denn anderswo auf die Vermittlung praktisch verwendbarer Kenntnisse und vorurteilsfreier Begriffe hinzuarbeiten hat.

Will ein solches Museum mehr, will es sich an der wissenschaftlichen Völkerkunde beteiligen, so muß seine Entwicklung, der Erwerb seines Materials schon unter besonders glücklichem Stern gestanden haben. Will es gar bei der Außenarbeit mittun, bei der Forschung am lebenden Objekt der Naturvölker, so kann sich die Möglichkeit sowohl wie die Berechtigung dazu nur bei einem Zusammentreffen besonders günstiger Umstände ergeben.

Ein solcher Fall schien mir für Lübeck gekommen, als der hier gebürtige Herr Günter Tessmann aus Kamerun zurückkehrte; er hatte während seines dreijährigen Aufenthaltes in der Kolonie deren Süden und einen Teil des angrenzenden Spanisch-Guinea durchzogen und, von jeher zu naturwissenschaftlichen Beobachtungen begabt, dabei botanische, zoologische, ethnographische Sammlungen angelegt sowie eine gute Kenntnis der Pangwe-Sprache erworben. Namentlich Letzteres bewog mich, dem Gedanken Raum zu geben, ob es nicht möglich sei, diese Gelegenheit zum Ausbau unseres Museums für Völkerkunde und zur Förderung der ethnographischen Wissenschaft zu ergreifen. Derselbe Beobachter auf denselben Fleck, unter dieselben ihm vertrauten Leute gestellt, deren Sprache er beherrschte, mußte bei einem neuen längeren Aufenthalte auf einer und derselben Station tiefer in das Volksleben eindringen können, als manche noch so große Expedition mit einem „Stab von Gelehrten".

Andererseits lag in der Kleinarbeit, in der Lebensdarstellung einer engumrissenen ethnischen Provinz für die Völkerkunde die Forderung der

[p. v]

Zeit, und ſie war nirgends dringlicher als in Kamerun. Klagte doch noch 1905 Hutter in ſeinen „Völkerbildern aus Kamerun" (Globus, Bd. 87, S. 237): „Die Frage nach dem damit ſpeziell ſich dokumentierenden geiſtigen Leben eines Volkes, nach ſeinen religiöſen Vorſtellungen, wäre zweifellos eins der anziehendſten Kapitel in der Ethnographie und würde bei der Beurteilung ſeiner Kulturverhältniſſe nicht minder wie bei ethnographiſchen Gegenüberſtellungen von ausſchlaggebender Bedeutung ſein; aber es iſt außerordentlich ſchwer, hierüber beſtimmte, zuſammenhängende Angaben zu ſammeln . . . ." Mit anderen Worten, eine intenſive ethnographiſche Forſchung lag in Kamerun damals noch kaum vor. Dieſe überall empfundene und beklagte Lücke um ein Weniges zu verkleinern, ſchien aus jenen angeführten Gründen im Rahmen unſerer ſehr begrenzten Lübecker Mittel recht wohl möglich. Ich griff alſo zu und hatte die Freude, das Intereſſe für eine „Lübecker Pangwe-Expedition" erwecken und die Pläne für ſie verwirklichen zu können. Als Arbeitsfeld wurde das ſüdlich des Kampo-Grenzfluſſes liegende Gebiet des Pangwe-Landes gewählt, weil es Tessmann am beſten bekannt war, und weil hier im ſpaniſchen Territorium die relativ größte Unberührtheit hinſichtlich europäiſchen Einfluſſes beſtand.

Die Expedition hat hier vom Herbſt 1907 bis zum Herbſt 1909 gearbeitet. Ihre Ergebniſſe beſtehen in der im Lübecker Muſeum für Völkerkunde befindlichen ethnographiſchen Sammlung und in dem Beobachtungsmaterial, das Herr Tessmann in der Monographie über die Pangwe, deren erſter Band heute vorliegt und deren zweiter Band im Herbſt 1913 erſcheinen wird, niedergelegt hat. Bei der kolonialen Entwicklung Kameruns, die jetzt mit dem Erwerb neuen Pangwelandes raſcher abzulaufen verſpricht und zweifellos auch Spaniſch-Guinea nicht unbeeinflußt laſſen kann, werden die Beobachtungen zur Zeit der Lübecker Pangwe-Expedition eine erhöhte und eine dauernde Bedeutung beanſpruchen dürfen. Ich bin daher ſicher, daß die Völkerkunde ſie als eine wichtige Bereicherung des ihr ſo ſehr nötigen Materials begrüßen wird, und ich wünſche aufrichtig, daß ſie von ihm einen reichen und weſentlichen Nutzen für ihre Arbeiten gewinnen möchte. Zweck und Ziel unſerer Lübecker Pangwe-Expedition hätte ſich uns dann erfüllt.

Lübeck.

Dr. Richard Karutz,
Muſeum für Völkerkunde in Lübeck.

Vorwort.

Die Drucklegung des vorliegenden Werkes wurde in der Hauptsache ermöglicht durch die Bemühungen des Herrn Dr. R. Karuß, des Konservators des Museums für Völkerkunde zu Lübeck, das mich mit der Leitung der Lübecker Pangwe-Expedition betraut hatte. Herr Dr. Karuß hat den größten Teil der als Beitrag zu den Druckkosten geforderten Mittel zusammengebracht, und ich spreche ihm daher an erster Stelle meinen Dank aus.

Für die gütige Bereitstellung dieser Mittel bin ich Sr. Exzellenz, dem Herrn Staatssekretär des Reichskolonialamts Dr. Solf, der Kgl. Preußischen Akademie der Wissenschaften zu Berlin, der Rudolf-Virchow-Stiftung, einem hohen Senate der freien und Hansestadt Lübeck und einer Reihe Lübecker Herren, vor allem Herrn Senator Emil Possehl zu großem Danke verpflichtet.

Herrn Senator Dr. Neumann habe ich meinen Dank für seine liebenswürdige und tatkräftige Unterstützung in der Führung so mannigfaltiger und schwieriger Verhandlungen auszusprechen.

Das von mir größtenteils in Orotava (Kanarische Inseln) fertiggestellte Manuskript wurde in Gemeinschaft mit Herrn Dr. R. Karuß durchgearbeitet, wobei außer redaktionellen Änderungen verschiedene Vorschläge betreffs Ausarbeitung und Abfassung berücksichtigt wurden. Den gemeinsamen Besprechungen habe ich wertvolle Anregung zu verdanken, im besonderen ergab sich daraus die genauere Umgrenzung des Begriffes Medizin und *einer den Pangwe zufolge der gesamten Materie innewohnenden Kraft*, die von mir Organisationskraft genannt wird.

Herr Dr. Erich M. von Hornbostel hatte die Freundlichkeit, den Abschnitt XX (Musik) zu bearbeiten. Er stützte sich dabei auf die phonographischen Aufnahmen, die ich gemacht hatte, und auf meine Beobachtungen und Angaben, die wir in gemeinschaftlichen Sitzungen durchgesprochen haben. Für seine Mitarbeit, für die ich wohl kaum einen Berufeneren hätte finden können, sei ihm mein wärmster Dank gesagt.

Das Titelbild (Fangneger) hat die Lübecker Malerin Fräulein Anna Petersen liebenswürdigerweise nach einer Photographie gemalt. Die übrigen sieben Buntdrucktafeln, welche Fische und wichtige Nutzpflanzen darstellen, wurden von mir in Afrika gemalt. Von den dort aufgenommenen Photographien stammen einige wenige von dem früh verstorbenen Zeichner der Expedition,

Herrn Hans Jobelmann, weitaus die meiften von mir, diejenigen der Mufeumsgegenftände hat in gütigem Entgegenkommen Herr Karl Diederichs in Eutin angefertigt.

Die Zeichnungen der völkerkundlichen Gegenftände des Mufeums, zum größten Teil von Fräulein M. Aereboe ausgeführt, ftellte Herr Dr. Karuß zur Verfügung. Von den in Afrika hergeftellten Zeichnungen und Plänen wurden einige wenige von Herrn H. Jobelmann hergeftellt, die übrigen von mir.

Herr Friedrich Jürgens-Lübeck ftiftete eine Tafel (Zeichnung der Copaifera tessmannii), wofür ich ihm auch an dieter Stelle meinen Dank ausfpreche.

Die im Text angeführten wiftenfchaftlichen Beftimmungen von Tieren ftammen vom Königl. Zoologifchen Mufeum in Berlin, deften Direktor, Herrn Prof. Dr. A. Brauer, ich für vieffach bewiefenes Entgegenkommen zu Dank verpftichtet bin. Die Namen der Pftanzen wurden mir vom Königl. Botanifchen Mufeum in Dahlem bei Berlin geliefert, das im Beftß meiner Sammlung gepreßter Pftanzen des Pangwegebietes ift. Bedauerficherweife ift es nicht möglich gewefen, atte von mir ats völkerkundtich wichtig bezeichneten Pftanzen zu beftimmen. Infotgedeften fah ich mich außerftande, für eine Reihe wichtiger Arten mehr ats den einheimifchen Namen anzugeben, für manche ift aber wenigftens der Gattungsname vorhanden (z. B. bei Trichofcypha-Arten).

Für die Durchficht der Korrekturbogen bin ich Herrn Dr. R. Karuß, Herrn Dr. L. Lindinger-Hamburg und Herrn J. Stuhr dankbar.

Mit einem nochmaligen herzlichen Dank an atte, die an dem Werke der Pangwe-Expedition und dem Zuftandekommen diefer Monographie mitgearbeitet haben, übergebe ich die Ergebniffe einer achtjährigen Arbeit der Offentlichkeit.

Lübeck, November 1912.

Günter Tessmann.

[p. IX]

Einführung.

Der Name der Pangwe wird zum ersten Male 1819 von T. E. Bowdich in „Mission from Cape Coast Castle to Ashantee" Appendice, — London — jedoch nur vom Hörensagen erwähnt. Der erste Weiße, der sie wirklich zu Gesicht bekommen hat, ist der berühmt-berüchtigte Reisende und Abenteurer Paul B. du Chaillu, der 1861 in seinem Buche „Explorations and adventures in Equatorial Africa" — London —, die erste „wissenschaftliche" Beschreibung von den Pangwe, die er im jetzigen spanischen Gebiet, wenige Tagereisen von der Küste entfernt, kennen gelernt hatte, gibt. Es soll nicht verkannt werden, daß Du Chaillu — allerdings hauptsächlich auf dem Gebiete der Zoologie — allerlei geleistet hat, und diese Leistungen erscheinen uns in besonders hellem Lichte, wenn man die Gefahren der Westküste zu jener Zeit berücksichtigt, aber ebensowenig kann verschwiegen werden, daß seine Berichte vielfach in der Verallgemeinerung unrichtig und maßlos übertrieben sind. Über das Jägerlatein, das er seinen leichtgläubigen Lesern auftischt, kann jeder, der selbst in den Urwäldern Afrikas gejagt hat, nur lachen, z. B. wenn er S. 77 gleich vier Elefanten auf einmal von den Eingeborenen mit Speeren (!) so lange bewerfen läßt, „till the poor wounded beast looks like a huge porcupine" — dazu ein Bild, das diese Theaterszene veranschaulicht — die schließlich natürlich den Jägern als Beute anheimfallen. Die Berichte aber, die er von der furchtbaren Menschenfresserei der Fang gibt, müssen von der Völkerkunde ausdrücklich verurteilt werden. Da hören wir von Frauen, welche dampfendes Menschenfleisch über den Dorfplatz tragen, von halbabgenagten Menschenknochen, die bei den Häusern herumliegen (S. 74), von Schwertscheiden, die diese „unmistakeable cannibals" mit Menschenhaut überzogen hatten[1]), da wird berichtet, daß die Pangwe Tote anderer Stämme kauften, um sie zu verzehren, ebenso Tote anderer Familien des eigenen Stammes. Außer diesen auf ihre Wirkung berechneten Schilderungen von den Menschenfresserorgien, der Blutgier und Gefährlichkeit der Fang macht du Chaillu einige wenige Angaben über das Äußere der Leute, über ihre Gebrauchsgegenstände und Waffen, aber auch sie sind leider wenig brauchbar, da hier, wie so oft, Kulturen verschiedener Volksstämme vermengt sind, so z. B. kennen die

[1]) In Wirklichkeit Varanhaut.

[p. xi] [p. x is blank]

Pangwe kein Wurfmesser, das wir (S. 79) unter den Waffen der Fang abgebildet finden[1]), ferner ist die Armbrust keine Kriegswaffe, wie Du Chaillu anzunehmen scheint.

Die Berichtigung der Du Chaillu'schen Angaben erfolgte alsbald und zwar durch den als wissenschaftliche Größe anerkannten englischen Afrikareisenden R. F. Burton, der nur zwei Jahre später und an ziemlich derselben Stelle — etwas südlicher, beim Gabunbecken — in das Gebiet der Pangwe eindrang und ebenfalls wie Du Chaillu nur bis in das erste Dorf (Magyan) der Fang kam. Den Bericht darüber veröffentlichte Burton in „The Anthropological Review" London, Vol. I unter dem anspruchslosen Titel: „A day amongst the Fans" anscheinend ohne Du Chaillus Berichte gekannt zu haben[2]). Wenn auch seine Angaben von Irrtümern nicht frei sind, so zeugen sie doch von ehrlichem Wollen und verhalten sich zu den Du Chailluschen Erzählungen wie der Tag zur Nacht. Im vollkommenen Gegensatz zu diesen stehen seine Angaben über die Menschenfresserei der Pangwe, und sie gelten heute noch, nämlich: „The cannibalism of the Fans is by no means remarkable, limited, as it is, to the consumption of slain enemies", und weiter: „Still no trace of the practice was seen at Magyan; this, however, is not caused by civilisation. The Rev. W. M. Walker and other excellent authorities agree, that it is a rare incident even in the wildest parts, but it is rendered unusual only by want of opportunity[3]). The corpse, when brought in, is carried to a hut in the outskirts and is secretly eaten by the men only, the cooking pots being finally broken. No joint of man is ever seen in the settlements. The people shouted with laughter when a certain question was asked. The sick are not devoured, the dead are decently interred." Und weiter: „During my peregrinations I never saw even a skull. Mr. Tippet, who had lived three years with this people, only knew three cases of anthropophagy." Wie bei der Kürze seines Aufenthalts erklärlich, teilt Burton natürlich nur Äußerlichkeiten mit, so z. B. beschreibt er die auffallenden und verschiedenartigen Frisuren der Eingeborenen, sagt, daß Pfeil und Bogen unbekannt sind und gibt seine Meinung über den Ursprung der Armbrust dahin ab: „The . . . cross-bow peculiar to this people, who seems to have invented, not to have borrowed it, as might be supposed, from Europe."

---

[1]) O. Lenz sagt in seiner „Reise auf dem Okande", daß die „Mbangwe", die zu den Akelle gehören, „eigentümlich geformte kleine Wurfmesser" verfertigen.

[2]) In seinem Buch „Two trips to Gorilla Land" usw. London 1876 heißt sein Abschnitt IX allerdings „A specimen day with the Fàn cannibals".

[3]) Letzteres ist allerdings eine willkürliche und nicht bewiesene Annahme.

Du Chaillus Geist war aber nicht so leicht zu vertreiben, die schaurigen Bilder, die seine Phantasie den entsetzten Europäern vorspiegelte, galten lange Zeit, ja, bis in die jüngste Gegenwart hinein, als die Wahrheit über die Wildesten aller Wilden, und durch ihn erst wurden die Fang zu dem schrecklichen und gefährlichen Menschenfresservolk der Westküste. Die geradezu lächerlichen Abbildungen seines Buches gingen in alle Naturgeschichts- und Reisewerke über, und ganz deutlich erinnere ich mich aus einem Buche „für die reifere Jugend" des Bildes, auf dem dargestellt wird, wie ein riesenhafter Elefant hochaufgerichtet und mit einem Neger auf den Zähnen wütend vor den mit Speeren und zwei zu einem Zopf verflochtenen Kinnbärten ausgerüsteten Eingeborenen steht, in der Tat einem „huge porcupine" vergleichbar — poor wounded beast!

Auch in den Köpfen der Forschungsreisenden, die das Pangwegebiet leidlich kannten, sonst ganz vernünftigen Leuten, spukt der Du Chaillusche Geist und richtet allerlei Unheil an, er verführt sie zu möglichst menschenfresserischen Überschriften und zwingt sie hinsichtlich des Kannibalismus und der Blutgier der Pangwe in seine Gedankenrichtung. So schreibt 1875 der Marquis de Compiègne im „Chapitre IV, Les Pahouins Cannibales" seines Buches „L'Afrique équatoriale" Paris, S. 155 folgendes: „car ils mangent non seulement leurs ennemis pris ou tués dans le combat, mais encore leurs morts à eux, qu'ils aient succombé à la guerre ou aux atteintes de la maladie peu importante", scheint aber aus eigener Anschauung nichts über Menschenschlächtereien wie Du Chaillu berichten zu können, was er aber nur darauf schiebt, daß die Pangwe, sobald sie in Berührung mit Weißen kommen, weniger häufig und auch mehr im Verborgenen dieser Unsitte huldigen. Freilich sieht der Du Chaillu in ihm noch einmal (S. 56) Leute, „qui remplaçaient les dents de tigre par des ossements provenant de doigts humains, enfilés au chapelet" [1]), sonst aber malt er ein im großen und ganzen zutreffendes Bild von den Pangwe, beispielsweise gibt er, wie schon Burton, eine wenig vorteilhafte Beschreibung von den Frauen, die ihm an sich schon häßlich genug erscheinen, sich aber durch Beschmieren mit Farbe noch häßlicher machen, ferner — und auch darin steht er hoch über Du Chaillu — schildert er (S. 169—171) eine Elefantenjagd, wie sie sich in Wahrheit abspielt, d. h. wie man die Dickhäuter einkreist und durch einen Zaun auf einen kleinen Platz zusammenpfercht, wo man sie halb verdursten läßt, ihnen dann vergiftetes Wasser hinstellt, von dem sie krank werden, und sie schließlich, wenn sie bereits vollkommen erschöpft sind, niederknallt. Sehr richtig weist derselbe Verfasser die gerade damals bei seinen Landsleuten herrschende übertrieben hohe Einschätzung der Pangwe zurück und sagt: „et

[1]) Wahrscheinlich Schwanzknochen des Leoparden, die als Medizin (vergl. Abschn. XIII) gelten.

XIV

l'on ne sait pas jusqu'où ira le mal que fera à notre colonie l'invasion de ces sauvages, que l'on considérait comme ses futurs régénérateurs."

Im Jahre 1898 tritt der deutsche Forscher Dr. O. Lenz mit seinen „Skizzen aus Westafrika" auf den Plan. Auch er hat die Pangwe nur im Süden des Gebietes in dem Unterstamm der Fang kennen gelernt, und auch über ihn hat noch der böse Geist Du Chaillus etwas Gewalt, denn sonst hätte er wohl nicht seinen Abschnitt V überschrieben: „Die Fan, ein Anthropophagenvolk", wo er S. 88 selbst zugibt, daß es nicht die Regel ist, „der Unsitte des Cannibalismus" zu huldigen, sondern daß es nur bei besonderen Feierlichkeiten, z. B. Siegesfesten, geschieht, daß diese „Orgien" auch nicht öffentlich als etwas Alltägliches stattfinden, daß keine Fremden dazugelassen werden, ja, daß die Fang fühlen, daß das Verzehren von Menschenfleisch sie in den Augen der anderen herabsetzt, und daß es deshalb eben im Verborgenen geschieht. Alles Beweise, daß die Pangwe eben nicht den Namen eines „Anthropophagenvolks" verdienen. Im übrigen kommen wir durch Lenz nicht viel weiter, er bewegt sich nur in allgemeinen Phrasen über den Charakter der Pangwe, die er grausam und unbarmherzig, aber nicht so feig und leichtsinnig als Okande und Akele nennt, meint, daß sie ein ernstes, fast finsteres Benehmen hätten, einen starren und stieren Blick, daß man ihren Versprechungen im allgemeinen mehr Glauben schenken könne als denjenigen anderer Neger. Weiter gibt er nur Äußerlichkeiten über ihre Sprache, die einsilbige Wörter hätte, die rauh und kurz hervorgestoßen würden, sagt, daß, wenn sich zwei die unschuldigsten Sachen erzählen, es in einem Tone geschähe, daß der Fremde glaube, es müsse im nächsten Augenblick ein Handgemenge vor sich gehen, bringt Allgemeinheiten über den Eindruck, den ihre Dörfer machen, über Kleidung und Schmuck, redet von Feuerwaffen, die Bogen und Pfeile verdrängt hätten, wo es doch vielleicht nie solche gegeben hat, usw. Religiöse Anschauung wäre nur in untergeordnetem Maße zu finden (!!).

Damit ist der erste Zeitraum der Pangweforschung abgeschlossen. Ihre Vorkämpfer hatten das Land im Süden erschlossen und der Einzelforschung den Weg geebnet. Es dauerte fast 20 Jahre, ehe sie kam. Inzwischen versuchten einzelne unerschrockene Männer in das Herz des Pangwelandes vorzudringen, unter unsäglichen Mühen durch die feindlichen Bewohner sich einen Weg zu bahnen und das Geheimnis, das diese Länder umschlang, in großen Zügen aufzudecken. Obgleich für die Völkerkunde ziemlich wenig dabei abfiel, verdienen doch die Namen der von der französischen Regierung ausgeschickten Expeditionsführer genannt zu werden, allen voran P. Crampel, der Ende der achtziger Jahre das Pangweland an der Ostgrenze (im Feindesgebiet) durchzog, dann A. Fourneau (1891), und C. Cuny (1896). Be-

sonders schlecht ist Fourneau auf die Pangwe zu sprechen, der auch kein gutes Haar an ihnen läßt — Tugenden besitzen sie für ihn überhaupt nicht — und S. 198 von ihnen nicht ganz unberechtigterweise sagt: „J'ai oui dire chez eux qu'il n'était pas d'affaire qui ne tournât en rapts des femmes, coups du fusil et empoisonnements." Teils Kopfschütteln, teils Heiterkeit muß folgender Passus erregen: „Ces Fans Betchis sont fort peu intéressants au point de vue ethnographique. Ils n'ont aucune religion, si ce n'est quelques practiques répugnantes de fétichisme." — Was man also nicht gesehen hat, nicht ad acta genommen hat, das gibt es überhaupt nicht! Aber: est solamen miseris, socios habuisse malorum! So auch für Fourneau: In demselben Jahre beschreibt nämlich gerade Heinrich Hartert im Globus 1891 Bd. IX einen „Besuch bei den M'pangwes am Muni" und sagt S. 211: „Daß bei einem Volke, welches, wie ich gezeigt, noch auf einer außerordentlich niedrigen Stufe steht, von einer Religion in unserem Sinne nicht die Rede sein kann, wird jedermann einsehen, und so sind denn auch die Anzeichen, welche vielleicht für das Vorhandensein einer solchen bei den M'pangwes sprechen könnten, außerordentlich geringe." —

Auch im Norden, im deutschen Gebiet, regte es sich seit den neunziger Jahren. Kund und Tappenbeck machten 1888 einen Vorstoß ins Innere, gelangten in das Gebiet der Jaunde und gründeten die Jaundestation, auf der schließlich G. Zenker als Stationsleiter zurückblieb. Von ihm stammen die ersten eingehenderen Nachrichten über die Jaunde, veröffentlicht in „Mitteilungen von Forschungsreisenden und Gelehrten aus den Deutschen Schutzgebieten", herausgegeben von Dr. Freiherr von Danckelman, von denen die Arbeit „Yaunde" 1895 besonders wichtig ist. Zenker hat erkannt, daß die Yaunde „zu den Pangvölkern" gehören, d. h. also ein Unterstamm der Pangwe sind, und sagt S. 61 sehr richtig: „Die Jaunde lieben die Jagd, doch sind sie keine großen Jäger", sowie S. 2: „im Kampfe zeichnen sie sich nicht durch Tapferkeit aus", S. 43 fügt er eine ganz gute Zeichnung eines tätowierten Jaunde bei. Neben vielem Richtigen finden sich auch große Unrichtigkeiten, z. B. sagt er S. 36: „Die Familienhäupter kennen kaum die Namen ihrer direktesten (!) Vorfahren", was durchaus falsch ist, ferner: „Zusammenhängende Dörfer gibt es im Innenlande nicht, bloß Gehöfte oder besser Weiler." S. 62 sagt er: „Bastzeuge" würden mit Mustern „bedruckt", Körbe aus den „Blattstielen der Weinpalme hergestellt" — ersteres ist nie der Fall, letzteres ein Ding der Unmöglichkeit —, S. 66: Die Eingeborenen sollten über keine Heilmittel gegen die „Erdbeerkrankheit (mabatta)", soll heißen mabada, verfügen, was ebenfalls nicht richtig ist, usw. Ganz schlimm steht es mit dem, was Zenker von den geistigen Vorstellungen der Leute, besonders von der Religion zu erzählen weiß; da wird

mit den Ausdrücken „Glaube" und „Aberglaube" gearbeitet, Wesentliches aber nicht gebracht, der wichtige Seo-kult gar S. 52 unter „Festen" behandelt. Mitgemacht hat Zenker die Seo-Feier freilich nicht, er gibt vielmehr nur die Antworten, die er auf seine Fragen von den Eingeborenen bekommen hat, wieder und hat daher den Zweck der Feier vollständig verkannt, ja, er glaubt, daß es sich dabei bloß um das Erlegen einer Seo-Antilope handelt, während diese in Wirklichkeit ein Symbol des Bösen ist; die Markung der Neulinge hält er für ein Stammeszeichen (S. 43. 44), offenbar weil die meisten Männer sie tragen. Vieles von dem, was er sagt, ist überhaupt unverständlich. Immerhin hat Zenker versucht, durch Eingeborenenbezeichnungen die Sache klarer zu machen, aber der Versuch ist mißlungen. Abgesehen davon, daß man die Jaundworte erst aus dem Sächsischen ins Deutsche übersetzen muß (ngu statt nku, infoua statt mvun), sind sie oft so falsch, daß man nicht einmal erraten kann, was gemeint ist, auch Mabeaworte bringt er hinein, z. B. S. 46 imboballa (Medizinmann) von maballa (Medizin) statt ngengang von biang usw.

Danach wird es still und stiller im Norden. Nur wenig über das Volk selbst bringen noch v. Stein, der in seinem Aufsatz: „Über die geographischen Verhältnisse des Bezirkes Lolodorf usw." (Mitteil. aus d. deutschen Schutzgebieten, XII. Bd., 3. Heft) einige ziemlich oberflächliche, nur auf dem Gebiet der Statistik genaue und wertvolle Beobachtungen über Bene und Bulu gibt, und Hauptmann Ph. Kugelhardt in „Eine Reise durch das Land der Mwele und Esum, Kamerun", erschienen im „Globus" 1904, Bd. 85, S. 1 ff.

Ende der neunziger Jahre setzt dann die Einzelforschung im Süden ein, und zwar mit den Veröffentlichungen des bei weitem fruchtbarsten, aber auch langweiligsten Fangwerkschriftstellers Les Missionar H. Trilles, der Jahre hindurch besonders die Zeitschrift „Les Missions catholiques" mit seinen Aufsätzen überschwemmt hat. Du Chaillu, dem es darum zu tun war, mit seinen Schilderungen Aufsehen zu erregen — verführt durch das Sensationsbedürfnis seiner Zeitgenossen, die hinter den damals kaum flüchtig bekannten Küstenstrichen des dunklen Erdteils unerhörte Geheimnisse vermuteten, und deren übersättigte Nerven wirklich nur durch äußerst grell beleuchtete Reiseberichte angeregt werden konnten —, Du Chaillu, dem Pionier einer alten, glänzenden Zeit, in der der Begriff „Völkerkunde" mit Wissenschaft nichts zu tun zu haben schien, mag für sein bißchen Afrikalatein allerlei zugute gehalten werden. Trilles, den der Hauch einer neueren Zeit umweht, kann für seine vielen Aufbauschungen und seine — durch Voreingenommenheit zu erklärende — vollkommen schiefe Darstellung der Fangkultur[1], keine solchen Milderungsgründe in Anspruch nehmen. Mag er z. T. auch, wie man zu seiner Ehre annehmen muß, durch die Erzählungen seiner

[1] „Chez les Fang" in „Les Missions Catholiques, Lyon, 1898".

Missionszöglinge getäuscht worden sein, so ist doch die Tonart des Ganzen meiner Meinung nach durchaus zu verwerfen. Der Zweck der Übung ist auch nur, zu zeigen, wie scheußlich, verderbt, verachtungswürdig das Leben und Treiben, insbesondere die Religion der „armen" Schwarzen ist. Die Aufsätze von Trilles sind daher auch nicht als wissenschaftliche Abhandlungen zu betrachten, das zeigen auch Ergüsse wie S. 268: „Et puis, oh! je vous prie, après cette lecture (nämlich der Kultfeierlichkeiten. Anmerk. d. Verf.), que de votre coeur jaillisse un hymne de reconnaissance et d'amour envers le Christ qui vous fit naître catholiques, une prière aussi, prière de foi, prière ardente pour nos pauvres sauvages qui vivent au milieu des abominations proscrites par le culte satanique."

Trilles kennt auch den Kult des Ngi (Ngil), weiß sogar, daß es Kultfiguren gibt: S. 268 „Devant la case qu'au fond de la forêt, ils se construisent en quelque coin, deux statues, grossièrement ébauchées en terre glaise, représentant un homme et une femme, et chacun de ceux qui viennent les consulter doit se livrer à une cérémonie horrible . . ." (Hier verwechselt er wahrscheinlich die Elong- und Bokungfigur mit dem Ngi), er betrachtet es aber als seine Aufgabe, nicht etwa die Kulte wahrheitsgetreu zu beschreiben oder den in ihnen liegenden Sinn zu erforschen, sondern sie — natürlich — mit allen möglichen Mitteln zu bekämpfen und zu zerstören: „Il faut lutter, nous autres catholiques, lutter jusqu'à la fin et, par tous les moyens possibles, travailler jusqu'à la mort, à étendre en ce pays désolé le royaume du Christ." Einen dieser Mittel ist die für die Neger höchst ungünstige Schilderung ihrer Kultur, insbesondere hier der Kultfeiern, die Trilles anscheinend nicht mitgemacht hat, sondern nur aus Erzählungen seiner Schwarzen kennt. Wie er mehrfach durchblicken läßt, ist der Ngikult ein Werk des leibhaftigen Satans, die Eingeweihten und die Kultleiter, die er unterschiedslos „Ngi(l)" nennt, sind seine Kinder, die Neulinge „ayant continuellement de mauvais exemples sous les yeux, vivant au sein de la plus hideuse corruption, sont bientôt gangrenés jusqu'à la moelle des os. Ayant tout vu faire, n'ignorant aucun des abîmes où descend la perversité humaine, ils sont prêts à tous les crimes, à toutes les abominations." (S. 268.) Daß diese Behauptungen völlig aus der Luft gegriffen sind, mag hier gleich festgestellt sein; im übrigen verweise ich auf Abschnitt XI meines Buches.

Offenbar hält auch Trilles, wie übrich, das Treiben der — nur in der Einbildung bestehenden — Zauberwesen für Wirklichkeit und bringt ihre — nur erlauschten — Blattaten als Tatsachen unter den Ngifeierlichkeiten. Anders wenigstens kann ich die wunderliche Geschichte von dem Abzapfen des Blutes und der Erzeugung eines Angehörigen des Neulings — „c'est un jeune frère,

une jeune sœur, parfois sa propre mère," S. 269 — nicht deuten (vergleiche dazu Abschnitt XII: Zauberglauben).

Sehr hübsch und belehrend ist, was Trilles von der Entstehung des Fetischismus[1]), S. 297, sagt. Man höre:

„Satan, a-t-on dit bien des fois déjà, n'est que le singe de Dieu, et son rêve est de se faire adorer par l'homme.

Tout le fétichisme est là, avec son origine, ses causes, sa force. Son origine, elle remonte à la chute de l'Ange; ses causes, on les trouve dans la double haine de l'Archange maudit, haine contre Dieu, haine contre la créature; ses forces, c'est toute la puissance dont Satan dispose. Qui, résumé en quelques mots, voilà tout le fétichisme, avec ses merveilles, ses pseudo-miracles, sa lutte acharnée contre le bien, les prestiges de ses magiciens, les abominations de son culte." Und S. 298: „Qu'est-ce donc en somme que le fétiche: simplement la ficelle par laquelle Satan s'attache l'individu. Reste à trouver qui il attache? c'est le fétiheur. Et la manière dont il l'attache? c'est le culte. Tout se réduit là. Satan, l'homme, une ficelle, et un intermédiaire pour relier le tout, voilà!" Dann wird anschließend eine Reichtum(Mekuk)-medizin beschrieben, die aber mit der Ahnenverehrung in einen Topf geworfen ist. Von der Ahnenfigur, die dabei aufgestellt ist, heißt es S. 298: „Souvent, affirment les vieux fétichesses, au cours des initiations, on voit soudain la statue s'animer, et de ses lèvres s'échapper des sons, des paroles . . . Prestiges, illusions, réalité? qui sait?" S. 435 ff. ist der Ahnenkult besprochen. Die Ahnenfigur wird dabei als „Dieu national" hingestellt, vergl. S. 436: „Cela, à proprement parler, c'est Bidzi, le Dieu national, le fétiche universellement redouté des non-initiés, la statue, représentation du Dieu invisible du mal" usw.

An diesem Beispiel möchte ich zeigen, daß ein Fremder doch ein ganz falsches Bild von der geistigen Kultur der Pangwe gewinnt, wenn er, wie z. B. bei Trilles, liest, daß die Eingeborenen in dem „Bidzi" einen Gott, einen Nationalgott sehen. In Abschnitt XI habe ich ausgeführt, daß diese Figur nichts weiter ist, als ein Abbild von Ahnen, eine Ahnenfigur, die noch so nach übereinstimmenden Angaben der Eingeborenen dazu gemacht ist, um Eingeweihte über die wahren Gegenstände der Verehrung, nämlich die Schädel der Ahnen, hinwegzutäuschen. Diese Schädel befinden sich nämlich in einer Truhe, auf der die Figur steckt. Daher verkaufen die Pangwe die Figur stets, wenn auch nach einigen Zögern, die Truhe mit den Schädeln

[1]) Trilles versteht darunter den Glauben an die Kraftübertragung von einer Materie auf die andere, den ich im Abschnitt X geschildert und dort „Medizinglaube" genannt habe; er hält aber auch die Kulte nur für „Fetischismus", was durchaus einseitig ist und zu großen Verwechselungen führt.

nie. Einen „Nationalgott" würde man wohl nicht einfach an die Weißen verkaufen.

Nach diesen Proben wird man wohl genug haben, es würde zu weit führen, auch nur die größten Unrichtigkeiten und schlimmsten Mißverständnisse zu berichtigen.

Die dem Trilleschen Aufsatz: „Chez les Fang" beigefügten Abbildungen sind schlecht und unrichtig — S. 450 gar ein „Village Fang" mit Kegeldachhütten! — z. T. zeigen sie, daß auch hier wieder einmal Kulturen anderer Stämme mit der Fangwekultur verwechselt sind.

1899 veröffentlichte Albert L. Bennet M.D. in „The Journal of the Anthropological Institute", London, einige „Ethnographical Notes on the Fang". Er kennt drei Unterstämme, Bulu, Ntum und Fang, und macht recht wertvolle Angaben über ihr Äußeres, ihre Sitten und Gebräuche, auch hören wir von ihm allerlei über Mediäen und über Kulte, die er — was verzeihlich ist — Geheimbünde nennt und auch nur vom Hörensagen kennt — daher weiß er nichts von heiligen Plätzen, von Kultfiguren und den Feierlichkeiten selber. Wenn auch nicht ohne Irrtümer, ist diese kurze Arbeit doch klar und bestimmt abgefaßt und verdient deshalb, wie jede ehrliche Forscherarbeit, Anerkennung.

1901 gibt V. Largeau eine — nicht gerade praktische — mit Grammatik und Wörterbuch verbundene zusammenfassende Arbeit heraus, die den prophetischen Titel: „Encyclopédie Pahouine" führt, aber mehr ein Sammelsurium von im einzelnen nicht übles Schilderungen der Sitten verschiedener Volksstämme ist; so rechnet Largeau, wie die Franzosen bis in die neueste Zeit leider alle tun, die Njem mit zu den Pangwe, außerdem hat er in sein Buch alles aufgenommen, was seine Berichterstatter ihm erzählten, auch was er nicht erlebt hatte und nachprüfen konnte. Infolgedessen sind das beste und wichtigste die Sagen und Märchen, die so wiedergegeben werden, wie sie die Neger erzählen; als verhältnismäßig gut können noch bezeichnet werden die Angaben über materielle Kultur, soweit Largeau sie auf seinen Reisen selbst beobachten konnte, bei der geistigen Kultur liegt indessen alles auf.

Was Largeau in seiner Einführung: „Notice sur les Fan' ou Pahouins" sagt, ist das Wiederaufflackern des Du Chaillueschen Geistes in abgeschwächter Form, und als unangebracht ist es zu bezeichnen, wenn sich Largeau S. 23 über die „hommes gens, qui se figurent naïvement que l'anthropophagie n'existait plus sur la terre" aufhält, nur weil sie die Frage wagen „Les Pahouins sont-ils anthropophages?" Allerdings gibt er zu, daß die Pangwe „si l'on veut, anthropophages modérés" sind, aber es liegt ihm nun mal daran, die Menschenfresserei an die große Glocke zu hängen. Er beruft sich dann auf

den Marquis de Compiègne, dem Du Chaillu nicht nur vorgeschwebt, sondern wahrscheinlich auch vorgelegen hat, auf die Antwort, die er von einem Mekel auf seine Suggestivfrage, welches die größten Menschenfresser wären, erhielt, nämlich „die Fang", auf die gar nicht mehr aufrecht zu erhaltende Annahme, daß die Bekai ihren Namen von a dai = essen hätten (vergl. S. 37, Anm. 1) und auf einen einzigen beglaubigten Fall, der aber, wie das wenige, was sonst über die heimliche Menschenfresserei tatsächlich bekannt geworden ist, die Pangwe noch lange nicht zu einem „Anthropophagenvolk" macht. Über Leichenraub macht Largeau einige Bemerkungen (S. 15), die ganz deutlich zeigen, daß er die Anschauungen von dem mystisch gedachten Treiben der Zauberwesen (vergl. Abschnitt XII) für Tatsachen hält und mit Menschenfresserei verwechselt. Im übrigen sind seine Beobachtungen für den Kern des Volkes nicht maßgebend, ja, nicht einmal für den Hauptteil der Fang, weil sie an der östlichsten Grenze des Pangwegebietes, wo schon viel fremde Kultur zu den Pangwe eingedrungen ist, aufgenommen sind und sich anderenteils größtenteils nur auf Mitteilungen von Eingeborenen gründen. Man sieht hier, daß die wissenschaftliche Erforschung eines Volkes durch Abfragen mit Hilfe eines Dolmetschers zu verwerfen ist und zu keinem brauchbaren Ergebnis führt.

1903 erschienen dann eine gute und bedeutende Arbeit Trilles „Proverbes, légendes et contes Fang", veröffentlicht im „Bulletin de la société Neuchâteloise de géographie", die Ergebnisse der Forschungen R. Avelot's im „Bulletin de la société d'anthropologie de Paris" unter dem Titel: „Recherches sur l'histoire des migrations dans le bassin de l'Ogôwé et la région littorale adjacente" und eine Studie über „La musique chez les Pahouins", beides Arbeiten, auf die an den geeigneten Stellen unseres Buches eingegangen wird.

So war im Jahre 1907 der Stand der Pangweforschung. In zwei ganz getrennten Gebieten war gearbeitet worden, im Norden, im Jaundeland, von den Deutschen, im Süden, besonders am Ogowe, hauptsächlich von den Franzosen. Zwischen beiden gähnte eine Kluft, denn die Deutschen kannten nicht den Süden, die Franzosen nicht den Norden; außerdem waren erklärlicherweise die bisherigen Forschungen im einzelnen äußerst lückenhaft und oberflächlich geblieben. Was als eigentliche Pangwesart, als eigener Kulturbesitz der Pangwe anzusehen war, wußte man nicht, und über ihre geistige Kultur, besonders über ihre Religion war außer Sagen und Märchen wenig Zuverlässiges bekannt, von der Bedeutung des ganzen großen Betriebes der Kulte hatte man kaum eine Ahnung. Diese Lücken auszufüllen, war Aufgabe des Verfassers, der auf Vorschlag und Antrag des Herrn Dr. R. Karutz, des Kustos des Museums, für Völkerkunde in Lübeck, von der Gesellschaft zur Beförderung gemeinnütziger Tätigkeit zu Lübeck in das Pangwegebiet geschickt

wurde, wo er schon einige Jahre vorher auf Reisen und Stationen wissenschaftlichen Forschungen und Sammlungen obgelegen hatte. So war er 1905 von Edea durch das Bassagebiet nach Jaunde und weiter über Simekon (Sembe) nach Kombokotto im Mwelegebiet vorgedrungen und dann auf anderem Wege nach Jaunde zurück und von da an die Küste nach Kribi gereist. Später (1906) führte ihn sein Weg von Kribi über Nkomakak im Bululand nach Südosten ins Kampo- und Uellegebiet, wo er die Stationen Makomo, später im Herzen von Span.-Guinea Aléu und Uelleburg am Uelle (1907) gründete. Von hier mußte er aus gesundheitlichen Gründen nach Deutschland zurückkehren. Auf der Lübecker Paingwe-Expedition 1907—1909 gelang es, von den Stationen Nkulentangan (bei Aléu), Uelleburg (1908) und Behai in der Nähe der Span.-Guinea-Kameruner Grenze (1908—1909) sowie auf kürzeren und längeren Zügen in das bisher noch unbekannte Spanisch-Guinea-Hinterland und in das jetzt von Frankreich an Deutschland abgetretene Gebiet der Kolonie Gabun die Aufgaben, von denen oben die Rede war, unter schwierigen Umständen und unter mannigfaltigen Gefahren, die von dem schlechten Klima des Innern und den noch nicht von einer Regierung „beruhigten" Eingeborenen drohten, zu einem glücklichen Ende zu führen. Der Rückmarsch wurde über die französischen Militärstationen Ojem, Nzork, Oyvan angetreten und endete am 6. Juni 1909 in Libreville. Den Abschluß bildete ein kurzer Ausflug nach Kap Lopez und auf einem Raddampfer den Ogowe hinauf nach Ndjole.

Abschnitt I.

Land und Leute.

Pangwegebiet: Lage, Größe, Oberflächengestaltung, Klima. — Tier- und Pflanzenwelt. — Bevölkerung. — Name „Pangwe". — Körperliche Beschaffenheit der Pangwe.

Das Land der Pangwe liegt an der Westküste Afrikas zwischen dem 1° südlicher und dem 5° nördlicher Breite sowie dem 9° und 14° östlicher Länge und umfaßt etwa 176 600 qkm d. h. einen Raum, der einem Drittel des Deutschen Reiches entspricht. Kolonialpolitisch gehört es in seinem nördlichen Teil zum deutschen Schutzgebiet Kamerun, in seinem südlichen zur Kolonie Gabun (Französisch-Äquatorialafrika, früher: Französisch-Kongo). Ein Ausschnitt im südlichen Teil des deutschen Gebietes, von der Küste bis zum 11°, steht unter spanischer Oberhoheit und führt den Namen Spanisch-Guinea. Der auf Kamerun entfallende Teil des Pangwegebietes ist 94 000 qkm groß[1]).

Dieses gewaltige, vom Ogowe bis zum Sanaga, vom Ivindo (Ajene) bis an die Küste des Atlantischen Ozeans reichende Gebiet ist ein im Durchschnitt 600—800 m über dem Meeresspiegel liegendes Hochland, das, zum größeren Teile eben, zum kleineren von Hügeln, Bergkuppen und Gebirgsketten überhöht wird. Die höchsten Erhebungen messen selten mehr als 1500 m über dem Meeresspiegel, so daß bei der durchschnittlichen relativen Höhe von 700 m der Hochgebirgscharakter fehlt. Das gesamte Gebiet ist bis auf den äußersten Norden mit dichtem Urwald bedeckt und wird von vielen an Stromschnellen reichen, zum Teil recht breiten und tiefen Strömen durchzogen, so vor allem von dem Nyong in seinem Mittellauf, von dem Kampo (Nteni), dem Uelle (Benito), den Zuflüssen des Muni- und Gabunbeckens, dem Abanga und Kon (zum Ogowe), dem Mwung nebst weniger bedeutenden rechten Nebenflüssen des Ivindo, sowie endlich vom Ivindo selbst. Der Dscha, der für eine Strecke unterhalb des Kaim bei Kam eben die Grenze des Pangwegebiets überschreitet, ist der einzige Fluß, der zum Wassernetz des Kongo gehört. Seen oder sonstige stehende Gewässer fehlen ganz, dagegen sind Sümpfe in Menge vorhanden.

Der aus rotem und gelbem Lehm bestehende Boden ist äußerst fruchtbar infolge der großen Luftfeuchtigkeit und der reichlichen Niederschläge, die sich auf zwei Jahreszeiten verteilen und eine jährliche Regenmenge von 1500 bis 2000 mm bringen. Der Ablauf dieser Jahreszeiten ist an verschiedenen Punkten des Pangwegebiets verschieden, im mittleren Teil etwa folgendermaßen:

Dezember bis Februar . = große Trockenzeit,
März bis Mai . . . . . = kleine Regenzeit,
Juni bis August . . . . = kleine Trockenzeit,
September bis November = große Regenzeit.

Die gesundheitlichen Verhältnisse sind, wie im übrigen tropischen Westafrika, schlecht. Malaria in allen Formen, Dysenterie und Hautkrankheiten sind endemisch, gefährden in erster Linie die Europäer, verschonen aber auch die Eingeborenen nicht, namentlich rafft die Malaria, gegen die die Erwachsenen eine gewisse Seuchenfestigkeit erwerben, kleine Kinder in Menge weg.

Die Tier- und Pflanzenwelt zeigt die für das südliche Waldgebiet bezeichnenden Formen und wird als Kamerun-Gebirgsfauna und -flora bezeichnet; nur im äußersten Norden bringt das stellenweise auftretende Grasland einen fremden Zug in das sonst einheitliche Bild. Von größeren Säugetieren finden sich Gorilla und Schimpanse, Elefant und Büffel — dieser nur in der Nähe größerer Flüsse —, Leopard, verschiedene Antilopenarten und, sehr selten, das Flußpferd. Von Vögeln erwähne ich als auffallend und typisch nur Perlhuhn und Frankolin, Schmarotzerweihen und Graupapagei, die verschiedenen Finsterfresser (Turaco) und Nashornvögel u. d — als seltensten und schönsten — den großen Kampfadler, Spinaetus. Lebensgefährliche Reptilien wie Krokodile und stark giftige Schlangen sind im allgemeinen nicht häufig. Die Fischfauna ist außerordentlich reich, besonders an Welsarten. Aus der Kerfwelt nimmt einige Plagegeister an den Pranger gestellt werden, es sind: Tsetsefliegen, die Menschenfresser Chrysops dimidiata Wolp (F.: ewoni), Sandflöhe, Culicoides-Arten (F.: ofige) und Sandfliege. Gegen Tsetsefliegen hilft ein Feuerbrand, gegen Bremsen die Fliegenklatsche, gegen Sandflöhe Rauch und gegen Sandfliege nur das Abmachen der Zehen, zwischen denen sie sich mit Vorliebe festsetzen. Die Honigbiene kommt vor, wird aber nicht gezüchtet.

Die Pflanzenwelt verfügt über einen ungeheuren Reichtum an Arten, deren Verteilung und Verbreitung noch wenig erforscht sind. Die Hauptcharakterpflanze des auf verlassenen Feldern entstehenden Buschwaldes ist der Schirmbaum, Musanga Smithii R. Br. (F.: ensing) Tafel 11. Auffallende große Bäume des Urwaldes (Abb. 1) sind der Bonnewollbaum, Ceiba pentandra

Abb. 1. Im Urwald bei Bikomadzap, Spec. Gottsau.
Im Vordergrunde über einer sumpfigen Serie die Baumstämme und eine Brücke (Dicke: Die Folgeseite.

(L.) Gärtn. (P.: dum), die Leguminosen **Piptadenia africana** Hook. f. (P.: tum), **Pentaclethra macrophylla** Benth. (P.: ebai), **Erythrophleum guineense** Don. (P.: elun), sowie die schlanke Combretacee **Terminalia superba** Engl. et Diels (P.: akom). Der dickste und gewaltigste Baum des Gebietes ist die ungemeinwohnende **Ceiba pentandra** Hgrms., der Geisterbaum der Pangwe. Palmen sind in ungefähr 15 Arten vertreten, die wichtigsten im Haushalt der Eingeborenen sind die Raphiapalme und der kletternde **Oncosperma** nebst Verwandten. Die Ölpalme kommt nur im Norden in größerer Anzahl vor. Von niederen Pflanzen sind die Scitamineen, besonders **Afromomum**-Arten, wichtig, die geradezu bestandbildend auftreten können.

Die Bevölkerung gehört bis auf unbedeutende Spuren einer älteren Rasse, auf die ich noch zu sprechen komme, zu den Pangwe, einem von Nordosten eingewanderten Negerstamm mit einheitlicher Sprache und Kultur. Diese Einheitlichkeit ist freilich nicht im Sinne einer unbedingten Stammeseinheit aufzufassen. Eine solche gibt es in Afrika nicht, wo zahlreiche, im einzelnen meist nicht nachzuspürende Mischungen die Rassen und Stämme durcheinandergewürfelt haben. Aber die Lebenskraft der Pangwe erwies sich bei der Berührung mit anderen Stämmen als kräftig genug, um denen Bestandteile aufzunehmen und trotz Aufnahme fremder Sprach- und Kulturteile ihre Eigenart zu bewahren.

Im Norden haben auf diese Weise die Eton, in weniger starkem Maße die Jaunde und Bene von den Bati, im Nordosten die Mwele von den Wute, im Osten die Bulu von den Njem und im äußersten Südosten die Mokuk von ihren Nachbarn fremden Volkstum angenommen. An gewissen Stellen der Grenzgebiete haben die Vermischungen zur Bildung neuer Stämme geführt, z. B. der Makei — zwischen Pangwe und Bakelle im Süden — und der Mumwkji — zwischen Pangwe und Benga am unteren Kampo.

Über die Art und Weise, wie die Vermischung stattgefunden hat, sind wir im einzelnen nicht überall genau unterrichtet. Man wird aber nicht fehlgehen, wenn man annimmt, daß sie meistenteils durch die Macht der überlegenen Pangwe erzwungen war. Durch den ungeheuren Druck, mit dem dieses Volk auf die westlichen und südlichen Völker drängte, durch Kriegszüge oder durch mehr oder minder gewaltsamen Kauf brachte es die Frauen der feindlichen Stämme in seinen Besitz, nahm auch wohl kriegsgefangene oder wenigstens abhängig gemachte Männer in seine Sippenverbände auf. Anders liegt die Sache im Norden. Hier war das Übergewicht der Pangwe an Zahl und Kraft nicht so groß, denn die Richtung des Vorrückens der Pangwe geht nach Südwest, dafür war der Ruf und das Ansehen, in dem dieses einzigartige Volk stand, derartig groß, daß die umgebenden Völker auch ohne direkten Zwang die Pangwesprache und -kultur annahmen. Hierher gehören die ursprünglich fremden und aus Norden eingewanderten oder nachgedrungenen Bati, und noch heute läßt sich der geschilderte Vorgang, der an den der „Mamaiflen" Ostafrikas erinnert, bei den Batjenga, einem Zweig der Bati südlich des Sanaga, beobachten. Diese Leute sprechen ihre eigene Sprache nur noch wenig, bedienen sich vielmehr fast ausschließlich des Pangwe und werden in wenigen Jahren ganz pangwisiert sein. Es ist hierbei zu einer dreifachen Verwechslung gekommen, insofern die Jaunde, also die südlichen Pangwe, ihre eigene Sprache, die Jaundemundart des Pangwesches, als Sabe fast, als Batisprache bezeichnen.

Außer den genannten Stämmen haben noch weitere Nachbarn in einem mehr oder weniger geringen Umfang Volksteile an die Pangwe abgegeben, so im Osten die **M o k o**, die noch wenig bekannt, aber wohl den Küstenstämmen zuzuzählen sind, im Nordwesten die **B a s s á**, ein Bruderstamm der Pangwe, der sich in alter Zeit mit ihnen von dem gemeinsamen Hauptstamm abgezweigt und seinen eigenen Weg verfolgt hat, längs der Küste und am Ogowe eine Reihe verschiedener Stämme, die infolge der kriegerischen Vorgänge im Innern in diesem Rückzugsgebiet verdrängt, durcheinandergemischt und daher kaum mehr voneinander zu scheiden sind. Am einfachsten und klarsten liegen die Verhältnisse im Norden, wo am weitesten im Innern die **N g o m b a**, dieser

Abb. 1. Fangfrauen (Frau, Bandung und Gewrung). Spon. Gabun.

als verhältnismäßig geschlossene Masse die Mabea und endlich auf einem schmalen Küstenstreif die Benga (Batanga, Nkowe usw.) wohnen. Die letzteren sind wirtschaftlich eigentlich schon aufs Meer gedrängt oder, wie im Süden beim Muni, auf die vorgelagerten Inseln, z. B. Koriako, zurückgewichen, wo sie sich noch am reinsten erhalten konnten. Am besten faßt man — bei der Unmöglichkeit, heute die einzelnen Stämme zu scheiden —, die gesamten westlichen und südlichen Nachbarstämme, mit Ausnahme der Okandegruppe, nach dem Muster Avelot's[7]; unter dem Namen Benga-Bakele zusammen. Von den nördlichen Stämmen der Benga-Bakele-Gruppe, die vom Nyong bis zum Muni reichen, haben sich schon früher die südlichen — die Bakele — infolge des Vordringens des Pangwe abgetrennt, werden aber mit unglaublicher Schnelligkeit von den Fang aufgesogen. Genau so wie den Stämmen der Benga-Bakele ergeht es den Stämmen der Okandegruppe, als deren wichtigster die Mpongwe zu nennen sind, die zum Teil am Gabunbecken, zum Teil südlich der Ogowemündung wohnen. Beide Gebiete, besonders das südliche am Gabun, werden von Jahr zu Jahr kleiner. Das Gleiche gilt von den übrigen Okande am unteren Ogowe, deren Hauptstamm die Galoa bilden. Als letzte Gruppe der Nachbarvölker bleibt die der Balinte (Fiotte) zu erwähnen, *dieser* denen als nächste Nachbarn im Osten besonders die Bakota- und im Süden, jenseits des Ogowe, die westlichen Bafiotestämme in Betracht kommen. Aber auch

[7] Vgl. M. R. Avelot, Recherches sur l'histoire des migrations dans le Bassin de l'Ogôwé, S. 31.

sie werden wohl mit der Zeit von den Pangwe noch zermalmt und im Meer gedrängt werden, denn schon heute stehen die Vorposten dieses unverwüstlichen Volkes, das wie ein Keil die morschen Stämme zersplittert und unerbittlich der Zerstörung übergibt, vor den Toren von Vernand Vaz.

Die Nachbarn der Pangwe sind es auch gewesen, die ihnen den Namen gegeben haben. Sie selbst kennen eine die Gesamtheit umfassende Stammesbezeichnung nicht, wenig wie das bei anderen in Gemeindeverbänden lebenden, politisch nicht geeinten Naturvölkern der Fall ist. Die Küstenneger hörten von ihre unmittelbaren Nachbarn sich „fang" nennen, faßten das Wort als „pang" auf und nannten ihrerseits in entwickelbarer Verallgemeinerung alle Stämme des Innern ebenso; sie konnten natürlich nicht wissen, daß sie es nur mit einem von mehreren verschiedenen benannten Unterstämmen zu tun hatten. Weiterhin änderte sich der Name dadurch, daß jene Küstenvölker den Wort „pang" für einen einzelnen Vertreter der Inlandstämme gebrauchten, für die Gesamtheit aber durch Anhängen eines we das Wort „pangwe" bildeten (vgl. Abschnitt II, S. 33). Die Erklärung dieses Vorganges und dieser eingeklemmten Silbe ist nur zu vermuten. Ein Mosekji erzählte mir, die Benga hätten beschlossen, als sie zum erstenmal mit den Fang in Berührung kamen, aus Abneigung gegen den bösen „häßlichen" Namen pang diesen Volk Pangwe zu taufen. Dann bliebe noch zu erklären, wie die Leute dazu gekommen wären, gerade we anzuhängen. Vielleicht ist die Vermutung erlaubt, die freilich nur von den Mpongwe geäußert wurde, daß dieser Stamm den Namen der gefürchteten Fang ihrem eigenen Stammesnamen, dessen Entstehung ganz anderer Art sein mag, bewußt angeglichen hat, womit der Zweck erreicht wurde, noch heute noch werden Pangwe und Mpongwe meist verwechselt.

Von den Küstenegern übernahmen die Europäer die Bezeichnung Pangwe für die Inlandstämme und wandten sie natürlich ebenso wie jene auf deren Gesamtheit an, ein Vorgang, der entsprechend etwa in den Beziehungen zwischen Franzosen und Deutschen stattgefunden hat. Einzelne übertrugen den Namen „Alemannen" von dem ihnen bekanntesten Unterstamm der Alemannen später einfach auf alle von ihrem Standpunkt aus den Alemannen verwandten und benachbarten Völker, also auf alle Deutschen.

Die Franzosen nennen die Pangwe, deren Namen sie sich mundgerecht gemacht haben, „Fahouins", fassen den Sammelbegriff aber so weit, daß sie die Bakoko (soll wohl heißen Bassa) und sogar die Njem (Ndemo) ?) dazu rechnen. Das ist nicht angängig. Will man die Bassa, die entschieden sehr nahe mit den Pangwe verwandt sind, einschließen, so muß man einen noch allgemeineren Sammelnamen, wie etwa „Pangweähnliche Völker" erfinden. Aber das ist fürs erste nicht nötig, jedenfalls haben wir es bei den Pangwe mit

?) Die Njem weichen in jeder Beziehung von den Pangwe ab und sind wohl bloß unter die „Fahouins" gerathen, weil man sie zu wenig kannte.

einem einheitlichen, abgeschlossenen, insbesondere durch die Sprache eng verbundenen Stamme zu tun.

Ich schlage die Bezeichnung „Pangwe" für die Gesamtheit der Völkerschaften vor, die von den Fang — dessen Name den Anstoß gebildet hat — nur mundartlich, nicht sprachlich verschieden und deshalb mit ihnen zusammen als Unterstämme eines großen gemeinsamen Stammes, eben des Pangwe-Stammes aufzufassen sind, das sind die Eton, Mvele, Jaunde, Beme, Bulu, Ntum, Mwai, Fang und Mokuk (Ochiöba).

Abb. 3
Frau mit Kleinkind (Prov. Kamerun) nach Kamerun.

Den Namen Fang auf die ganze Völkergruppe auszudehnen — wie es wohl geschieht —, würde sich deshalb nicht empfehlen, weil sehr leicht Verwechslungen mit dem Unterstamm Fang vorkommen würden, ferner weil jeder Unterstamm gewisse kulturelle Eigenheiten aufweist und daher nicht einer für alle stehen darf, endlich weil ein von den Jagern längst selbst gebildeter, eindeutiger Name vorliegt. Die Schreibart Spangwe ist aus einer Verwechslung mit dem Namen Mpongwe entstanden. Wenn man schließlich an Stelle von Fang auch Fan schreibt, so ist das ganz zu verwerfen, da diese Bezeichnung den Wortklang des Wortes fan (so deutsch geschrieben) durchaus unvollkommen wiedergibt. Bei den französischen Schriftstellern, von denen diese Schreibweise wohl übernommen ist, erklärt sie sich leicht, aber auch sie schreiben eigentlich Fang, weil die französische nasale Aussprache von fan der Aussprache der Eingeborenen wohl kommt, den scharfen Kehlverschluß am Ende aber nicht trifft. Ebenso steht es mit Fan-Fan, was nichts weiter bedeuten soll, als richtige, einheimische Fang (Verstärkung wird in der Pangwesprache durch Verdoppelung des Stammes ausgedrückt).

Wir haben gesehen, daß die Pangwe sich mit den fremden Negerstämmen, mit denen sie auf ihren Wanderungen in Berührung kamen, vermischten; sie haben es gewiß auch mit den Resten Bewohnern, den Landes, den Pygmäen,

getan, die früher vermutlich in größerer Zahl die westafrikanischen Wälder durchzogen, heute innerhalb des Pangwe-Gebietes nur mehr in wenigen verstreuten Horden vorkommen. Wie weit diese Mischung gegangen, in welchem Umfange sie nicht nur eine anthropologische, sondern auch eine ethnographische war, läßt sich bei unserer im Grunde vollständig behandelt werden. Ich habe mich jedoch bemüht, eine möglichst große Anzahl von Kopf- und Gesichtstypen nach anthropologischen Grundsätzen aufzunehmen, und glaube, daß die hier gegebenen Abbildungen nicht bloß dem Laien, sondern auch dem Fachmanne ein genügend klares Bild von der körperlichen Erscheinung des Pangwe sowie dessen Stellung zu den übrigen Negern vermitteln.

Abb. 4. Dieser aus Bitsel (Fran. Kongo).

digen Unkenntnis der Zwergvölker nicht sagen. Ich selbst habe nur einen einzigen Pygmäen gesehen bzw. für meine Untersuchungen verwerten können und werde an den geeigneten Stellen darauf zurückkommen.

Anthropologische Messungen gehörten nicht zu den Zwecken und Aufgaben der Expedition, und so werden die körperlichen Verhältnisse der Pangwe von mir nicht

Ich spreche schon von den sprachlichen und kulturellen Mischungen in unserem Gebiete. Ihnen schließen sich diejenigen der Rassenelemente an, und zwar lassen sich in der Hauptsache zwei Typen unterscheiden, ein größerer negerartiger und ein feinerer nördlicher (hamitischer). Jener zeigt einen breiteren Schädel, kürzeres und breiteres Gesicht, flachere Nase mit eingedrückter Wurzel, wulstig aufgeworfene Lippen, vorgeschobene Kiefer, gedrungenen Körper und entwickeltere Muskulatur mit Neigung zu Fettansatz (Taf. III); der zweite schmälere höheren Schädel, längeres Gesicht, hohen Nasenrücken, Orthognathie mit europäerähnlicher Kiefer- und Lippenbildung, längeren Körper, zierlicheren Knochenbau und schwächere Muskulatur (Abb. 5). An Zahl

AJÓNG BOKA (FAM. ESSAUDONGO, FANG).

[facing p. 8]

Abb. 5. Bassa (Fang, Gewehr), Spec. Gabun.

überwiegt der erste Typ, dessen dunkle schokoladenbraune Hautfärbung häufig auch dort noch bemerkt, wo Körperbau und Kopfbildung dem zweiten, feineren angehören. Also nicht immer, aber doch häufig gehört zu dem letzteren eine hellere, fast rötliche Hautfarbe, die den Fangwo auffallend von den Nachbarvölkern unterscheidet. Im übrigen gehen beide stark durcheinander und vereinigen sich zu zahllosen Übergangsformen.

Abschnitt II.

Sprache.

Ihre Wichtigkeit. — Laute: Vokale, Konsonanten, Veränderungen, Lautangleichung und Lautabstoßung, Einschiebung von Vokalen. — Musikalische Töne: Tonhöhen, einfache Töne, zusammengesetzte Töne, Beispiele. — Dynamischer Ton: Beispiele, Schnelligkeit und Schwierigkeit der Sprache. Tonverschiebungen. — Wortbildung: Stamm- und Nachsilbe und ihre Entstehung, Bedeutung der Nachsilben, Beispiele, Vorsilben und ihre Bedeutung, Beispiele. — Satzbau: Kurzer Überblick und Beispiele. Vergleichende Zusammenstellung der Pangwemundarten, vergleichende Sprachproben der Nachbarvölker.

Es bedarf keiner Erläuterung, daß es zu einem erfolgreichen Studium des Negers und zu einem innigeren geistigen Verkehr mit ihm erforderlich ist, seine Sprache zu beherrschen. Aber noch mehr, diese Sprache selbst, in ihrem Aufbau und in ihren ethymologischen Beziehungen, offenbart uns erst die Kreise seiner Vorstellungen wie die Richtungslinien seines Denkens, sie ist der wahre Schlüssel zum Verständnis seines Lebens. Ein Überblick über sie darf hier daher nicht fehlen.

Zum Verständnis der Sprache ist es nötig — da ich nach Möglichkeit die einheimischen Ausdrücke angeführt habe —, einen Blick auf die phonetische Schreibweise der Wörter zu werfen, um auch dem Leser, der sich nicht mit Bantusprachen beschäftigt hat, einen genauen Begriff von den für das Pangwe wichtigen Lauten und ihrer Aussprache zu vermitteln. In folgendem habe ich mich bei allen in den deutschen Text aufgenommenen Pangwewörtern und -namen nach der deutschen Rechtschreibung gerichtet [1]), also danach, wie wir die Laute in deutscher Aussprache am ähnlichsten wiederzugeben gewohnt sind; dagegen ist alles *kursiv* gedruckte nach den phonetischen Regeln auszusprechen. Die hier angewandte phonetische Schreibweise beruht auf den Vorschlägen von Prof. C. Meinhof.

Bei Vokalen haben wir zu unterscheiden: lange und kurze (Quantität), geschlossene und offene (Qualität). Bei jedem Vokal kommt es nicht nur auf die Quantität, sondern auch auf die Qualität an, doch gibt es nur beim e und o lange geschlossene und kurze geschlossene, lange offene und kurze offene Vokale, beim i und u fallen die langen offenen weg, so daß wir nur drei verschiedene i und u haben. Beim a und ô dagegen ist es bei den kurz gesprochenen sprach-

[1]) Auch auf den Karten ist die deutsche, nicht die phonetische Rechtschreibung bevorzugt.

[p. 10]

Abb. 6. Onde aus Angbanzani (Fam. Gamwang). Span. Guinea.

lich nicht von Wichtigkeit, ob sie offen oder geschlossen sind, oft ist es nicht einmal zu unterscheiden. Wir haben also folgende Vokale:

		geschl.	offen
a kurz	ȧ		
a lang		ȧ	ȧ
ö[1]) kurz	ö		
ö lang	ö	ö	ö
i kurz		ɨ	ɨ
i lang		ɨ	
e kurz		ẻ	ẻ
e lang		ẻ	ẻ
u kurz		ȕ	ȕ
u lang		ȕ	
o kurz		ȯ	ȯ
o lang		ȯ	ȯ

Die Kürze oder Länge (Quantität) ist hier also durch einen Bogen (kurz) oder Strich (lang) über dem Buchstaben, die Qualität, und zwar nur bei den

[1]) Ich kann mich nicht dazu entschließen, hier ö zu schreiben, wie Pater Nekes nach dem von P. W. Schmidt im „Anthropos" Bd. II, 1907 veröffentlichten phonetischen System will, denn der Laut — mag er auch aus e entstanden sein — entspricht unserm ö. Wenn zugegeben wird, daß dieser Laut eben heute

Abb. 7. [illegible]

offenen, durch einen Strich u n t e r dem Buchstaben kenntlich gemacht; wo die Qualität unbezeichnet ist, ist sie geschlossen oder wie in *a* und *ó* beliebig.

Wichtig ist nun im Fangwe, daß das offene kurze *i (ɪ)* in ein kurzes geschlossenes *e (e)* übergeht, daher die Schwankungen in der Rechtschreibung, z. B. bei „Baum" *ɛ́ʃ* oder *éʃ*. Ebenso steht es beim *ɛ* und *ɔ*, man kann schreiben *mɔkɔ́* oder *mɔkɔ́* (Pfeiler, Pflock). Bei den Mundarten des Südens treten vielfach die offenen langen *ɛ* und *ɔ* an Stelle von *á* und *ó*; auch *ɣ* und hauptsächlich *ɣi* ist ein Kennzeichen mundartlicher Verschiedenheit, besonders bezeichnend ist das für die Ntum: *oɣɣi* (Tuch), *aɣɣɣi* (Eisvogel). *ɣ* und *ɣ* vertreten sich dabei, so *mɣɣi* (Unterstamm) bei den Fang, *mɣɣi* bei den Ntum; *ɣbɣi* (Sippe der Fang) F. und *ɣbɣi* Nt.

Von Konsonanten haben wir:

1. Aspirata, *h* (nur in den nördlichen Mundarten für *v*),
2. Gutturales *k, g, ŋ*,
3. Dentales *t, ts, tʃ, d, dz, dʃ, s, z, n, l*,
4. Dentilabiales *f, v*,

---

nicht mehr *e*, sondern ein eigener dumpfer Vokal ist (wie das französische *e* muillet), wir also ein besonderes Zeichen für den Laut wählen müssen, warum dann fremden Völkern zuliebe *e* und nicht, was uns Deutschen doch näher liegt, *ə*? Denn international ist diese phonetische Schreibweise leider nicht.

Abb. 6. Bibengi-Kinder (Fang, Djoki). Spem. Gabun.

5. Lateralen *pf, v, b, m,*
6. Palatalen *ń (ng),*
7. endanische Lautverbindungen *pb (pbw), kp (kpw),*
8. Halbvokale *w, y.*

Fremdartig für uns ist das gutturale *ń*, das im Worte *ńże* (Unterstamm der P.), in deutscher Schreibung Fang, vorkommt. Dem langen, silbisch auftretenden *ń*, *n* und *m* sind Laien stets geneigt, beim Niederschreiben ein *e* vorzusetzen und z. B. *enbu* statt *mbu* (Pinangfresser, Tarsius-Arten) zu schreiben. Das deutsche *w* in „Wasser" ist phonetisch *v*, außerdem gibt es noch *w* als bilabiales *v*; der phonetische Buchstabe *w* ist wie im Englischen „water" zu sprechen, in einfachem Druck muß er durch *u* oder *o* ersetzt werden, z. B. Ramsong, phon.: *ramwń* (Sippe der Fang). Das *y* neigt oft zu dem Reibelaute *j*; da dies indessen ganz wechselnd ist, so kann man z. B. ebensogut *ajua* wie *ayua* (Name) schreiben. Ebenso ist es mit *t, ts* und *tš* (in deutscher Schreibung tsch), die einander in den verschiedenen Mundarten ersetzen, so *tšl* (Fleisch) oder *tsil* oder *til*. Die Dentalen *t, ts* und *tš*, *d, dz* und *dž*, ferner *s* und *z* sind fast immer palatalisiert; man merkt es daran, daß die Pangwe unser deutsches *s* und *sch* nie richtig aussprechen, sondern stets dabei einen Reibelaut hervorbringen. Diese Palatalisation, die ich — weil durchgängig — nicht bezeichnet habe, ist meiner Meinung nach zum Teil auf Rechnung der künstlichen Ver-

Abb. 9 [illegible]

stimmung des Zahnspitzens zu setzen, und sie hat sich so verwirrt, daß harte auch Laute mit unverwandtem Gebiß immer palatalisieren, dagegen wechselt die Aussprache *ti*, *tsi* und *tsir* nach dem Untersinnen, genau wie *d*, *dz* und *dz'* z. B. in *dzo* (Auge), *dzo* und *dzio*. Besonders wichtig ist es, zwischen schnellem und weichem *o* (phon. schnell: *o* und weich: *ö*) zu unterscheiden. Im einfachen Druck spreche man ein einfaches *o* stets weich aus, z. B. in *lö (ö)* — Leopard wie in Sonne; die Schärfe habe ich durch Verdoppelung angezeigt, wie in *lso (so)* — Mondkult. Das wäre das einzige, was man bei der deutschen Schreibweise zu beachten hätte. Damit ist uns nicht gesagt, daß harte und weiche Laute, wie *s* und *z*, durchaus unverwechselbar wären, vielmehr ersetzen sie sich oftmals; so wird *pf* (im Nasal) zu *f*, *t* zu *d*, *s* zu *z*, letzteres tritt stets in der gesamten Sprache der Regel nach ein, man vergleiche *zambe* und *zambe* — *zamba* (Gott), *a sipe* — sich erschrecken und *sipe* — der Schreck. — Hier muß ferner die ungemeine Flüchtigkeit und leichte Veränderlichkeit von Lauten erwähnt werden. Lautangleichung (Alliteration) und Lautabstoßung (Elision) werden in einem Umfange geübt, der fast aus Straffaire grenzt, Konsonanten in einer Weise zurückgemattet, die ihnen unser Mitleid sichert, Vokale derart angerichtet, daß es oft nicht möglich ist, ihre „Identität" festzustellen. Hier die corpora delicti:

ndiio statt *ndiibego* (Schlüssel), *afjio* statt *afjogolo* (Hut), *ewut* statt *ewunde* (Kinte), *ei* statt *sipe* (Treibersmann), *fse* statt *fsie* (legen, setzen, stellen), *ajo* statt *sono* (Tante, Schwester des Vaters), *mina* statt *minogo* (Frau).

Abb. 63. [illegible] (Frau, Gabun). Spam. Gabun

Dieses fallen viele Konsonanten vor nachfolgenden Vokalen aus, so: *ndzó* (Zucker), aber *ndzo a ntangan* = der Zucker des Weißen, europäischer Zucker, *a bwi* = klopfen, aber *a bo a ndo* = ein Haus klopfen, *bin* = Papagei, aber *bwa-ni* = Papagei der Erde = [illegible]-Arten (Webervögel), wegen *mêm na mam* = mein Gatte statt *mame mam*. In den meisten dieser Fälle habe ich den Einfluß in eckigen Klammern beibehalten, damit das Grundwort erkennbar ist, der eingeklammerte Buchstabe ist aber nicht mitzusprechen. Dafür wird dann, wenn Konsonanten auf Konsonanten stoßen, ein euphonisches *e* und sogar ein *l* eingeschoben, letzteres aber nur, wenn es ursprünglich im Stamme enthalten war, wie in *ko* (Schildkröte): Wasserschildkröte = *kulekó*, oder im Beginn des Märchens: Die Schildkröte und der Leopard = *kule ko ná*. Anderswo z. B. in Zusammensetzungen, werden harte Laute, die am Ende des Wortes stehen, wie *mystê* = Heim, in weiche verwandelt, also *mystê-gi* (Name einer Sippe der Jaunde) statt *mystê-gi*. Daß hörtere Laute auch am Anfang keine besonderen Aussichten auf Fortkommen haben, ist gelegentlich der Verwandlung von *s* in *z* wohl bemerkt worden, ebenso ist es z. B. bei Wörtern wie *(n)ním* = Weg, *(n)ná* = Leopard, von denen ist oft nur ein Hauch geblieben, während sie bei den südlichen Fang und in Zusammensetzungen wie einiger wieder auftreten. Doch damit wollen wir das Stiefkindregister schließen.

Zugleich kann ich damit meine Vorbemerkungen über die Schreibweise der Fangwörter beendigen, die Erörterung dieses an sich trockenen Stoffes

erschien mir aber für die, welche sich mit den Pangwe im allgemeinen und dem Studium dieses Buches im besonderen beschäftigen, unumgänglich nötig.

Was die Pangwesprache vor vielen, selbst Bantu-Sprachen auszeichnet, ist die Wichtigkeit des musikalischen Tones. Wir werden in späteren Abschnitten auf Schritt und Tritt uns vor die Notwendigkeit gestellt sehen, auf die Tonhöhe genau zu achten, z. B. bei Namen, gar nicht einmal zu reden von der Trommelsprache, die ja auf den musikalischen Regeln der Sprache beruht. Die musikalische Höhe der Sprachtone wechselt bekanntlich in Form einer Kurve, deren Durchschnitt man als seine mittlere Höhe bezeichnet. Für den praktischen Gebrauch ist es nötig, aus der Menge der Töne gewisse wiederkehrende Gruppen zusammenzufassen, und man kommt da, je nach der musikalischen Begabung des Beobachters, zu vielen oder aber nur zu zwei Tönen, eben einem höheren und einem tieferen. Bei den meisten Bantu-Sprachen genügt die Unterscheidung von drei Tönen, im Pangwe läßt sich leider damit nicht auskommen, sondern man muß fünf einfache Töne unterscheiden, die ich als Hochton, Mittelhochton, Mittelton, Mitteltiefton und Tiefton bezeichne. Das Schwierige ist nun, daß sich die von dem Mittelton entsprechend weit nach oben oder nach unten entfernten Töne —, also Mittelhochton und Mitteltiefton, Hochton und Tiefton —, oft ersetzen können, und zwar je näher dem Mittelton, desto leichter. Die Töne bezeichnet man einfach durch einen Strich beim Vokal der Tonsilbe, sei es seitlich oben, über, unter oder seitlich unten beim Buchstaben. Am besten mag die Verhältnisse das folgende Schema verdeutlichen:

Notenschrift[1]:

In phonetischer Schrift:

Diese Tonhöhen sind zum Verständnis der Sprache nicht zu entbehren, das beweist als eines der auffallendsten Beispiele das Wort *mbas* in seinen vier verschiedenen Bedeutungen als

Flasche: *mbɔ́s* (F.), Kugel: *mbǫ́s*,
Kokosnuß: *mbás* (J.), Elfenbein: *mbǫ́s*.

An diesem Beispiel sieht man auch, daß fünf Tonhöhen nötig sind, der Mittelton kann, weil zu nahe dem Mittelhochton und Mitteltiefton, in

[1]) Die Notenschrift ist nur schematisch gedacht, es stimmen natürlich die Tonhöhen der Pangwetöne nicht mit den Tönen unseres Notensystems überein.

d i e o e u Fälle als Unterschied nicht in Betracht kommen, obwohl er natürlich vorhanden ist. Der Mittelton ist unbezeichnet geblieben, da er als mittlerer Sprachton gilt und unterschiedlich nicht sehr hervortritt. Sehr verwickelt wird die Sache durch das Auftreten von zusammengesetzten Tönen. Man könnte sagen: es gibt also *e* mit *á*, *á* mit *a*, *a* mit *à* und *a* mit *e* verbunden. Da aber hinzukommt, daß jeder dieser beiden verbundenen Töne von derselben oder von verschiedener Länge sein kann, so ergibt sich eine Fülle, die unserer Auffassung, unserer Schreib- und Sprechweise verderblich werden müßte, wenn man nicht vereinfachte, und man kann das sehr gut tun, indem man bei zusammengesetzten Tönen nur unterscheidet, ob sie hochtief oder tiefhoch sind. Nun fragt sich: sind sie beide gleichlang, oder welcher ist länger? Das gibt eine Gruppe von sechs zusammengesetzten Tönen, die in folgendem Schema zusammengestellt sind. Die gegenüberstehenden können sich wieder, je näher sie sich im Schema stehen, desto leichter ersetzen.

	Hochtiefton	Tiefhochton	
gleichlang	*á*	*à*	gleichlang
kurzlang	*ǎ*	*ȁ*	kurzlang
langkurz	*à*	*ȁ*	langkurz

Glücklicherweise ist hier wenigstens *d a s* Gute, daß bei den beiden letzten Tönen meist ein *i* für den nachschleifenden Ton eintritt, so daß man die Zeichen für diese Töne vermeidet. Beispielsweise schreibe ich *ciri*, (Heimchen, Zikade), nicht, was vielleicht auch berechtigt wäre, *cǐǐ*. Es nimmt eben durch den nachklappenden kurzen Ton — sei er fallend oder steigend — der Laut eine andere Klangfarbe, meist die des *i*, an. Wer sich das klarmacht und vor allem bedenkt, daß sich *á* und *à*, weil nahestehend, ersetzen können, wird bei Streitfragen, die einen solchen Fall betreffen, seine Ruhe bewahren können. Wir haben also im ganzen fünf einfache und vier zusammengesetzte Töne in der Pangwe-Sprache zu beachten.

Mancher könnte nun meinen, die vielen Töne, die nur einem eingefleischten Phonetiker eine angenehme Musik sein würden, wären praktisch nicht von Bedeutung, und das angeführte Beispiel sei nur eine Ausnahme. Ein Blick in ein Wörterbuch der Pangwe-Sprache wird das Gegenteil erweisen; es seien aber auch hier einige Beispiele von Tonhöhen angeführt, die im Verein mit den Vokalunterschieden einen Begriff von der Schwierigkeit der Pangwe-Sprache geben. Von den vielen Wortspielen zwischen *ngɔn* = Mädchen, Mond und

ngán (ngán) = Ngon, ein Kiténgwéché Gummiaxpe oder Cogn. und zwischen *ngá* = Gewehr und *ngá* = Frau will ich schweigen, aber nun höre nur folgende kleine Zusammenstellung:

mvin = Frucht der Elpalme, *mvin* F. *mvin* Bl. = Schwarzstück-Schopfantilope, Cephalophus ruficrypta Peters, *bvin* = Schmerz.

ngi = Feuerkalt, *ngi* = Gorilla.

mbin = Kult, *mbin* = Verbrechen und Wiedergutmachung, Herpestes mulemuna Gray.

ndzi = Pentaclethra macrophylla Benth. (Leguminosae), *ndzi* = Gadia adamia Gerke (Boraginac.).

ngwi = Schwein, *ngwi* = Stachelschweinähnlichkeiten, Anomalurus-Arten;

ndzi = Schirmantilope Tragelaphus kasiani Lemberg, *ndzi* = umgefallener niederliegender Baum;

a bi = zuklappen, zuschlagen intrans., *mbi* = weg, fort, *a bi* = fangen und sich fangen, *bi* = fange, Imperativ;

a bidi o jib = erhöht sitzen, z. B. *mun a bidi mitu* = der Vogel sitzt oben auf einem Ast, *a bidi o jib* = aufhängen (etwas), *a bit* = hinaufgehen;

ngyi = Manniophytum abyssinum Muell. Arg. (Euphorbiaceae), *ngyi* = eine Ficusart; *ngyi* = Kautschukliane Carpodinus mannii K. Sch. (Apocynaceae) und Eingeweihter in Kulte, *ngyi* = Messing;

mbyi = Mannik, Kamore, *mbiá* = Nachtiertalle, *mbyi* = Fiesthalken im Hause;

ndzi = weibliche Scham, *ndzi* = Frucht von Mimusops djave, *ndzu* = Schamgegend, *ndzu* = Brust, Geliebte;

ndzi = Penis, *ndzi* = Zuckerrohrhütten, *ndzi* = Aufbewahrungskörbe der Frauen, *ndzi* = Seele.

bdi = Meerkatze, *bdi* = Schnecke;

fi = schwarze, auf der Erde kriechende Schlangen verschiedener Gattungen, *fi* = kleinere Nager, Nagetier, *fi* = Pulverläschchen, *fi* = Erkenntn, *fi* = eitriges Geschwür, Hautgeschwür, *mfi* = eine Baumart, wahrscheinlich Bussia thiersatha (Anonaceae).

Neben dem musikalischen Ton hat der dynamische, durch einen Akzent bezeichnete, eine nicht unwesentliche, wenn auch geringere Bedeutung. Man vergleiche: *ndzin* = Anopyxis klaineana Pierre (Rhizophoraceae), *dzin* = Raubvögel, insbesondere Schmarotzermilane, Plural: *dzin* = Sippe, Familienverband, *dzin* = Name und *ndzin* = stehen, *ndzin* = Hitze; *a ndi* = im Nachteil sein, *d ndi* = wohnen, sich niederlassen; *d dzin* = abpflücken, abtreiben, *a dzin* = tanzen, *d bzi* = in ein Lager bringen, austreten (mit den Füßen), *ndzi* = Tanz, Fest, *ndzi* = Rotnasenaffe Nas hypoxanthus Pucheran

Abb. II u. III. Leute Fang (Fang, Bassonga, Fang, Gabon), rechts Mädchenkopf aus Ottobongo (Fang, Bassonga) Süd-Kamerun.

T o n; *á ŭlne* — anbinden, *a ŭ́jne* — her- oder hinschieben; *á bjm* — anhaken, *a bj́m* — spielen, schlagen (ein Musikinstrument), *dbém* — Stützpfahl eines Hauses, *abj́m* — Bauch, Unterleib; *ddeŭ* — Betrug, Lüge, *adáŭ* — Kreuz, Wirbelkreuze, Floral.

Diese Beispiele, die sich ins Ungemessene vermehren ließen, sollen nur dartun, daß die Beobachtung von Quantität wie Qualität der Vokale, von musikalischem wie dynamischem Ton zur Vermeidung von Mißverständnissen unerläßlich ist. Man wird durch sie einen Begriff bekommen, mit welchen Schwierigkeiten die Erlernung der Pangwe-Sprache verbunden ist, und warum fast alle, die versucht haben, sich in Afrika mit den Bantu-Sprachen praktisch zu beschäftigen, sich darin einig sind, daß wenigstens in Westafrika das Pangwe am schwierigsten zu erlernen ist.

Weiter wird das Verständnis dadurch erschwert, daß die Pangwe die Silben mit einer unglaublichen Schnelligkeit — besonders in Augenblicken der Erregung — hervorstoßen, wofür der Pangwe selbst den treffenden Ausdruck *a tjé* — brodeln, vom kochenden Wasser, erfunden hat[1]).

Wie bei Lauten Lautverschiebungen, so kommen bei den Tönen Tonverschiebungen vor, auch ist keineswegs immer der musikalische Ton in Einzahl und Mehrzahl gleich, vergleiche: *sípa* — Hirschferkel, Hyemoschus aquaticus

[1]) Von den Bene ist es bekannt, daß sie etwas langsamer als die Jaunde sprechen.

Ogilby: Mehrzahl: ala. Daß auch der dynamische Ton in bestimmter Rede sich unwillkürlich ändert, versteht sich wohl von selbst.

Die Verschiedenheit der Laute und die feine Unterscheidung von Tonhöhen in ihrer Sprache läßt von vornherein bei den Pangwe neben einer großen musikalischen Begabung ein ausgeprägtes Gehör für den Wert einer Sache vermuten, und das führt auch auf die Betrachtung der Wortformen, auf die Theorie der Wortbildung, für deren Erkenntnis das Studium des Pangwe von größter Bedeutung zu werden verspricht. Nehmen wir einmal das Hauptwort. Mit drei geschickten Hieben kann man es fast immer, falls es nicht zusammengesetzt ist, in seine drei Bestandteile zerlegen, vorn fällt die Vorsilbe (Präfix) ab, hinten die Nachsilbe (Suffix), in der Mitte bleibt der einsilbige Stamm zurück. Die Nachsilben, die sich übrigens auch bei Zeitwörtern finden, sind freilich mit dem Stamm enger verbunden als die Vorsilbe.

Soweit sich bei den spärlichen bisher vorliegenden Untersuchungen über Wortbildung sagen läßt, ist die Nachsilbe in der Pangwe-Sprache eine freilich weiter entwickelte Wiederholung des Stammes. Der Stamm der heutigen einsilbigen Wörter besteht aus Konsonant + Vokal. Die Nachsilbe hat wahrscheinlich aus Vokal + Konsonant + Vokal bestanden, ist indessen heute ganz abgeschliffen. Der Anfangsvokal der Nachsilbe ist mit dem Endvokal des Stammes verschmolzen und hat ihm eine andere Klangfarbe gegeben oder auf seine Tonhöhe verändernd eingewirkt, der Schlußvokal ist größtenteils heute schon abgefallen, tritt aber bei nachfolgendem Konsonanten in der Form des besprochenen euphonischen *e* wieder auf. Werfen wir also zuerst einen Blick auf den Stamm. Wir haben da drei Urkonsonanten: Kehllaut *(k)*, Gaumenlaut *(t)*, Lippenlaut *(b)*, und drei Urvokale, die in der Bedeutung den Urkonsonanten entsprechen, nämlich *a*, *i (e)* und *o (u)*. Die Bedeutung liegt ursprünglich

1. bei k — a in der Bewertung des vom Wort ausgedrückten Begriffes,
2. bei t — i (e) in dessen Eigenschaft,
3. bei b — o (u) in dessen Beziehung.

Warnung vor Gefahr z. B. ist eine Bewertung, daher die Kehllaute der warnenden Affen, die in dem bewundernden oder warnenden Ausruf *ké* der Pangwe noch ganz ursprünglich wiederklingen. Der Wunsch, etwas zu besitzen, ist Beziehung, und wir finden ihn bei Menschenaffen im Spitzen der Lippen, bei den Pangwe ebenfalls so, wenn man auf etwas zeigt, um es zu haben — das Zeigen mit dem Finger deutet keine Beziehung an, sondern eine Bewertung im feindlichen Sinne oder aber eine Eigenschaft und gilt deshalb im Verkehr als unanständig.

Abb. 15. Afjangen, Fangmädchen aus Alen (Fran. Guinea)

Natürlich sind die Stämme in dieser ursprünglichen Form nicht mehr vorhanden, sondern sie haben sich weiter entwickelt, und zwar in der Richtung der Nachsilben. Da eine Grenze anzugeben, ist heute nicht mehr möglich, man kann nur sagen, die Nachsilbe ist eine entwickeltere Form des Stammes, die dem mehr oder weniger entwickelten Stamm später angehängt wurde, und ein neues Wort war damit geprägt. Da diesem Wort eben etwas anderes bezeichnet als der Stamm, so ist er klar, daß die Nachsilbe auch einer ganz anderen Gedanken- und damit Lautgruppe entnommen ist als jener. Die ursprünglichen Verbindungen zwischen Gedanken und Laut mögen folgende gewesen sein:

1. Bewertung: etwas, was nicht aus meinem Willen heraus entsprungen ist, noch von mir mit meinen Anschauungen in Einklang gebracht werden kann; etwas, was mir feindlich gegenübersteht, oder dem ich feindlich gegenüberstehe, (göttliche) Bestimmung, Vergangenheit.
2. Eigenschaft: etwas, dem ich im Augenblicke weder feindlich noch freundlich gegenüberstehe, Gegenwart.
3. Beziehung: etwas, was ich wünsche, oder was sich mit meinem Streben, meiner Willensrichtung, meinem Begriffsvermögen deckt, was mir freundlich gegenübersteht, oder dem ich freundlich gegenüberstehe, Richtung, Zukunft.

Wie sich aus diesen drei Grundklassen die übrigen entwickeln, ist aus der folgenden Aufstellung zu sehen. Im Laufe der Zeit fing man an zu unterscheiden, ob sie in der Gegenwart vorhandene Eigenschaft eine dauernde oder nur eine zeitweilige ist — Pronomen I und II — und kam so auf vier Zeitformen. Bei jeder unterschied man dann, ob Absicht oder Nichtabsicht vorliegt, ob aktive oder passive Richtung in Betracht kommt. So entstanden acht Klassen, die wir bei den Nachsilben noch deutlich unterscheiden können. Im Gegensatz zu den Vorsilben hat bei den Nachsilben jedes Wort in der Mehrzahl dieselbe Nachsilbe wie in der Einzahl.

Muster für Nachsilbenklassen.

Bei Zeitwörtern hat die Nachsilbe k eine transitive Bedeutung.

Beispiele:

Stamm *ape* = Etwas, das nach zwei Seiten geht oder geführt wird.

Kl. I: *apé-k* = Stachel des Quastenstachlers, **Atherura africana** Gray. Stamm *ape*, weil der Stachel niedergriegt und aufgerichtet wird. Bewertung, weil er in feindlichem Sinne, gegen mich, Anwendung findet, wenn ich das Tier anfassen will. Aktiv, weil er in der Absicht gebraucht wird, den Feind abzuwehren.

Kl. II: *a-apé-a* = Fangnetz, ursprünglich wohl zum Fische fangen, übertragen Schmetterlingsnetz. Stamm *ape*, weil es beim Gebrauch nach zwei Seiten geführt wird (wie jeder weiß, der einmal damit gefischt hat). Bewertung, weil es von anderen Stämmen eingeführt ist, daher als etwas „Heiliges" betrachtet wurde, dem man, wie allem Unbekannten,

Freunden, meist in feindlicher Weise gegenüberstand. Passiv, weil es nicht aus meiner Überlegung heraus nach zwei Seiten geführt wird, sondern weil diese Handhabung einfach übernommen, „Vorschrift", göttliche Bestimmung war.

Kl. III: *ŋpá-m* = Freundschaft, besonders im Sinne der Sippenfreundschaft (angedeutet durch Ineinanderhaken der Zeigefinger der rechten und linken Hand). Stamm *ŋpa*, weil sie nach zwei Richtungen wirkt, von mir zum andern Manne (bezw. zur anderen Sippe), von ihm (bezw. ihr) zu mir. Diese Eigentümlichkeit ist ihr dauerndes Wesen. Aktiv, weil sie in bestimmter Absicht, meist zur Erlangung persönlicher Vorteile geschlossen wird (daher heißt unbeabsichtigt durch Zuneigung entstandene Freundschaft *ə-ŋyéi/l/* und ist passiv).

Kl. IV: *ŋpá-n* = Krokodil, langschnauziges, **Mesistops ziziphrastus** Cuv. Stamm *ŋpa*, weil das Krokodil nach zwei Richtungen läuft, d. h. einen Zickzackkurs macht (vergl. auch den Lauf unserer Eidechse). Diese Eigentümlichkeit ist sein dauerndes Wesen. Passiv, weil es nicht in bestimmter Absicht geschieht, sondern in der Natur des Krokodils liegt.

Kl. V: *ŋpá-t* = **Kickxia elastica** Preuss, Kautschukbaum, Stamm *ŋpa*, weil der Baum durch Kreuz- und Querhiebe des Hammeners eingeschnitten wird. Diese eigentümliche Behandlung ist zeitweiliges Wesen, weil es nur dann geschieht, wenn man den Kautschuksaft gewinnen will. Aktiv, weil es in der Absicht geschieht, ihn technisch zu verwerten.

Kl. VI: *ŋpá-a* = (ursprünglich) Greifzehe der Vögel, dann — übertragen — kleiner Finger, kleine Zehe, Nebenhuf, Afterklaue und Ranke. Stamm *ŋpa*, weil sich die Wendezehe (Papagei!), wie ihr deutscher Name sagt, nach zwei Richtungen stellen läßt, nach vorne und hinten. Zeitweiliges Wesen, weil die Greifzehe ihrer Natur nach bei den Vögeln, die nicht Wendezeher sind, nach vorne, und nur zeitweise und ausnahmsweise nach hinten steht. Passiv, weil es in der Natur der betreffenden Vögel liegt, nicht aber in bestimmter Überlegung von ihnen ausgeführt wird. *ə-ŋpá-a* = Farnkraut, **Pteris aquilina** Willd. und **Bryopteris gueylindes** (Kuhn) O. Ktze. Von vorigem abgeleitet. Die eingerollten Fiedern (vergleiche ein jüngeres, noch nicht ganz entfaltetes Blatt), die sich gegenüberstehen, werden mit Greifzehen verglichen. Eigentlich: die (Pflanze) mit Greifzehen, daher Vorsilbenklasse *ə*, Werkzeugklasse.

Kl. VII: *ŋpá-b* = Schwanzflosse der Fische, Schwanz der Raubvögel, insbesondere des Milans, eigentlich: Steuer. Stamm *ŋpa*, weil Schwanzflosse wie

Rückstoßschwere als Stamm nach zwei verschiedenen Richtungen geführt wird. Beziehung, weil es mit dem Träger verbunden ist, zu ihm gehört und ohne ihn nicht denkbar ist. Aktiv, weil das Stamm mit der Absicht in Anwendung gebracht wird, den Körper in eine bestimmte Richtung zu bringen.

Kl. VIII: ngá/// — Gewehr. Stamm ngu, weil es nach zwei Seiten geht (Schuß und Rückstoß). Beziehung, weil es ein Teil vom Menschen ist, denn ohne ihn ist seine Wirkung nicht denkbar. Passiv, weil die Gegenwirkung, der Rückstoß nicht berücksichtigt ist[7]).

Bei den Vorsilben liegt die Sache weit einfacher. Es sind da schon längst allgemeine Gesichtspunkte aufgestellt, nach denen die Einordnung von Wörtern in Vorsilbenklassen nach bestimmten Grundanschauungen stattfindet[8]). Diese Bantuvorsilben sind freilich in der Fangwe-Sprache mehr äußerlich beschränkt, wie denn überhaupt diese Sprache zur Einsilbigkeit neigt.

Der Gedanke, den man wohl aussprechen hört, daß der Mensch die Umwelt zuerst in Belebtes und Unbelebtes eingeteilt hätte, ist natürlich vollkommen falsch, denn für einen Naturmenschen ist alles belebt; fremde Menschen, Tiere oder auch Pflanzen und Naturkräfte unterscheiden sich für ihn durch nichts, wenn sie in gleicher Weise, sei es freundlich oder feindlich, auftreten. Vielmehr geht die Einteilung in Vorsilbenklassen nach genau denselben Grundsätzen vor sich wie die der Nachsilben und der Stämme. Bewertung, Wesen, Beziehung sind die drei Gesichtspunkte, aus denen die Beantwortung der Frage nach dem Namen eines Dinges sich ergibt. Es ist ja auch nur natürlich, daß der naive Mensch von einem Ding entweder eine Eigenschaft nennt, eine Aussage macht oder zweitens die Beziehung dieses Dinges zu anderen oder zu sich darlegt, also vergleicht, oder aber drittens den besonders hohen oder besonders geringen Wert des Dinges angibt, also einschätzt, bewertet. Um sich über die Eigenschaft des Wesens klar zu werden, war man bestrebt — eine spätere Folge —, hervorzuheben, entweder: es sei ein Mensch, oder zweitens: es sei nicht mehr ein Mensch, sondern ein Tier oder eine Pflanze oder eine Naturerscheinung (der Übergang ist noch heute zu erkennen), oder drittens: es sei ein Werkzeug, ein Gebrauchsgegenstand, dem die Wesenheit des Menschen anhaftet, z. B. to(b)o — sitzen, etɣ — das zum Sitzen — Sitzplatz, Schemel. Bei der Beziehung kam in Be-

---

[7]) Die Angst vor dem Rückstoß hat die Pangwe auch dazu veranlaßt, das Gewehr mit gestreckten Armen abzuschießen.

[8]) Carl Meinhof, Grundzüge einer vergleichenden Grammatik der Bantusprachen. Berlin 1906.

Abb. 18. Fangfrau aus Alén (Foto. Tessmann)

trachtet: entweder sind es zwei Stücke, die einen bilden wie das Auge „paar" oder aber es ist ein Stück, das in zwei Hälften zerfällt. Beim Wort teilt man danach ein, ob er sehr groß oder sehr klein ist, ursprünglich deckt er sich mit der körperlichen Größe, ein kleines Tier wie ein Vogel ist wenig wert, weil man nicht satt davon wird, ein größeres natürlich entsprechend mehr. Später hängt die „besondere Schätzung", die irgendeinem Tiere oder Dinge zukommt, mehr von seinen Beziehungen zu gewissen, insbesondere religiösen Anschauungen ab. Die Sachlage ändert sich durch Betrachtung mehrerer Stücke derselben Art, der Gedankengang springt in eine andere Reihe hinüber, z. B. steigen Tiere, man denke an Haustiere, im Range, wenn man nicht mehr die Tierart im allgemeinen, sondern eine bestimmte Menge ins Auge faßt — sie werden nun zu *Persönlichkeiten* und bekommen die Menschenvorsilbe *be*: *bebad* — Ziege, *be-bebad bôlo* Nt. — die drei „Herren" Ziegen, aber die Ziegen im allgemeinen *bebad*; andere Tiere, Pflanzen und Dinge tragen die „Menschen"vorsilbe ständig. So sind in der folgenden Aufstellung die zwar öfter wiederkehrenden, aber nicht nach den gleichen Grundgedanken verbundenen Wortformen durch eine gestrichelte Linie angedeutet, sie stellen also Abweichungen vor, bei denen die Einzahl zu einer anderen Klasse gehört als die Mehrzahl. Trotzdem halte ich es für den praktischen Gebrauch nicht für angebracht, Einzahlvorsilben und Mehrzahlvorsilben überhaupt in verschiedenen Klassen unterzubringen, sondern erwähne die betreffenden Wörter als abweichend bei einer ihrer Vorsilbenklassen.

28.

Muster der Vorsilbenklassen.

Die römische Zahl hinter den Hauptwörtern, die im Text genannt sind, bezeichnet also die Vorsilbenklasse, bei den Ausnahmen die der Mehrzahl. Um die Gründe kennen zu lernen, die zur Benennung der Dinge nach den angeführten Gesichtspunkten geführt haben, betrachte man vor allem die höheren Tiere, weil von deren Wesenheit wir sowohl wie die Eingeborenen am besten unterrichtet sind. Bei Gegenstände, dagegen, auch schon bei Pflanzen, läßt

sich viel schwerer erkennen, was für den Pangwe das Wichtige und Bestimmende gewesen ist. In folgendem führe ich die hauptsächlichsten Säugetiere und die Vögel mit Bezug auf den Grund ihrer Namensbezeichnung an. Von den Säugetieren gehören zur

I. Klasse

1. Die Ginsterkatze **Genetta ashrynna** Fuch., *ashrá*, als angebliche Stammmutter der Hauskatze (vgl. Abschnitt XI, Religion).
2. Nächtliche oder nächtlich rufende Tiere:
   mmatíldi, siehe Kl. III, 4; *nagŷ* — Spitznasenbunzki, **Rostrum elongatulum** Leconte; *ngŷm* — Zwergflughund, **Scotonycteris ansheni** Matschie; *ndá* — Baumnasen **Dendromys mesomelas** Thomas; besonders auffällig rufend: *nkŷŷ* — Schirrantilope **Tragelaphus kostensi** Lemberg.
3. Tiere, die besonders viel Höhlenreier fressen und so als „Verbrecher" gelten: *nsŷm* — Wiesenmangusta **Herpestes melanurus** Gray und *nsŷm* — Weibchen des Ölpalmenwichtelchens **Selerus chevirarus** Du Chaillu (vgl. Religion).

II. Klasse

die kleinen Tiere, das heißt soweit sich die Kleinheit aus dem Vergleich mit verwandten Arten ergibt, so: *ashm* — Zwergmoorkatze, **Miopithecus talapoin** Erxl; *ngŷm* — Zwergnaki, **Nemigalago demidoffi** Fischer; *ndŷŷ* — Fledermaus; *ssŷn* — Streifenwichtelchen, **Selerus lemniscatus** Leconte und **sharpei** Gray; *ndá* Nl. *ndá* F. — Zwergmaus, **Mus pusillulus** Peters; *ndŷŷ* — Zwergböckchen, **Neotragus batesi** Winton und *ngbwŷ* — Zwergantilope **Cephalophus nehanehanus** Gray und wenige mehr.

III. Klasse

1. Tiere mit menschlichen Eigenschaften: *mjá*, Pl. *bo-má* — Schimpanse, ebenso *ongŷmo* — Schimpanse (vgl. Abschnitt XI, 4, Religion, Kulte).
2. Eierfresser *bag* NT. *gbá* F. Sumpfeichhörnchen — **Sciurus wilsoni** (vgl. Abschnitt XI, 4, Religion, Kulte).
3. Haustiere, denn sie sind uns Menschen ans Herz gewachsen, auch mögen alte Anschauungen vom Aufenthalt der Seelen in solchen Tieren mitspielen: *tôlí* und *ndŷŷngo* — Hausratte, **Mus rattus** L.
4. Tiere mit menschlichen Scherz- und Spottnamen, denn sie werden damit behandelt wie Menschen:

   ongŷndungo — Schimpanse (von *ongŷn* Scheitel, *ndŷngo* menschlicher Name, also Scheitel des „Fritz" — daher auch Vorsilbe *o* — etwa Scheitelfritze); *mmatíldi* — Avantibo-Halbaffe, **Arctocebus aureus** Winton (von *a sa lôl* — es ist kein Tier wegen seines außergewöhnlichen Aussehens), geht auch nach Kl. I.; *sô-jŷ* — Streifenmaus **Mus pulchellus** Gray (*sô* Name, eigentlich Leopard, wegen der Schönheit dieses Tieres, *jŷ* Nager); *ekŷghoŷ* — Rohrratte **Thryonomys** (*aff.*) **swindernianus** Temm. (Name nicht zu erklären); *ekŷngŷlŷngo*, *lŷngo* (von *lôk* blasen — flöten) und *mekŷmo*, Scherznamen für den Baumschlieifer **Dendrokyrax tessmanni** A. Br.

IV. Klasse

die ja die Tierklasse ist, die nicht erwähnten Tiere.

V. Klasse

alle Tiere, von denen eine Tätigkeit ausgesagt ist, und zwar lautnachahmend insofern der Ruf, so z. B.:

ntrme Gelbhauchmeerkatze, **Cercopithecus** grayi Fraser (lautnachahmend *ŋrm*); *ondm* = Stumpfnagelmoki **Sciurocebus** gabonensis Gray[7]); *ondŋm* = Fledermaus; *ada* = Meerschweinchen (von *a da* weinen, piepsen), ribemm von demselben Stamme *ebjn* Rotschenkelwichtelchen **Scierus** rubripus Du Chaillu; *ngbwjm* J. der Löwe (für kurze scharfe Ruf des Löwen lautnachgeahmt: *ngbwjm*); *ongnda* = Baumschlieder (von *ngu* stark, *da* weinen wegen des Rufes, vergleiche das Märchen: Der Ruf des Baumschliefers[8]).

Nach der VI. und VII. Klasse gehen keine Säugetiere.

VIII. Klasse

1. Tiere, die im Gesicht auffällig zweifarbig sind:
   ngbm = Weißnasenmeerkatze **Cercopithecus** lhoesti Pocock; *ebjñ* = Rotnasenratte **Mus** hypoxanthus Pucheran.
2. Tiere, die stets zu zweien anzutreffen sind:
   bwem = Perlhuhn, **Peradicticus** bateni Winton; *dbjn* = Fischotter, **Lutra** materkini Cabrera.

Bei den Vögeln ist es ähnlich, ich will aber keine Namen mehr nennen, sondern nur die allgemeinen Gedanken für die Klassen I, III, V, VIII angeben.

Zur I. Klasse gehören

a) metallisch glänzende Vögel;
b) nächtlich rufende Vögel, wie Waldralle und Uhu;
c) flötende Vögel, wie Haarvögel;
d) wegen der Zeichnung und des seltenen, aber auffallenden Rufes das Perlhuhn (vgl. Abschnitt XI, 4, Religion, Kulte).

Zur III. Klasse gehören

a) (schreiende) Sumpfvögel wie Ibis, Reiher;
b) Hühnertöter, Eierfresser oder Eierverschlepper: Habicht, Würger, Kuckucke[9]), Drongo;
c) Hausvögel: Schwalben, Webervögel;
d) wegen menschlicher Eigenschaften: Honiganzeiger;
e) Vögel mit menschlichen Namen, Scherz- und Spottnamen, wie Bachstelze („Wippstert"), graue Nigritaäften („Aschenbrödel"). Bei den

---

[7]) Vgl. einen Scherzvers, in welchem dem Maki die Worte unterlegt werden: *mâ, mâ, mâmên, mâ mâ lude ya* = ich, ich, ich selbst, ich ich ging hier vorbei.

[8]) Günter Tessmann: „Das Verhältnis der Fangneger zur umgebenden Tierwelt" in „Zeitschrift für Ethnologie" Heft 4 u. 5, 1907, S. 760.

[9]) Die Eingeborenen sagen, die Kuckucke holten Eier anderer Vögel fort und legten sie in ihr eigenes Nest.

zur V. Klasse
gehörenden Vögeln ist der Ruf meist lautnachahmend wiedergegeben, wie *ekúkū* (entspricht unserem Kuckuck) = **Trachylaemus purpuratus** Verr.

Zur VIII. Klasse gehören
Vögel mit zwei verschiedenen Rufen, wie Eule und Timalie, **Alethe castanea** Cass, *akáḷát* F. (vgl. Erzählung von der Armbrust und der Timalie, Abschnitt XXI, ferner Abschnitt XI, Religion), Vögel, die ausgesprochen paarweise leben, wie Wildente und Taube, zur VII. Klasse als Vogel mit auffallender Erscheinung der Doppelfärbung der Geieradler, **Gypohierax angolensis** Gm., der in der Jugend und im Alter ganz verschieden gefärbt, doch ein und dasselbe ist, daher *dɛ́ǎn* (vgl. Märchen: Der Geieradler und das Mädchen, Abschnitt XXI).

Ich bin auf diese Verhältnisse so genau eingegangen, weil ich glaube, daß die Denkweise eines Naturvolkes gut verständlich wird aus der Art und Weise, wie es das Wesentliche bei den ihm nahestehenden Tieren auffaßt und benennt. Ich werde bei der Besprechung der Religion und der Kultformen auf die mitgeteilten Anschauungen zurückkommen.

Wichtig in der Pangwe-Sprache ist, daß von der Vorsilbenklasse, zu der das Hauptwort gehört, die Form aller übrigen auf dieses Hauptwort bezüglichen Satzteile abhängig ist, und zwar tritt dieser Fall ein bei der Genetivsilbe, den auf das Hauptwort hinweisenden, den besitzanzeigenden und den fragenden Fürwörtern, den Eigenschaftswörtern, den Zahlwörtern von 1 bis 6 und dem fragenden Zahlwort: wieviel.

Beispiel:

bǒŋgo büe bɛ̀sɛ̀ bö mane vǒt
Jungen + deine + alle + sie sind längst müde;
melū me ɛ́ǒk mɛ̀bui me ǎke mɛ̀ dɛ́a
Köpfe + von Elefanten + zwei + sie nicht gehen (in) Topf + einen.

Zwei Elefantenköpfe gehen nicht in einen Topf (Sprichwort). —

Verstärkung, aber auch Abschwächung wird durch Verdoppelung des Stammes ausgedrückt: *ma nga yɛ̀ne yɛ̀n*
ich habe (es) nur gesehen

und *pfi'di* = Kohle, *e-pfi(d)i-pfidi-eli* = der kohlrabenschwarze Baum = Ebenholz (**Diospyros**).

Da ich hier keine Grammatik geben, sondern nur auf die Grundgesetze der Sprache, besonders soweit sie für das Verständnis und die Beurteilung der im Texte angeführten Pangweausdrücke, Rätsel und Sprichwörter in Betracht kommen, aufmerksam machen wollte, so muß ich mir weitere Einzelheiten versagen. Doch möchte ich hier einige Proben aller von mir aufgenommenen Pangwemundarten anführen, damit man sieht, wie einheitlich die ganze Sprache ist, und zum Vergleich einige Wörter von Nachbarsprachen darstellen.

Abb. 15. Blick auf die Ortschaft Afaetom (Fam. Okông), Span. Guinea.
Nur die Versammlungshäuser sind sichtbar; die Wohnhäuser sind von den Plantenpflanzungen verdeckt.

Abschnitt III.

Siedelungsgeschichte.

Wanderungsüberlieferungen, Wanderungsverlauf, Anlage von Siedelungen, Art und Weise der Wanderungen, Grundlage der politischen Ordnung. — Familienverbände, ihre Namen und deren Erklärung. — Verbreitung der Familienverbände. — Gruppierung der Ansiedelungen, Anzahl der Seelen für das Quadratkilometer, Hüttenzahl der Dörfer, Anzahl der Seelen für eine Hütte. — Einwohnerzahl des Pangwegebietes.

„Die Pangwe kommen" war ein Ruf, der in früheren Zeiten unter den Küstennegern wie unter den Europäern ein ähnliches Entsetzen hervorrief, wie im alten Rom der Ruf: „Hannibal ante portas". Daß die Pangwe nicht so ganz diese Furcht verdienten, gilt heute wohl als ausgemacht, immerhin sind sie auch jetzt noch durch ihre Masse und ihre Stoßkraft sowie durch ihre noch verhältnismäßig unverdorbene Kultur selbst für den Weißen beachtenswert, ja sie könnten — einsichtsvoll geleitet und zu einem festen politischen Verbande zusammengefügt — zu einer Macht werden, die den europäischen Kolonialbesitz zu gefährden oder wenigstens dessen Entwicklung auf längere Zeit zu hemmen imstande wäre. Freilich werden viele ihrer guten Charaktereigenschaften unter der Berührung mit den

[p. 35]

Europäern sich rasch verändern, d. h. natürlich verschlechtern, aber die ungeheure, in der Masse schlummernde Lebenskraft wird noch lange wirksam bleiben, eine Kraft, die dieses Volk in unverwüstlicher Urtümlichkeit weit aus dem Osten des innersten Afrikas bis an die Westküste geführt hat. Getrieben wurden die Pangwe, die die ganze westafrikanische Völkermasse ins Wogen und Wanken und Wandern gebracht haben, teils von dem Druck äußerer Verhältnisse, teils von der Sehnsucht nach dem Gottesreich, das im Westen liegen mußte, dort, wo allabendlich das leuchtende Tagesgestirn versank[1]). Daß wirklich das Streben nach einem besseren Lande, nach einem „Gottesreich", ein Beweggrund gerade der westlichen Zugrichtung gewesen ist, zeigen die Worte Gottes, die er dem ersten Menschen (d. h. Pangwe) zurief, als er sie wegen ihrer Sünden verließ: „Dir sage ich, damit du allein es wissen sollst, ich bleibe nicht hier, und wenn du mich vergeblich suchst, so wisse, ich bin über das Meer gegangen, und auch dort suche mich nicht, denn ich bin auf zum Himmel gegangen." Gott nahm also an, daß die Menschen (Pangwe) ihn suchen würden, nachdem er sich von ihnen zurückgezogen hatte, und sein Abraten hat sie denn auch nicht davon zurückgehalten, ihm nachzugehen. Als dann später, zuerst durch Nachrichten, dann durch greifbare Beweise die Anwesenheit über das Meer gekommener weißer Menschen an der Küste bekannt wurde, da erschien dies wie eine Bestätigung der alten Überlieferung vom Gottesreich mit seinen geistigen wie sinnlichen Glücksgütern. Und als die damals in der Nähe der Küste wohnenden Stämme durch den Handel mit den Weißen und den Zwischenhandel mit dem Hinterland Reichtum und — was für den Neger dasselbe ist — Glück erwarben, da hieß es von ihnen, sie seien die von Gott bzw. seinen weißen Abgesandten Bevorzugten. In einer Sage z. B. sagt der älteste Sohn Nsambes (Gottes), der Stammvater der Pangwe: „Ich will meinem jüngeren Bruder folgen, der nach Westen gegangen ist"[2]). So setzte die vielleicht schon zum Stillstand gekommene Bewegung mit erneuter Kraft wieder ein, und noch heute sehen wir den alten Drang nach Westen im Volke lebendig.

Obgleich ich es für sehr gewagt halte, auf die Übereinstimmung von Namen in den Wanderungssagen allzu großen Wert zu legen und schon jetzt danach den zurückgelegten Weg genau bestimmen zu wollen, scheint mir doch eine Geschichtsforschung bei den Pangwe von größtem Werte, zumal für das Sammeln der Überlieferungen, trotz der Abgeschlossenheit des Gebietes, schon die elfte Stunde geschlagen hat. Besonders Avelot hat in seiner bereits erwähnten vorzüglichen Arbeit alles Wichtige über die Wanderungsgeschichte der Völker des Ogowebeckens, zu denen ja auch die Südpangwe gehören, zusammengestellt. Als Ursprungsland wurde Largeau Mvoketanga angegeben, mir auch

[1]) Der Stamm des Namens „Nsambe" = Gott ist von der Sonne hergeleitet, vgl. Abschnitt XI, Religion, Gott.

[2]) V. Largeau, Encyclopédie Pahouine, Paris 1901, S. 27.

Mvokeji [1]). Genaueres über die Wanderungen konnte ich nicht erfahren, und deshalb mag hier der Bericht folgen, den nach Avelot Missionar Trilles [2]) von den „Bedzi [3]) de la Mondah" erhielt, sowie die Bemerkungen, die Avelot daran knüpft:

„Es ist sehr lange her, daß wir fruchtbare Täler bewohnten, welche angefüllt waren mit Planten, aber wo der Maniok und der Mais fehlten; wir hatten weder Pulver noch Flinten, sondern Bogen [4]) und Waffen, die wir uns selbst schmiedeten. Da wir angegriffen wurden von einem sehr bösartigen Volk von Menschenfressern, die stärker waren als wir, sind wir fortgezogen, wir sind ohne Unterlaß 13 Monate gegangen, haben sehr hohe Berge überschritten, wo das Wasser hart wird wie Stein; wir sind hinabgestiegen in die tiefen Täler, wo die Büffel in großen Herden lebten; da sind wir lange geblieben, und mein Großvater ist da gestorben. Das schnelle Anwachsen der Bevölkerung und der Nachschub unserer Brüder, welche uns folgten, zwang uns wieder, fortzugehen; ich war damals ein Kind; wir gingen während einer langen Zeit den großen Fluß Bah, welcher zu unserer Rechten floß, hinunter, und mit ihm gingen wir nach und nach wieder gegen Norden; wir wurden oft durch große Zuflüsse aufgehalten, die von Süden kamen, denn es gibt im Lande unserer Väter weder große Flüsse noch Kanus; wir hatten auch zahllose Kämpfe zu bestehen, besonders mit den Pygmäen „Be-kü". Nach elf Monaten haben wir aufs neue

---

[1]) Auch Mvoketanga wurde mir genannt; da ich aber die Unvorsichtigkeit begangen hatte, den Namen schon vorher auszusprechen, so wird es — wie üblich — möglicherweise mir zuliebe geschehen sein.

[2]) R. P. Trilles, Chez les Fangs. (Miss cath. XXX 1898, p. 81—82 und 92—94.)

[3]) *ti* Pl. *bōti* oder *tśi*, *bōtśi* Verräter ist ein Name, der von den Fang den Ntum gegeben ist und, wie es scheint, auch anderswo als Bezeichnung der „Anderen" üblich ist. Trilles Erklärung von *a dśi* essen erscheint mir zweifelhaft, zumal das Wort bei den Okak *tśi* heißt, und die Südfang die Neigung haben, die harten Laute in weiche zu verwandeln; vergleiche: *fōlefōs* (Höhenblitz) Nt. und *vōrōs* F., *apfə'n* (Urwald) Nt. und *afə'n* F., *ntutüm* (Regenbogen) Nt. und *ndutüm* F. Dann aber ist die Erklärung Trilles', daß die betr. Leute besonders gern Menschen verzehrt hätten, durchaus unpassend. Dieser Vorwurf würde für die Ntum noch weniger zutreffen als für die Fang, bei denen mir die Menschenfresserei, die überhaupt außerordentlich selten ist, nicht im Volke ursprünglich gewesen zu sein scheint. Bedenkt man nun noch, daß sich die Nordpangwe auch *bōti (bati)* nennen, daß es außerdem noch die Bati als fremdes Volk in der Nähe gibt, so dürfte man besser tun, den Namen zu vermeiden, da er überall zu Mißverständnissen führt.

[4]) Wahrscheinlich sind Armbrüste, nicht Bogen gemeint.

Halt gemacht in einem Lande von Ebenen und Sümpfen, durch das ein nach Norden fließender sehr großer Fluß lief, und diesen Ort haben wir Teuj genannt.

An einem unglücklichen Tage wurden wir von Leuten angegriffen, die eiserne Kleider und lange Lanzen hatten, und die fremdartige, vierfüßige Tiere bestiegen hatten; da die Unserigen nur ihre Schilde von Elefantenhaut, ihre Messer und ihre Wurfspieße hatten, mußten wir das Feld räumen; dann gingen wir beständig gegen Süden, zur Rechten ließen wir hohe Berge; oft beschloß man zu verweilen, um ein neues Dorf zu bauen, aber hinter uns kamen fortwährend andere Volksstämme, und aus Furcht, vor Hunger zu sterben, mußten wir unseren Vormarsch sehr schnell wieder aufnehmen. Alle Fang vereinigten sich endlich in einem Orte, genannt Ekoumaza, am Zusammenfluß von zwei großen Flüssen, und da trennten wir uns; die Fang zogen zur Rechten den Fluß Dzong entlang, die Meke verfolgten ihren Weg weiter nach Süden, den Fluß Dzoh entlang, und wir, die Bedzi, nahmen die Mitte ein, indem wir nach Westen hinabgingen. Nachdem wir den Berg Ekoumanzork (Elefantenvater) überschritten hatten, teilten wir uns noch einmal, die einen sind den Womm hinuntergegangen, die anderen den Komm und wir den Ntem, hierauf den Noya, dann den Ebé und endlich den Tsini, wo wir nun sind."

Hierzu bemerkt Avelot: „R. P. Trilles, der diese Erzählung zu erklären suchte, verlegte den Ursprungsort der Pangwe auf die Hochebene, die im Westen das Becken des Bahr-el-Gazal begrenzt; die Vermutung ist berechtigt: der Name Bemvou, den Eindringlingen gegeben, läßt an die Momvou des oberen Arouhimi (Momvou, Plur. Bemvou) denken; überdies sind die Pangwe mit den Mombuttu vom anthropologischen Standpunkte aus durch enge Bande der Verwandtschaft verbunden[1]). Aber was den nachher gegebenen Reiseweg betrifft, so wäre es mindestens verfrüht, ihn wiedererkennen zu wollen. Die Pangwe haben aber doch auf ihrem Wege Inseln als Zeugen hinterlassen, die Bendzi (die welche essen) am Uelle und die Dualla am oberen Sanga; diese letzteren haben wahrscheinlich einige Beziehung zu dem Lande der Ndoua, von dem der Admiral Fleuriot de Langle spricht[2]). Der Platz Ekoumaza,

[1]) Was ich mangels jeglichen Beweises bezweifeln möchte. Übrigens hat Avelot neuerdings in den „Bulletins et Mémoires de la Société d'Anthropologie de Paris", Ve Série, Paris 1909, eine Arbeit über das Ursprungsland der Pangwe und Bakele veröffentlicht. Er führt darin aus, daß die „Bemvou" nicht mit den „Momvou" gleichbedeutend sind, wie er irrtümlich angenommen hatte, sondern daß die Bemvou den Ababua im Gebiet zwischen dem Likati, Rubi, Bomokandi und dem Uelle entsprechen.

[2]) Fleuriot de Langle, Croisières à la côte d'Afrique. Tour du monde 1er sem. 1876, p. 268.

wo die große Trennung stattgefunden hat, ist bekannt: er liegt nahe dem Zusammenfluß des Kadéï und des Batouri (oberer Sangha) unweit des Gebietes der Fan-Dzem, Dzima oder Dziman (daß diese gar keine Pangwe sind, sagte ich schon früher. Anmerkung des Verfassers), der Mvôgh-Etangha des M. Largeau, im Winkel des Fächers, welcher durch folgende drei auseinanderlaufende Wasserstraßen gebildet wird:

Rechts der Dzong oder Nyong, welcher die Kolonie Kamerun von Osten nach Westen durchfließt;

links der Dzoh oder Dzah, ein Nebenfluß (Zufluß) des Sangha, des Dzam-a-nên des M. Largeau;

in der Mitte der Womm (Benito), der Komm und der Ntem (Quellflüsse des Kampo), der Noya (Muni) und der Ebé (Zufluß des Monda).

Was nun den Ekoumanzork betrifft, so ist er von Crampel nahe am Dzah wieder aufgefunden und zuletzt vom Pater Trilles wiedergesehen worden." —

Ich habe diesen Bericht ohne Erläuterungen wiedergegeben, da ich glaube, daß, wenn überhaupt der Wanderungszug der Pangwe wissenschaftlich festgelegt werden kann, dies nur mit Hinzuziehung und Vergleichung der gesamten mittelafrikanischen Völkerstämme und deren Kulturen geschehen kann, daß aber hierzu noch nicht die Zeit gekommen ist. Zweitens sind die geschichtlichen Überlieferungen der Pangwe selbst noch eingehender zu erforschen, und erst wenn größere Reihen von solchen Berichten vorliegen, kann man urteilen. Das hat auch Avelot ganz richtig gefühlt. Damit will ich nichts gegen die Theorie an sich sagen. Es ist ja möglich, daß das Ursprungsland der Pangwe das Bahr-el-Gazal-Gebiet ist, oder besser gesagt, daß sich in diesem Lande ein für das Leben des Volkes wichtiger Abschnitt abgespielt hat, und, wenn man das annehmen will, so ergibt sich eigentlich der Reiseweg nach Westen von selbst. Denn noch heute wandern die Pangwe mit den Strömen[1]), sei es stromauf oder stromab, hauptsächlich ist natürlich letzteres der Fall. So mußten sie das Bahr-el-Gazal-System aufwärts ziehend zum Mbomu und Ubangi kommen. Diesen Flüssen folgten sie bis dorthin, wo der Ubangi sich nach Süden wendet. Vielleicht vermuteten sie, daß diese Südrichtung sie zu weit abführen würde, verließen deshalb den Ubangi an seinem Knie, zogen an den kleinen Zuflüssen dort in nordwestlicher Richtung aufwärts und gelangten in das Stromgebiet des

---

[1]) Vgl. die Stelle aus einem Seelenfestgesang: *mvida ya mayon nte mbök*, d. h. Mwila (Nebenfluß des Kampo) und die Sippen eine Richtung, die Sippen der Pangwe sind in derselben Richtung wie der Fluß, also nach Südwest gewandert.

Schari. Diesem wären sie vermutlich gefolgt, wenn sie nicht bald auf die Reitervölker des Scharibeckens gestoßen wären, vor deren überlegener Macht sie zur Umkehr genötigt und in die Südwestrichtung abgedrängt wurden, die sie noch heute einhalten. Über den allerletzten Abschnitt der Wanderung habe ich folgendes gehört: Die Ntum und Fang trafen nach ihrer Angabe im Ober- und Mittellaufe des Kampo keine Bevölkerung. Ihre zuerst dort eingetroffenen Stammesgenossen, die Mwai und Mokuk, waren von den dann folgenden Bulu durchbrochen und zersprengt worden, so daß man sie heute in der Nähe der Küste ebensogut wie an der Ostgrenze des Gebietes findet. Man kann also von westlichen und östlichen Mwai und Mokuk reden. Auf die Bulu stießen die Ntum, wurden aber von jenem kräftigen und zahlreichen Stamm (daher der Name *a bülü*, viel, in Menge da sein) nach Süden abgedrängt. Dasselbe Schicksal hatten die Fang, die in zwei Haufen ankamen, von denen der eine weiter südlich längs des Benito, der andere, die Okak, nördlich des Kampo in den Fußstapfen der Ntum nach Westen zog. Sie nennen die Ntum deshalb *ntümü* von *a tübü zen*, eigentlich den Weg aushöhlen, Wegfinder sein, weil sie ihnen bei der Wanderung vorausgegangen sind. Auf die Kämpfe zwischen den Bulu einerseits und den Ntum und Okak andererseits, auf den großen „Krieg" *(oban)*, so könnte man beinahe übersetzen, beziehen sich viele Seelenfestgesänge oder Stellen aus ihnen. Die Bulu blieben im ganzen Sieger und wahrten ihre Einheitlichkeit, kamen aber unter dem Druck der ganzen Bewegung wieder in Fluß und schoben sich hinter den Ntum und Okak in westöstlicher Richtung bis an den Dscha.

Wir haben so innerhalb der einzelnen Unterstämme der Pangwe dasselbe, was wir bei den Küstenvölkern gesehen haben: Vorwärtsdrängen nach Westen [1]) und Vorwärtsstoßen oder Zerspalten und Zersplittern der schwächeren Volksteile. Aber die Wanderungen gehen nicht bloß in dieser großzügigen, gewaltsamen Weise vor sich, sondern verlaufen auch in einem beständigen, friedlichen Fluß sich vorwärtsschiebender und die Vordermänner überspringender kleiner Verbände. Man kann sich das etwa so vorstellen, daß innerhalb nicht allzuweiter Grenzen die Letzten sich an die vorderste Stelle schieben, indem sie über die dazwischen liegenden Massen hinausziehen; dann folgen die nunmehr Letzten

---

[1]) v. Stein erwähnt übrigens eine nord-nordwestliche Wanderungsrichtung der Pangwe in Kamerun, und seine Meinung ist als angeblich feststehende Tatsache in das Sammelwerk von Meyer: „Das deutsche Kolonialreich", 1907, S. 460, übergegangen. Die Ansicht besteht meiner Meinung nach nicht zu Recht und gründet sich, soweit das Innere Kameruns in Betracht kommt, wahrscheinlich auf örtliche Verschiebungen, soweit die Ostgrenze in Betracht kommt, auf eine unrichtige Zuweisung fremder Stämme, z. B. der Njem, zu den Pangwe.

bei ihrem Umzug den früher hinter ihnen sitzenden Familien und siedeln sich in deren Nähe oder gar noch weiter nach vorn an. So findet eine stetig wechselnde Abwanderung im Osten und Zuwanderung im Westen statt, die oft ein fast fluchtähnliches Gepräge aufweist, oft von Zeiten der Ruhe unterbrochen wird. Daher gibt es an gewissen Stellen Dörfer, deren Lebensdauer fünf Jahre nicht überschreitet, während anderswo, z. B. am Oberlauf des Kje, überhaupt im mittleren Fanggebiet, die Dörfer so lange stehen, wie sich die ältesten Leute erinnern können, oder gar schon die zweite Generation beherbergen sollen. Man sieht, die Verhältnisse sind äußerst verschiedenartig und schwer zu übersehen, so daß hier nur im großen und ganzen die wirksamen Kräfte genannt, nicht die Wanderungen im einzelnen beschrieben werden können. Dies für jedes einzelne Gebiet festzustellen, bleibt einer späteren Zeit vorbehalten. Wie die Wanderungen im kleinen vor sich gehen, beschreibt auch Largeau in seiner Enzyklopädie ganz richtig. Die hinten (das ist immer im Osten), sei es aus Furcht vor feindlichen Überfällen, sei es weil zu viele Todesfälle in dem Dorfe vorkamen oder aus anderen Gründen, Fortziehenden überschlagen in der geschilderten Weise eine ganze Reihe vor ihnen liegender Landschaften und siedeln sich oft viele Meilen entfernt an der Spitze des Zuges wieder an. Die notwendigsten Habseligkeiten, Körbe, in die das bewegliche Gut verpackt wird, und Mahlsteine *(ngŏk)* nehmen die Leute mit; das Haus mit den Trockenbrettern und Fleischaufbewahrungskisten *(bŭbŭ)*, das sie zurücklassen, ist ja jederzeit leicht aus der Raphiapalme (drüben Bambu, engl. Bamboo = Bambus, genannt) wieder hergestellt. So ein leeres Dorf gibt einen trostlosen Anblick, der erst freundlicher wird, wenn der früher abgeschlagene Busch wieder die alte Scholle erobert, wenn sich Gras und Kraut liebevoll an die kahlen Wände schmiegen, und Lianen und blütenbedeckte Winden eifern, das Haus einem Dornröschenschloß gleich zu überwuchern und zu umspinnen. Aber auch dann noch kommt es uns nirgends so einsam, so weltvergessen vor wie in solchen verlassenen Dörfern. Um so regeres Leben herrscht vorn in der neuen Siedelung, Hütten werden gebaut, nachdem ein geeigneter Platz gerodet und zurechtgemacht ist, und Pflanzungen werden angelegt. Solange diese keine Erträgnisse liefern, vielleicht für ein paar Monate, wird das Essen *(bedŭ)* von benachbarten und befreundeten Sippen gekauft, oder man sieht sich, wo geeignete Beziehungen nicht vorhanden oder wegen der Entfernung der fremden Dörfer nicht anzuknüpfen waren, in der Weise vor, daß man einen Teil der Männer vom alten Platze aus vorausschickt, um den Wald zu roden, für sich und die Nachfolgenden kleine, vorläufige Hütten zu bauen, die später allmählich durch bessere, dauernde ersetzt werden, und den Boden um diese Häuser für den nunmehr in gleicher Weise

vorausgeschickten Weibertrupp vorzubereiten, der die Kulturgewächse pflanzen soll. Unterdessen schaffen die Männer weiteren Platz für den Anbau der größeren Pflanzungen. Wenn die ersten Feldfrüchte der Reife entgegengehen, folgt der Hauptteil der Familie mit Kind und Kegel nach und erntet die ihnen vor und hinter der Tür angebauten Kassave, Erdnüsse usw. sofort ein. Das bedeutet natürlich eine große Zeitersparnis. In diesen landwirtschaftlichen Maßnahmen ist ein gut Teil praktischen Sinns, überlegter Berechnung und planvollen Handelns enthalten; um so mehr muß es verwundern, daß die Pangwe durchaus kein Verständnis für die Berechnung der Pflanzungs- und Erntezeiten haben und jede dahin gehende Frage — wie bei Besprechung der Kulturpflanzen angeführt werden wird — geradezu als kleinlich und albern empfinden. Wenn das noch bei den Männern allein der Fall wäre, so könnte man es verzeihen, aber ich weiß auch von einer ganzen Reihe von Weibern, daß sie sich erst mit Mühe erinnerten, wie lange Zeit die Erdnuß vom Tage des Anpflanzens bis zur Ernte braucht. Was Wunder, wenn bei solcher Gleichgültigkeit Hungersnöte auftreten, wie sie uns in den Märchen vielfach erzählt werden. Aber nie würde der Pangwe auf den Gedanken kommen, sich selbst wegen seiner Denkfaulheit einen Vorwurf zu machen; ergeben trägt er vielmehr sein Schicksal, nimmt indes mit Waldfrüchten vorlieb, besonders den nahrhaften Nüssen von **Coula edulis** Baill. (Olacac.) *ewuəmo* F., Nuß selbst *kəmo*, **Irvingia barteri** Hook. f. (Simarubac.) *andək*, Nuß *ndək*, **Chonopetalum stenodictyum** Radlk. (Sapindinac.) *nùm angəlongə*, **Pachylobus tessmannii** Engl. (Burserac.) *nga angəlongə*, ferner mit Baumpilzen und sogar Blättern, besonders von **Pseuderanthemum nigritianum** (T. And.) Radlk. (Acanthac.) *ndzəɣ*, der **Justicia insularis** T. And. (Acanthac.) *num e fəi*, der Urticacee **Fleurya aestuans** L. Gaudich *ngəkən*, von Farnkraut und vielen anderen, und hilft sich so über die magere Zeit hinweg.

Daß nun eine derartige, in steter schwingender Bewegung befindliche Masse, in der die kleinsten Gruppen sich gewissermaßen anziehen und wieder abstoßen, keine umfassende politische Gestaltung gewinnen konnte, ist klar. Das äußere Leben des Pangwevolkes können wir uns — wie wir gesehen haben — als das langsame Fluten einer Wassermasse vorstellen, aber dieses gleicht nicht dem ebenmäßigen Dahinfließen eines Stromes in seinem Bett, sondern dem unmerklichen Vorrücken der Flut am Meeresstrande. In Bewegung, in Aufruhr sehen wir nur kleine und kleinste Teile, die als Wellen sich gegenseitig überstürzen, erdrücken, sich gegeneinander aufbäumen, gegeneinander anprallen, wenn sie auf ein Hindernis stoßen. In der Pangwe-Flut sind die einzelnen Wellen, die den Blick hauptsächlich fesseln, die Sippen oder Familienverbände, die sich wie die Wogen teilen und in immer kleinere Bestand-

teile auflösen, so daß es einem, wenn man sie greifen, wenn man sie fassen will, erscheint, als bliebe in der Hand nur ein einziger Tropfen, der einzelne Mensch. Aber das gehört in einen anderen Abschnitt.

Jedenfalls bleibt die größte politische Einheit der Familienverband, er gilt dem Pangwe als „Vaterland", nicht etwa ein Unterstamm, wie die Fang, oder gar die gesamten Pangwe, von deren Zusammenhang er nun schon gar nichts weiß. Mancher Fang wird freilich dem Europäer zuliebe sagen: ich bin ein Fang oder, wenn ihm unglücklicherweise dies Buch zu Gesicht und Verständnis gelangen sollte: ich bin ein Pangwe, aber der unberührte Fang sagt nie anders wie: „*ma ne mǒne esdwǒn*" = ich bin ein Essauong, oder wie der Familienverband sonst heißen mag. Fragen wir einen solchen Essauong, ob er ein Ntum oder Fang sei, so pflegt er uns oft recht dumm anzusehen, gerade wie vor nicht allzu langer Zeit ein deutscher Bauer, der sich als „Meckelnbörger" oder „Bayer" vorgestellt hat, geglotzt hätte, wollte man von ihm hören, ob er ein Deutscher sei.

Also der Familienverband ist für den Pangwe die höchste politische Verfassung, d i e soziale und sittliche Ordnung. Nur innerhalb des Familienverbandes gelten seine Rechtsgrundsätze, und wer nicht mit ihm auf diesem Boden steht, ist fremd, rechtlos, sein Feind. Ein Haupt hat diese Verfassung nicht, sie verkörpert sich nicht in einem einzelnen Menschen, sondern in der Gesamtheit aller älteren Familienmitglieder, und der jeweilige Familienvater hat sie nur nach außen hin zu vertreten. Ein Herrschaftsverhältnis in unserem Sinne wird dadurch verhindert, daß die ursprünglichen, kleinen Familienverbände sich nur vergrößern, um sich sofort wieder, wie ich im Vergleich schon andeutete, in kleine Einzelteile aufzulösen. Diese werden ganz selbständig und behalten entweder den alten Namen bei oder legen sich einen eigenen zu, zumal, wenn sie anfangen, sich zu vergrößern, wie man noch heute beobachten kann. Sie übernehmen die Sippenordnung der früheren Gemeinschaft. Die wechselnden Erscheinungen auf diesem Gebiete fallen in die gesellschaftliche Ordnung im engeren Sinne und werden später besprochen werden. Es bleibt hier nur festzustellen, daß der Pangwe den Schritt von einer gesellschaftlichen Ordnung zu einer staatlichen Ordnung nicht hat machen können. Wie er nicht gerade feige ist, aber auch nicht mutig, so ist er andererseits nicht gerade schwächlich, aber auch nicht willensstark, durchgreifend, keine rücksichtslose Herrennatur. Er gehört zu den „Halben", und solche Leute taugen nicht zur Herrschaft. Allerdings ist im Norden, besonders bei den Mwele, der Häuptling eine Persönlichkeit mit fast politischer Macht (Mwelehäuptlinge Simekoa und Kombokoto)[1]), aber auch da erstreckt sich diese nicht einmal immer über eine ganze Sippe, wenigstens seit der europäischen Machtentfaltung nicht mehr;

[1]) Wegen der Kriegslust dieser Leute; der Name *mvélɛ̄* kommt von *a vele*: bekriegen, die Jaunde nennen außerdem die Bassá *mvele*, ein Wort, das nur durch die Tonhöhen von dem Namen des Unterstammes unterschieden ist.

andererseits haben wir wohl in der strafferen, machtvolleren Organisation der Nordpangwe den Einfluß der Grasland- und Gebirgsvölker des Nordens (siehe Abschnitt I) vor uns. Mag nun ein Häuptling größere oder geringere Macht haben, jedenfalls dreht sich für den Pangwe alles um den Familienverband, nicht um Person oder Volk. Und daher ist der Familienverband so ungeheuer wichtig. Von den kleineren Eton abgesehen, kann man vielleicht im Mittel für jeden der übrigen acht Unterstämme 30 — vielleicht noch mehr — Familienverbände, bei den Mwele, Jaunde und Bene *ndä* = Haus, bei den anderen Pangwe von den Bulu an *ayön* = Familie genannt, rechnen, so daß ihre Gesamtzahl für die Pangwe wohl 240—300 betragen dürfte. Bei den verschiedenen Unterstämmen sind mir folgende bekannt:

Yimisgmö, Menkgm, Embäni (Yembäni), Yenkgndä, Yeźüm, Bökőä, Yibikglö, Yembädäk, Yemrelo, Yengänö (Engänö), Yembämo, Mbidambäne, Edäma, Ndöń, Mrog-Eyä, Mroge-Näna, Mrog-Ebela, Mroge-Eźümbä.

Jaunde

(*Yegndö* J. B. auch *Yehgndö* und *Yewgnö* Nt. F.).

Evgndö (Ehgndö), Bäva (Bäbä), Yehändä (Yegndä), Yeläńga (Eläńga), Yemvöń (Emröń), Etädi, Jenö, Edzö, Embümbün, Ngoe, Elega, Evunzok, Betseńga[1]*), Mrog-Adä, Mroge-Fäda, Mrog-Esümendänä, Mrog-Ebända, Mroge-Betsi, Mroge-Bölö, Mroge-Tsuńgobäla, Mrog-Anlańganabäla, Eländi.*

Bene.

Mroge-Bölińga, Mrog-Ehgndu, Mroge-Bala, Mroge-Balabesglo, Mrog-Amak, Mrog-Amugetsögo, Mroge-Žäńga, Mroge-Mäńga, Mroge-Nsök, Mroge-Manezö, Mrog-Eyeńge, Amugobane, Emgmbö, Tsińga, Abi.

Nach v. Stein[2]) noch: *Mroge-Ndi, Mroge-Nomo, Mrog-Aka, Mroge-Sambo, Mvoge-Nkû, Mroge-Bobjäla, Mroge-Matsä, Mroge-Yömo, Mroge-Tèla, Mroge-Memrunu (Mroge-Ngandzoke), Mroge-Menkulu, Mroge-Sa, Mroge-Mayé, Mroge-Ngele, Mroge-Ndzek, Mroge-Ngame, Mroge-Sisema, Ntulu.* Die von ihm angeführten *Erundo, Mrog-Ada* (Mvogeda) und *Mrog-Ebanda* (Mvogebande) gehören nach meinen Erkundigungen zu den Jaunde, oder sie zählen sich teils zu den Jaunde, teils zu den Bene.

Bulu.

1. *Yemrak* von *mvak* = Ichneumon, **Herpestes galera** Erxl. und **almodovari** Cabrera, weil die Ersten diese Tiere besonders viel erlegt haben sollen.

---

[1]) Die letzteren sechs nach Angabe des Herrn P. H. Nekes.

[2]) v. Stein, Über die geographischen Verhältnisse des Bezirkes Lolodorf usw. in „Mitteilungen von Forschungsreisenden und Gelehrten aus den deutschen Schutzgebieten" von Dr. Freiherr v. Danckelman, XII. Bd. 3. Heft, Berlin 1899.

2. *Pfǘn (Fǘn)* von *apfǘn (afǘn)* = ein wohlriechendes, zur Suppe benutztes Kraut. Dies soll diese Familie zuerst „gehabt" haben.
3. *Yembǘn* von *mbǘn* = Tragbalken. Diese Leute sollen jede Kleinigkeit, z. B. eine erlegte Meerkatze, an einem Tragbalken zu zweien getragen haben.
4. *Yempfǘk* von *mpfǘk* = Umhängetasche aus Ananasfasern. Die Leute sollen immer derartige Taschen, nie Felltaschen, getragen haben.
5. *Yegème* von *a gém mǫm* = Sachen kennen, etwas wissen; sie sollen alles gewußt haben. Dieser Stamm sitzt heute am weitesten westlich zwischen Kribi und Nkomakak.
6. *Esakǫk* von *a kǫ́k mǎm (a lène mǎm)* = in Sachen schwankend, wetterwendisch sein. Eigenschaft des oder der Ersten dieser Familie. (In folgendem ist diese Beziehung als selbstverständlich nicht mehr erwähnt.)
7. *Esampfǫ́n* von *a pfǫ́ne bǫt* = Leute verleumden, fälschlich beschuldigen.
8. *Yesa'mǎn* von *a sǎmǫ mot* = jemand in seiner Nacktheit sehen bzw. dahin wirken. Es geht die Sage, daß die Weiber mit ihren Schwiegersöhnen „gespielt", d. h. ihnen das Zeug hochgehoben und sie so in ihrer Blöße gesehen hätten (gerade für den Pangwe etwas Unerhörtes).
9. *Yekǫmbǭ.* 10. *Yeisǫ́n.* 11. *Yekǫ́ǫ.*

Die Namen konnten nicht erklärt werden.

Die Familienverbände der Bulu sind mit vorstehend aufgeführten noch lange nicht erschöpft.

Ntum.

1. *Esamɛin* von *mɛin* = Schwarzsteiß-Schopfantilope, **Cephalophus callipygus** Peters.
2. *Esamɛ̄i* von *mɛ̄i (mɛ̄i)* = Fleckenroller, **Nandinia binotata** Reinwardt.
3. *Nkǫodǘǭ* von *nkǫ* = Hügel, Berg und *odǘǭ* = Zwergböckchen, **Neotragus batesi** Winton, auf einem Hügel, wo Farmen gemacht wurden, töteten die Leute stets Zwergböckchen.
4. *Obǎkǫ́i* von *a ba* = teilen, zerlegen und *kǫ́i* = Hamsterratte, **Cricetomys (aff.) dissimilis** Rochebrune, die Leute sollten immer Fallen für Hamsterratten, die sie dann unter sich teilten, aufgestellt haben.
5. *Esǫ́n* von *asǫ́n* = Schirmbaum, **Musanga smithii** R. Br. (Moraceae).
6. *Ndǫ́n* oder *Ndǫ́nobokoe* von *ndonǫ* = Kreisel bzw. Schneckenkreisel, weil der Erste immer damit gespielt haben soll.
7. *Esangbuǫk* von *ngbuǫk* = Deissel, weil der Erste stets einen Deissel genommen haben soll.
8. *Esabɛ̄i* von *ebɛ̄i* = Raphiablattstielstreifen, die zum Hausbau verwendet werden, denn die soll der Erste gemacht haben.
9. *Esamǫngǎn* von *a ngǎnǫ o jǒb* = überragen, z. B. *eli a ngǎnǫ o jǒb* = der Baum ragt über, weil diese Familie (auch noch heute) alle andern an Stärke überragt.
10. *Yegǫbǫ* von *a gǫbǒ bǒt* = Leute niederwerfen beim Ringkampf, das haben diese immer getan.

11. *Esakängn* von *a käne mebim* = die Töten (eigentlich Leichen) rächen (Blutrache nehmen).
12. *Esatäk* von *etäk* = Topfscherbe, die als Unterlage für den Kochtopf dient. Der Erste soll immer im Hause der Mutter geblieben sein, wie die Scherbe, die im Gegensatz zum Topf immer an derselben Stelle bleibt.
13. *Esatgb* von *a tgbö* = bleiben, sitzen bleiben. Wenn von dieser Familie Leute als Gastfreunde kamen, so „saßen sie fest" und zeigten nicht sobald Lust, nach Hause zu gehen.
14. *Epfärk* von *a pfä[k] aśgj* = Eisenstein ausgraben. Diese Familie soll sich noch heute am meisten mit Eisenschmelzerei abgeben.
15. *Esabümän (Mebüman)* von *a bümän a nzen* = (jem.) unterwegs treffen, sich begegnen. Als Nsambe (Gott) seine „Kinder" besuchen wollte, soll er diese unterwegs getroffen haben (vgl. Essapfuman bei den Fang).
16. *Aśok* von *a śok* (Hauptwort *nśok*) = durcheinanderreden, weil sie bei Verhandlung von Prozessen alle durcheinander geredet haben.
17. *Esabäng* von *a bäno möt* = jemand verfluchen, sie sollen stets den Fluch ausgesprochen haben.
18. *Esandgn* von *a ndgnebö* = gebückt gehen, weil der erste im Kriege durch ein feindliches Dorf — anstatt zu schleichen — gebückt ging.
19. *Zgmä* von *a śgmä mäm* = Streitsachen ruhig entgegensehen; sich nicht fürchten, Streitsachen zu bekommen.
20. *Esaśgm* von *a śume mvuän* = Tiere treiben, Treibjagd abhalten, weil die Familie darin groß gewesen ist.
21. *Esambé* von *mbé* = Schlechtigkeit; die Familie ist streitsüchtig, roh, die Leute sollen ihre eigenen Weiber töten und, wenn diese ein Kind von einem andern bekommen, es wegwerfen, indem sie sagen: Nicht ich war es, der dieses Kind gezeugt hat.
22. *Mabäan* von *a bäne eläń* = den Hintern hervorstrecken (zeigen), vgl. Abschnitt XI, 6, Seelenfest.
23. *Esambidä* von *a bidän bim* = Sachen verderben.
24. *Obäk* von *a bäge mäm* = falsche Dinge erzählen, verleumden.
25. *Odźärb* von *a dźärb ebon* = eine Frau beschlafen, wenn sie schwanger ist oder ein Kind hat, das noch nicht geht (ist *eki* = verboten).
26. *Esaküdän* nicht zu erklären.

Mwai.

1. *Esabäm* von *obäm* = Raubvogel, insbesondere Schmarotzermilan; die Familie pflegte diese Vögel zu erlegen.
2. *Esabedäńga* von *a däń* = übertreffen, weil sie alle andern übertrafen, vgl. Essamongun (Ntum).
3. *Ekäńa* von *a käńa bot* = allen Leuten gehorchen, jedem gehorchen, der einem Anweisung gibt (ohne Überlegung).
4. *Esaekigi* von *ekigi* = Eisen, sie pflegten viel Eisen zu machen oder zu haben.
5. *Esasgn* von *sgn* = altes, bereits bitteres und schlecht schmeckendes Bündel mit Essen, dieses pflegten die Leute zu essen.

6. *Esamedźáń* von *adźáń* = Tod, weil viele starben.
7. *Esamabǒńa* von *a bǒńe* = verscheuchen, wegjagen, sie pflegten die Ziegen, die ihre Vorräte plünderten, wegzujagen.
8. *Yebǭ,* von *ebǭ,* = verdorben, weil sie verdorbenes Fleisch (!?) essen.
9. *Esałǖń* von *a łǖńe* = folgen, weil sie Nsambe (Gott) immer folgten.
10. *Esamenü,ń* von *anü,ń* = Abfall von Speisen usw., die Leute ließen das Essen verkommen.
11. *Esabɪ* von *a bɪ* = fangen, diese Leute fingen die Fremden stets weg.
12. *Esakǖm* von *akǖm* = Holzmirliton, das bei den Liebesgesängen und -tänzen gebraucht wird, sie pflegten solche Vorführungen zu machen.
13. *Yemfǒk* Name nicht zu erklären.

Fang.

In dem Namen *Fáń* steckt der Stamm *fá(fe)* Busch, Wildnis, die Nachsilbe *ń* ist angehängt, und da sie — wie in Abschnitt II erwähnt — eine Ableitung bedeutet, würde Fang also heißen „der vom Busch stammt", also Buschmann, daher auch die leichte Verallgemeinerung in Pangwe. *Okák* soll von *akák* = Geiz, geizig kommen, ein Name, mit dem die Ntum sich für das *Bǒłśi* (siehe S. 37 Anmerkung 3) „revanchiert" haben.

1. *Ngu,ɛ̄, Ngbwɛ,* von *ngu,* = Schwein.
2. *Esengí* von *ngí* = Gorilla, sie sollen viele Gorillas getötet haben.
3. *Bokǖɛ,* von *kǖ,ɛ̄* = Schnecke, die Leute sollen Schnecken gegessen haben (heute für alle Weiber und für Männer, deren Frauen schwanger sind, verboten).
4. *Evǖnźǒk* von *evǖ* = Sitz der Zauberkraft, *źǒk* = Elefant, weil die Leute die Ewu des Elefanten aßen.
5. *Pfǖń* siehe S. 45 (unter Bulufamilien).
6. *Esabǭk* von *abǭk* = eßbares Kürbisgewächs, **Cucurbita maxima** Duch., weil die Leute dies viel essen.
7. *Yebekǫn* von *ekǫn* = Plante, diese Familie liebt noch heute die Planten sehr.
8. *Esesɪ,ɛ* von *ésɪ,ɛ (ìsɪ,ɛ)* = Schattendarsteller beim Mondkult *(so)*.
9. *Omɣáń* von *mɣáń* = Ziernarbe, sie sind noch heute besonders mit Ziernarben geschmückt.
10. *Yemandźɨm* von *mandźɨm* = Wasser, weil die Familie so zahlreich ist wie Wasser.
11. *Okǒń* von *akǒń* = Geschicklichkeit, geschickt, in praktischer Arbeit erfahren.
12. *Abɛ,ɛ̄* von *a bɛ,ɛ̄* = gebären, die Frauen sollen schon früh geboren haben.
13. *Esapfǒ,ɛ* von *a pfǒ,ɛ bim* = Sachen hinstellen und dann vergessen.
14. *Yenǫń* von *nǫńe mot* = Mann mit gelblicher Hautfärbung.
15. *Esabáń* von *a báńe bɨm* = Sachen beginnen, bevor die alten fertig sind, immer etwas Neues anfangen.
16. *Esazɨń* von *a sɨń* (Hauptwort *zɨn*) = nicht gern sehen, nicht lieben, hassen.
17. *Esapfamán* von *a pfáman* = verfehlen, weil Nsambe, als er ausging, seine Kinder zu besuchen, die Leute dieser Familie nicht antraf.

18. *Asõbo (Aśõbõ)* von *a śõgebõ* = sich zusammenziehen, sich ziehen, z. B. Rinde der Bäume, dann der Schultermuskel; bei allen Leuten ist nämlich dieser Muskel stark ausgebildet.
19. *Okgs* von *a kg[s] bim* = Sachen auffangen, die Leute pflegten die Sachen, die sie sich zuwarfen, aufzufangen.
20. *Esawõń* von *a wõn* = sich fürchten, feige sein.
21. *Oyěk* von *a yěk* = ausweichen, ebenso.
22. *Esandõń* von *a ndõńe mam* = von jemand Sachen, die man nicht genau weiß, erzählen, andere in schlechten Ruf bringen (vgl. *Esapfan* unter Bulu).
23. *Ngämä*. 24. *Yemyäm*. 25. *Esametśuä*. 26. *Olä*. Namen nicht zu erklären.

Im einzelnen weichen die Erklärungen etwas voneinander ab, aber die angegebenen mögen als Anhalt dienen. Die vorausgesetzte Silbe *ye* oder *esa* (von *tä*, *sä* = Stamm für Vater) bedeutet wohl soviel wie Sippe, ihr entspricht bei den Jaunde und Bene *myök* (eigentlich Heimat, Stammesplatz), nur scheinen alle mit *myök* zusammengesetzten Familienverbände spätere kleine Abzweigungen von Sippschaften zu sein, wenn sie heute auch vollkommen den Rang einer solchen haben.

Auffallen muß es, daß in den Namen Wörter vorkommen, die heute nicht mehr oder selten gebraucht werden, so *adźań* = Tod; ferner, daß vielfach eine Verschiedenheit der Tonhöhen vorhanden ist, so in *Ngu,é* und *ngui*, und in *Bokõe*, und *kõ,e*; letzteres Wort ist außerdem dadurch wichtig, daß es bei den Familiennamen *(Ndońobokoe* und *Bokoe)* nach der Menschenklasse geht, *kõ,e*, Plural *bokõ,e*, während es heute nur nach der IV. Klasse (Tierklasse) geht.

Eine Karte des Pangwegebietes, mit farbiger Eintragung der Familienverbände, würde, selbst in großem Maßstabe gezeichnet, bunter aussehen als eine Karte der deutschen Fürstentümer im Mittelalter. Eine Vorstellung von dem Durcheinander kann man sich nach der beigegebenen, im Maßstab 1 : 100 000 gehaltenen Karte machen (zwischen S. 48 u. 49), auf der sämtliche Dorfschaften in einem Gebiet von 600 qkm verzeichnet sind. Das Stück ist auf der Hauptkarte rot umgrenzt. Man sieht als größte Sippschaft die Essauong *(Esawońń)*, die 18 Ortschaften (zwei liegen außerhalb des Rahmens der Karte) einnehmen. Wie man nach dem, was über die Wanderung gesagt ist, nicht anders erwarten wird, ist dies natürlich nur ein Teil, wenn auch der Hauptteil der Essauong; andere Trupps wohnen viele Meilen entfernt am oberen Bimfille und am Ober- und Unterlauf des Uelle. Ebenso steht es mit den übrigen Familienverbänden. Schlimmer als diese Zersplitterung ist für die ethnologische Betrachtung die Tatsache, daß Ntum und Fang durcheinander wohnen. So ist die Familie der Omwang die nämliche wie die Familie der Essandun, also ursprünglich eine Ntumfamilie; da sie sich aber früh abgetrennt

hat, und einzelne Trupps bei der Wanderung zwischen die Fang-Okak geraten sind, so rechnen sie sich eben unter dem Namen Omwang heute zu den Fang. Andererseits ist zwischen beiden eine tatsächliche Verschmelzung eingetreten, weil die Angehörigen einer Sippe nur die Frauen einer anderen heiraten dürfen, die Omwang also meistens Fangfrauen genommen haben, und wir verstehen, daß die Frage, ob Ntum, ob Fang, den Eingeborenen tatsächlich oft in Verlegenheit bringen kann. Man darf bei vergleichender Betrachtung der Pangwe-Kultur also nicht zu fest an den Unterstämmen kleben, sondern in Betracht ziehen, daß überall Mischungen stattgefunden haben.

Die Karte zeigt weiter die Verteilung von Ortschaften und Dörfern in dem dargestellten Gebiet und deren Bevölkerungsmenge. Ortschaften (Abb. 15) nenne ich Gruppen von Dörfern, die mit einem Namen bezeichnet werden. Der Pangwe nennt sie: *nnam I.* Die Dörfer einer Ortschaft gehören natürlich meist zu einem Familienverband, doch können sich auch zwei Familienverbände einigen und eine Ansiedlung gemeinsam begründen. Zum größten Teile folgen die Dörfer einer solchen Ortschaft hintereinander wie die Perlen an der Schnur und sind höchstens ein oder zwei Minuten Wegs voneinander entfernt. Dörfer, die weiter als ¼ Stunde auseinanderliegen, gehören selten zu einer Ortschaft, und wenn, so hat sich meist ein Teil der Einwohner des alten Dorfes wegen Streitigkeiten oder aus anderen Gründen abgetrennt und sich ein paar Kilometer weiterhin angesiedelt, der Name der neuen Ortschaft ist aber noch nicht gefunden. Wie ein Blick auf die Karte lehrt — man nehme z. B. die östlichen Ortschaften Owöng, Makoga und Bebadda —, sind meist 3—4, auch 5 Dörfer zu einer Ortschaft vereinigt, 6—8 gehören schon zu den Seltenheiten, doch kommt es auch vor, daß man eine ganze Stunde braucht, um eine Ortschaft zu durchschreiten, aber das sind Ausnahmen. Ein derartiges Beispiel ist die Schumuortschaft Melé mit 17 Dörfern. Im Nordpangwegebiet, wo die gesellschaftliche Ordnung fester ist, werden im allgemeinen größere Dörfer gebaut als im Süden.

Um zu einer ungefähren Schätzung der Einwohnerzahl zu kommen, muß man auf die Hütte zurückgehen. Die Anzahl der Hütten eines Dorfes, die ebenfalls (auf ein Mittel gebracht) aus der Karte zu ersehen ist, schwankt zwischen 2 und 50, sie ist im mittleren Fanggebiet selten höher. Eine Ausnahme ist das Dorf Mabungo mit 75 Häusern. Dagegen findet man im Norden bei den Jaunde, Mwele und Bene, wie gesagt, größere, dafür aber weniger zahlreiche Dörfer. Nach meiner Erfahrung darf man für jede Hütte nur 1½ bis 2 Seelen im Durchschnitt rechnen und auf ein Gebiet von 2000 qkm ungefähr 2770 Hütten, auf 90 Ortschaften verteilt, annehmen. Danach kämen auf das Quadratkilometer 2—3 Seelen. Da aber das der Berechnung zugrunde

gelegte Stück[1]) relativ dicht bevölkert ist im Gegensatz zu weiten im Südosten und Süden gelegenen Gebieten, in denen man z. B. in der Nähe des Jwindo 7—8 Stunden von einem Dorf zum andern gehen muß, so glaube ich für das gesamte Pangwegebiet nicht mehr als 2 Seelen für das Quadratkilometer annehmen zu dürfen. Das wäre also im ganzen eine Pangwebevölkerung von ungefähr 300 000 bis 400 000 Seelen [2]).

---

[1]) Ein Viereck von der deutschen Grenze südlich bis an den Bimfille und die Abea.

[2]) Im Heft 5/6 des vierten Bandes des „Anthropos" veröffentlicht P. H. Trilles eine Studie unter der Überschrift „Les Légendes des Bena Kanioka et le Folk-lore Bantou", in der er S. 947 in der Anmerkung 2 sagt: „L'ensemble des clans fang dépasse dix millions d'individus". Diese ungeheuerliche Übertreibung brauchte eigentlich kaum zurückgewiesen zu werden, nachdem bekannt ist, daß ganz Kamerun, dem der französische Kongo an Größe nahesteht, überhaupt nur 3 500 000 Einwohner hat. Die Familienverbände der Fang schätzt Trilles an derselben Stelle auf 400, was selbst für die gesamten Pangwe zu hoch sein dürfte.

Abschnitt IV.

Dorf und Haus.

Namen für Ortschaften (Herleitung und Erklärung). — Flurnamen. — Anlage der Dörfer. — Siedelung; Entwicklung einer Siedelung zu einem Dorf; Dorf; Bedeutung des Namens; Vergrößerung des Dorfes. — Vorläufige Versammlungshäuser: Anlage, Form. — Endgültige Versammlungshäuser: Gerüst; Dachdeckung (Verfahren, Material zu Sparren und Belag); Seitenwände (Material, Ausführung, Aussehen); Veranda. — Inneres der Versammlungshäuser: Pfeiler; Ruhebänke; Feuerstellen; Gerät (Gewehrhalter, Trophäen u. a.). — Leben im Versammlungshause. — Wohnhäuser: Formen; Aussehen; Türstück; Tür; Zustand. — Inneres der Wohnhäuser: Schlafbänke; Hängeböden und Speisekammer; Rahmen mit Trockenbrettern und Körben; Haken; Schemel; Feger. — Raphiapalme: Arten; Namen; Ausnutzung. — Vorratshäuser; Fremdenhäuser; Feldhütten; Krankenhäuser. — Pfahlhäuser. — Beleuchtung: Herdfeuer; Fackeln; Lampe; Pilzfackeln; Feuerbereitung. — Dorfplatz (Aussehen, Reinlichkeit). — Abort. — Zierpflanzen. — Verkehrswege. — Verkehr zu Wasser. — Brücken.

In dem großen, mit Urwald bedeckten Pangwegebiete liegen die Ortschaften zerstreut wie Oasen in der Wüste und ungleichmäßig verteilt derart, daß sie in der Richtung der Hauptverkehrswege, die das Land in der überwiegenden Mehrzahl von Ost nach West durchziehen, gehäuft auftreten.

Die Ortsnamen knüpfen sich meist an hervorstechende Merkmale der umgebenden Natur, an Gegenstände, Erlebnisse oder Eigenschaften der betreffenden Einwohner. So sind benannt

a) nach Palmen.

1. Niescham von *a nɨ* = legen, *ɛ́ạm* = Sumpf, Raphia, d. h. das Dorf ist dahin gelegt, wo es Raphia, die wichtigste Pflanze für den Hausbau, gibt.
2. Mabäscham von *a bē* = folgen, *ɛ́ạm* = Sumpf, Raphia.
3. Makoda von *akōda*, Mehrzahl *makōda* = Sumpfpalme, **Sclerosperma mannii**, Mann et Wendl., zum Hausbau benutzt wie Raphia.
4. Nkan von *nkạ̄n(e)* = **Ancistrophyllum acutiflorum** Becc., Kletterpalme, zur Flechterei benutzt.
5. Mekan, ebenso, Mehrzahl.
6. Nsamenkan von *ɛ́ạm (nɛ́ạm)* = Sumpf, Sumpf von der Kletterpalme **Ancistrophyllum.**
7. Alen von *alẹ̄n* = Ölpalme.
8. Malen, ebenso, Mehrzahl.

b) nach Kulturpflanzen.

9. Matumabai von *atú*, Mehrzahl *matú* = Taro, **Colocasia antiquorum** (L.) Schott, *mabai* = zwei, also zwei Taro.

[p. 51]

10. Bekaba von *ekábа*, Mehrzahl *bekábа* = **Xanthosoma violaceum** Schott.
11. Emäangon von *a mê ngôn* = Ngon ausstreuen, d. h. zum Trocknen auf dem Dorfplatz.

c) nach eßbaren wilden Früchten oder Fruchtbäumen.

12. Essun von *esŭ̧n* = Frucht des Kardamom, **Aframomum alboviolaceum** K. Sch.
13. Madschab von *madzə̆'b* = Öl von **Mimusops djave** (Lan.) Engl.
14. Fan von *fə̆'nę* = Frucht der Anacardiacee **Sorindeia rubriflora** Engl. *(afə̆'nę)*.
15. Abe von *abē* = Kolanuß und -baum, **Cola acuminata** (P. Beauv.).
16. Andok von *andŏ̧k* = **Irvingia barteri** Hook. f., Simarubaceae. Mandok.
17. Nkoandok von *nkŏ̧k* = niedergefallener Baumstamm, d. h. der **Irvingia.**
18. Ngong von *ngŏ̧ṅ IV* = Früchte der **Trichoscypha** sp. *(engŏ̧ṅ)*.
19. Alöb von *alə̆'b* = **Desbordesia glaucescens** Engl. (Simarubaceae).
20. Mangame von *mangə̆'me III* = **Myrianthus arboreus** P. B. (Moraceae), vielleicht auch das Sinnbild der Vereinigung, der Sammelfrucht entnommen.

d) nach sonstigen Bäumen.

21. Akak von *akăk* = **Leptonychia tessmannii** Engl., Sterculiacee, der Friedensbaum, die Friedenslinde.
22. Makak ebenso, Mehrzahl.
23. Nkomakak oder Nkolemakak von *nkō[l]* = Hügel, d. h. Hügel von **Leptonychia**-Bäumen *(makak)*.
24. Abang (Abanga) von *abă̧ṅ* = **Ficus**art, zur Rindenzeugherstellung beliebt.
25. Mabang (Mabanga), ebenso, Mehrzahl.
26. Akam von *akăm* = große **Ficus**arten, z. B. **F. preussii** Warb. und **laurentii** Warb., auffallende Bäume und zur Zeugherstellung benutzt.
27. Ajo, Jusch (Ajusch) von *ayŭ̧ś* = **Triplochiton tessmannii,** zur Herstellung von Hausrinde beliebt.
28. Majo (Majusch), ebenso, Mehrzahl.
29. Nkolemajo = Nkolajo von *nko[l]* = Hügel von **Triplochiton.**
30. Owöng von *ovŏ̧ṅ* = **Copaifera tessmannii** Harms, berühmter Geisterbaum, größter Baum des Fanggebietes.
31. Awöngabai, zwei **Copaifera** (*abai* = zwei).
31a. Ndschiowöng von *ndzę̆ṅ* = Brücke, Brücke von **Copaifera.**
32. Elun von *elŭ̧n* = **Erythrophloeum guineense** Don. (Leguminosae). Auffallend durch seine rote Rinde, Giftbaum.
33. Belun, Mehrzahl.
34. Ejen (Elibengang) von *eję̆n, elə̆bengăṅ* = **Distemonanthus benthamianus** Baill., auffallend durch schöne, lilarote Rinde, Medizinbaum.
35. Andung von *andŭ̧ṅ* = **Croton welwitschianus** Muell. Arg. (Euphorbiac.), schön wegen der silberglänzenden Blätter.
36. Akom von *akŏ̧m* = **Terminalia superba** Engl. u. Diels.

37. Makom (Makomo), ebenso, Mehrzahl.
38. Nkoakom von *nkok* = niedergefallener Stamm, d. h. der **Terminalia.**
39. Engo von *engō̆*, nicht bestimmbarer Baum.
40. Akoga von *akūga* = **Lophira alata** Banks, schöne, duftende Blüten.
41. Makoga, ebenso, Mehrzahl.
42. Assam von *asū̆m* = **Uapaca guineensis** Muell. Arg., reicher, duftender Blütenschmuck.
43. Massam (Massama), ebenso, Mehrzahl.
44. Angok von *angō̆k* = **Albizzia brownei** Oliv., schöner Baum.
45. Dum von *du,m* = **Ceiba pentandra** (L.) Gärtn.
46. Medschimitum von *medźī* = Wurzeln, *tūm* = **Piptadenia africana** Hook. f.
47. Asseng oder Assöng von *asō̆ṅ* = Schirmbaum, **Musanga smithii** R. Br.
48. Massöng, ebenso, Mehrzahl.
49. Nkoassöng von *nkok* = niedergefallener Stamm vom Schirmbaum.

e) nach landschaftlichen Merkmalen.

50. Ngbai von *ngbā,ī* = entblätterter lebender Baum (Winterzustand).
51. Mekumu von *nkū,m I* trockener, aufrechtstehender Baumstamm ohne Krone.
52. Ndangöng von *ndängō̆ṅ* = Lichtung.
53. Ewüöle von *eṛūō̆le* = Lichtung.
54. Nko von *nkō* = Hügel.
55. Anko = am Hügel.
56. Akok von *akūk* = Stein, Fels.
57. Makok, ebenso, Mehrzahl.
58. Maschok von *maśōk* = Wasserschnellen, Fälle.

f) nach Tieren bzw. Teilen von ihnen.

59. Schok von *źō̆k* = Elefant.
60. Mbang und 61. Mbangschok von *mbā,ṅ* = Elfenbein, *źō̆k* vom Elefanten.
62. Mboleschok von *ebō[l]* verdorben, d. i. verdorbener Elefant.
63. Akuleschok von *aku[l]* = Füße von Tieren, Füße des Elefanten.
64. Nnoschok = Nloschok von *niō̆, nnō̆* = Kopf, Kopf des Elefanten.
65. Abumeschok von *abū̆m* = Bauch, Bauch des Elefanten, weil sie die Pflanzungen des Dorfes aufgefressen hatten.
66. Bindeme von *indē̆m V* = fliegender Hund.
67. Böngomo von *ongō̆mo III* = Schimpanse.
68. Akulangomo von *akū[l]* = Füße, Klauen des Schimpansen.
69. Ebóloua [1]) von *ebō[l]-o-wōá* = Verdorbenes vom Schimpansen, verdorbener Schimpanse.
70. Akuasö von *akūa* = Lager von Tieren, *zō̆* = Leopard,
71. Olamesö von *olām* = Falle, Zugfalle, *zō̆* Leopard.
72. Ewes von *eṛē̆s* = Knochen.

---

[1]) Die amtliche Schreibweise ist Ebolowa. Um indessen folgerichtig zu bleiben, schreibe ich Ebóloua, da ich durch w in deutscher Schreibung nur Lippenlaute wiedergebe.

73. Bojabúnkulu von *boyá* = Weibchen, Mehrzahl, *bo* = von, *(n)kü[l]ü* = Schildkröten, also Schildkrötenweibchen.
74. Bebass von *ebä,s* = Schuppe, die Leute essen wohl viele Fische.

g) nach Gegenständen.

75. Ntum von *ntúm* = Spazierstock.
76. Ebai von *ebai* = Raphiablattstielstreifen, zum Hausbau benutzt.
77. Bebai, ebenso, Mehrzahl.
78. Ngam von *ngäm* = Widerhaken am Speer.
79. Bebada von *ebä'da* = Tragkörbchen der Männer.

h) nach Erlebnissen oder Eigenschaften der Ortsbewohner.

80. Bissis von *isī,s V* = Schattendarsteller im Mondkult.
81. Elanga von *elä'ń* eigentlich = After, übertragen = schlechte Leute.
82. Ekekö von *a ke ekękö,* = gänzlich ausbleiben, weil die Fremden abgefangen und getötet wurden, so daß sie nicht wieder zurückkamen.
83. Esamedulu von *a zámädüḷü* = Schande treiben, d. h. mit einer Frau aus derselben Familie geschlechtlich verkehren.
84. Nssälang von *nsę́ń* = Dorfplatz, *elä'ń* (siehe unter 81), die Leute trieben auf dem Dorfplatze Schlechtigkeiten, Feindseligkeiten, wenn ein Fremder durchkam.
85. Biänemajong von *a bę̄ne, bię̄,ne* = sich nicht vor jemand fürchten, d. h. keine Rücksicht üben, *mayöń* = Familien, die Leute üben gegen Angehörige anderer Familien keine Rücksicht.
86. Ajaofun von *a ńá* oder *njá* = sich nähren, *fä'n* = Mais.
87. Akinebetom von *a kine* = zusammenlaufen, herbeilaufen, *etöm* = Streit, die Leute laufen zusammen, um Streit zu machen.
88. Olunemang von *olä'n* = Unwille, Ärger, *mąń* = Küste, die Leute waren über die Bewohner der Küste — vielleicht Weiße — unwillig gewesen, oder aber auch wegen der Entfernung.
89. Ngba von *ngbä'* = ruhige, friedliche Leute (Gegensatz zu 82).
90. Massambe von *a sä,mä tä'n* = mit dem Netz fischen.
91. Nschugebot von *nźuge* = viel durcheinanderreden, *böl* = Leute, es sind viele Leute, die dort reden.
92. Euuma von *a wä'mąn* = einen Rückfall in einer Krankheit haben.
93. Awomo von *a ṷö'mö* = in Ohnmacht fallen, dieser Name spielt wie der vorige auf die Verwicklungen dieser Grenzdörfer zwischen Ntum und Bulu an.
94. Nnoajong von *nnö'* = das Haupt, *ayöń* = Familie, also die „Hauptvertreter" der Sippe.
95. Ajene von *a yę̄n* = sehen, auf die Berge, die vom Dorf aus sichtbar sind, bezogen: „Montevideo".
96. Ntedenga von *ntěl* = hundert, *ngá* = Gewehr; hundert, also unendlich viele Gewehre.

97. Makunanam oder Makonanam von *akün* = Pfahl, Pfeiler, *nnäm* = die Ortschaft, d. h. eine Ortschaft, die so fest steht, wie ein Pfeiler.
98. Ndschiabot von *ndźǵi,* = Brücke, *böl* = Leute, d. h. Brücke für Menschen.
99. Ejamang von *a yäk* = über Nacht bleiben, *a mạń* = auf dem Wege zur Küste, also eins der wenigen verkehrs- und fortschrittsfreundlichen Dörfer, sogar:
100. Ajaamentangan von *a yäk* = rasten, *mentaṅgan* = Weiße.
101. Akunekiä von *akü,n* = Pfahl, Pfeiler, Pflock, *ekiǵi* von Eisen (vgl. 98).
102. Ebualebambe von *a büeḷe* = zerbrochen sein, *mbä,mạ̄ III* = großes Dorf, die Häuser waren äußerst baufällig.
103. Niemajong von *a nɪ,ḗ* = hineinlegen, *mayöń* = Familienverband, d. h. das Dorf war zwischen Dörfern anderer Sippen angelegt.
104. Ndschobangon von *dźọb* = Himmel, *ngạ̄n* = Mond, also Mondhimmel.
105. Olöadzob von *olȫɪ,* = Loch, *dźọb* = Himmel, Loch am Himmel (wohl zwischen den Wolken).

Abb. 16. Plan eines Dorfes der Ortschaft Nsälang (Fam. Essauong) Fang. Aufgenommen 1908.

Außer den Ortsnamen kennt der Pangwe noch Flurnamen, so z. B. in der Umgebung der Ortschaft Alén (Essauong) folgende: *enumepfidi* = Pulverpfad, *nsa[k]-abea* = Abeasumpfwald. Eigene Bezeichnungen für Berge gibt es nur wenige, z. B. Nememböng = gutes Herz (siehe Karte); meist ist der Name von Bergen und Gebirgen dem der umliegenden Ortschaften entlehnt. Flußnamen lassen sich nach Angabe der heutigen Einwohner zum größten Teil nicht mehr erklären, weil sie, wie zum Teil auch die Ortsnamen, von den früheren Bewohnern des Landes übernommen seien.

Wie im vorigen Abschnitt erwähnt, werden die Dörfer längs der Wege angelegt, und zwar immer in der Richtung von Ost nach West (vgl. Abb. 16).

Merkwürdigerweise gaben die Leute als Grund hierfür an, daß das Land nach Westen (zum Meere hin) abfiele, und das Regenwasser dahin ablaufen könne. Natürlich spielt dieser Punkt insofern eine große Rolle, als man sich hütet, das Dorf derart anzulegen, daß das Regenwasser eine der Hüttenreihen überschwemmt, indessen kann das nicht der einzige Grund sein; ich habe auch auf vollkommen ebenem Boden, der einen Wasserablauf in gedachter Richtung nicht begünstigt, die Ost-Westrichtung als die bevorzugte festgestellt. Wenn z. B. ein Weg nach Süden führt, so biegt er vor dem Dorfe um, läuft in ihm von Ost nach West und nimmt am anderen Ende die alte Südrichtung wieder auf (vgl. Abb. 16, Weg Nssälang I-Beniaa). Offenbar spielen hier noch andere Gründe mit, so der allgemeine Zug nach Westen, von dem schon im vorigen Abschnitt die Rede war[1]).

Das Pangwedorf besteht meist aus zwei gleichlaufenden Häuserreihen, die den Weg zwischen sich lassen (Tafel IV und Abb. 16), selten aus einer einzigen an der Straße liegenden Reihe, ist aus dem Zusammenschluß zweier oder mehrerer Einzelansiedlungen entstanden und zeigt hiernach verschiedene Entwicklungszustände, die wir überall im Gebiete nebeneinander beobachten können.

Will ein Familienvater eine Ansiedlung gründen, so baut er zwei Häuser, ein Wohnhaus und ein Versammlungshaus. Das Wohnhaus ist das eigentliche Reich der Frau, in dem sie mit ihren Kindern lebt und schafft, und in dem sich der Mann eigentlich nur nachts, am Tage nur gelegentlich aufhält. Das Versammlungshaus ist umgekehrt der gewöhnliche Aufenthaltsort des Mannes, in dem er sich tagsüber beschäftigt, seine Nebenarbeiten verrichtet, Besuche empfängt, und in das die Frau nur hin und wieder kommt. Werden die Kinder größer, so baut der Vater jedem ein eigenes Haus anschließend an das ursprüngliche erste Wohnhaus, ebenso bekommt jede seiner weiteren Frauen ihr eigenes Haus. Die erste Frau bleibt jedoch seine Lieblingsfrau, und infolgedessen ihr Haus, das ist das erste, das er gebaut, und das neben dem Versammlungshause liegt, sein Heim, das er auch nach dem Tode der Frau behält.

Der nächste Schritt der Entwicklung zum Dorfe wird dadurch getan, daß aus irgendwelchen Gründen ein zweiter Familienvater seine Siedlung an die des ersten anschließt. Das geschieht z. B., wenn ein Angehöriger des gleichen oder eines anderen Familienverbandes zuwandert, oder wenn nach dem Tode des Vaters der älteste Sohn dessen Versammlungshaus, Wohnhäuser und Frauen erbt, der jüngere Sohn sich aber nicht seinem älteren Bruder und nunmehrigen Häuptlinge unterordnen will. Er bzw. der neue Ankömmling baut sich für seine Familie in derselben Flucht die nötige Anzahl Häuser, zum Teil sogar in un-

---

[1]) Vgl. auch die meist ostwestliche Richtung der Gräber.

1: Tessmann FH9 Fang

[facing p. 56]

DORF MAKONANÁM (FAM. OJEK), SPAN GUINEA

Verlegt und gedruckt bei Ernst Wasmuth A.-G., Berlin.

Abb. 17. Pangwedorf, Span. Guinea.

mittelbarem Anschluß an die bestehenden, und schließt seine Siedlung ebenfalls durch ein am Ende aus der Reihe herausgerücktes Versammlungshaus ab, das, wenn es ein vorläufiges ist, längs (vgl. Abb. 16), wenn es ein dauerndes ist, quer gestellt wird (vgl. Tafel IV).

Dadurch ist aus der bisherigen Einzelsiedlung ein „Dorf" geworden, das deshalb, weil es wie das Augenpaar *(dʌ́ʒ̣*, Mehrzahl *mʒ̣)* aus zwei Hälften besteht (Abb. 18), „*dʌ́ʌ́*, Mehrzahl *mʌ́*" heißt (vgl. das über die Bedeutung der Vorsilben Gesagte). Es gibt also zwei Familienväter in jedem Dorfe, deren Häuserreihen in der Mitte irgendwo zusammenstoßen, eine Grenzlinie, die natürlich nur Eingeweihten erkennbar ist. Was aber jeder sieht, sind die zwei in der Flucht des Dorfplatzes jederseits liegenden Versammlungshäuser, die eben den beiden Familienvätern gehören.

Diese beiden stehen sich rechtlich gleich, nur verleihen dem einen bestimmte Verhältnisse, auf die in einem späteren Abschnitte zurückzukommen sein wird, ein gewisses Übergewicht. Unter Umständen tritt zu den zwei das Dorf bildenden Einzelsiedlungen noch eine dritte mit ebenso anschließenden Häuserreihen und ebenfalls einem Versammlungshause (vgl. Abb. 18).

Das Versammlungshaus ist, wie gesagt, der Hauptaufenthalt des Häuptlings, aber auch aller seiner Söhne, männlichen Verwandten und Anhänger, die ihm beim Bau helfen und ein dauerndes Benutzungsrecht darauf haben.

Abb. 18. Entstehung einer Dorfschaft aus Einzelsiedelungen.

Daher die Beziehungsvorsilbe *a* in *abǫ* = Versammlungshaus, daher wahrscheinlich auch der Januskopf, den ich an dem Pfeiler eines Versammlungshauses sah (vgl. Abb. 19). Den Stamm des Wortes *a-bǫ* führe ich zurück auf *ba* = teilen, verteilen[1]) und glaube, daß es ursprünglich den Platz bezeichnen soll, auf dem das erlegte Wild verteilt wurde. Das Versammlungshaus ist jetzt der Ort, an dem sich alle öffentlichen Vorgänge, vom Verteilen von Fleisch an bis zu Gerichtsverhandlungen, gemeinsamen Beratungen und Fremdenempfängen abspielen.

Das bei der Siedlungsgründung errichtete Versammlungshaus behält zuweilen dauernd den Charakter des vorläufigen, es bleibt unvollendet, weil die Leute zu faul sind — jeder meint, der andere solle zuerst anfangen —, und der Häuptling keine Macht hat, seine Leute dazu zu zwingen. So stellte einmal der Häuptling des Dorfes Nssälang, von dessen vorläufigen Versammlungshäusern Abb. 23 eines zeigt, an mich das Ansinnen — das ich natürlich dankend abgelehnt habe —, ich sollte seine Leute zwangsweise dazu bringen bzw. ihm meine Leute zur Verfügung stellen, ihm ein neues Versammlungshaus zu bauen, denn dann würden alle Leute sagen: „Ja, dieser Häuptling des Weißen ist ein ganzer Kerl, man sieht doch gleich, daß hier ein Weißer bei seinem Dorfe wohnt." Wenn es hoch kommt, bringen die Leute ihm einige Dachmatten zu dem Bau und glauben so ihre Pflichten gegen das gemeinschaftliche Werk erfüllt zu haben, die eigentliche Arbeit bleibt immer auf dem Häuptling sitzen. Sein Eigen wird das Haus aber dadurch nicht, es ist vielmehr in jedem Falle der gemeinsame Besitz der Männer, und wenn jener sagt: „Es ist m e i n Versammlungshaus", so tut ihnen das nicht weh. Der Pangwe meidet alles, was ihn in seiner gewohnten Ruhe und Bequemlichkeit stören könnte, scheut die Arbeit und läßt den Dingen ihren Lauf:

ǫ́ǫ́[k] e tśrdan ebɛ́ɛ,-asgi, a ɣe oa aiɛ́i, a ni
Elefant, er fortscheuchte (von) Grube-Eisenstein, er gab dir Armut, er nahm

oa adśɛ,i
dir Schwere,

[1]) Derselbe Stamm in dem Zahlwort zwei *(bai)*, das ja gefunden ist durch Teilen e i n e s Gegenstandes.

Das heißt: Der Elefant, welcher dich von einer Eisensteingrube fortscheuchte, machte dich zwar arm, aber er nahm dir eine Last ab (nämlich das Eisen zuzubereiten).

In einigen Fällen hatte man bei der Herrichtung des Baugrundes an der üblichen Stelle Schwierigkeiten (Baumstümpfe, Wurzeln und dergl.) und legte das Versammlungshaus seitlich in die Reihe der Häuser, freilich in der Querstellung (vgl. Abb. 44). „Man" kam dann öfter nicht dazu, dieses später durch ein neues an der richtigen Stelle zu ersetzen, mochte der Häuptling es wegen der Leute auch noch so sehr wünschen. Wo es doch geschah, pflegte man das alte nicht gleich abzubrechen, sondern mit dem neuen zusammen noch weiter zu benutzen.

Abb. 19. Pfeiler aus einem Versammlungshaus in Malés (Fam. Essamong) Fang.

Das Versammlungshaus (Abb. 20, 21) ist seiner Form nach ein Giebeldachhaus mit quadratischem oder rechteckigem Grundriß. Der erwähnte Brauch, sich bei neuen Siedlungen mit flüchtigen, vorläufigen Versammlungshäusern *(ongôn e ngɨ)* zu begnügen, denen erst später, wenn das wirtschaftliche Leben einen gewissen Beharrungszustand erreicht hat, die endgültigen *(tsɨnand III)* folgen — oder auch nicht folgen, bedingt im übrigen Formenverschiedenheiten, die zugleich ein Bild ihrer Entwicklung geben. Die einfachsten Häuser (vgl. Abb. 110) sind im Grunde nur Schutzdächer: ein Firstbalken ist über zwei, zuweilen drei oben gabelig auslaufende Pfeiler *(akûn)* von etwa 2 m Höhe gelegt, die tief in den durch Roden zubereiteten, dann geebneten und geglätteten Boden gestoßen werden. Über den Firstbalken sind in kürzeren oder längeren Abständen als Dachsparren in der Mitte geknickte Raphiastengel gelegt (vgl. Abb. 24 f.). Sie liegen mit dem unteren Ende direkt — ohne Unterlage — dem Boden auf. Das Sparrenwerk wird mit Matten aus Raphiablattfiedern gedeckt. Diese Matten *(ɛ́ɛ́gi)*, (Abb. 22), werden derart zubereitet, daß mehrere Stöcke in den Boden gesteckt, an ihnen zwei lange Raphiastengelstäbe *(a)* quer angebunden werden, und hierüber eine in der Mitte umgebrochene Fieder gelegt wird *(b)*, die man unterhalb der Querstäbe durch je ein Stück Raphiablattstielrinde zusammenheftet. Eine zweite Fieder *(c)* wird bis an die Mittelrippe über die erste gelegt und nun in derselben Weise an diese geheftet. Darauf folgt die dritte und so fort, bis die gewünschte Länge von mehreren Metern erreicht ist. Die Matten werden dachziegelartig übereinander an den Sparren befestigt.

Abb. 23. Versammlungshaus in Olonga (Fam Ewodengbuak).

Eine zweite Form des Versammlungshauses (Abb. 23) ist aus der beschriebenen dadurch entstanden, daß das Verfaulen der Sparrenenden auf dem feuchten Boden sowie häufige Besuche von allerlei unliebsamen Kriechtieren es notwendig machten, die Sparren durch Unterschieben von Balken zu lüften. Diese Balken sind entweder unbehauene Stämme und Knüppel oder längshalbierte Hölzer, die dann mit ihrer Schnittfläche meist nach außen gekehrt liegen und zwischen mehreren Paaren von senkrecht in den Boden gesteckten Pfosten übereinandergeschichtet werden. Dem obersten liegt das Dach lose auf. Damit ist der erste Ansatz zu einer Hauswand gegeben. Außer den genannten Beweggründen war noch der Gedanke bestimmend, bei einem plötzlichen Angriffe hinter den Schutzwänden vor feindlichen Speerwürfen besser gesichert zu sein, als unter den einfachen Schrägdächern.

Bei den endgültigen besseren Versammlungshäusern erfahren Wand und Dach eine sorgfältigere Ausbildung. Der Hauptunterschied ist jedoch der, daß sie niemals mit dem Giebel auf den Dorfplatz schauen wie jene, sondern mit der Langseite, entsprechend tritt man durch diese ins Haus.

Zuerst wird, wie überall, das Gerüst aufgestellt, eine Arbeit, die in verhältnismäßig kurzer Zeit geschehen ist. Es entspricht in allen seinen Teilen dem des vorläufigen Versammlungshauses, nur ist es größer und weitläufiger (Abb. 24). Auf den in die Längsachse gestellten Hauptpfeilern *(dbém)* a, von

Abb. 21. Versammlungshaus eines Ntumdorfes in Neu-Kamerun.

denen je nach der Größe des Versammlungshauses zwei bis fünf vorhanden sind, ruht der Firstbalken *(mbǔn I)* b. Das Gerippe der Vorder- und Rückwand besteht aus einer Reihe von Wandpfosten *(mɛ̄, IV)* c, die oben zugespitzt werden. Über die Spitzen wird als Gesimsbalken *(mʃǒ, I)* e ein längshalbierter Raphiastengel gelegt und durch Schlag oder Zug festgedrückt. Über den First kommen dann die Dachsparren f, wie vorher beschrieben, wobei man sie ein Stück über den Gesimsbalken vorstehen läßt. Die beiden äußersten Sparren ruhen auf den Pfosten, die das Gerüst der Seitenwand bilden *(mɛ̄, esá)* d. Darauf beginnt man mit dem Eindecken (Abb. 26), das mehr Mühe erfordert als das Gerüst und weit sorgsamer ausgeführt ist als bei den vorläufigen Versammlungshäusern. Zuerst werden die Dachsparren *(ntǔgn I)* f durch eine in der Firstlinie quer über sie hinweggelegte und mit dem Dachbalken verschnürte Leiste aus Raphia *(obʃbʃ)* g festgeklemmt. Ähnlich wird ein Verschieben der Sparren an den unteren Enden durch zwei auf der Ober- und Unterseite über sie hinweglaufende Leisten verhindert. Eine abweichende Bauart sah ich bei Versammlungshäusern der Fang im Gebiete des Komo (Abb. 25). Hier war der Firstbalken an den freien Enden nicht gestützt, sondern mit Lianenstricken im Boden verankert und durch scharfes Anziehen der Stricke heruntergebogen.

Die Matten werden nun von oben, wo etwas unter dem First mit Matte k

(vgl. Abb. 26), begonnen wird, nach unten oder umgekehrt, von unten nach oben, dachziegelartig übereinandergelegt und entweder an jedem zweiten Dachsparren oder an eigenen Halttauen *(mbēgd-eźę,ı)* festgebunden, die vom First zu dem die Sparrenenden zwischen sich fassenden Raphiastreifen laufen; seltener legt man über die Sparren in der Längsrichtung Leisten und befestigt an ihnen die Matten. Zuletzt wird die Eindeckung des Firstes selbst vorgenommen. Dazu werden zwei Dachmatten *(obıt, elät-eźę,j)* h mit den oberen Kanten aneinandergenäht und als oberste Schicht über den First gelegt. Zum Schutz kommt darüber noch die eigentliche Firstmatte *(ngüm IV)* i, eine in der Mitte gebogene Matte, die mit Stiften aus Raphiastengelrinde l an die Doppelmatte geheftet wird.

Abb. 22. Stück einer Dachmatte, mit deren Herstellung eben begonnen worden ist.

Da, wo es Raphia nicht gibt, werden an Stelle der Sparren aus Raphia- solche aus Ölpalmblattstielen (so in Jaunde) oder aus Stämmchen,

Abb. 23. Kleines Dorf der Ortschaft Nsallang (Fam. Baduong) Spm. Gabun.

an Stelle von Matten die Blätter von **Sarcophrynium velutinum** (Bak.) K. Schum. *(okudikui)*, vgl. Tafel XI, und der Sumpfpalme, **Selerosperma mannii** Mann et Wendl. *(akōda)* verwendet, zum Verdecken von Lücken auch Bananenblätter. Dieser Mattenersatz ist wenig haltbar und mühevoll herzustellen, da man stets Dachlatten braucht, um die Blätter zu befestigen, und vom First zum Dachrand dicht an dicht Aframomumstengel legen muß, da die Blätter sich sonst ziehen oder abgeweht werden. Die Haltbarkeit eines mit Sumpfpalmenblättern gedeckten Daches ist so mäßig, daß es — wie die Leute angaben — nur ein Jahr tadellos bleibt, während sich ein Mattendach fünf Jahre hält, ehe Ausbesserungen nötig werden. Ein mit Sarcophryniumblättern belegtes Dach sieht außerdem sehr unschön aus, besonders von innen, wo die in der Nähe der Spreite abgeschnittenen Blattstiele ins Haus hineinragen.

Abb. 24. Gerüst eines Hauses.
Fig. 1 von oben, Fig. 2 von vorne, Fig. 3 von der Seite.

Ist das Haus unter Dach gebracht, so geht es an die Seitenwände. Als Material nimmt man die Rinden bestimmter Bäume, deren Namen bei den Rindenarbeiten (Abschnitt VIII S. 205) aufgeführt sind, Sumpfpalmen- und Sarcophryniumblätter, beide mehr für die Giebelwände, sowie schließlich Raphiamarkstreifen und Matten, diese aber wegen ihrer vielen kleinen Stacheln nur ungern.

Die 1—2 m langen, ungefähr ½ m breiten Rindenstücke werden in folgender Weise am Gerüst angebracht: Auf der Innenseite der Wandpfosten werden

Abb. 25. Gerüst eines Versammlungshauses der Fang aus dem Gebiete des Komo (Dorf Omvan, Fr. Kongo). Längsdurchschnitt.

in gewissen Abständen Längsstreifen aus Raphiablattstielen *(ebai)* als Latten befestigt, und an sie die Rindenstücke mittelst Raphiastreifen festgedrückt, die genau den Latten entsprechend verlaufen. Die Pfosten stehen also meistens außerhalb des Hauses, nur sehr selten auch innen. Zusammengehalten werden Rindenstücke und Raphiastreifen durch Bänder aus **Oncocalamus** *(nlon̄ I* = Oncocalamus und Band)[1]), vgl. Tafel XVI, und von zwei Leuten gleichzeitig in der Weise verfertigt, daß der eine drinnen, der andere draußen hockt, und nun dieser das von jenem durchgesteckte Band wieder nach innen zurückführt usw. Zum Durchbohren der Rindenstücke bedient man sich eines Pfriemens *(nson̄ I)*. Wie bei uns die Nägel in einer Linie untereinander eingeschlagen werden, so müssen auch bei den Pangwe die Heftstellen der verschiedenen Längsstreifen genau in einer Linie liegen (vgl. Abb. 35). Bei Raphiamatten pflegt man wegen der erwähnten kleinen Stacheln — übrigens oft auch bei Rindenstücken — die Latten so dicht übereinander zu legen, daß von den Matten nur wenig oder gar nichts zu sehen bleibt (wie in Abb. 33). In gleicher Weise wie die Rinden werden die Raphiamarkstücke zwischen Latten festgehalten, indem man von oben nach unten Markstreifen nebeneinander stellt und nur in größeren Abständen mit den Latten verschnürt.

Die Behandlung der Wände ist mit Ausnahme der stets ganz geschlossenen Giebelwände eine sehr verschiedene; die nie fehlende Rückwand ist meist mit einigen Fensteröffnungen versehen, einer mittleren, in Form eines Quadrates oder Rechtecks, und je einer seitlichen, in Form einer horizontalen Längs-

Abb. 26. Querschnitt durch den First eines Hauses.

[1]) Die Jaunde kaufen dieses „Buschtau" von Elandi, wo es für das Jaundegebiet allein noch Buschtau gibt, sonst verwenden sie statt dessen **Dipteropeltis poranoides** Hallier f. *(atŭ[k]e ndźik)*.

spalte. Die mittlere Öffnung wird meist zugleich als Fenster und Tür benutzt, ist aber so klein, daß man sich nur mit einiger Geschicklichkeit hindurchzwängen kann. Es gibt an dieser Stelle jedoch auch Türen in unserem Sinne, die bis zur Erde reichen, und zwar mit oder ohne Schwellen.

Die Vorderwand gleicht entweder genau der Hinterwand, ist also bis auf seitliche und mittlere Fensteröffnungen geschlossen, oder sie ist nur bis zur halben Höhe aufgeführt oder ist nichts anderes als eine Brüstung bzw. ein Geländer aus Raphiastengeln, oder sie fehlt auf der einen Seite oder schließlich ganz.

Das Dach läßt man vorn gern so weit vorspringen, daß eine

Abb. 27a. Fig. 1. Grundriß eines Versammlungshauses in Majo (Fam. Schumu).
a Hauptpfeiler, *b* Feiltrommel, *c* Schleifstein, *d* Feuerstellen.
Fig. 2. Seitenansicht.

Abb. 27b. Fig. 1. Grundriß eines Versammlungshauses in Mbá (Fam. Essákunan).
a Hauptpfeiler, *b* Schmiedegrube, *c* Blasebalg, *d* Steilnetz für Wild (*c* und *d* hängend), *e* Amboß (Stein), *f* Feuerstellen, *g* Sitz (Baumstumpf), *h* Holztrommel. — Fig. 2. Seitenansicht.

gedeckte Veranda entsteht, und stützt es durch einige Pfeiler *(omṝmṝ,)*; vorn oder an den Seiten schließt man den Vorraum mitunter durch eine Brüstung oder ein Geländer ab. Ein Holzbalken als Schwelle hindert den vom Dach abtropfenden Regen daran, ins Haus einzudringen [1]).

Das Innere (Tafel V, Abb. 27 a und 27 b) bildet einen einzigen leeren Raum, der nur von den freistehenden Pfeilern (mittleren Trägern des Firstbalkens) unterbrochen wird. Vereinzelt sah ich diese schön geschnitzt, aber nur dann, wenn das Haus bloß einen Mittelpfeiler besaß. Die Schnitzerei zeigte stilisierte oder abgewandelte menschliche Figuren (Abb. 19) und recht naturgetreue Darstellungen von Tieren; so erinnere ich mich eines sehr schönen Pfeilers mit einem Schwein, das einen Leoparden in den Schwanz beißt, aus dem Dorfe Bingomo (Fam. Abái).

An den Wänden stehen niedere Ruhebänke, von denen ich zwei Formen gesehen habe. Die einfachsten und deshalb mehr für vorläufige Versammlungshäuser berechneten bestehen aus längshalbierten Stämmchen des Schirmbaumes (**Musanga**) oder Raphiastengeln, die einfach über zwei Querrollen aus demselben Holz gelegt sind *(kŭdŭ III)*. Sie finden sich dauernd auch dort, wo man keine Raphia hat, und ferner in Unterkunftshütten für Gäste. Die zweite Form (vgl. Abb. 28—29) ist ein rechteckiges Gestell aus längshalbierten Raphiastengeln *(enöṅ)*; die Schmalseite besteht aus je zwei Füßen *(a = akökŋ̄ök)* mit spitzen Zapfen *(c = mbĕn -ak. I* F. *ojĕn* J.*)*, auf die zu unterst eine Holzleiste, dann drei Raphiastengel übereinander gesteckt sind. Die Holzleiste (b = *ojĕmĕja-enöṅ)* ist bis auf die Enden zur Aufnahme von neun oder mehr hineingeschobenen Stengeln e ausgeschnitten, die den Boden des Gestelles zusammensetzen; die drei Raphiastengel (d = *kŭdŭ -enöṅ III)* dienen zum Festhalten der letzteren und als Nacken- und Fußstütze. Mitunter kommt auch eine Rückenlehne (f = *ajĕgebĕ -enöṅ)* vor, ein Raphiastengel, längshalbiert, der einfach auf die verlängerten Zapfen der hinteren Füße aufgesetzt wird.

In einigen Versammlungshäusern laufen die vorderen Füße nach oben in einen halbrunden Fortsatz aus, der die Schmalseiten der Nackenstützen verdeckt und auf der Außenfläche entweder zu einem Gesicht ausgeschnitzt oder zu rot und weiß bemalten Zierflächen eingeschnitten ist (Abb. 29).

Abb. 28. Seitenwand einer Ruhebank.

[1]) Nach Fertigstellung des Hauses pflegt man im Innern die Erde feucht zu machen und dann einige Tage Bananenblätter darauf zu legen, damit, wie man sagt, die Erde „stark" würde.

FH9 Fang

INNERES DES VERSAMMLUNGSHAUSES VON OLANGA
(FAM. ESSÁNGBUAK), NTUMGEBIET.

[facing p. 66]

Verlegt und gedruckt bei Ernst Wasmuth A.-G., Berlin.

Nächst den Ruhebänken sind das wichtigste Ausstattungsstück des Versammlungshauses einige Holzscheite, die zu einer Feuerstelle zusammengelegt werden (vgl. Abb. 27). Tagsüber brennt das Feuer stets, und während der Nacht werden die Scheite kunstgerecht so zusammengelegt, daß es sich oft bis zum anderen Morgen hält. Die Bedeutung des belebenden Feuers in den Tropen ist wichtiger, als man glauben sollte, denn es schützt nicht nur vor der oft empfindlichen Morgenkühle und erwärmt den Raum bei regnerischem kalten Wetter, sondern ist auch das einzige Schutzmittel gegen die überaus lästigen Sandfliegen, Culicoides *(afige)*, ganz kleine, kaum erkennbare Insekten, deren Stich ein unangenehmes Jucken, wie etwa von Brennesseln, verursacht.

Fig. 1. Fig. 2.
Abb. 29. Bemalter Sockel einer Ruhebank in einem Versammlungshaus. Fanggebiet.
Fig. 1. von vorne, Fig. 2 von der Seite.

Dem Sachenbestande des Versammlungshauses kann man sonst nur noch Trommeln (Holz- und Felltrommeln), einen Schleifstein und — am Dache aufgehängt — das große Tiernetz zurechnen, das die Einwohnerschaft gemeinsam auf Treibjagden benutzt; in einigen Fällen fand ich Gewehrhalter *(ekob e nga)*, Abb. 30, die in derselben Weise wie bei uns Kleiderhaken an der Wand angebracht werden. Man legt die Gewehre darauf, um sie bei einem plötzlichen Angriff bei der Hand zu haben. Eine zweite gleichfalls nicht häufige Form (Abb. 31) besteht aus einem unten zugespitzten, oben mit einem Ausschnitt versehenen Brett. Dieser Gewehrhalter *(e[a[k]-e-nga)*. wird vor dem Versammlungshause in die Erde gesteckt Man stellt die Flinte mit dem Kolben auf den Boden und steckt den Lauf in den Ausschnitt des Brettes.

Abb. 30. Gewehrhalter. Engugumo, Fang.

Häufig sieht man Schädel von erlegten Tieren als Jagdtrophäen beim Versammlungshause aufbewahrt; entweder sind sie mit Stäben unter die Dachmatten gesteckt oder sie liegen auf dem Dache umher; nur große Schädel, z. B. von Elefanten, werden auch vor dem Hause aufgestellt.

In vielen Versammlungshäusern sieht man ferner

eine Schmiedegrube (Abb. 27 b, Fig. 1 b) und Gebrauchsgegenstände des Schmiedes, nämlich einen am Dach aufgehängten Blasebalg (Abb. 27 b, Fig. 1 c) und den Schmiedestein (Abb. 27 b, Fig. 1 e), der zugleich als Schleifstein benutzt wird, zuweilen wohl auch einen Feuerfächer *(erum e nduan)*, Abb. 32. Zuletzt ist auch die berühmte Tabakpfeife aus Bananenblattstiel zu nennen, die über zwei in die Wand gesteckte Haken gelegt wird.

Abb. 31. Gewehrständer. Owöng (Fam. Essandöng) Fang.

Selbstverständlich liegt auch noch allerhand Gerümpel im Hause umher, halbfertige Körbe, Fischreusen, Werkzeuge, Abfall vom Essen usw., kaum geeignet, das Bild freundlicher zu gestalten.

Sehr selten sind die Versammlungshäuser mit einigen Zierrinden außen (Abb. 33) oder innen geschmückt; häufiger dagegen sind die Rindenwände, besonders der Giebelseiten, innen zwischen den Raphialatten mit Kohlezeichnungen bedeckt, doch kann ich hier nicht genauer auf diese Kunstleistungen eingehen (vgl. Abschnitt IX: Bildende Kunst).

Abb. 32. Feuerfächer.

Wären nicht die Menschen da, die mit ihren Handwerken und Tätigkeiten das Haus belebten, gäbe nicht das auf- und niederflackernde Feuer den großen, halbdunklen Räumen eine besondere, fast geheimnisvolle Eigenart — es wäre zu trostlos; gerade hier merkt man, daß überall nur das pulsierende Leben, der Mensch in traurigen und in fröhlichen Stunden uns anziehen kann, nicht das Material. Wie anders wirkt derselbe Raum, den wir eben noch mit einem abfälligen Blick abgetan haben, wenn des Abends sich die Männer und jungen

Abb. 33. Versammlungshaus in Nschüggebot (Fam. Ojek), Span. Guinea, mit Zierplatten aus Rinde.

Leute einer nach dem andern einfinden, um zu hören, was der alte, buckelige Njema-Ndongo von den unheimlich-anheimelnden Gestalten der Märchenwelt erzählt; unermüdlich lauschen sie, mag er noch so lange sein Garn spinnen, regungslos blicken sie auf ihn, wie er rastlos sich über dem Feuer die Hände reibt, den Finger drohend hin und her bewegt, die Holzscheite auseinanderlegt oder beiseite stößt, wenn es ihm zu heiß wird, und den Rauch von seinem Gesicht abwehrt, wie man ein kleines Kind sanft, aber entschieden von sich fortschickt! Es sieht aus, als spräche er mit dem Feuer und hielte den Holzscheiten eine Rede. Alles lauscht still, alles hängt an seinem Munde. Und nun eine Kunstpause: Dann hebt er mit eindrucksvoller Tonmalerei von neuem an, und bei bekannten Stellen fallen alle Zuhörer mit einem kurzen Chorgesang ein, der auf das Solo des Alten antwortet. Oder es gibt eine Klatschgeschichte zu erzählen, und hinüber und herüber fallen scharfe Worte, wobei ungezwungene Heiterkeit herrscht. Ein andermal lockt ein Vortrag des berühmten Xylophonkünstlers, an dessen Vorführungen das ganze Dorf, Weiber und Kinder eingeschlossen, teilnimmt. Die letzteren klappen den Takt auf Holzstückchen mit, die ersteren klopfen würdevoll Erdnüsse und Ngon auf, die das „Honorar" darstellen, leise einen Kehrreim mitsummend und ab und zu einen vielsagenden Blick dem unermüdlichen Spieler zuwerfend.

Das Wohnhaus *(ndö*, Mehrzahl *mandö)*, Abb. 34, ist gleich dem Versammlungs-

Abb. 31. Wohnhaus in Makonanám (Fam. Ojek), Span. Guinea.

hause ein Giebeldachhaus mit rechteckigem Grundriß und tritt uns wie dieses in vorläufigen und endgültigen Formen entgegen. Erstere stehen innerhalb der Häuserreihe mit dem Giebel zum Dorfplatz, während die endgültigen ihm ihre Langseite zukehren. Ein weiterer Unterschied ist der, daß bei den vorläufigen Wohnhäusern die Tür in der Giebelseite liegt und die Längswände der Zeitersparnis halber nur etwa ½ m hoch aufgeführt, die Dächer dementsprechend weiter heruntergezogen werden und fast bis auf den Boden reichen. Die dadurch bedingte größere Steilheit des Daches ermöglicht ein rascheres Abfließen des Regenwassers und so eine Ersparnis an Material, da man die Matten nicht so dicht übereinander zu legen braucht.

Bei den endgültigen Wohnhäusern sind stets alle vier Wände durchgeführt, Fenster fehlen. Eine Tür, deren Schwelle ½ m über dem Boden bleibt, und die darum wie ein Fenster wirkt, ist in der Mitte der Längswand angebracht, und zwar haben die meisten Häuser eine Tür sowohl in der Vorderwand als auch gegenüber in der Hinterwand, oft nicht breiter als unsere Fensterflügel. Die Konstruktion entspricht im großen und ganzen derjenigen des Versammlungshauses, nur beschränkt man oft die Zahl der Pfosten der Vorderwand auf vier, die dafür um so dicker genommen werden und durch ihre sorgfältige Bearbeitung auffallen. Hier wie dort nimmt man zu den Seitenwänden nicht Baumrinde, sondern Sumpfpalmen — seltener Sarcophryniumblätter oder Raphiamark-

Abb. 35. Türstück eines Wohnhauses in Olanga (Fam. Essángbuak), Süd-Kamerun.

streifen —, wenn man etwas auf geschmackvolles Äußeres gibt. Vor dem Hause schafft man mitunter einen gedeckten Vorraum, indem man das überstehende Dach an seinem freien Rande durch Pfeiler — wie beim Versammlungshause — stützt.

Das Stück der Vorderwand zwischen den mittleren beiden Pfosten, in dem die Türöffnung ausgeschnitten ist, wird vielfach recht sorgsam ausgearbeitet, mindestens sind einige kurze Raphialängsstreifen, zumal zwischen Erde und Türschwelle, eingeschoben (Abb. 35). Die Türschwelle *(mpfä,dega I)*[1]) besteht, wie auch oft der Türsturz, aus einem längshalbierten Raphiastengel, der an beiden Enden schwalbenschwanzförmig ausgeschnitten ist und so in die Türöffnung eingeklemmt wird, daß die Wände in den Ausschnitten zu liegen kommen. Ihm wird mitunter eine gefällige Form dadurch gegeben, daß man ihn gegen das Ende zu abflacht und recht hübsch mit Palmband umflicht. An den Seiten dagegen begnügt man sich mit einfachen Raphiastengelstreifen als Türfüllung.

Zu beiden Seiten der Türöffnung *(mbẹi I)* stehen innen je ein dicker oder einige dünnere Pfosten *(andẹi)* (vgl. Abb. 37 h, 38). Zwischen sie klemmt man einen oder auch zwei diagonal gestellte Stäbe, mit denen das als Tür dienende Stück Rinde *(eɣrn e nda, eɣrn e mbẹi* = Hausrinde oder Türrinde) festgehalten wird. Seltener sind Schiebetüren, die zwischen

[1]) Stamm *pfa (fa)* einengen, einklemmen.

Wand und je einer Latte oberhalb und unterhalb der Türöffnung laufen und tagsüber zur Seite, nachts vor die Öffnung geschoben werden. Die Türpfosten fehlen auch hier nicht, da sie hauptsächlich bezwecken, am Tage bei offener Tür dem Fremden das Hineinblicken in die Hütte zu verwehren. Die meisten Rindentüren schließen nur mangelhaft, da sie sich ziehen, oft besteht die „Tür" in nichts weiter als in einigen schmalen Rindenstücken, die von innen lose nebeneinander gegen die Öffnung gestellt werden und natürlich große Spalten zwischen sich lassen. Es liegt auf der Hand, daß sie von jedem plötzlichen Windstoß niedergeworfen werden, wohl auch von selbst umfallen, und ich bin dann oft über dieses ungewohnte klappende Geräusch aufgewacht oder von der kühlen Nachtluft und den Stichen der hineinschwärmenden Anophelesmücken unliebsam geweckt worden.

Abb. 36. Tür eines Wohnhauses in Alén (Fam. Essäuong). Aus Holz geschnitzt, mit Tonerde hellgrau gefärbt.

Türen aus Holz (Abb. 36) kommen hier und da vor und sind manchmal mit einfachen Schnitzmustern verziert; sie werden von innen gegen die Türöffnung gestellt oder festgeklemmt. Von den Faktoristen eingeführte, mittels Angeln aus Palmbändern eingehängte Brettertüren haben im allgemeinen erst wenig Anklang gefunden.

Ausführung und Zustand sind — genau wie bei den Versammlungshäusern — sehr verschieden. Manche Häuser sind so sauber und hübsch gebaut, daß sie wie aus einer Puppenschachtel frisch aufgestellt erscheinen, andere wieder arg verfallen, unsauber und unschön, von so abschreckender Wirkung, daß — wie ich oft meinen Pangwe gesagt habe — sich nicht einmal ein Hund der Weißen darin wohlfühlen würde. Die meisten stehen natürlich zwischen diesen beiden Gegensätzen, d. h. wenn man den Durchschnitt aus mehreren Dörfern nimmt — die Häuser e i n e s Dorfes sind vielfach an Güte ziemlich gleichwertig, was gewiß mit von ihrem gleichem Alter herrührt. Es gibt da Dörfer, die, wie das Spielzeug eines Riesenkindes, eben vom Riesenspielzeughändler gedrechselt und auf die saubere Erde wie auf einen Riesentisch aufgestellt erscheinen, andere, in denen man wahrhaftig nicht e i n Haus findet, das den Regen nicht in Strömen durchließe, nicht e i n e s, dessen Wände noch gerade stünden, das zwischen Wand und Erde nicht einen Durchschlupf den nächtlichen Kriechtieren böte! Man denke an die Bedeutung des Dorfes Ebualebambe (= eingefallenes Dorf), das allerdings, wie ich sah, seinem Namen alle Ehre machte.

Mögen die Häuser sorgfältig gebaut sein oder nicht, stets sehen sie gedrückt aus, weil sie zu niedrig sind im Verhältnis zur Länge, die noch größer

Abb. 37. Grundriß eines Wohnhauses der Pangwe.
a Schlafbänke, *b* Feuerplatz (Küche), *c* Topf mit Wasser, *d* Mahlstein, *e* Körbe, *f* Maiskolbenbündel, *g* Hühnernest, *h* Türpfosten.

zu sein scheint durch die Reihenanordnung der Häuser. Denselben Eindruck bekommen wir, wenn wir ins Haus eintreten; im Durchschnitt ist es so niedrig, daß man nur gebückt in ihm stehen kann, falls man nicht mit dem Dach oder dem daran hängenden Hausrat in unangenehme Berührung kommen will; es ist eine Seltenheit, wenn man auf einer der niedrigen Schlafbänke aufrecht stehen kann, ohne mit dem Kopf anzustoßen.

Das Innere des Hauses (Abb. 37) stellt, ebenso wie das Versammlungshaus, einen einzigen Raum dar, den der Pangwe in *atúm a nkiai* und *atúm akui*, d. h. in ein westliches (niedriger gelegenes) und ein östliches (höher gelegenes) „Zimmer" links und rechts der Tür teilt. Einen Einblick in eine Fanghütte bietet Abb. 38, wobei die eine Seitenwand und die rechte Hälfte der Vorderwand der Übersicht halber herausgenommen ist.

Die vier Ecken, mindestens drei von ihnen, sind von den Schlafbänken (Abb. 37 a) eingenommen, die ebenso gebaut sind wie die Ruhebänke der Versammlungshäuser. Die Entfernung zwischen Nacken- und Fußstütze beträgt indessen nur etwa ¾ der Körperlänge, so daß man mit hochgezogenen Beinen liegen muß. Die Schlafbänke reichen bis an die Türpfosten und nehmen so den meisten Platz im Hause ein. An der einen Schmalseite liegt zwischen zwei Schlafbänken der Feuerplatz (Abb. 37 b), d. h. ein paar zusammengelegte Scheite, Herd und Ofen zugleich. Darüber ist eine Vorrichtung zum Trocknen und Aufbewahren von Eßwaren und Geschirr angebracht, die folgendermaßen zusammengesetzt ist (Abb. 39): Über die Türpfosten (a) und zwei in den Ecken eingerammte Gabelstöcke ist ein mit Raphialeisten überflochtenes Gestell gelegt, der Topfboden = *akdn̄ e mvé* (c), auf dem man gewöhnlich einige Töpfe und eine Tonwasserflasche aufgestellt sieht. Auch andere, selbst nicht für den Neger als „Wertsachen" zu bezeichnende

Abb. 38. Wohnhaus der Fang.
Die rechte Hälfte der Vorderwand und eine Seitenwand sind fortgenommen, um einen Einblick ins Innere zu gestatten.

Stücke finden sich darauf, z. B. Bananenschalen, Maisspindeln, auf deren Verwendung ich noch zurückkomme, usw. Darunter hängt der Trockenboden oder „Erdnußboden", *akán owǫ̃nõ* (d); er dient, wie der Name sagt, nur zur Aufbewahrung von Erdnüssen und ist meist ebenfalls aus Raphiastreifen geflochten. Dann folgt das für die Hausfrau wichtigste Hausgerät, die Speisekammer in Form einer Aufbewahrungskiste, *bu,bu*, oder *bu,u* (e), hauptsächlich für Fleisch und andere Delikatessen bestimmt. Diese Kiste ist oft sehr hübsch aus Raphiamark hergestellt, trägt vorn meist einen kleinen Vorsprung zum Abstellen von Salz, Löffeln, Pfeffer, also eine Art „Stummer Diener", und hat an der Seite eine Öffnung, die mit einer Schiebetür aus Mark geschlossen wird. Die Kiste füllt den Raum zwischen den Betten aus, so daß man da knapp stehen kann. Unter der Kiste hängen ein oder zwei Trocken- oder Röstbretter, *etǫ́n* (f und g), das letzte dicht über dem Feuer. Sie dienen zum Rösten der Erdnüsse oder zum Trocknen von Sachen.

Auf der gegenüberliegenden Seite ist in gleicher Höhe und Art ein Rahmen gespannt, über den Trockenbretter gelegt werden können, und an dessen vorderem Rande die langen Körbchen der Frauen *(nkán I)* hängen. Darunter ist der Fußboden oder, wenn hier eine Schlafbank steht, diese vollgestellt mit Körben, Mahlsteinen und anderem Gerät oder mit Vaters Siebensachen, und ratlos steht man zunächst in der Mitte des Ganges zwischen Vorder- und Hintertür. Platz schaffen bedeutet hier gänzliche Ausräumung, ohne sie ist daher ein Haus für einen Europäer unbewohnbar. Im Norden,

besonders bei den Bulu und teilweise auch den Ntum, sind die Hütten etwas größer und wohnlicher.

Zum Aufhängen von Körben, Kalebassen, Taschen und anderen Gegenständen an der Wand bedient sich der Pangwe eines natürlichen Hakens *(ekgb)*, das ist ein Stück eines Baumstämmchens, das etwas oberhalb und unterhalb eines Zweigabganges herausgeschlagen wird. Der Nebenzweig wird abgeschnitten, der stehenbleibende Rest etwas angespitzt und das Stück nun in derselben Lage, wie es sich am Baume befand, zwischen die Raphialängsstreifen der Wandinnenseite geschoben. Am Dach befestigt man Gegenstände sehr leicht dadurch, daß man zwischen die Matten Raphiastäbchen steckt, über deren freies Ende die betreffenden Sachen gehängt werden können.

Ein wichtiges Gerät ist der Schemel *(kpa III)*, Abb. 40, ein aus Holz geschnitzter dreifüßiger runder Hocker, der rings um den Rand mit Kerbschnitzmustern verziert wird. Er steht auf der Erde, vielfach in der Nähe der Türpfosten herum und gilt sozusagen als Ehrenplatz — für Fremde und den Familienvater —, in der Art wie unser Sofa.

Als letztes Hausgerät ist der Feger zu erwähnen, der in verschiedenen Formen auftritt, je nachdem er im Wohnhause, für die Ruhebänke des Versammlungshauses oder für dessen Fußboden bzw. den Dorfplatz gebraucht wird.

Für das Haus ist ein Besen *(evüd[k])*, Abb. 41 a, bestimmt, der aus fächerartig zusammengebundenen Raphiablättern besteht. In Jaunde gibt es für die Ruhebänke der Versammlungshäuser „vornehmere" Besen aus pinselartig auseinandergeschlissenen Stengelstücken der Liane **Ertela scandens** Benth., Leguminosae, *nlü* genannt (b), oder aus dem Blütenstand der Ölpalme (c), die also unseren Staubwischern entsprächen. Eine dritte Form (Abb. 42) ist aus zwei Holzbrettchen, die mit Bändern an einen Stiel gebunden werden, ge-

Abb. 39. Querschnitt durch ein Wohnhaus von Tür zu Tür.
a Türpfosten, *b* Schlafbänke, *c* Topfboden, *d* Erdmaßstreckenboden, *e* Speisekammer, *f* und *g* Rituelbrenner.

fertigt und gleicht unseren Schneeschippen; sie ist keineswegs in jedem Dorfe vorhanden und wird auch dort, wo sie zur Verfügung steht, nicht häufig gebraucht.

Bei den voraufgehenden Beschreibungen wird es aufgefallen sein, wie häufig die Raphia als Material erwähnt ist, und in der Tat ist diese im Negerenglisch „Bamboo" genannte Palme die weitaus wichtigste und wertvollste Pflanze für die Pangwe. Dort, wo sie selten ist, wie in Jaunde, beschafft man sie sich, wenn nötig, von weit her.

Im Kampo-Uellegebiete gibt es vier Arten der Raphia. Von ihnen kommt **Raphia hookeri** M. *(esa)* nur an den Ufern der größeren Flüsse, **R. regalis** M. et Wendl. *(andǎṭm)* nur in hügeligem Gelände und sehr zerstreut vor. Sumpfbildend treten auf[1]) und ließen sich als eigentliche Raphiapalmen bezeichnen: **R. vinifera** P. B. *(nia dǎṭń* = richtige, echte R.), das ist die gewöhnliche, und eine letzte Art *(akgdǎṭ)*, die an den blau bereiften Blattstielen erkennbar und oft unter den Beständen der ersteren eingesprengt ist. Der allgemeine Name für Raphia *dǎṭ-ń*, weist auf ihre Bedeutung hin, denn sie ist „die Mutter des Dorfes", *dǎa (ń* vgl. Nachsilben), weil das ganze Dorf aus Raphia gemacht ist, und in der Tat würde kein Name zutreffender sein, denn was wird nicht alles aus ihr hergerichtet und hergestellt! Folgende Liste gibt einen Begriff von der Vielseitigkeit ihrer Verwendung.

Abb. 40. Schemel, Fang.

I. Nahrungsmittel.

1. Palmkohl.
2. Fruchtfleisch.

II. Gewürze.

3. Salz (aus den Blättern und Stengeln zusammen mit anderen Pflanzen, siehe Abschnitt VI S. 147).

III. Öle.

4. Haaröl (aus dem Fruchtfleisch, siehe Abschnitt VII S. 190).

IV. Baumaterial.

a) Blattfiedern.

5. Matten *(eǎg,i)* fürs Dach.

b) Ganze Blätter.

6. Geflochtene Einfriedigungen um die Kultplätze.

c) Ganze Blattstiele.

7. Gesimsbalken *(mfǎ,s I)*.
8. Dachsparren *(ntǎgn I)*.

d) Halbe Blattstiele.

9. Schlaf- und Ruhebänke *(kwda III* und *endń)*.
10. Längsstreifen der Hauswände *(ebǎṭd* Nt., *ebadk* F.).

e) Mark.

11. Hauswände.

[1]) Daher *zǎm* = Sumpf- und Raphiapalme (Sammelname).

Abb. 41. Feger.
a Besen für Wohnhäuser, b und c Staubwischer für Versammlungshäuser.

V. Hausgeräte.

12. Erdnußkörbe *(angaʌn)* aus Mark.
13. Trockenbretter *(elǫá)* aus Blattstengelrinde, Rahmen aus Mark.
14. Trockenböden *(akdá)*.
15. Näpfe für Rotholz.
16. Kämme (aus Stengelrindenstücken).
17. Besen (aus Blättern).
18. Korken für Pulverfläschchen, für Bambustrinkrohre (Mark).
19. Nägel, z. B. zum Zusammenfügen des Markes.
20. Plantenschäler (Rindenstück).
21. Tone zu Korbtellern (Markstrahlen).
22. Nadeln, um Sandflöhe herauszunehmen (Rinde).
23. Stöcke zum Beritzen der Tontöpfe, ferner Pfriemen, um die Nase zu durchbohren (Rinde).
24. Meisserscheiden (Mark).
25. Stöcke zum Bereiten der Tondüse (Stengel).
26. Gußformen, um die Messingringe zu gießen (halbe Stiele).
27. Feuermaterial, *ekóba* (Stengelstreifen).
28. Taue (Bast).
29. Pfeifenköpfe (aus den Fruchtkernen) vgl. Abschnitt VI S. 170.
30. Nadeln, Nähnadeln (Mark).
31. Feuerfächer (Mark).

VI. Fanggeräte, Waffen.

32. Fischkörbe, *agǎ*, *ngǒ,dège*, *nsǒ,a*.
33. Fischwehre, *oldm*.
34. Schlingen für Zugfallen (Piassave).
35. Bogenfalle der Jaunde für Ratten *(ebgdę)*.
36. „Speere" gegen Zauberwesen.

VII. Musikinstrumente.

37. Raphiainstrument, *mǫ̀l* (aus den Stengeln).
37. Guitarre, *ndβnga* (aus dem Mark, Saitenträger aus den Stengelstreifen.
39. Klopfer zum Musikbogen, *elǐm* (Stengelstreifen).
40. Sehnen für die Harfe (Piassave).
41. Schlägel für die Kriegstrommel, *ngǫ́mo* (aus Mark).
42. Schlägel für die Sprechtrommel, *nká* (Stengelstücke).

43. Kinderzither (halbe Stengel, Klopfer: Stengelstücke).

VIII. Spielzeug.

44. Kinderrasselstab (Mark, Stengelstücke).
45. Bogen und Pfeile (Stengel).
46. Gewehr aus Mark, neuere Form (Mark).
47. Hahn und oberer Teil bei Gewehren, alte Form (Stengelstreifen).
48. Hauer, Messer, Werkzeuge (Mark).
49. Falle für Bremsen (Mark, Stengelstücke).
50. Essenstehler (Stengelstück).
51. Gedächtnisspiel, *nkọk endẹlẹ* (Mark).
52. Steinspiel, *akụ́ụ́* (Stengelstücke).

IX. Kleidung, Schmuck.

53. Strohhüte (Mark).
54. Raupe für Schmuckmützen, *odụ́bdu* (Mark).
55. Weiberschwänze (Bast).
56. Baststreifen zum Nähen von Zeugen (Bast).
57. Kopfschmuck, *akọt* (Bast).
58. Armschmuck (Bast).
59. Halsschmuck (Bast).
60. Gürtel (Bast).
61. Taue, um starke Perlen aufzureihen Piassave).
62. Spazierstöcke, feinere aus **Raphia hookeri** M. *(esa)*.

Außer den beschriebenen Versammlungs- und Wohnhäusern bauen die Pangwe noch eine Reihe anderer Hütten zu besonderen Zwecken, nämlich Vorratshäuser, Fremdenhäuser, Feldhütten, Krankenhäuser.

Die Vorratshäuser sehen verschieden aus. Die einen sind nur ausgeräumte Wohnhäuser, die anderen gleichen ihnen, haben aber eine oft den europäischen Vorbildern nachgeahmte Holztür, noch andere stehen wie die vorläufigen Wohnhäuser mit der Giebelseite zum Dorfplatz, sehen auch ebenso aus, nur sind sie fest und dauerhaft gearbeitet. Vorratshäuser sind nur in Dörfern reicherer Häuptlinge anzutreffen.

Die Fremdenhäuser *(esờbdd)* sind genau nach Muster und Anlage des gewöhnlichen Wohnhauses, jedoch ganz flüchtig aufgeführt: die Wände sind meist nur verflochtene Palmblätter, die Tür reicht ohne Schwelle bis auf den Boden, die Schlafbänke sind diejenigen der einfachen Art *(kwda III)*, oft nur aus längshalbierten Schirmbaumstämmen, die über zwei Rollen aus gleichem Holz gelegt sind. Sie werden besonders beim Seelenfest, wenn Fremde in größerer Anzahl zu erwarten sind, aufgeführt und nach Schluß der Festzeit wieder abgebrochen.

Im Urwald oder auf weit entfernten Pflanzungen werden Unterkunftshütten gebaut, die oft nichts anderes sind als einfache Schutzdächer *(mpờ e ngỵ III* = Gorillaheim), oder die den einfachsten vorläufigen Versammlungshäusern gleichen, d. h. Hütten, deren Giebelseiten offen sind, und deren Längswände entweder fehlen oder nur aus einem oder einigen Stämmen bestehen *(angụ́ụ́ e ngỵ* = Gorillascheitel, d. h. die auf dem Gorillaschädel kammartig vorspringende Scheitelleiste).

Für Kranke mit ansteckenden Leiden (Frambösie, Aussatz) baut man neben oder hinter den Wohnhäusern oder dicht vorm Dorfe eigene Häuser (vgl. Abb. 16), die, weil nur für einen berechnet, meist kleiner als die Wohnhäuser, von derselben Form, aber unordentlich aufgeführt sind und bald verfallen, weil keiner etwas daran ausbessert.

Hier und da fand ich Ställe; ich komme im nächsten Abschnitt darauf zurück.

Schließlich sei angeführt, daß es in manchen, besonders küstennahen Dörfern Pfahlhäuser gibt, die den europäischen Faktoreien nachgeäfft sind und sich für die Eingeborenen durchaus nicht bewähren, weil ihr Bau größere Sorgfalt und Mühe erfordert als der von gewöhnlichen Häusern, und die bei den Pangwe wahre Zerrbilder von menschlichen Wohnstätten darstellen.

Abb. 41. Herzlampe, Fang.

Einige Worte über die Beleuchtung. In den Häusern, die — wie wir gehört haben — fensterlos und deshalb recht dunkel sind, ist das Herdfeuer zugleich die sehr notwendige Lichtquelle. Das Feuer *(ndüdn)* ist, wie die Pangwe in ihren Sagen erzählen, durch Mode-Sama, den ersten Menschen, von Gott (Sama) geholt bzw. ihm von Gott übergeben worden und seit Modes Zeiten auch noch nicht erloschen. Das nützliche Element wird von einem Hause zum anderen, schlimmstenfalls von einem Dorf zum andern getragen. Neu herzustellen braucht der Pangwe es nicht, das Feuer brennt den ganzen Tag über im Versammlungshause zum Schutz gegen Kälte, Feuchtigkeit und Sandfliegen, in den Wohnhäusern Tag und Nacht zu Koch- und Heizzwecken; gehen die Frauen in die Pflanzungen, so werden die Scheite so sorgsam zurechtgelegt (für das Zusammenlegen allein gibt es vier verschiedene Ausdrücke!), daß sie glimmend bleiben, oder das jüngste Töchterlein wird damit beauftragt, den Altar der Vesta zu hüten. Sollte das Feuer wirklich in einem Hause ausgehen, so wird aus dem Nachbarhause neues geholt, und nur in Ausnahmefällen ist einmal ein kleineres Dorf ohne Feuer; in solchem Falle schickt man dann nach der nächsten Ortschaft.

Abb. 42 Schmutzschippe zum Reinigen des Versammlungshauses. Ntum.

Eine bessere Beleuchtung als das Herdfeuer gibt das Fackellicht, mit dem

Abb. 44 Dorf Olanga (Fgm. Essängbuak), Süd-Kamerun.
Auf dem Dorfplatz ein „Denkmal": eine eigentümlich gebildete Baumwurzel, in der die Eingeborenen ein Pferd sehen.

z. B. bei Tänzen der nächtliche Dorfplatz erhellt wird, und das die merkwürdigen wilden Bewegungen der Tänzer durch sein Flackern noch phantastischer erscheinen läßt, als sie es an sich schon sind. Als Fackel dienen getrocknete Stengel des Kardamom **Aframomum alboviolaceum** K. Sch. *(adiŋm*, Stengel: *kymö IV* F., *küme IV* Nt.), Tafel in Abschn. XI, oder fein geschlissene Raphiastengelstreifen *(ekärba)*, die — gut getrocknet — recht hell brennen, allerdings auch recht schnell aufgebraucht sind.

Die feinste, aber eine nicht gerade häufige Lichtquelle bei Festlichkeiten oder sonstigen Vorgängen auf dem Dorfplatze ist die Harzlampe (*otü* = Harz), Abb. 43, ein Rindentönnchen, welches das wohlriechende Harz der Anacardiacee **Canarium schweinfurthii** Engl.[1]) *(abé* Nt., *obé* F., Harz = *otü)* enthält.

Auf längeren Wegen, wenn man z. B. einen Bekannten besuchen oder bei plötzlichen Krankheitsfällen des Nachts heilkräftige Pflanzen im Walde suchen will, bedient man sich statt der Fackel, die zu schnell abbrennen würde, eines Feuerscheites, das hin und her geschwenkt wird. Braucht man kein starkes Licht, so begnügt man sich wohl auch mit Zweigstücken, die mit dem glänzendweißen Myzel eines Pilzes überzogen sind und dadurch in der Dunkelheit hell scheinen.

---

[1]) Nach der Mitteilung des Herrn Dr. Mildbraed, der diesen Baum ebenfalls gesammelt hat.

Abb. 45. Kanus auf der Nit (Nebenfluß des Kampo). Neu-Kamerun.

Zu weiteren Jagdausflügen oder Kautschuk„expeditionen" in ein größeres Urwaldgebiet, wo in der Wildnis genächtigt werden muß, wird ein brennendes Scheit Holz mitgenommen, früher außerdem noch „Feuerhölzer" für den Fall, daß das Holzscheit erlöschen sollte. Heute haben die Pangwe ganz verlernt, nach alter Weise durch Quirlen Feuer herzustellen. Ein älterer Häuptling hat mir zwar einmal gezeigt, wie früher Feuer „gemacht" wurde, aber obgleich er sich unendliche Mühe gab, und obgleich zwei Mann sich die Arme lahm quirlten, haben sie nicht einen Funken herausbekommen. „Theoretisch" jedoch wußte mein guter Häuptling ganz genau über die Funkenherstellung Bescheid: „Man" nimmt zwei Holzstöcke von einer der drei Tiliaceen **Triumfetta cordifolia** Guillet *(okọn)*[1]), **Leptonychia tessmannii** Engl. *(akạk)* oder **Desplatzia dewevrei** Burs. *(afọnọk)* und läßt sie mindestens einen Tag über Feuer trocknen. Der eine wird in der Mitte eingekerbt, auf die Erde gelegt und mit den Füßen festgehalten, der andere senkrecht in die Kerbe gestellt und darin gequirlt. Der Funke, der dann entstehen „soll", wird mit Werg aus zerzupften Fasern der **Dioclea reflexa** Hook. f. *(kọndọg III)*, das um die Kerbe gelegt wird, aufgefangen. So unterrichtet, verlangte ich nach dem einen Mißerfolge anderswo die Umsetzung dieser Theorie in die Praxis, aber die meisten Eingeborenen machten ein sehr dummes Gesicht dazu oder lachten mich gar aus.

[1]) In einem **Triumfetta**-Stock soll auch nach einer Sage das Feuer vom Himmel gebracht sein.

Abb. 43. Brücke über die Abéa (Nebenfluß des Bimfille) bei Makonám (Fern. Ojek) während der Trockenzeit. Span. Guinea.

Der Dorfplatz bleibt meist ganz frei, nur sehr selten hat man einmal einen Baum stehen gelassen oder gepflanzt, dem eine medizinische Bedeutung zukommt; häufiger sieht man Gerüste, auf denen das Raphiapalmöl bereitet wird (vgl. Tafel IV). In einem Falle traf ich ein Denkmal, das ein Pferd vorstellen sollte (Abb. 44): eine Baumwurzel, die man der merkwürdigen Tierähnlichkeit halber beim Roden hatte stehen lassen.

Die Reinlichkeit der Dorfplätze ist eine sehr verschiedene. Es gibt sehr schmutzige, auf dem Schaf- und Ziegenkot, Reste von Zuckerrohr, zerkautes Rohr, Hausbaumaterial usw. in Menge herumliegt, ja, wo nicht einmal das Gras ausgejätet ist, andererseits sehr reinliche, wo aller Unrat hinter den Häusern zusammengekehrt wird. Recht nachlässig hierbei sind die Männer, die für das Versammlungshaus zu sorgen haben und ihren Kehrichthaufen *(akan)* fast bis in die Tür hineinwachsen lassen.

Der Abort *(ełák)* liegt, wie Abb. 16 zeigt, nicht sehr weit von den Häusern entfernt im Plantenhain, oft so nahe, daß der Gestank, zumal bei ungünstigem Winde, unerträglich werden kann. Die Anlage besteht aus einer ziemlich tiefen Grube, in deren Mitte ein oder zwei Paar Gabelstöcke eingerammt sind, und über die eine Lage Baumstämme so gelegt ist, daß die mittelsten vom Rande der Grube nur bis zu den Stöcken reichen und mit ihrem freien Ende in der Gabel liegen. So bleibt eine viereckige Öffnung frei, um die herum das

Abb. 47. Brücke über den Bimfüle bei Ebiánemajong (Fam. Essúuong) während der Regenzeit.

Ganze meist mit Lehm beschüttet wird. Manchmal spart man sich auch die Lehmdecke. An Stelle von Klosettpapier benutzt man trockene Maisspindeln.

Beachtenswert ist, daß sich die Pangwe auch Zierpflanzen halten, die auf dem Dorfplatz, an den zuführenden Wegen, hinter oder seitlich der Häuser oder, falls nur eine Reihe Häuser vorhanden, an Stelle der gegenüberliegenden stehen. Im wesentlichen sind es eine hübsche Amarantacee **Gomphrena globosa** B. *(ngŏ̂ IV)*, die auch in Amerika vorkommt und vielleicht von dorther eingeführt ist, und das sogenannte Fiebergras, **Andropogon schoenanthus** L. *(ŏ̄ímenlá̄ngan = ŏ̄ím* [**Ocimum**] der Weißen), ein ebenfalls eingeführtes Gewächs.

Die Wege sind oft kaum sichtbare Pfade, die zuerst durch Jäger ausgetreten, zum Teil mit Benutzung von Elefantenwechseln, später durch den größeren Verkehr von selbst breiter werden, wenn sie auch natürlich immer nur im Gänsemarsch zu begehen sind. Wo kleine Bäche vorhanden, die in der Marschrichtung fließen, benutzt man sie als Weg.

Um über größere Gewässer zu setzen, bindet man ein paar Stämmchen des Schirmbaumes zu einem Floß zusammen, oder man nimmt Einbäume *bīd*, Mehrzahl: *mā*, Abb. 45, die sonst für Fischereizwecke gebraucht werden. Nur in seltenen Fällen schwingt man sich zu Brücken *(ndáę I)* auf, am ersten da, wo Pflanzungen und Dorf auf verschiedenen Ufern eines Flusses liegen, und eine regelmäßige und rasche Verbindung erforderlich ist. Sie bestehen

(Abb. 46 u. 47) aus mehreren Pfeilern von je zwei in Form eines Schräg-(Andreas-)kreuzes in den Boden gesteckten und miteinander verschnürten Stämmen und aus einem oder mehreren darübergelegten Längsbalken. An die oberen Enden der Pfeiler knotet man Haltetaue oder befestigt längshalbierte Stöcke als Geländer. Wird ein Brückenbalken morsch, so legt man einen neuen darüber, aber man denkt nicht daran, das Gerüst, das die stärkere Last nicht tragen kann, zu erneuern, und deshalb stürzt die Brücke, wenn sie älter wird, bald zusammen.

Neuerdings gibt es Brücken nach Art der europäischen *(kāża III)* aus zwei Reihen Stützpfähle und Längsbalken, über die dicht an dicht Knüppel, wie bei unseren Knüppeldämmen, gelegt werden. Sie sind noch lebensgefährlicher als die der älteren Form, da öfters Stützpfeiler zusammenbrechen, die Brücke sich einseitig senkt und man auf den glatten Knüppelenden böse zu Fall kommen kann.

Abschnitt V.

Wirtschaftsformen.

Erster Teil: Ackerbau. Allgemeines: Geräteschaften, Vorbereitung des Bodens, Arbeitsverteilung. Die wichtigsten Nahrungspflanzen und ihre Bedeutung. Erdnuß (Abarten, Kultur, Schädlinge, Medizinen, Verwertung). Mais. Ngon (Beschreibung, Abarten, Bedeutung, Entstehung des Namens, Kultur, Ernte, Trocknung, Schädlinge, Medizinen, Verwertung). Yams, Kassave, Zuckerrohr, Taro und Makabo (Beschreibung, Abarten, Kultur, Verwertung). Plante und Banane. Weitere angebaute Nutzpflanzen.

Zweiter Teil: Viehhaltung. Hunde, Aussehen, Bedeutung für die Pangwe, Rufnamen: Ziege und Schaf, Kastrieren der Ziegen (Ausführungsweise, Zweck); Huhn und seine Bedeutung; Ente; andere gezähmte Haustiere.

Dritter Teil: Fischerei. Fischreichtum, Übersicht über die Fischwelt des Pangwegebiets. Fischfang (Allgemeines, Hauptzeiten), Arten: Fischtreiben, Angeln, Fischgifte, Gerätswehr, Korbwehre, Fischreusen, Fischfangkörbe, Fischgräben, Fischnetze.

Vierter Teil: Fallenstellerei. Fallgruben, Schlagfallen, Schlagteller, Speerfalle, Schlingen, Zugfallen, Frankolinfalle, Bogenfallen, Alarmfalle.

Fünfter Teil: Jagd. Allgemeines, Treibjagden mit Körben und Netzen, Fleischverteilung, Unglücksfälle, Einzeljagd mit Gewehr und Armbrust. Armbrust (Herkunft, Beschreibung, Pfeile).

---

1. Ackerbau.

Die Wirtschaftsformen der Pangwe sind Ackerbau, Fischfang und Fallenstellerei; im Vergleich hierzu spielen Jagd und Viehhaltung nur die Rolle einer nebensächlichen Beschäftigung.

Die eigentümlichen Bezeichnungen der Pangwesprache: *a bḗ bidḗị* = „Essen"pflanzen, d. h. pflanzen und *a nyǒṅ bidḗị* = „Essen" nehmen, d. h. ernten, scheinen noch darauf hinzudeuten, daß die Kulturstufe des Ackerbauers aus derjenigen des primitiven Sammlers, d. h. der bewußte Anbau der Pflanzen aus der Beobachtung und Nutzung wild in der Natur vorkommender eßbarer Blätter, Früchte usw. hervorgegangen ist. Letztere Stufe haben die Pangwe durchweg überwunden, und sie fallen nur gelegentlich in der Not in sie zurück.

Der Ackerbau ist Hackbau, d. h. der Boden wird mit Hacke und Grabstock aufgelockert. Die Hacke (*ebǵk* Nt., *ebǵk* F.), Abb. 48, besteht aus einem Eisen, das an einen hakenförmig gekrümmten Holzstiel geschnürt wird, der Grabstock (*eṛẹ̄n* Nt., F., *tǒṅ* J.) ist ein an einem Ende schneidezahnförmig zugestutzter Holzstab. Jene ist für die Frauen, dieser für die Männer

[p. 85]

bestimmt. Weitere landwirtschaftliche Geräte sind Axt *(orɛ̃n)*, Abb. 49, und Buschmesser *(fa̤,-tši IV)*, Abb. 50. Letzteres heute durch die europäischen Hauer (Cutlass), *nkpwɛ,da̤ I*, fast ganz verdrängt, ist dazu bestimmt, Knollen, wie Yams, aus der Erde zu heben und den Boden zu ebnen. Für letzteren Zweck sah ich auch Holzspaten, die an einem Stiel befestigt waren, in Benutzung. — Die Bodenbestellung beginnt mitdem Roden *(a li tši)*. Zuerst werden die Lianen, das Unterholz und dünnere Bäume mit dem Hauer abgeschlagen; ist auf diese Weise etwas Luft geschafft, so geht man an das Fällen der dickeren Bäume mit der Axt. Gewöhnlich wird eine Gruppe von Bäumen zusammen vorgenommen, und zwar in der Weise, daß man die Lianen durchschlägt, damit sie die Bäume nicht mehr halten können, die meisten dünneren Stämme anhaut und nur einen etwas massigeren fällt. Letzterer reißt dann im Falle ziemlich die ganze Baumgruppe samt dem Lianenwerk mit, so daß nur wenig zu tun übrigbleibt. Die ganz großen Bäume werden meist als Schattenbäume stehen gelassen und nur, wenn unbedingt nötig, mit Zuhilfenahme von Feuer, das an die Wurzeln gelegt wird, beseitigt; ohne dieses Mittel würde es einige Tage erfordern, einen solchen Baumriesen umzuschlagen, und dazu haben die Pangwe in der kurzen Trockenperiode selten Zeit. Ist der gesamte Busch bis auf die Schattenbäume umgeschlagen, so wartet man einige Tage, bis die Sonne das Holz getrocknet hat, und legt dann Feuer hinein, man „brennt" die Farm, *a da̤,ge tši*. Am Ende der Trockenzeiten sieht man überall im Lande Rauchsäulen aufsteigen und hat auf Märschen oft das zweifelhafte Vergnügen, eine solche brennende Farm passieren zu müssen. Eine Menge von Raubvögeln, besonders die nie fehlenden Schmarotzermilane, umkreisen da ungeachtet der Hitze die Neufarm, um alles Kriechende, was dem Feuer entflieht, abzufangen. Kommt die Regenzeit, so ist es mit dem Farmschlagen vorbei, nun „legt man das Essen". Die Männer räumen die verkohlten und unverbrannten Reste der Bäume

Abb. 48. Hacke.

Abb. 49. Axt.

Abb. 50. Buschmesser.

Abb. 51. Fangfrauen, die mit Feuerholz von den Pflanzungen zurückkehren.

auf die Seite oder häufen sie als Grenzmarken in der Farm selbst auf (vgl. Tafel II), die Frauen schaffen das kleinere Reisig weg. Sie beherrschen von nun an das Bild, säen oder pflanzen die Nutzgewächse, jäten das Unkraut, das in der Regenzeit bald genug üppig zu treiben beginnt, und besorgen die Ernte, alles übrigens leichtere Arbeiten. Aus dieser Verteilung der Arbeit geht hervor — und das wird sich später im einzelnen weiter verfolgen lassen —, daß die schwerere, stärkere Anspannung der Kräfte erheischende Arbeit den Männern zufällt, die leichtere dagegen den Frauen überlassen bleibt; da nun der Natur der Sache nach die erstere kürzere Zeit dauert, so entsteht der Eindruck, als ob die Frauen bedeutend mehr Arbeit zu leisten hätten als die Männer, aber das ist nicht der Fall, es wird nicht anders sein als in Deutschland auch, nur ist die Art der Arbeit eben eine andere. Wenn man freilich die großen, vollbepackten Körbe sieht, die die Frauen täglich vom Felde bringen (Abb. 51), so möchte ein Uneingeweihter wieder irre werden, jedoch ist das Tragen von ganz unverhältnismäßig schweren Lasten, das den weiblichen Körper so sehr verunstaltet, teilweise der Frauen eigene Schuld; man wird da an das niederdeutsche Sprichwort erinnert: „De Fule drägt sich doht un de Flitige löpt sich doht." Die Frau möchte sich nämlich am Nachmittag ausruhen, und manche besitzt sogar eine ganz erkleckliche Portion Arbeitsscheu, übrigens ein weiterer Grund für die im dritten Abschnitt erwähnten häufigen Zeiten des Nahrungsmangels, die zuweilen in richtige Hungersnöte ausarten.

Die wichtigsten Hauptnahrungspflanzen der Pangwe sind folgende sieben:

Südliches Gebiet (Fang):	Nördliches Gebiet (Jaunde):
1. Kassave (Maniok)	1. Kassave (Maniok)
2. Plante	2. Erdnuß
3. Erdnuß	3. Plante
4. Ngon	4. Mais
5. Mais	5. Ngon
6. Taro	6. Taro
7. Yams	7. Yams

Wohlverstanden sind hier die Gewächse nach ihrer Wichtigkeit als Nahrungspflanzen, also im Haushalt, als „Essen" zusammengestellt, nicht nach dem Umfang des feldmäßigen Anbaues; da ändert sich die Reihenfolge vielmehr vollständig. Das Zuckerrohr, das nur als Genuß- oder Erfrischungsmittel, nicht als Volksnahrung Wert hat, kommt hinzu, die Plante tritt ganz zurück, denn sie gedeiht auch ohne Pflege und bedarf keines sorgfältigen Anbaues; ähnlich die Kassave, die zwar eine gewisse Kultur erfordert, aber als dauernde Staude sich weiterentwickelt und mit ihren Wachstums- und Anbaubedingungen nicht an bestimmte Zeitabschnitte gebunden ist; Erdnuß und Ngon spielen nunmehr die führende Rolle. Wenn man nach der Form der Kultur Feldbau und Gartenbau unterscheidet und für jeden von ihnen die Anbaufläche als Maßstab nimmt, so erhält man folgende Reihe der Gewächse:

I. Feldmäßiger Anbau:

1. Erdnuß	Nebengewächs	Mais
2. Ngon	„	Yams
3. Kassave	„	Zuckerrohr als Genußmittel

II. Gartenmäßiger Anbau:

4. Taro	Nebengewächs	Makabo
5. Plante	„	Banane als Frucht

Damit ist nicht gesagt, daß stets Ngon zusammen mit Yams, oder Kassave mit Zuckerrohr angepflanzt sein muß, es gibt reine Yamsfarmen und reine Zuckerrohrfarmen genug; es soll nur angedeutet werden, daß vielfach der Anbau dieser Nebengewächse mit dem des wichtigsten Hauptgewächses verbunden ist, und daß vor allem die Anbaubedingungen beider sich gleichen oder doch ähneln. So kann ich mich für die genauere Schilderung auf die Kultur der fünf Hauptpflanzen obiger Aufstellung beschränken.

Tafel V

ERDNUSS, ARACHIS HYPOGAEA.

a Ganze Pflanze.
b und *c* Längsschnitte durch Schoten (¹/₁ nat. Gr.).
d Korn (Erdnuss), (²/₁ nat. Gr.).
e Längsschnitt durch den Keim (etwas vergr.).

Günter Tessmann, del. Pangwe Verlegt und gedruckt bei Reimer Wasmuth A.-G., Berlin.

[facing p. 88]

Die Erdnuß, **Arachis hypogaea** L.
(Tafel VI.)

Die Erdnuß (*owänö*, hergeleitet vom Stamme *a wäno* = legen, pflanzen) nimmt die dritte, bei den Jaunde sogar die zweite Stelle ein in der Reihenfolge der wichtigsten Nahrungspflanzen. Man unterscheidet im Fanggebiet fünf verschiedene Abarten, von denen allerdings eine — *möne ow.* — wegen der kleinen Früchte wieder aufgegeben ist. Von den übrigen vier sind die aufrechte, mehr behaarte, *asümena*, die nach Sadebeck[1]) **A. asiatica** Lour. heißt (sie ist auf Tafel VI abgebildet), und die niederliegende **A. africana** Lour. oder **var. glabrata** D. C. *ebdö* Nt., *ekäb* oder *engüs* F. gleichmäßig häufig miteinander auf einem Felde anzutreffen, auch die Abart *evölo* F., *evüöle* Nt., die sich durch dickere und nicht so lange Früchte auszeichnet, und die Abart *ezöna* findet man mitunter auf demselben Feld.

Welch große Rolle die Erdnuß in der Landwirtschaft der Eingeborenen spielt, wird jeder, der das Pangweland bereist, sofort erkennen —, die einzigen Farmen, die das Auge eines Europäers erfreuen können, sind die Erdnußfarmen. Wenn man nach Durchschreiten der keinen freien Überblick gewährenden Kassave- und Zuckerrohrpflanzungen, der Ngonfarmen, in denen man fortwährend über die liegengebliebenen Baumstämme klettern muß, oder gar des dichten Busches oder Urwaldes auf eine Erdnußpflanzung hinaustritt, dann atmet man ordentlich auf, so frei liegt vor dem Wanderer die vom Dunkel des Urwaldes umrahmte Pflanzung, durchsetzt von dem helleren Grün des jungen Maises, der meistens zugleich mit der Erdnuß als Abschluß nach dem Urwald zu und in der Mitte an den Grenzen der einzelnen Feldstücke angebaut zu werden pflegt (Tafel VII), so sehr erinnert sie mit ihrer Sauberkeit und Übersichtlichkeit an europäische Gemüsefelder: ein Erdnußpflänzchen neben dem anderen treibt seine vielen vierteiligen Blätter hervor, gedüngt von dem reichlichen Naß des tropischen Regens, und hier und da sieht man die gelben Blüten aus dem Kraut herausleuchten.

Die Pflanzungs- und Erntezeiten der Erdnuß stellen sich so:

Erste Aussaat: gepflanzt im September und Anfang Oktober,
geerntet Ende Dezember;

Zweite Aussaat: gepflanzt im März und April,
geerntet im Juli und August.

Die Erdnuß wird also vor den Regenzeiten gepflanzt und am Ende der darauf folgenden Trockenzeiten geerntet.

Das Farmschlagen und -brennen wird demgemäß im Februar, März und wieder im Juli, August von den Männern des Dorfes gemeinsam betrieben.

---

[1]) R. Sadebeck, Die Kulturgewächse der deutschen Kolonien und ihre Erzeugnisse. Jena 1899. S. 230.

Das Feld wird unter sie aufgeteilt, und nun gehen sie daran, die größeren Baumstämme und Äste beiseite zu räumen, während die Weiber die Farm reinigen und dann die Samen oder die bereits gekeimten Nüsse legen, indem sie mit der Hacke ein kleines Loch scharren, die Samen bzw. die Nüsse hineinwerfen und mit dem Fuße die Erde wieder daraufdrücken. Bei der Ernte, die dann beginnt, wenn das Kraut, mit Ausnahme der obersten Blätter, ziemlich vertrocknet ist, wird der Boden aufgelockert, die Nüsse werden von den Weibern ausgelesen und in die Korbteller *(dźä,d)* getan.

Erst nach drei Jahren kann man auf demselben Boden wieder Erdnüsse bauen; auch ist den Weibern aufgefallen, daß die Erdnuß — sie ist an einen gewissen Kalkgehalt des Bodens gebunden — nicht überall gedeiht, und so pflegen sie zu sagen: „Laßt uns hier in der Nähe nicht wieder Erdnüsse pflanzen, denn sie gedeihen hier nicht." Wie die meisten tropischen Nutzpflanzen haben die Erdnüsse so gut wie gar keine Schädlinge. Am meisten schaden noch durch Abfressen der Blätter die Schirrantilope, **Tragelaphus knutsoni** Lemberg *(nkǔk)*, und das Zwergböckchen, **Neotragus batesi** Winton *(odźŏ,ĕ)*, sowie durch Zernagen der Nüsse die Streifenmaus, **Mus pulchellus** Gray *(zŏ[ŏ III)*; indessen pflegt sich in manchen Jahren stellenweise eine Art Schwarzfäule der Nüsse zu zeigen; einige Raupenarten, welche die Blätter fressen, sind kaum als wirkliche Schädlinge zu bezeichnen. Wahrscheinlich hat das Auftreten der Schwarzfäule den Weibern Anlaß zu dem Glauben gegeben, daß andere Frauen imstande wären, ihre Erdnüsse durch „Medizin" krank zu machen und zu verderben; diesem Streiche suchen sie durch eine Medizin zu begegnen, die aus zu Kohle verbrannten und dann zerstampften Knochen der Schildkröte, des Elefanten, des Schweines und der Schirrantilope besteht und vor dem Pflanzen auf die Samen gestreut wird. Von den sonstigen Medizinen, die das Gedeihen der Erdnüsse günstig beeinflussen sollen, besteht die wichtigste im Einreiben der Erdnüsse mit einer besonders zugerichteten Farbe aus Rotholz, *ba-ayǝ̄*, nach der diese Medizin *ba-ayǝ̄* heißt. Diese rote Farbe (vgl. Abschnitt XVIII, Geschlechtsleben) hat die Wirkung, daß Gewolltes gelingt und Feindliches abgewehrt wird; Rot ist überall die Farbe der Freude, des Gedeihens, der Zeugung. An dem Tage, an welchem die Frau die Erdnüsse pflanzt, zieht sie sich nun mit dem „Medizinrot" einen Strich zwischen Zeigefinger und Daumen, das gibt eine glückliche Hand; oder sie zieht einen solchen auf der oberen Fläche eines Baumstumpfes und umhüllt den Stumpf mit Blättern gleichwie mit einer Mütze. Das heißt: „Möget ihr Erdnüsse unter einem solchen Schutze (das sollen die Blätter andeuten) blühen, wachsen und gedeihen (hierfür das Rot), niemand wird euch etwas anhaben können (hierfür die Medizin)." Ferner pflegt der Mann am Vorabend der Aussaat den im Korbe „versammelten"

Tafel VII.

ERDNUSSPFLANZUNG, IM HINTERGRUNDE MAIS, NTUMGEBIET.

Günter Tessmann, die Pangwe Verlegt und gedruckt bei Ernst Wasmuth A.-G., Berlin

[facing p. 90]

Erdnüssen durch einen im Hinblick auf sie verübten Koitus ein gutes Beispiel mit auf den Weg zu geben: „Mehret euch!"[1]) Eine weitere Fruchtbarkeitsmedizin besteht aus folgendem Gemisch: 1. Rinde der Simarubacee **Irvingia barteri** Hook. f. *(andŏk)*, 2. Rinde der Anacardiacee **Pseudospondias microcarpa** (Rich.) Engl. *(ofŏs)*, 3. Elefantenmist, 4. Sand vom Kampo oder Uelle, 5. Salz, und wird am Abend vor der Aussaat den Nüssen beigemengt. Auch sie ist als unmittelbare Kraftübertragung zu verstehen: der Erdnüsse sollen so viele werden wie die Früchte der beiden genannten Pflanzen, sie sollen so außerordentlich groß werden wie der Elefantenmisthaufen außerordentlich groß ist, so zahlreich, wie Sand im Kampo — wir würden sagen wie Sand am Meer — und so unendlich viele wie die Salzkörnchen. Schließlich pflanzt man bestimmte Liliaceen *(aydn)* zwischen die Erdnüsse, damit ihre Blätter so grün werden wie die der Lilien auf dem Felde. Man sieht, an freundlicher Belehrung und gutem Beispiel fehlt es nicht.

Die Früchte, die Tafel VI Fig. *a* u. *b* im Durchschnitt zeigen, haben meistens zwei, seltener drei, noch seltener einen Samen. An unser Vielliebchenessen erinnert es in etwas, wenn ein Junge, der eine solche dreisamige Frucht im Korbe seiner Mutter oder auf dem Felde während der Arbeit gefunden hat, seine Kameraden herbeiruft, mit denen er sich in die Samen teilt. Es heißt dann euphemistisch: *bi ki kăbăd* = wir zerlegen eine Ziege; also auch hier die Lehre: Wohlzutun und mitzuteilen vergesset nicht, wenn ihr im Überfluß lebt! Mehr aus Spielerei essen die Pangwe, besonders die Kinder, wohl auch die rohen Nüsse, sonst werden diese hauptsächlich als Suppe oder Mus bereitet; auch kocht man die ganzen Früchte im Topf mit Wasser und ißt nachher die Samen. Aufbewahrt werden die Nüsse in großen hohen Körben aus Raphiamark, die unter dem Dache hängen bzw. auf einem Bette stehen, oder lose auf dem Erdnußboden, *akdn owŭnŏ*.

Infolge ihrer Faulheit und Gleichgültigkeit kommen die Pangwe selten mit den Erdnüssen aus, sie müssen sich immer eine Zeit ohne sie behelfen, bis die neue Ernte eingeheimst und ausreichend getrocknet ist. Daher steigt im Ntum- und Fanggebiet zu dieser Zeit der Preis für den „Teller"[2]) Erdnüsse auf 10 Speer (= 70 ₰), während sonst nur 5 Speer (= 35 ₰) dafür gegeben werden. Im Jaundegebiet kostet der Teller freilich immer 70 ₰ (= 100 Jaundespeere). Die Erdnuß wird einfach als Suppe oder Mus gegessen.

---

[1]) Das wird sogar gemacht, wenn die Frau menstruiert, während man sonst in der Periode den Geschlechtsverkehr vermeidet. Hier, als medizinische Handlung, soll der Geschlechtsverkehr mit einem menstruierenden Weib für die Erdnüsse besonders günstig sein, vorausgesetzt, daß die Frau „glückbringend *(ayüe)*" ist (vgl. Abschnitt XVIII, Geschlechtsleben).

[2]) Die flachen Korbteller, Buschteller genannt, sind Maßeinheit.

Abb. 52. Erdnuß-Maispflanzung bei Bébai (Fam. Esseng), Süd-Kamerun.

Der Ölgehalt der Nüsse wird in größerem Maßstabe nicht verwertet, das beim Kochen freiwerdende Öl wird aber auf die Haut gerieben, um es nicht umkommen zu lassen. Zum Schluß sei das Rätsel erwähnt:

ongn o nga bvi a fä e bonvę:

(Ein) Vogel, er lebt gebären hinter dem Hause der Mütter:

akv avǫk a kŏke bǫn avämm

Ei eines; es kriechen aus Junge zehn.

Antwort: *owǫno* = Erdnuß.

Der Mais, **Zea mays** L. *(fän IV)* wird, wie gesagt, fast immer mit der Erdnuß zusammen angebaut (Abb. 52) und zwar meistens als Begrenzung der einzelnen Feldstücke und als Saum gegen den Busch rings um die Pflanzung. Reine Maisfarmen sind verhältnismäßig selten. Ebenso wie die Erdnuß wird der Mais Anfang Oktober gepflanzt und reift Dezember, dann wieder im März angepflanzt und reift Mitte Mai bis Juli. *kándǿn* = rate ein Rätsel! *kandǿn* = ich rate.

ma yęn bönènga, bö mbe ekö-ne, bönènga bete:

Ich sehe Frauen, sie waren auf Wanderschaft, Frauen besagte:

mabǫm a mabǫm

Bäuche — Bäuche.

Ich sehe Frauen, die von der Wanderschaft kamen (d. h. hier früher nicht waren), und alle sind schwanger (die Kolben in den Scheiden).

Antwort: *fän* = Mais.

NGON, CUCUMEROPSIS EDULIS COGN.

a Stück einer Ranke.
b Männliche Blüte.
c Dieselbe im Durchschnitt.
d Weibliche Blüte.
e Dieselbe im Durchschnitt.
f—*h* Früchte.
i Querschnitt durch eine Frucht.
k Korn.

[facing p. 92]

Der Ngon, **Cucumeropsis edulis** Cogn. *ngǭn IV* J. *ngǭn IV* F.
(Tafel VIII.)

ist eine zu den Kürbisgewächsen gehörige Pflanze mit fünfeckigen, seltener fünflappigen Blättern, die am Rande fein gezähnt sind. An dem fast runden Stengel stehen die Blätter in Abständen, und diesen sind außer einem gelegentlichen Nebenzweig gewöhnlich noch eine Ranke, eine oder zwei männliche Blütenrispen und stellenweise eine einzige weibliche Blüte eingefügt. Ein Stück eines solchen Stengels zeigt die Abbildung. Die Blüten, von den Fang scherzhaft *atśṛne kó* = Schildkrötenfüße genannt, sind nicht sehr groß, mit zurückgeschlagenen, zitronengelben Blütenblättern, die in der Größe etwas veränderlichen weiblichen Blüten (*d—e*) tragen einen unterständigen Fruchtknoten, der Rand und die Griffel sind grün, bei den männlichen Blüten (*b—c*) dagegen sind die Staubgefäße oben gelb. Früchte groß, länglich eirund.

Im Fanggebiet werden drei Abarten des Ngon unterschieden, die indessen nur an den Früchten kenntlich sind (Fig. *f—h*). Die größten Früchte hat die Abart *osə́bǭme (f)*, sie sind ca. 15 cm lang, hellgelbgrün mit verwaschener, sprenkelartiger Zeichnung und in der Mitte schwach eingezogen. Bei der zweiten Abart *nia ngǭn*, d. h. richtiger Ngon, oder *nśnśnte*, d. h. dunkler Ngon *(g)*, sind die Früchte im Gegensatz zu voriger meist eiförmig, 12 cm lang und dunkelgrün mit Striemen oder Flatschen von hellgrüner Farbe; auch gibt es gefleckte. Diese Abart scheint die gewöhnlichste zu sein; *mǭne ngǭn* = kleiner Ngon *(h)* schließlich ist bedeutend kleiner, mißt nur 9—10 cm, selten mehr, und ist heller. Hier ist die sprenkelartige Zeichnung, die wir schon bei *osə́bǭme* sahen, so zusammengelaufen, daß man von hellgrünen Flecken auf etwas dunklerem Grunde sprechen kann. Was die Kerne anbetrifft, so zählte ich bei *osə́bǭme* 190—200, bei *nśnśnte* 224 und bei *mǭne ngǭn* nur 80, sie sind birnförmig (*e*) und weiß; nur ihr Inneres wird gegessen. Unter den Früchten kommen vielfache Übergänge vor, an einer und derselben Pflanze finden sich jedoch meist gleichartige, und man kann deshalb ebensogut wie bei Äpfeln und Birnen von richtigen Sorten sprechen.

Unter den sieben Hauptnahrungspflanzen nimmt der Ngon die vierte Stelle ein, nur bei den Jaunde ist er an die fünfte Stelle getreten und dafür der Mais an die vierte gerückt. Ob es allein die Rücksicht auf das trockenere Klima des Jaundelandes gewesen ist, die dem Trockenheit liebenden Mais vor dem im regenreichen Süd- und Westpangwegebiete besser gedeihenden Ngon den Vorzug gegeben hat, vermag ich nicht zu entscheiden, jedenfalls ist der Ngon für das riesige Pangwegebiet und weit darüber hinaus so wichtig, daß man glauben sollte, es wäre ihm in Fachbüchern über tropische Nutzpflanzen

ein breiter Raum gewidmet, indessen findet man weder bei Sadebeck noch bei Fesca oder anderswo die Pflanze auch nur erwähnt.

Über die Entstehung des Namens hören wir den Fang folgendes Geschichtchen zum Besten geben: Zuerst kannte man den Namen *ngǒn* gar nicht, man nannte die Pflanze nur allgemein *ekǎluga* (von *a kat* = klopfen, weil die Kerne aufgeklopft werden, allgemeiner Ausdruck für alle Früchte, die aufgeklopft werden, und deren Inneres eßbar ist, z. B. *andǒk* = **Irvingia** usw.), auch war sie noch nicht angepflanzt wie heute, die Weiber suchten sich vielmehr die Früchte im Busch zusammen. Nun war einmal ein Mann, der hatte keine Schwester, durch deren Verkauf er sich eine Frau hätte verschaffen können, noch hatte er sonst einen Menschen, der ihm helfen konnte, zu heiraten; da kam er nun auf den Gedanken, eine riesige Ngonfarm zu machen, und als der Ngon reif war, kamen viele Leute und kauften die Kerne. So hatte er schließlich so viel Geld verdient, daß er den Kaufpreis für ein Mädchen beisammen hatte. Als das andere Leute, die auch keine Weiber hatten, erfuhren, begannen sie, es ihm nachzumachen und heirateten auch mit Hilfe der Pflanze. Daher sagt man: „Oh, ich sehe dieses Gewächs wie ein Mädchen *(ngǒn)*, und darum soll es auch *ngǒn* heißen, denn hätte der Mann keinen Ngon *(ngǒn)* gehabt, so hätte er auch kein Mädchen *(ngǒn)* heiraten können. Man beachte, daß die beiden Worte durch die Töne verschieden sind, die Pflanze hat Hochtiefton im Fang *(ngǒn)*, Tiefhochton im Jaunde *(ngǒn)*, das Mädchen nur Hochton *(ngǒn)*. Ähnlich ist eine Erzählung in der Schöpfungsgeschichte.

Der Ngon wird bloß einmal im Jahre gepflanzt, da seine Kultur die Zeit vom April bis Dezember erfordert. Im April, oft schon sehr lange vorher, wird der Busch geschlagen und gebrannt, der Boden jedoch nicht gereinigt, sondern alles liegen gelassen, wie es fällt, höchstens einmal auf den Verbindungswegen das gröbste Reisig beiseite geräumt. Eine Durchwanderung der Farm, zumal auf Pflanzungswegen, kommt daher einer turnerischen Leistung gleich. Oft wird eine Ngonfarm von den Einwohnern zweier benachbarter Dörfer derselben Sippe gemeinschaftlich geschlagen, jedoch sind die Grenzen, die durch stehengelassene oder gefallene Bäume, seltener durch Lianen angezeigt werden, die man an das Gezweige der liegenden Baumstämme geknüpft hat, dem Uneingeweihten nicht erkennbar, und man muß sich wundern, daß keine Grenzstreitigkeiten vorkommen.

Ist im April die Farm gebrannt, so ziehen die Weiber aus und pflanzen mit ihrem Universalwerkzeug, der Hacke, die Ngonkerne, die vorher einen Tag im Wasser gelegen haben müssen, in die Erde, und zwar zwei bis drei zugleich; da dies aber wegen der herumliegenden Stämme und des Gestrüpps eine böse Arbeit ist, so pflegen wenigstens am ersten Tage die Männer mit

Abb. 53. Frau aus Bibai (Fam. Esong) beim Aufklopfen der Ngonfrüchte in einer Kassavepflanzung.

Hauer und mit dem Grabstock beim Pflanzen zu helfen, während beim Erdnußpflanzen „kein hübscher, junger Mann, überhaupt keiner, der durch Kraft, Schönheit und Einfluß irgend etwas bedeutet", hilft, nur hier und da ein häßlicher oder alter Mann, der sich bei seiner Frau recht beliebt machen will, „damit sie ihm nicht am Ende einmal ausrückt und zu einem anderen geht". Ist die Pflanzarbeit zu Ende, so wird der Ngon sich selbst überlassen und rankt nun an den Baumstämmen und -zweigen hoch; Mitte Mai ist er schon kniehoch, im Juni, Juli wird einmal gejätet, später unterdrückt der Ngon selbst, alles überrankend, das Unkraut, nur einige größere Pflanzen schießen trotzdem in die Höhe und werden bei Gelegenheit ausgerissen. Im September finden wir schon einzelne Früchte ausgereift, und mit Anfang der Trockenzeit, im November und Dezember, kann zur Ernte geschritten werden. Laub und Stengel sind dann fast ganz vertrocknet, und die Früchte hängen an den trocknen Stengeln in dem nunmehr wieder kahl gewordenen Geäst der Bäume, die der Pflanze als Stütze gedient hatten.

Zur Zeit der Ernte wird ein Platz in der Pflanzung gereinigt und mit Blättern sauber belegt. Nun werden die Früchte abgepflückt, was bei mittleren Pflanzungen in drei Tagen beendet ist, und auf dem Platz aufgehäuft, um den ein Gitter von Ölpalmenblättern hergerichtet ist, dann werden die Früchte mit einem Stock aufgeschlagen (Abb. 53) — der Inhalt wird darin gelassen — und zum

Schutz gegen Feldmäuse und Regen mit Kardamomblättern bedeckt. Diese Arbeit ist in einem Tage erledigt. So müssen die Früchte vier Tage liegen. Nach dieser Zeit werden die Kerne aus den Früchten herausgenommen und in gewöhnlichen mit Bananenblättern ausgelegten Körben einen Tag im Hause stehen gelassen, dann werden sie am Flusse gewaschen, um den umgebenden, in Gärung übergegangenen Fruchtschleim zu beseitigen. Den Schluß dieser ziemlich umständlichen Zubereitung bildet das Trocknen. Zu diesem Zweck werden die Kerne zusammen mit Lehm in der Hand durchgeknetet und dann auf dem Dorfplatze ausgebreitet. Warum dies Durchkneten in Lehm geschieht, ist unsicher. Einige sagen — was das Wahrscheinlichere ist —, daß der Ngon dadurch „stärker" würde, da natürlich die dunkle Lehmfarbe die Sonne stärker auf den Kern wirken läßt; von anderen, besonders Jaundefrauen, stammt die Angabe, daß andernfalls, wenn nämlich die Kerne nicht mit Lehm vermischt werden, beim Aufklopfen Schlafsucht oder Schwindel in den Augen eintritt. Ob dies nur ein Aberglaube ist oder auf richtiger Beobachtung beruht, kann ich nicht entscheiden. Jedenfalls müssen die Kerne zwei Tage oder, falls schlechtes Wetter dazwischen kommt, entsprechend länger an der Sonne auf dem Dorfplatz trocknen. Wandert man nach der Ngonernte durch die Dörfer, so findet man vor vielen Häusern die Mengen der weißen, mit Lehm überzogenen Kerne ausgebreitet, Kinder oder Weiber bewachen den Schatz vor vorwitzigen Hunden und Hühnern, beantworten jedes unbefugte Betreten ihrer Ernte mit entrüsteten Drohrufen — besonders eifrige Frauen bewerfen das zudringliche Vieherug mit Steinen, Holzstückchen oder anderen Wurfgeschossen, bis endlich der besorgte Gatte aus dem Versammlungshause hervorkommt und mittels Stock oder Fliegenklatsche die Störenfriede in respektvollere Entfernung vertreibt, wo sie die Einsicht gewinnen, daß es noch andere, bessere Plätze gibt, und sich auf den nächsten, weniger scharf bewachten Haufen stürzen. Diese Zeit habe ich immer besonders gerne auf Reisen gehabt, da sich dann wenigstens etwas Leben auf dem sonst so stillen Dorfplatz zeigte. Und vollends, wenn eine schwarze Wetterwolke das Nahen eines Tornados anzeigt, kommt Leben in die Gesellschaft; alles eilt, die Kerne einzusammeln, selbst stämperige Greise und die kleinen, nackten Kinder beteiligen sich eifrig, aber doch mit großer Vorsicht, um nicht den Staub mitzunehmen, der trotz alles Kehrens mit dem Besen den Dorfplatz in Masse bedeckt. Für gewöhnlich geschieht das Einsammeln dagegen am Spätnachmittag mit großer Ruhe und Langsamkeit, zumal der anhaftende Lehm, von dem ich vorhin sprach, sorgfältig von den Kernen entfernt wird. Die Angst vor überraschenden Regengüssen hat übrigens allerlei Schutzmedizinen erzeugt, die ich an anderer Stelle (Abschnitt XIV) beschreibe.

Von Schädlingen hat der Ngon mehr als die Erdnuß zu leiden, so sind kleine Käfer und Raupen, besonders aber eine Wanzenart auf die Blätter, einige Säugetiere auf die Früchte erpicht, unter diesen besonders die rotschwänzige Meerkatze, **Cercopithecus kuscalis** Leconte *(ośók)*, und, wo er vorkommt, der Pavian, **Maimon planirostris** Elliot *(esŭrge)*, ferner aus der Familie der Eichhörnchen **Sciurus ebariverus** Du Chaillu *(mvǫk)* und **Sc. lemniscatus** Leconte *(oszǫn)*, von den Mäusen tritt am schlimmsten auf **Dendromys messorius** Thomas *(njoa)*, nebenbei noch andere Arten wie **Mus pusillulus** Ptrs. *(okǫb)*; stellenweise richten Elefant und Büffel, die ebenfalls die Früchte fressen, große Verwüstungen an, die Schirrantilope *(nkǫk)* frißt die Blätter. Auch die Fruchtfäule *(ntŭr ngǫn*, d. h. Durchfall des Ngon), eine Folge zu reichlicher Regenfälle, vermindert die Ernte mitunter um ein Beträchtliches. Gegen alle jene Feinde ist ja nun nicht viel zu machen, da sie sich zu wenig um Schutzmedizinen kümmern, jedoch glauben die Pangwefrauen die Kerne und die jungen Pflanzen durch allerhand Mittel, ähnlich wie bei der Erdnuß, günstig beeinflussen zu können. Ein solches, *ba-ape*, ist schon bei Besprechung der Erdnuß beschrieben worden, ein zweites ist das Bestreuen der im Buschteller zur Aussaat aufbewahrten Kerne selbst mit zerriebenem Rotholz (Rotholz als Zeichen des Wachstums, der Freude und der Zeugung). Ein anderes Verfahren, die Ngonpflanzen in der Farm im Wachstum zu stärken und zu reichem Fruchtansatz zu veranlassen, heißt *emiŕ ndób*, d. h. Ausspritzen von (der Medizin im) Bananenblattgefäß. Dazu wird ein Gefäß aus Bananenblättern in der Mitte der Farm eingegraben bzw. aufgestellt und folgende Sachen hineingetan:

1. Früchte von **Alchornea cordifolia** Muell. Arg. *(abut)*, wegen der Menge der Früchte, daher auch der Name *abut* von *abut* = viel (vgl. *a bus* = zerbrechen, denn dann gibt es viele Stücke!);
2. Kraut der Amarantacee **Aerva lanata** (L.) Juss. *(anggnenggne III anggnggne* = angeglichen, *anggnggnǫ)*, wegen des reichlichen Blütenstandes;
3. Früchte der **Pseudospondias microcarpa** (Rich.) Engl. *(ofǫs)*, wegen der vielen Früchte (vgl. Erdnußmedizinen);
4. Früchte der Euphorbiacee **Staphysora dusenii** Pax. *(owŭwŭmu II* und *III)* wegen der vielen Blüten, daher ist der Name von *a wŭmu* = ausetzen durch Verdoppelung gebildet;
5. Laub des Meleguetapfeffers **Aframomum melegueta** K. Schum. *(andǫs)* zerrieben, ebenfalls wegen der Üppigkeit der Pflanze.

Alles dies wird im Gefäß mit Wasser zerrührt und nun mit einem Stengelstück des Cissus *(pfádók IV)* auf die jungen Ngonpflanzen gespritzt, damit der Ngon „so üppig wachere wie die Cissusranke".

Je nach der Gegend wechseln die verschiedenen Teile und Zusätze der Medizin, oft werden einige von ihnen allein benutzt, z. B. **Staphysera** mit Holzkohle vermischt in die Pflanzung gestreut, alle sind sie aber gewählt unter dem Gesichtspunkte, daß sie ihre Kraft auf die Ngonpflanzen übertragen können.

Auf die Wichtigkeit des Ngon im Wirtschaftsleben wirft das Ngonverbot bei den Ntum und Fang ein Licht, das denjenigen Weibern, die gepflanzt haben, für drei Monate geschlechtlich zu verkehren verbietet. Was diese unverhältnismäßig lange Fastenzeit, wenn ich so sagen darf, heißen will, ermißt man daran, daß z. B. bei dem wichtigen Weiberkult Mekang die Neulinge nur zehn Tage geschlechtliche Enthaltung zu üben brauchen, und daß sie bei dem allerwichtigsten Männerkult, dem Sso der Jaunde, faktisch nur drei Monate dauert. Die Fang sagen: Der Ngon würde nicht wachsen, wenn das Verbot gebrochen würde, und der Magen geht ihnen denn auch zu sehr über die Liebe, als daß nicht im allgemeinen dieses Verbot innegehalten würde.

Als Nahrung verwertbar ist nur der weichere Inhalt der Ngonkerne. Man muß sie also aufschlagen, und zwar geschieht das mittels eines kleinen Stockes aus dem Baum **Microdesmis puberula** Hook. f., Euphorbiaceae *(obimrɔ̀n)*, mit dem man leicht auf den hochkant gestellten Kern schlägt. Alt und jung, Mann und Weib beteiligt sich an dieser Arbeit, die in und vor dem Wohnhause wie im Versammlungshause ausgeführt wird und sich durch jenes eigenartige knackende Geräusch verrät, das man nicht leicht vergißt, wenn man es einmal gehört hat. Trotz seiner Wichtigkeit im Haushalt wird der Ngon nicht sehr vielseitig bereitet; er wird, wie die Erdnuß, nur als Suppe und zerrieben, in einem Blattbündel gekocht, gegessen.

Und zum Schluß, geduldiger Leser: *kɔ́ndɔ́ɔ́* (rate ein Rätsel!): *kɔ́ndɔ́ɔ́* (ich rate):

akɔ́ɔ́ afə̀, e mane nkɔ̀rna ngɔ̀ɔ,
Speer einer, er macht fertig Herde-Schweine.

Antwort:

okɔ̀k ofə̀, e mane dɔ́ɔ́d e ngɔ́n
Klopfer einer, er macht fertig Buschteller (mit) Ngon.

Yams, als Nebengewächs des Ngon, wird hauptsächlich in zwei Arten angebaut, diese sind der dreiblättrige Yams **Dioscorea dumetorum** (Kunth) Pax *(andɔ́ɔ́)* und der gewöhnliche, **Dioscorea minutiflora** Engl. *(emɔ́ɔ́)*

mit je vier Abarten; daneben unterscheiden die Pangwe noch zwei als Arten, die aber vielleicht zu **D. minutiflora** gehören oder ihr nahestehen: *ígŋ̀ III* Nt., *dzŋ́*, Mehrzahl *bíŋ́* F. und *ebŋ́ŋ́*. In Jaunde gibt es noch den Jaundeyams mit großen Knollen: *ekŋda* J. Schließlich baut man auch den Luftknollenyams **D. sativa** L. *(alók)* an, aber nur sehr wenig. Wie oben gesagt, gleichen die Wachstumsbedingungen des Yams denen des Ngon, auch er rankt an dem liegengelassenen Strauch- und Baumwerk hoch und wird deshalb oft, zumal der Luftknollenyams, zusammen mit dem Ngon angepflanzt. Eßbar am Yams sind im allgemeinen nur die Wurzelstöcke, beim Luftknollenyams nur die Luftknollen, die, wenn sie reif sind, alle zugleich abfallen. Das hat zu einem symbolischen Brauche beim Yamsessen der Kinder Anlaß gegeben. Wenn z. B. drei Söhne einer Mutter Yams essen, so stößt der erste den zweiten an und dieser den dritten, zum Zeichen, daß sie nacheinander, wie es das natürliche ist, sterben wollen und nicht an einem Tage, wie die Luftknollen.

Abb. 54. Kassavesteckling.

Bedeutend weniger als von der ersten und zweiten Gruppe ist von der dritten zu sagen, deren Hauptgewächs Kassave oder Maniok, **Manihot utilissima** Pohl *(mbŋ̀n I)*, ist. Die Zeiten für die Kassave liegen folgendermaßen:

ŋŋgn esób = große Trockenzeit (Dezember bis Februar), Farm geschlagen;
ósgó, esób = kleine Regenzeit (März bis Mai), Pflanzen gesteckt;
ofŋ̀n = Regenhalbjahr verstreicht.

Im folgenden *esób*, also vom Januar des nächsten Jahres an, das sind sieben Monate nach dem Auspflanzen, kann die Ernte beginnen und sich über beliebige Zeit hinaus erstrecken, da die Pflanze eine ausdauernde ist.

Medizinen zum Gedeihen der Kassave, wie bei Erdnuß und Ngon, gibt es nicht. Das Gebet der Pangwe — Altbekanntes in neuem Gewande — würde sein: „Lieber Gott, laß Erdnuß und Ngon recht gedeihen, die Kassave wächst von selber!" Feinde hat sie nämlich verhältnismäßig wenig, nur Ziegen und Schafe, die die Blätter gern verzehren, und eine Heuschreckenart *(mbadadn III)*, die sich massenhaft auf den Blättern sämtlicher Kulturpflanzen, insonderheit von Kassave und Zuckerrohr einfindet. Varietäten der Kassave gibt es sieben, indessen würde es zu weit führen, sie hier aufzuzählen. Die Kassave wird wie Abb. 54 zeigt, gesteckt, indem man die Erde etwas über dem Steckling anhäufelt.

Ähnlich verhält sich das Zuckerrohr, **Saccharum officinarum** L. *(nkɔ̈k I)*; es wird ebenfalls in den Regenzeiten „gesteckt", und zwar werden die Stecklinge vom oberen Teil des Stengels genommen, den man „Pfeil" (P.: *esɔ̈k*) nennt, bedarf aber längerer Zeit zur Reife, denn es wird in der zweitfolgenden Regenzeit, also nach 13 Monaten, geerntet. Kassave und Zuckerrohr findet man häufig auf einer Pflanzung, oft noch mit Plantenkulturen dazwischen.

Rätsel:

1. *ofüe e ne m' oko, ke a wụlụ*
(Ein) Wasser, es ist mir dort, nicht (zu) fließen.
— Der Saft im Zuckerrohr.

2. *bangá-tsida*[1]) *be ne m' oko, vö medźọke medźọk*
Weiber-Vaters sie sind mir dort, bloß (mit) Tanzhauben, Tanzhauben
— *masạm me nkɔ̈k* = Blüten des Zuckerrohrs.

3. *ma vuán okö-a ngɔ̈k, o ke lạme nga*
Ich werfe-zu Steinchen vom Geröll, es geht treffen Frau:
ndɔ̈n-kọ́dọ́ abɔ̈n
Ndongkodo (am) Knie.

Die Auflösung ergibt sich aus folgender Zeichnung (Abb. 55). Ndongkodo ist ein Scherzname für das Zuckerrohr und spielt auf die Biegung seines Schaftes an; *ndɔ́n*, *ndɔ́no* bedeutet ursprünglich Gestirn, Sonne, ist später auf Menschen übertragen und als Personenname gebraucht, *kọ́l* = krumm, wir würden etwa sagen: Ihre Exzellenz von Krumm.

Abb. 55. Zuckerrohrsteckling.

Ich wende mich zu dem zweiten Teil der Nutzgewächse, nämlich den gartenmäßig, d. h. in kleinen Betrieben und im wesentlichen hinter dem Wohnhause oder dicht dabei angebauten zu. Freilich ist der Unterschied zwischen Feld- und Gartenwirtschaft nicht überall scharf, z. B. das Gartengewächs Taro pflanzt man oft fern von dem Dorfe in Feldern an, und Planten zieht man vielfach auf Kassave- und anderen Farmen.

Taro, Colocasia antiquorum Schott *(atá)*, und **Makabo, Xanthosoma violaceum** Schott *(ekábe)*.

Der Taro oder die Kolokasie ist — wie schon der lateinische Name sagt — ein altes Kulturgewächs, auch für die Pangwe, daher ist ihnen die Erklärung des Namen *atá* nicht geläufig; im Gegensatz dazu ist der Makabo, der aus

[1]) Altertümliche Form, heute meistens *boyá*.

Amerika stammt, erst kürzlich eingeführt und nach Angabe der Eingeborenen von den Küstenvölkern vor vielleicht 30 Jahren[1]) übernommen, daher der Name *ekábe* von *a kab-an*, abgeben, teilen, Besitz ergreifen. Beide Pflanzen gehören zur Familie der Araceen; der Taro ist vom Makabo dadurch zu unterscheiden, daß die Blätter am Grunde nur leicht eingebuchtet sind, und der Blattstiel unten in der Spreite eingelenkt ist, während der Makabo richtig pfeilförmige Blätter hat, also der Einschnitt bis auf den Blattstiel hinabreicht Ferner sind die Makaboblätter auf der Oberfläche schwach glänzend, während die Taroblätter matt, um die Adern fast bläulich bereift sind. Der Taro hat gelbe, der Makabo weiße, grün und rosa angehauchte Blüten; beide blühen in den Regenzeiten.

Merkwürdigerweise pflegen die Europäer in Kamerun den Makabo, der für sie die Kartoffel in Afrika vertritt, dem Taro vorzuziehen, obwohl dieser, rein gedämpft, zweifellos wohlschmeckender ist, während die Pangwe den Makabo wenig lieben und den Taro, ihr altes Kulturgewächs, beibehalten haben. Vielleicht kommt das daher, daß sich die Europäer zuerst der Batanga-Köche, die zu den Küstenvölkern gehören, bedienten; ihnen ist der Makabo wichtiger als der Taro, und ihre Bezeichnung *akabe*, Mehrzahl *makabe*, ist bei den Europäern zu Makabo geworden. Von einer Kultur des Makabo seitens der Pangwe kann im allgemeinen kaum die Rede sein, an den alten Stellen zwischen den Planten am Dorf hat man ihn stehen lassen, so wie er von den abziehenden Vorgängern verlassen wurde; da steht er auch heute noch — halb verwildert — und jeder kann sich davon nehmen, soviel er will. Bei Besiedlung eines neuen Gebietes pflanzen dann freilich auch die Pangwe ihn beim Dorfe an und bringen es dann stellenweise zu einer regelrechten Kultur. Man unterscheidet zwei Abarten, die grüne *mfəm ekábe* (*mfəm* = weiß, hell), deren Wurzelknollen weiß sind, und eine zweite *nsət ekábe* (*nsət* = dunkel), bei der die Blattstiele dunkelrötlich und die Knollen ebenfalls rötlich sind. Die weiße Abart ist unstreitig die bessere, die dunkle ist zur Herstellung der bei den Europäern beliebten Makabokeks nicht geeignet.

Der Taro wird dagegen angebaut, und zwar, da er bekanntermaßen feuchten Boden liebt, in der Nähe von Sümpfen oder an wasserreichen Stellen seltener in der Nähe der Häuser, meist zusammen mit Makabo. Die Farmen sind im allgemeinen nicht groß. Vom Taro gibt es drei Abarten:

1. *mfəm atá*: Blattstiele grün, Blattunterseite glatt;
2. *atáále III* (von *a dáá* = anfüllen, die Abart trägt so viele kleine Knöllchen, daß sie einen ganzen Teller füllen): Blattstiele bläulich, Blattunterseite glatt;

---

[1]) Gegen genaue Angaben von geschichtlichen Daten wird man sehr zurückhaltend, wenn man mit dem Schätzungsvermögen der Neger Bekanntschaft gemacht hat.

3. *undondóle III*: Blattstiele bläulich, Blattunterseite an den Blattrippen jederseits mit dunkelgrünen, flechtenähnlichen Auswüchsen.

Der Taro wird zweimal gepflanzt, in der großen und kleinen Regenzeit, und zweimal geerntet, in den darauffolgenden großen und kleinen Trockenzeiten, dabei werden alle Knollen aus dem Boden entfernt, die Farm also ganz abgeerntet; sollte einiges vergessen sein, so liest man in der nächsten Trockenzeit nochmals nach, aber damit ist es zu Ende, mehr als zwei Ernten von derselben Aussaat werden niemals gehalten. Das Stück Land, auf dem Taro gestanden hat, bepflanzt man nie zum zweiten Male, da man an sumpfigem Land genug zur Verfügung hat. Wachstumsmedizinen gibt es für Taro nicht.

Die Knollen und jungen Blätter werden als Gemüse gegessen. Übrigens ist es den Pangwe bekannt, daß nicht genügend gar gekochte Knollen „*melsáw*", das ist Jucken im Halse usw., verursachen; sie benutzen sie ferner als Medizin bei Blutgeschwüren (*mɛ̨l'm*), indem sie die harzartige Ausscheidung des **Pachylobus fraxinifolius** Engl., Burseraceae (*asɛ̨ń*), auf die Geschwulst bringen und darüber ein Geschabsel von rohen Taroknollen schmieren, durch dieses Mittel sollen die kranken Stellen, „*ntégan*", das ist schwach, weich werden.

Plante.

Die Schößlinge der Plante sowie ihres Nebengewächses, der Banane, werden ums Dorf herum oder in Farmen angepflanzt, gedeihen ohne Pflege und reifen zu jeder Jahreszeit. Die Plante[1]) oder Negerbanane **Musa paradisiaca** L. (*ekgn*) (Abb. 56), die im Pangwegebiet in 25 Abarten vorkommt, erreicht freilich nicht die Üppigkeit der Banane, die geradezu wuchert, aber sie ist doch auch sehr fruchtbar, so recht eine Pflanze für den Neger.

Rätsel: *mónénga e ne m' okö, a wgle bɛ̄ bɔ̄n, kaa nüm*
Frau sie ist mir dort, sie viel gebärt Kinder, kein (ohne) Mann.
Antwort: *ekgn* = Plante.

Das ist so das Ideale: Lohn ohne Arbeit, Früchte ohne Anstrengung, Essen, das einem ohne der Hände Werk in den Mund wächst, und in diesem Sinne verdient die Plante wie ihre Schwester, die Banane, den Namen paradisiaca wirklich am meisten von allen Kulturgewächsen. Von der Banane, **Musa paradisiaca var. sapientum** L., gibt es zwei Arten, die Buschbanane (*adźńí, adź.-ekgn*) und die Edelbanane (*elɛ̨l, el.-ekgn*). Man ersieht aus

[1]) Das Wort Plante ist aus dem englischen plantain übernommen und dieses wieder aus dem spanischen plátano, das Banane heißt. Da die Plante sehr von der echten Banane zu unterscheiden ist, so halte ich die Beibehaltung des Wortes Plante für zweckmäßig. Die Franzosen nennen sie banane-cochon.

Abb. 36. Planten (Negerbananen) und Bananen bei Nsaälang (Fam. Easäuong).

dem Namen, daß auch bei den Pangwe die Bananen als eine Form der Planten gelten. Die Edelbanane, die wir kennen, ist, so sagen die Pangwe, von der Küste her eingeführt, man nannte sie zuerst *madźñi mentaŋgan*, d. h. Bananen der Weißen, später gab man ihnen den Namen *etał* vom Stamme *a tał* = stöhnen. „Man" aß nämlich zu viel davon, das konnte „man" nicht vertragen, „man" wurde schlapp, und „man" erlegte nichts mehr auf der Jagd usw., bei den Pangwe immer der Hauptkummer.

Auf die weniger wichtigen Gemüsepflanzen kann ich an dieser Stelle nur kurz eingehen; die Süßkartoffel, **Ipomoea batatas** L. *(dəgŋ̄ III)*, wird nicht kultiviert, sie wuchert in der Nähe der Dörfer und erstickt jedes andere Unkraut, so daß man von Batatenwiesen „en miniature" sprechen kann. Sie ist als Nahrung nicht sehr beliebt. Von weiteren Gemüsepflanzen, die teils in der Nähe der Häuser, teils auf den Farmen mit ausgesät und angepflanzt werden, ist in erster Linie zu nennen die zur Familie der Cucurbitaceen gehörige **Cucurbita maxima** Duch. *(abŋk)*, von der es vier Sorten gibt. Das Fruchtfleisch wird gegessen, ebenso das Innere der Samen, kleine unreife Früchte kommen auch ganz als Zutat ins Erdnußbündel. Die jungen Blätter werden zerschnitten und als Gemüse gegessen, doch soll man die Fruchthaut nicht entfernen, sonst würde man im Kampfe verwundet. Die Kerne müssen von den Männern vermieden werden, wollen sie nicht ihre Manneskraft in der

folgenden Nacht einbüßen, daher verstößt es gegen den Takt, wenn die Frauen die Früchte mit den Kernen den Männern zum Essen auftischen.

Von den Malvaceen und Tiliaceen werden gepflanzt: **Hibiscus** und **Corchorus** *(tège III* = Früchte, *etɛ̈tám)*. Der Name kommt von *a tɛ̈k* = schwach, denn die Blätter werden in kurzer Zeit auf Feuer gar, die Früchte heißen *etɛ̈tam* von *a tɛ̈bɛ̈ etám* = alleinstehen, denn sie stehen allein an der Spitze des Stengels, wenn das Laub verwelkt oder abgepflückt ist. Früchte wie Blätter werden gegessen. Man unterscheidet als Abarten **Hibiscus moschatus** Roxb. *(nia tège* = richtiger Hibiscus) und die Tiliacee **Corchorus olitorius** L. *(ngbábelɑ̃mo IV)*. Unter dem Namen *esáṅ* faßt man drei Pflanzen verschiedener Familien zusammen, nämlich die Malvacee **Hibiscus sabdariffa** L. *(engɑ̃ne-esáṅ)*, die Polygonacee **Rumex abessynicus** Jacq. *(ebábɑ̃dɑ̃-es.)* und die Melastomatacee **Dissotis decumbens** (P. B.) Trian. *(esɪsáṅ-bongɑ̃n-b'oyek)*.

Alle diese Pflanzen werden ausgesät und ihre Blätter gegessen.

Weitere Nutzpflanzen sind:

Aus der Familie der Solanaceen: **Solanum melongena** L. var. **inerme** Hiern. *(azɑ̃n)*, **Solanum dinklagei** U. D. *(ogɑ̃la)*, **Solanum lycopersicum** L. *(azɑ̃ṅ nlɑ̃ṅgan = azɑ̃ṅ* [S. melongena] der Weißen — von diesen drei Solanumarten werden die Früchte gegessen —, ferner **Solanum aethiopicum** L. *(ẓɑ̃m IV, enɛ̃m)* mit drei Abarten: *niá ẓɑ̃m* = eigentlicher *zɑ̃m*, *nlɑ̃ma I* und *ndzɛ̃ẓɑ̃m* sowie **Solanum macrocarpum** L. var. **thonningii** *(etür-zɑ̃m* von *etür* = **S. duplosinuatum** U. D., wegen der Ähnlichkeit der Früchte) — von letzteren beiden Arten werden die Blätter gegessen. Aus der Familie der Amarantaceen: **Celosia argentea** L. *(ẓɑ̃m e mvɛ̃lɛ̃*, d. h. *ẓɑ̃m* der Mwele), **Celosia laxa** Schum. et Thom. *(ḟɑ̃lɑ̃m [?], ebɑ̃nègán)*, **Amarantus paniculatus** L. *(ḟɑ̃lɑ̃m IV, ḟóm IV)*. Aus der Familie der Labiaten: **Ocimum basilicum** L. *(osɪm)*, **O. gratissimum** L. *(asɑ̃b)*, **Plectranthus** spec. *(avá)*, *afɑ̃ṅ* und **Aeolanthus edlingeri** Gürke *(elɛ̃lɑ̃ṅge* NT., *elɑ̃ṅgelɑ̃ṅge* F.).

II. Viehhaltung.

Die Pangwe halten sich aus gleich zu erwähnenden Gründen Haustiere, doch kommt es dabei nicht zu einer ausgesprochenen Wirtschaftsform, die man als Viehzucht bezeichnen könnte. Von den vierfüßigen Haustieren kommen vor: Hund, Ziege und Schaf, von Geflügel das Huhn und neuerdings eingeführt die Ente.

Der Hund *(mɛ̃ɑ́ IV)* wird im wesentlichen der Jagd wegen gehalten, er wird aber auch gegessen, mit besonderer Vorliebe von den Jaunde. In den Augen

des Europäers ist er nichts weiter als eine Karikatur, ein abstoßendes Zerrbild; ein Blick in ihre falschen Augen genügt, um die Tiere zu hassen; gewöhnlich von Geschwüren bedeckt, von diebischem und verlogenem Wesen, unfolgsam, feig und streitsüchtig zugleich, drängen sie dem Beobachter oft einen Vergleich mit ihren Herren auf; auffällig erschien mir, im Gegensatz zu europäischen Hunden, ihr nicht so stark ausgeprägter Geschlechtstrieb. Um so höher schätzt sie der Pangwe, eben wegen ihrer guten Verwendbarkeit auf der Treibjagd. Gute Jagdhunde sind sehr schwer von ihren Besitzern zu haben und gelten so viel wie mittelgroße weibliche Ziegen und Schafe (14 Mk. oder 200 Speer). Hunde haben ebensogut wie bei uns ihre Namen, die aus der Liste der menschlichen Rufnamen genommen sind oder auf Eigenschaften der Tiere in scherzhafter Weise Bezug nehmen. Öfters hat man sogar diese schweinsschnauzigen Köter ganz wie Menschen mit Vor- und Vaternamen versehen oder, da die Feststellung der Vaterschaft erklärlicherweise mitunter auf Schwierigkeiten stößt, mit Vor- und Mutternamen, so: *ăkut-e-mbaṅ*.

Von menschlichen Rufnamen, die auf Hunde übertragen werden, stellte ich fest: *ndǫ̆no* (sehr alter Männername, siehe S. 100), *asŏṅ* (Schirmbaum, Männername), *mrǫ̆nǫ̆* (Satansaffe, **Colobus anthracinus** Lecontе), *ondǫ̆* (?, Männername), *ntǫ̆de-abǫ̆ṅ* (einzelner Fischotter, Frauenname), *mfŭ̈meṡǫ̆k* (das Weiße des Elefanten d. h. Elfenbein, Frauenname), *mbă,ṅ* (Elfenbein, Frauenname).

Sonstige Hundenamen: *obǫ̆nǫ̆* (von *obǫ̆n* = Perle, Perlengeschmückte, vielleicht auch Weibername), *olŭ,ṅ* (Baum **Rinorea dentata** [P. Beauv.] O. Ktze.), *ebŏ̈nenǫ̆ṅ* (der immer auf dem Bette liegt), *ajrṡǫ̆k* (*a jr* = sich sehnen, *ṡǫ̆k* = Elefant, also der sich nach Elefantenfleisch sehnt), *angŭ,ṅ* (Hundeglocke), *odzä'm* (Zwergmaki, **Hemigalago**, weil der Hund so durchs Gebüsch springt, wie die Zwergmakis auf den Bäumen), *akŭ,t* (der Dumme).

Ziege und Schaf, von den Fang als „*kǫ̆băd*" zusammengefaßt, werden als Großkapital, aus Liebhaberei und erst in dritter Linie als Schlachtvieh gehalten. Während sonst das Wirtschaftsleben unter dem Gesichtspunkt „Essen" betrachtet wird, tritt dieser auffälligerweise bei den Haustieren ganz in den Hintergrund gegen denjenigen der Freude am Besitz. Wir haben also eine richtige „Thesaurierung", deren Zweck die Aufspeicherung von Brautgeld ist, mit ihren bekannten Folgen, einer bis zum Geiz gesteigerten Sparsamkeit, die sich nur bei ganz seltenen Gelegenheiten ein Stück Fleisch gestattet und vor dem Genuß gefallener Tiere nicht zurückschreckt.

Die Ziegen *(ekŏle)* sind ebenso unangenehm wie die Hunde wegen ihres geradezu niederträchtigen nächtlichen Radaus und sonstiger unanständigen und respektwidrigen Eigenschaften. Das einzige uns sympathische Haustier ist das Schaf *(ntǫ̆ma I)*, Abb. 57, aber auch hier verdirbt das böse Beispiel der Ziegen oft gute Sitte. Ihre „Spezialität" ist es, besonders nachts ein

Abb. 57. Schafe, Dorf Makonanám (Fam. Ojek.)

menschenähnliches Stöhnen hervorzubringen, das in seinem erschütternden Ausdruck einem die Tränen ins Auge zu treiben geeignet ist. Für Ziegen und Schafe baut man in Gegenden, wo es Leoparden gibt, Ställe (Abb. 58) aus Knüppeln, in die sie des Nachts getrieben werden.

Kastrieren ist im Pangwegebiete nur bei Ziegen üblich, nicht bei Schafen (*a tə̄b miǵk* = [den Hodensack] aushöhlen [zu] Verschnittenen) und wird ausgeführt, „damit die Ziegen mächtig groß werden und viel Fett ansetzen". Das Verfahren ist sehr roh; der Fachmann, der übrigens vielfach zugleich das Beschneiden der Kinder ausübt, öffnet mit dem Rasiermesser (*okŏngŏn*) den Hodensack der jungen Tiere durch zwei seitliche Schnitte und nimmt den Hoden heraus, dann wird der Sack vier Tage lang mehrmals täglich mit warmem Wasser ausgewaschen. Dem Wasser ist eine Medizin beigemischt, nämlich der Saft der Guttifere **Haronga paniculata** Pers. (Loid.) (*atū,rn*), angeblich, um den Sack zusammenzukleben (der Baum schwitzt unter der Rinde einen klebrigen gelben Saft aus, den man auszieht, indem man Rindenstücke in Wasser legt.)

Der günstige Einfluß auf die körperliche Entwicklung des Tieres bringt eine Wertsteigerung von nebenbei 14 Mk. auf 35 Mk. (500 Speer), also eine Kapitalvergrößerung mit sich, die dem Pangwe gewiß erwünscht ist, größer aber ist noch seine Freude an dem schönen Aussehen der kastrierten Tiere.

Abb. 38. Schaf- und Ziegenstall in Massóm (Fam. Ndong), Süd-Kamerun.

Auf der Wirkung der Kastration beruht der Vergleich der symbolisch, nicht körperlich kastrierten Menschen (vgl. Abschnitt XVIII, Geschlechtsleben), die sich nun auch — bis zu einem gewissen Zeitpunkt wenigstens — geistig hervorragend entwickeln sollen, mit den kastrierten Ziegen und die Benennung jener mit demselben Namen. Daß das Fleisch solcher Tiere auch als Nahrungsmittel genommen, durch die Kastration besser wird, spielt nur eine nebensächliche Rolle.

Prächtige alte Stücke, auch nicht kastrierter Ziegen und Schafe, werden mitunter mit einem menschlichen Namen belegt, und der Besitzer würde ein derartiges Tier niemals verkaufen, nicht einmal als Heiratsgut fortgeben.

Von sonstigen Haustieren kommt nur die Katze *(pfëʼs IV F., esiʼŋa)* vor, die erst ganz neuerdings von der Küste mitgebracht ist.

Von Geflügel ist einheimisch nur das Huhn *(kub IV)*, von dem man nicht die Eier, sondern nur das Fleisch als Nahrungsmittel benutzt und auch das nur selten und bei besonderen Gelegenheiten. Auf seine Bedeutung in der religiösen Anschauung der Eingeborenen komme ich an geeigneter Stelle zurück.

Für die Hühner werden kleine Ställe aus Knüppeln hinter dem Hause gebaut, ferner werden ihnen Körbe an der Außen- und Innenwand des Hauses hingehängt, in denen sie ihr Brutgeschäft abmachen können, auch wird ihnen

im Hause auf einem unbenutzten Bett ein Ruheplatz nicht verweigert, falls die Glucke ihn für sich und ihre Küchlein der Sicherheit wegen für den geeignetsten hält; durch ein Loch unten in der Wand findet die Hühnerfamilie einen Ausschlupf.

Enten mit einem roten Kragen um das Auge sind in den achtziger und neunziger Jahren eingeführt; sie gelangten etwa 1890 in das Fanggebiet nnd hießen *elõ̃* (Wildente = *elõ̃l*), später wurden sie *sõ,ũ̃ III* benannt.

Tierfreunde, wie andere Naturvölker, können die Pangwe nicht genannt werden. Gezähmte Tiere des Waldes sieht man außer Papageien so gut wie gar nicht, selbst nicht Affen. Die Pangwe „ermüden" = *a ɾõ̃l*, sie zu pflegen und zu füttern, und man kann es den freiheitlich gesinnten Vierfüßlern und Vögeln dann nicht verdenken, wenn sie das Weite suchen oder sich zum Sterben legen. Graupapageien, die sich gleich mit ihren Rufnamen, z. B. als *esõ̃sõ̃* = Milan, jedem Fremdling vorzustellen pflegen, gibt es recht häufig; sie finden ihre Nahrung meist auf den Abfallhaufen oder unter den Speiseresten im Hause. Hin und wieder kommen jung eingefangene Wildschweine vor, einmal wurde mir ein junger Leopard gebracht, den eine Frau versucht hatte, durch Anlegen an die Brust am Leben zu erhalten, das Tier hatte aber die hilfsbereite Frau arg zerkratzt, und sie war gar bald von der freiwillig übernommenen Mutterpflicht zurückgetreten.

Die Biene, **Apis mellifica** L. var. **adansoni** *(mɾũfũ,ñ IV, ñũ,ĩ IV* F.*)*, wird nicht gezüchtet, wohl aber wird der wilde Honig *(wũ,ɾ*, Mehrzahl *mũ,ɾ)*, der meist in Baumstämmen zu finden ist, eingesammelt und roh verzehrt.

III. Fischerei.

Wie Westafrika überhaupt eines der reichsten Fischgebiete der Erde ist, so weisen auch die zahlreichen Flüsse und Ströme des Pangwelandes eine große Masse verschiedener Fischarten auf. Einige der hervorragendsten und typischsten Vertreter der Fischwelt des Kampo-Uellegebietes zeigt Tafel IX. Besonders reich vertreten ist hier die Familie der Welse (Siluridae). Von ihnen sind zu nennen: **Eutropius banguelensis** Blgr. *(ekɪ,da* F., *kɪ,da IV* Nt., jung = *esõb)* der Stachelwels **Auchenoglanis balayi** (Sauv.) var. **gravoti** Pellegr., das ist der Katzenfisch der Pangwe: *nsɪ̃ñ I*[1]), **Clarias submarginatus** Ptrs. *mɾõ̃ IV* F., *mɾõ̃ IV* Nt.) und **Clarias walkeri** Gthr. *(ngõ̃ IV)* sowie eine neue **Synodontis**-Art, **S. tessmanni** Papph., *(ebõ)* und eine neue **Clariallabes**-Art, **Cl. longicaudatus** Papph. *(ndõ̃ñga I, odõge III)*. Ferner wurden Arten aus den Gattungen **Doumea, Parauchenoglanis** und **Atopochilus** gesammelt. Von den Mormyriden sind zu nennen: der überall vorkommende, wegen seines merk-

[1]) *nsɪ̃ñ I*, die Ginsterkatze, **Genetta**, weil der Fisch ebenso gefleckt ist.

TAFEL IX

FISCHE AUS DEM KAMPO UND UELLE

a Auchenoglanis balayi (Sauv.) var. gravoti Pellegr. (Fam. Siluridae).
b Eutropius bangueleensis Bgr. (Fam. Siluridae).
c Distichodus hypostomatus Pellegr. (Fam. Siluridae).
d Barbus guirali Thomas. (Fam. Cyprinidae).
e Sarcodaces odoi (Bl.) (Fam. Characinidae).

Verlegt bei Ernst Wasmuth A.-G., Berlin

[facing p. 108]

würdigen, mit einem elektrischen Organ ausgestatteten Schwanzes beachtenswerte **Gnathonemus moorii** (Gthr.) *(anẽn)*, ferner **Marcusenius sphekodes** (Sauv.) *(ntŏtŭm I)*, beides kleinere, für die Pangwe unwichtigere Arten. Aus der Familie der Characiniden ist besonders erwähnenswert: **Sarcodaces odoë** (Bl.) *(nsŏ̃ I)*, **Distichodus hypostomatus** Pellegr. *(mbŭ̃n I)*, als neu **Alestes tessmanni** Papph. *(ekɨ̨da* F. *kɨ̨da IV* Nt.); aus der Familie der Cypriniden **Barbus**-Arten, so **B. guirali** Thomin *(mɨ̨ŭ̃ III endzɨrma mɨ̨ŭ̃)* und der neue **B. malacanthus** Papph. sowie mehrere Arten der Gattung **Barilius.** Weiter habe ich Arten aus den Familien Cyprinodontidae, Anabantidae, Cichlidae und Mastacembelidae gesammelt, auf die ich hier indessen nicht näher eingehen kann.

Die Ausnutzung des Fischreichtums der größeren Ströme ist eine verhältnismäßig geringe, weil die Pangwe sich mit ihren schlechten Flößen auf den meist reißenden Gewässern zu unsicher fühlen, und die wenigen vorhandenen Einbäume, die außerdem den Verkehr an den Übergangsstellen bewältigen sollen, zu einer genügenden Ausbeutung des Fischreichtums nicht ausreichen und für einen Fischereibetrieb überhaupt nicht geeignet sind, dazu kommen die Abgeschlossenheit der Dörfer und die schlechten Verkehrsverhältnisse. Im einzelnen schaffen die hydrographischen Verhältnisse schon auf ziemlich kleinem Gebiet große Verschiedenheiten, so spielt z. B. in Jaunde die Fischerei nicht die große Rolle wie im Süden, die Bawa (Unterstamm der Jaunde) kennen beispielsweise außer dem Fischtreiben nur vier Fangmethoden, nämlich den Korbwehrfang mit langen Körben *(nsŏ̃n I)* und den mit gewöhnlichen Körben *(nkŏ̃ɨ̨ĕ I)*, das Vergiften der Fische *(ngŭ̃m IV)* und das Angeln.

Um ein allgemeines Bild von dem Fischereibetriebe zu geben, dessen wechselnde Formen in den verschiedenen Gegenden zu schildern zu weit führen würde, bespreche ich nur die verschiedenen Verfahren, die ich bei den mittleren Pangwe im Flußgebiet des Kampo mit seinen linken Nebenflüssen, des Uelle in seinem Mittellauf und vor allem seiner Nebenflüsse Bimfille, Abea usw. kennen gelernt habe. Die besten Monate für den Fischfang sind dort September bis Februar, wenn die Flüsse nach ihrem höchsten Stand anfangen zu sinken; während der übrigen Zeit wird nur geangelt oder hier und da ein Korb gelegt.

Die Fischerei ist Männerarbeit mit alleiniger Ausnahme des Fischtreibens, das Sache der Weiber ist. Die Methoden sind folgende:

1. Fischtreiben, *a lŭ̃k* (Zeitwort).

Es besteht darin, daß in seichten Bächen oder Quelläufen das Wasser mit flachen Körben, sogenannten Buschtellern *(dzĕ̃d)*, stromabwärts getrieben

wird, nachdem zuvor in einigem Abstande Querdämme aus Steinen oder Zweigstücken aufgeworfen sind. Diese verhindern die Fische zu entkommen. Dann fischen die Frauen mit einem engmaschigen, flachen Netze, das an einen zusammengebogenen Stengel aus der biegsamen Scitaminee **Trachyphrynium violaceum** Radl. *(nkǔmonkǔmo)* gebunden ist und wie der Buschteller eigentlich zur Kücheneinrichtung gehört (zum Kassavewaschen verwendet), die stehengebliebenen Lachen durch.

Die Ausbeute besteht nur in finger-, höchstens spannenlangen Fischchen, verschiedenen Schnecken, Garneelenarten[1]), Libellenlarven und sonstigem niederen Getier, aber die Gesamtmenge ist ziemlich groß, alles wird gegessen, und das Fischen macht den Frauen einen Hauptspaß, denn alle naselang sieht man die gesamten Weiber eines Dorfes vom ältesten Mütterchen bis zu dem kleinsten Mädchen nach dem Urwald auswandern, wo sie einen geeigneten Bach wissen, und dort nach Herzenslust bis in die späte Nacht im Wasser herumpatschen. Oft erst, wenn der erste Uhu seinen schaurigen Ruf durch den stillen Wald ertönen läßt, kehrt die Gesellschaft mit reicher Beute, die kaum in den langen Frauenkörben *(nkán)* zu bergen ist, ins Dorf zurück. Bei Gelegenheit des Treibens bauen die Weiber *ʃɩ,s* F., *pʃɩ,s* Nt. oder *ebǝ'da*, das sind Haufen dicht am Ufer ins Wasser geworfener Steine, Aststückchen usw., unter denen sich die Fische sammeln. Beim nächsten Fischtreiben dämmen sie ober- und unterhalb dieser Stelle den Bach ab und fangen nun leicht die Fische nach Ablaufen des Wassers.

Die Jaunde wenden diese Methode auch in größeren Bächen und nicht zu tiefen Flüßchen an, wo allerdings keine Dämme gezogen, sondern die Fische in seichte Buchten oder auf den überschwemmten Waldboden getrieben werden. Natürlich kann ein solches Treiben nur von einer größeren Anzahl Menschen zugleich ausgeführt werden, und deshalb ruft der Häuptling die Weiber aus der Umgegend zusammen, geht mit ihnen an die Stelle, wo sie fischen wollen, und stellt sie an ihre Plätze. Von der Beute erhält er dafür eine bestimmte Abgabe, und zwar muß ihm jedes Weib die Hälfte ihres Fangs — bei ungerader Zahl rundet man nach oben ab — ausliefern.

2. Fischtreiben *(abǔ,lǎ)*.

Es entspricht dem eben von den Jaunde beschriebenen Verfahren, findet aber nur nachts und ohne Absperrung des Wassers in größeren Flüssen statt.

3. Kinderangeln *(ngǎ,k IV)*.

Die Ntum- und Fangjungen fangen sich kleine Fische mit Angeln aus den Stacheln des Quastenstachlers, die vor der Spitze umgeknickt und vermittels

---

[1]) In der Hauptsache von **Palaemon marcrobrachyum** Herklots *(nwǒs I)* und **Caridina togoensis** Hlgd. *(sɩ,ǔ IV)*.

der sehr festen Wurzelfäden der Aracee **Rhektophyllum mirabile** N. E. Brown *(ndes IV, kles IV)* in Hakenform zusammengehalten werden.

4. Die Angel *(nlöb I)*.

In Jaunde kennt man eine Angel ähnlich der unsrigen aus Schnur, Rute, Haken und Schwimmer, die nach Angabe meiner Jaunde schon vor Ankunft der Weißen in Gebrauch gewesen ist. Die Angeln der Fang und Ntum (Abb. 59) sind wesentlich anders; ihr Haken wird durch einen an der Schnur befestigten Stein auf dem Grund festgehalten; früher hatten sie auch einen Schwimmer, er ist indes später meist als zwecklos aufgegeben worden. Der Angler hockt mit der Schnur in der Hand auf einem Floß oder Kanu, das im Ufergestrüpp verborgen liegt. Als Köder dienen überall Würmer.

5. Tauangel oder Hängeangel *(ekele nlöb, elüm nl.)*.

Sie unterscheidet sich von der eben genannten nur dadurch, daß die Schnur an einem über den Fluß gespannten Lianentau befestigt ist, ins Wasser hineinhängt und durch den als Senker wirkenden Stein in der Lage gehalten wird.

Abb. 59. Angel.

6. Speeren und Schießen.

Größere Fische speert der Pangwe vom Ufer oder einem im Wasser liegenden Baumstamm aus, oder er schießt sie mit Gewehr oder Armbrust. Anhangsweise erwähne ich auch, daß Fische in seichtem Wasser mit dem Hauer erschlagen werden.

7. Fischgift *(ngüm IV)*.

Der Fischfang durch Vergiften des Wassers ist über das ganze Pangwegebiet verbreitet, wird aber nicht häufig geübt, weil nicht überall geeignete Plätze vorhanden sind, d. h. durch Steine abgeschlossene Becken oder Buchten, in denen der Bach langsam fließt; hier halten sich zwischen den Steinen besonders gern **Distichodus hypostomatus** Pellegr. *(mbüm)*, Tafel IX, auf, und ihn fängt man hauptsächlich auf diese Weise. Der Name stammt von einem Kraut *(ngüm)*, das im Jaundegebiet vorkommen soll und dort zum Fischtöten benutzt wird; dann wurde der Name als Sammelname auf alle anderen Fischgifte übertragen. Im Süden werden folgende Pflanzen dazu verwendet:

1. Schoten der furchtbar (nach Abwasser) stinkenden Leguminose **Pachyelasma tessmannii** Harms *(makop III)*;

2. Früchte einer Rubiacee *(oyö)*; meist mit 1 zusammen;
3. Blätter und Stengel der Passifloraceen **Ophiocaulon cissampeloides** Hook. f. und der **Adenia lobata** (Jacq.) Engl. (gemeinschaftlicher Name *undündä* oder *ündöndöle a ndzɪk*);
4. Blätter von **Duverronia extensa** (T. And.) Lieb., Acanthacee *(ngünekiä,r-nya-zäm IV)*[1]), zerrieben, bis es schäumt; meist mit 3 zusammen;
5. Rindenstücke der **Piptadenia africana** Hook. f., Leguminosae *(tüm IV)*;
6. Rindenstücke der **Rinorea dentata** (P. B.) O. Ktze., Violaceae *(olü,n)* meist mit 5 zusammen;
7. Schoten der Leguminose **Tetrapleura thonningii** Hook. f. *(agbwö' III, eslsɛɪ,)*[2]), zerrieben;
8. Blätter der Leguminose **Tephrosia vogelii** Hook. f. *(ndäwölö III)*[3]), zerrieben.

7. Fischwehr *(oläm)*.

Die großartigste und ergiebigste, freilich auch umständlichste Vorrichtung für Fischfang ist das Fischwehr (Abb. 60). Es schließt den Fluß quer ab und besteht aus drei Teilen, dem Hauptwehr (a) und zwei Seitenwehren (b), das sind Wände aus dicht gestellten Knüppeln oder aus Stöcken, zwischen denen Blätter oder Rindenplatten (Hauptwehr) befestigt sind. In den Seitenwehren werden unten am Grunde Ausschnitte angebracht und in sie Körbe eingelegt. Das Hauptwehr setzt sich dicht unter dem Wasserspiegel in ein bis vier dreieckige Roste (c) fort, die in der Stromrichtung schräg von unten nach oben so eingestellt sind, daß ihre Spitzen etwas aus dem Wasser herausragen.

Abb. 60. Lageplan einer Fischwehr in der Abea. *a* Hauptwehr, *b* Seitenwehren, *c* Roste der Hauptwehr, *d* am Ufer wachsender, über das Wasser geneigter Baum.

Selbstverständlich können solche Wehre nur zur Zeit des tiefsten Wasserstandes gebaut werden; steigt der Fluß, so führt er viele Fische mit sich und

---

[1]) Auch die Acanthacee **Lankesteria elegans** (P. B.) T. And. *(ngünekiä,r IV)* scheint für Fische giftig zu sein. Nach Angabe der Neger zerreibt man die Blätter auf Steinen, d[illegible] im Wasser liegen; dann kommen die Fische (wohl betäubt) an die Oberfläc[illegible] und werden mit dem Hauer erschlagen.

[2]) Sie duften übrigens sehr schön nach Heißwecken, darin gerade das Gegenteil von **Pachyelasma**.

[3]) Vom Stamme *a wölö* morden; vergl. *wöle* (Uelle) = der Mordende.

treibt diejenigen, welche nicht in die Körbe der Seitenwehre geraten, auf die Roste, auf denen sie oft in großen Mengen liegen bleiben und von den Negern einfach abgenommen werden. Man gelangt dahin, indem man vom Ufer aus eine eigene Brücke baut oder auf dem Rand der Seitenwehre entlang klettert.

Diese Art Fischwehr ist überall mit Ausnahme des Nordens verbreitet. Meist regt der Häuptling einige Leute zu dem Bau an, diese haben dann das alleinige Besitzrecht auf Fischwehr und Fische, geben ihren Verwandten und Bekannten wohl unentgeltlich von dem Fang ab, sei es aus Gemeinsamkeitsgefühl, sei es aus der Berechnung, bei ähnlicher Gelegenheit von ihnen ebenso bedacht zu werden, lassen sich von Fremden aber bezahlen, und zwar je nach Größe 1 oder 2 Speer (7 bzw. 14 ₰) für das einzelne Stück. Der größte Teil der Ausbeute wird sofort verzehrt, der Rest wird getrocknet. Bei dem schnellen Verfaulen der Fische in den Tropen kommen nur wenige über ihren Fangort hinaus, zumal die unsicheren Verhältnisse im Fanggebiete einen regelrechten Tauschhandel verhindern [1]).

Neben der eben genannten aus Haupt- und Seitenwehren bestehenden Vorrichtung kommen auch die Seitenwehre allein als selbständige „Korbwehre" vor. Sie sind weniger ergiebig, dafür aber nicht an einen bestimmten Wasserstand gebunden und liefern deshalb einen gleichmäßigen Ertrag. Man verwendet für sie drei verschiedene Korbarten:

8. *nkö,é I* = gewöhnliche Körbe,
9. *ayä* = kurze Fischkörbe (Abb. 61),
10. *nsö,ń I* = lange Fischkörbe (Abb. 62),

und zwar meist je zwei zugleich.

In kleineren Flüssen oder Bächen, z. B. dem Miemie, Nebenfluß des Kje, werden *nsö,ń* und *ayä* gelegt, in großen Flüssen eine größere Form der *ayä* und *nkö,é*, und zwar immer die zwei Arten Körbe in einem Wehr, da man die Erfahrung gemacht hat, daß die eine Fischart sich leichter in der einen Sorte von Körben fängt, eine andere wieder leichter in einer anderen. Nur selten war eine Korbart, z. B. *nsö,ń*, ausschließlich verwandt. Diese langen Körbe *nsö,ń*, die bis zu 30 cm Durchmesser haben können, sind besonders in Jaunde üblich, kommen aber auch im Süden vor. In ein Wehr werden gewöhnlich drei bis vier Körbe gelegt, etwa zwei *ayä* und zwei *nsö,ń* (Abb. 63). Zu beachten ist dabei, daß die langen Körbe *nsö,ń* mit der Öffnung nach der Quelle zu liegen, dagegen die *ayä* (wie übrigens auch die *nkö,é*) mit der Öffnung nach der Flußmündung zu, so daß auch die flußauf wandernden Fische gefangen werden. Das aus *ayä* und *nsö,ń* bestehende Wehr gilt folgenden

[1]) Märkte gibt es überhaupt nicht.

Abb. 61
Kurzer Fischkorb.

Tieren: Stachelwelsen (Sammelname *kgmésgm IV*[1]), **Clarias walkeri** *(ngg)*, **Synodontis tessmanni** Papph. *(ngg, nwgg I)*, ferner **Mareusenius sphekodes** (Sauv.) *(ntógm)*, **Gnathonemus moorii** (Gthr.) *(angn)*, Krebsen, Taschenkrebsen, **Palaemon**-Garneelen *(nwás)* usw., auch werden **Clariallabes longicaudatus** Papph. *(ndóna I)* darin gefangen.

Die Körbe *nkóp* sind ebensogroß wie die gleichnamigen von den Frauen bei der Feldarbeit benutzten und haben einen Trichter, durch den die Fische ins Innere, aber nicht wieder zurück gelangen; in ihnen werden hauptsächlich gefangen: **Sarcodaces odoe** *(nsó I)*, Tafel VIII, **Clarias walkeri**, Stachelwelse, **Xenocharax spilurus** Gthr. *(mfrga, mfrnga I)*, **Anabas pleurostigma** Blgr. *(awgn)*, **Parauchenoglanis guttatus** (Lönnbg.) *(ebw, evás)*, **Eutropius bangnelensis** Blgr. *(nkrde III*, jüngere Stücke = *okig III)* und Taschenkrebse; dagegen wird nicht erbeutet **Barbus guirali** Thomin. *(mrgá III)*.

Abb. 62.
Langer Fischkorb für Korbwehre.

11. Korbfalle *(ngnp IV)*.

Die Korbfalle (Abb. 64) ist ein länglicher, mit einer Klappe vor der Öffnung versehener Korb. Die Klappe wird nach Muster der Zugfallen durch eine am Ufer aufgestellte Vorrichtung zugezogen, wenn ein Fisch das im hinteren Ende des Korbes angebrachte Hebelsystem auslöst. In den Korb, der in nicht allzu tiefen Gewässern am Grunde fest verankert wird, legt man eine Schnecke als Köder. Diese Falle ist hauptsächlich für den Fang von **Clarias walkeri** *(ngg)* und von Taschenkrebsen *(kgdá)* berechnet.

Abb. 63. Lageplan eines Korbwehres.

12. Fangkorb *(ngndgó III)*,

ist ein kleiner, mit einem Trichter vor der Öffnung versehener Korb (Abb. 65), der für den **Clarias walkeri** bestimmt und, mit einem Köder versehen, in einem Flusse ausgelegt wird. Der Köder besteht aus Stücken eines Ameisennestes (dies *dzgk*, *ndzgk IV*

[1]) *kg(s)-a-masgm*, d. h. Fisch mit Rückenstacheln.

genannt) mitsamt den Ameisen von der Art **Cremastogaster striatula** Em. *(esʃn, osʃn)* oder aus Stücken von Baumtermitennestern (gleichfalls *dzgk*).

In derselben Weise werden die Fischkörbe *agä*, mit Kassaveköder[1]) oder auch mit Zweigen (ohne Blätter) der **Oxystigma buchholzii** Harms, Leguminose *(pfaʌ IV)*, versehen, einzeln ausgelegt. In diesem Falle heißen sie *awa-agä* (von *a wa* = auswerfen).

Abb. 64. Korbfalle für Fische.

13. Riesenfischkörbe *(edagä, adad)*.

3—4 m lange, 1—2 m breite Körbe, so groß also, daß 4—5 Leute in ihnen Platz hätten, werden in tiefe Gewässer versenkt, wo sie das erste Mal vier, später jedesmal drei Tage liegen bleiben. Der ganze Korb wird lose angefüllt mit Zweigen der Leguminose **Millettia thonningii** Bak. *(onçmezok)*, der **Impatiens dichroa** Hook. f. *(eʃès)* und besonders der Euphorbiacee **Cleistanthus angolensis** M. Arg. *(ngbgde I)*, alles Pflanzen, deren Schleim oder Blätter die Fische fressen, ferner mit den beblätterten Stengeln des Kardamoms, **Aframomum albo-violaceum** K. Sch. *(adzöm)*, oder der verwandten Scitaminee **Renealmia albo-rosea** K. Sch. *(adzöm-mekam)*, deren Geruch die Fische lieben, sowie schließlich mit den Wurzeln der Kassave und der Euphorbiacee **Uapaca guineensis** Muell. Arg. *(asem)*, zwischen denen sich die Fische gern aufhalten. Der Korb ist an der Vorderseite offen und wird mit dieser offenen Seite zuerst aus dem Wasser gezogen, so daß die Fische — außerdem durch das Wurzel- und Zweigwerk behindert und verwirrt — nicht so schnell entweichen können.

Abb. 65. Fangkorb für Fische.

[1]) Ganze Wurzeln gekocht *(agbawa ma mbgä)* und kleingeschnittene, getrocknete Kassave *(ndzgä mb.)*.

14. Riesenfischkasten *(ɛtβ, baβ III)*.

Statt der Riesenkörbe werden auch Kästen verwandt, die aus Rinde hergestellt, bei einer Länge von 3—4 m 1,5 m hoch sind. Von den Körben unterscheiden sie sich außer in ihrer Form durch einen Deckel, der im Wasser offen steht und sich zuzieht, wenn der Kasten hochgezogen wird.

Die Riesenfischkasten und -körbe sind nicht leicht herzustellen und zu handhaben, und man sieht sie deswegen nicht häufig.

15. Fischgraben *(moŋ) IV., moβ)*.

Ein Graben (Abb. 66) wird senkrecht zur Richtung des Flusses ausgehoben, gegen diesen durch eine in der Mitte mit einer Falltür versehene Rindenwand *(a)* abgeschlossen und mit Köder aus Nestern der oben erwähnten Ameisenart *(c)* versehen. Quer über den Graben baut man einen Steg *(b)*. Nachdem man die Tür einige Tage hat offen stehen lassen, schließt man sie eines Nachts vom Steg aus und fängt die Fische, hauptsächlich wieder **Clarias walkeri** und nebenbei noch **Marcusenius** *(ntotom)*, mit einem Netz heraus. Nur im südlichen Gebiete üblich.

Runde Fischnetze, die ausgeworfen werden und sich im Sinken fallschirmartig ausbreiten — wie sie an der Küste überall gebräuchlich sind —, kennen die Pangwe nicht. Das kleine, runde Netz, das die Weiber zum Kassavewaschen wie auch als Fischkätscher gebrauchen, ist bereits erwähnt. Es bleibt nur noch ein Fischfanggerät zu besprechen, die

16. Netzfalle *(ɔlφɔ)*.

Sie besteht aus der Verbindung eines Netzes mit einem Gerüst. Das Gerüst zeigt Abb. 67 von hinten gesehen; es sind drei Einzelteile vorhanden: Der vordere Galgen *a* mit zwei Querhölzern *d*, der hintere Galgen *b* mit der Tragleiste *c* und der Mittelteil. Letzterer ist zusammengesetzt aus dem Netzreifen *f*, dem daran gehängten Netz (das in der Abbildung noch nicht aufgesteckt ist) und drei langen in *x* befestigten Raphiastengeln, einem freien *(g)* und zwei anderen *(e)*, die noch in *y* und *z* an den Netzreifen festgebunden sind und dem Querholz *c* aufliegen. Eine Person, die auf dem vorderen Galgen sitzt, kann mit dem Stock *g* das Netz handhaben; sie kann es damit herunterlassen (Abb. 68) oder, wenn es nicht gebraucht wird, heraufheben, zwischen die Stangen *d* schieben und nun *g* auf *c* zurücklegen (Abb. 69). Das Gerüst wird so, daß das Netz auf den Grund zu liegen kommt, in einem Bach aufgestellt und dieser an beiden Seiten eingedämmt, so daß die Fische von der Strömung in das Netz getrieben werden, aus dessen spitz zulaufendem Beutel sie nicht

entfliehen können (vergl. Abb. 69). Das Netz wird *ottáne* genannt. Erklärlicherweise werden in der Netzfalle, die schon wegen ihrer Form nicht übermäßig praktisch genannt werden kann, nur kleinere Fische gefangen.

Abb. 66. Lageplan eines Fischgrabens. *a* Rindenwand mit Tür, *b* Steg, *c* Köder.

IV. Fallenstellerei.

Die — nach Ackerbau und Fischfang — drittwichtigste Wirtschaftsform ist die ausschließlich in den Händen der männlichen Bevölkerung liegende Fallenstellerei. Die verschiedenen Fallen, die der Pangwe baut, lassen sich folgendermaßen einteilen:

A. Fallen, in die das Wild hineinstürzt:
   1. Grubenfallen *(ebéj, ndáa I)*.

B. Fallen, die durch Niederstürzen eines Balkens, Tellers oder Eisens wirken.
   2. Schlagfallen *(ekúsdí)*,
   3. Schlagteller *(akui)*,
   4. Speerfalle *(eláa)*.

C. Fallen, die aus einer Zugschlinge bestehen:
   5. Einfache Schlingen *(afma* usw.*)*,
   6. Zugfallen *(oldm)*:
      a) Bodenzugfallen *(oldm)*[1]),
      b) Baumzugfalle *(nkpmdá I)*,
      c) Halbaffenfalle *(mbáa I)*,
   7. Frankolinfalle *(ndáa IV)*,
   8. Bogenfallen *(ekuele)*.

D. Fallen, die Lärm schlagen:
   9. Zibethkatzenfalle *(nlía I)*.

1. Grubenfallen *(ebéj, ndáa I)*.

Die einfachste Form der Falle, die Grube, ist über das ganze Gebiet verbreitet. Überall an Wegen durch den Urwald befinden sich schmale, rechteckige Gruben von oft 3 m Tiefe so dicht am Wege, daß sie — sorgfältig bedeckt wie sie sind — mitunter Fußgängern, die nicht genau achtgeben, gefährlich werden können. Sie gehen nach unten so schmal zu, daß ein Mensch, der hineingestürzt ist, in halber Höhe zwischen den Wänden eingeklemmt hängen

[1]) Nicht zu verwechseln mit dem *old'm* (Fischwehr).

Abb. 67. Gerüst einer Stellfalle für Fische.

bleibt und allein nicht wieder heraus kann. Gruben mit spitzen Pfählchen auf dem Grunde sind nicht für Wild, sondern nur im Kriege in Gebrauch. Die Gruben werden gewöhnlich von zwei Leuten, den Eigentümern, angelegt, von denen der eine gräbt, der andere die Erde wegträgt. Der erstere darf nach dieser Arbeit fünf Tage lang geschlechtlich nicht verkehren. Die Grube ist nämlich ein Loch, wie das weibliche Geschlechtsorgan; würde er sich also durch den geschlechtlichen Verkehr mit der Frau beflecken, so würde er auch in der Grube nichts fangen.

2. Schlagfallen *(eküidi)*.

Von Schlagfallen, d. h. Fallen, in denen das Tier durch einen über einem Gange liegenden und durch eine Schnappvorrichtung ausgelösten Rammstamm oder durch einen frei aufgestellten und hochgerichteten, beschwerten Teller erschlagen wird, unterscheiden die Pangwe sieben Abarten, und zwar:

A. Eigentliche Schlagfallen für Wild:

1. *eküidi-asaḃ* oder *asaḃ*,
2. *eküidi-esçdo*,
3. *eküidi-nkok*,
4. *alaṣa-eküidi*.

B. Rattenschlagfallen:

5. *eküidi-o-si*,
6. *eküidi-o-jeb*.

C. Schlagteller:

7. *akui*.

Abb. 6f und 6h.
Flachbau mit einem Sitz, der in Verbindung mit einem Gerüst steht.

Die einträglichste und deshalb häufigste Schlagfalle für Wild ist die in Verbindung mit einem Wildgatter aufgestellte *oadjb*. Sie ist in Abb. 70 Fig. 1 und 2 abgebildet. Das Gatter zieht sich mit verschiedenen Durchlässen oft durch den ganzen Wald, zumeist an den Wegen entlang, und besteht aus nebeneinander eingeschlagenen Stöcken, die entweder dicht aneinander stehen oder in größeren Zwischenräumen und dann mit Blättern von **Sarcophrynium velutinum** *(ekiaikui)*, der Raphiapalme oder der Sumpfpalme verflochten werden, so daß die meist kleineren Tiere an dem Gitter entlang laufen und keinen anderen Ausweg finden als jene Durchlässe. Hier werden die eigentlichen Fallen eingebaut: man zieht quer zum Gitter einen Gang aus zwei Reihen dicht nebeneinander eingeschlagener Stöcke *(i)*, von denen der vordere oder einer der vorderen (in der Abbildung der linken Seite), *k*, oben eine Gabel trägt. In den Gang wird ein Baumstamm *g* so eingespannt, daß er mit seinem hinteren Ende dem Boden aufliegt und durch andere Stämme *(h)* beschwert, mit dem vorderen Ende dagegen an einem Hebel *(e)*, der in dem Gabelstock *k* einen Stützpunkt findet, aufgehängt und in der Schwebe gehalten wird. Der Hebelstock *e* wird seinerseits von einer Schnappvorrichtung gehalten, die bei allen Schlag- und Zugfallen in gleicher Weise wiederkehrt und hier deshalb ein für allemal beschrieben werden soll. Die Vorrichtung besteht aus einem Fallenbogen *a*, der beiderseits in den Boden gesteckt wird, und einem Klemmstock *b*, der durch ein Holzstückchen *c*, den Klemmer, an den Fallenbogen gedrückt wird. Die Verbindung dieser Auslösevorrichtung mit dem Hebel geschieht durch ein an den Klemmer geknüpftes Tau *d*, das an dem freien (linken) Hebelarm festgebunden ist und so den an dem anderen Hebelarm aufgehängten Baumstamm hochhält. Der Klemmstock *b* reicht durch die Gitterstäbe frei in den Gang und wird hier durch Laubwerk, das über giebelförmig geknickte Stäbe *m* gelegt ist, verdeckt.

Tritt nun ein Tier in den Gang und auf den Klemmstock, so wird dieser niedergedrückt und dadurch der Klemmer ausgelöst, der Hebel fliegt mit seinem linken Arme hoch, und der Baumstamm fällt herunter.

Diese Schlagfalle wird trotz der großen Arbeit, die das lange Gitter erfordert, meist nicht von allen Dorfbewohnern gemeinschaftlich, sondern — wie das Fischwehr — von zwei Männern hergestellt. Sie fängt besonders folgende Tiere: Hamsterratte **Cricetomys dissimilis** Rochebrune *(bdi)*, Quastenstachler **Atherura africana** Gray *(ngim)*, Eichhörnchen, die Zwergeselhörnchen **Cephalophus maximorbus** *(ngbwaja)*, in der Nähe von Gewässern das Hirschferkel **Hyemoschus aquaticus** Ogilby. *(ngbe*, Mehrzahl *bla)*, von Vögeln einige am Boden lebende Arten, wie Tauben, Perlhühner, Francolins **Francolinus squamatus** Cass. *(ngbwa)*, Drossel **Turdus saturatus** Cab. *(ngep)* und Hochtrolle **Elanoides**

Abb. 30. Schlagfallen.

kaemaepus (Tem.) Hartl. *(nkwlangw)*, deren auffälliger Ruf auch mit der Schlagfalle in Verbindung gebracht wird[1]). Schließlich geraten auch hin und wieder Nilvaranar hinein.

Von der *oaj* unterscheidet sich die *ohidi-oapij* nur durch das Fehlen des Gatters und die dadurch nötig werdende Beigabe von Köder. Man legt

---

[1]) Die Falle ruft:

ma hawlí' ohiíjí o ei, — ha,
ich falle (in die) Schlagfalle hinein, fällt an (lautnachahm.),

oder:

ma hawlí' ohiidi — ma hai.
ich fall' in die Falle — ich entwiche.

Bananen für Halbaffen und Fleckenroller, tote Ratten für die Ginsterkatze, Früchte der Tiliacee **Desplatsia dewevrei** B u r s e t (Früchte = *ngôk IV*) für Hamsterratten und Quastenstachler, Kassave für dieselben, für Eichhörnchen und Feldmäuse.

Eine gleiche Falle wird neben niedergestürzten Baumstämmen *(nkǫk)*, an denen sich Wildfährten entlang ziehen, gebaut und heißt dann *eküidi-nkǫk*. Natürlicherweise fällt hier wieder die Köderung weg.

Die *aluna-eküidi* (Abb. 70 Fig. 3) ist eine Zusammensetzung zweier Schlagfallen. An einen kleinen viereckigen, bis auf zwei Durchlässe eingezäunten Platz, in dessen Mitte die Früchte der Guttifere *nsərngǫmǫ III* als Köder gelegt werden, sind die beiden Fallen so angebracht, daß sich die eine nach vorn, die andere nach hinten öffnet. Die Tiere, Hamsterratten, Quastenstachler, Streifeneichhörnchen und Mäuse, sehen die Früchte durch die Einzäunung hindurch, suchen nach einem Eingang und geraten in die Fallen.

Die Rattenfalle *eküidi-o-si*, (*o si* = unten) ist ebenfalls eine Schlagfalle, wie die *osab*, und wird von außen gegen die Rattenlöcher an den Hausecken angebaut (Abb. 70 Fig. 4 und 4*a*); an die Spitze des in den Gang eingeführten Klemmstockes wird, wie Fig. 4*a* zeigt, ein Köder angebunden; nagt die Ratte daran, so wird der Klemmstock unter dem Klemmer herausgeschoben, und die Falle schlägt zu.

Waren sich die bisher aufgeführten Schlagfallen alle sehr ähnlich, so kommen wir jetzt bei der *eküidi-o-jab* (*o jab* = oben) zu einer Falle, die äußerlich ganz anders aussieht, obgleich sie zu derselben Gattung gehört. Wir haben hier nämlich — vgl. Abb. 71 Fig. 1 und 2 — eine Vereinigung von zwei Hebelsystemen, die zusammen einen Schlagbalken tragen und in einiger Höhe über dem Boden angebracht sind. Ein halber Raphiastengel wird mit der Schnittfläche *(x)* nach oben wagerecht auf die Hauswand gebunden oder senkrecht zu ihr und frei *in den Raum hineinragend auf ihr befestigt. Auf ihn werden oben zwei Reihen* Raphiablattstielstreifen gesteckt, die das Gatter der anderen Schlagfallen vertreten *(i)* und auf der dem Hauminnern zugewandten Seite von zwei Gabelstützen *k* flankiert werden, denen die Hebel *e* aufliegen. Nur der e i n e Hebel wird von dem Klemmer, dessen Auslösevorrichtung seitlich am Raphiastock (vgl. Fig. 2) angebracht ist, gehalten, der andere wird mit dem freien Ende unter den ersten gesteckt. Beide Hebel halten einen Schlagbalken *g*, der also, im Gegensatz zu den anderen Schlagfallen, frei über dem Gange schwebt, so daß die Ratte von beiden Seiten Zutritt hat. Dieser Schlagbalken wird nun von einem jederseits durch Taue an ihm befestigten, unterhalb des Raphiastengels hängenden Balken *h* herabgezogen, wenn die Klemmvorrichtung ausgelöst wird, an der, wie bei der *eküidi-o-si*, ein Köder angebracht ist; meist

Abb. 71. Rattenfalle *ekūidi-o-job.*
Fig. 1 von der Seite. Fig. 2 von vorne.

läßt man die Falle einige Zeit stehen, bevor man die Schnappvorrichtung einstellt, und streut Kassave auf den Gang, damit die Ratten sich daran gewöhnen, ihren Weg über die Falle zu nehmen; zu demselben Zweck setzt man sie eine Zeitlang außer Betrieb, wenn sie eine Anzahl Ratten gefangen hat[1]).

[1]) Die Fachausdrücke der Pangwe für die verschiedenen Teile der Schlagfallen sind:

a) Fallenbogen = *ekǭleyá* Nt., *ekuluga* F. von *a kulu* = umbiegen;
b) Klemmstock = *mɽǭnegan* F. von *mɽǭnegan* = der Jüngere, der Fallenbogen ist der Ältere, weil man ihn zuerst in den Boden stecken muß, dann erst kommt der Klemmstock;
c) Klemmer = *asụ̄ń* von *asụ̄ń* = der Zahn;
d) Klemmertau = *nkǭ-asụ̄ń* von *nkǭ* = Tau, *asụ̄ń* = Zahn, Klemmer;
e) Hebel = *mbɽmeyá I* F. von *a bime* = schlagen, zuschlagen, auch *mbǭń I* genannt;
f) Schlagbalkentau = *nkǭ-ekūidi* von *nkǭ* = Tau, *ekūidi* = Schlagfalle;
g) Schlagbalken = *mɽǭk IV*;
h) Druckbalken = *eisi,deja* F. *isi,deja IV* Nt. von *a iside* = aufdrücken, beschweren;
i) Schlagbalkengitter = *nzábega* F., *sá,bejá IV* Nt. von *a sáb* = aneinanderreihen;
k) Hebelstütze = *ata[k]-ekūidi* von *atak* = Gabelstock; (vgl. S. 124)

[Fortsetzung der Anmerkung S. 124.]

3. Schlagteller.

Der Schlagteller *akui* ist eine ganz einfache Falle, die statt des Ganges und der Schlagbalken nur einen hochgestellten, mit Lehmklößen oder Steinen beschwerten Teller *(nka-akui)*, aus der Schlingpalme **Ancistrophyllum acutiflorum** *(nhane)*, zeigt, der auf die Tiere (kleinere Nager) herabfällt, falls sie den bis unter den Teller reichenden und mit Köder (Kassave) versehenen Klemmstock berühren.

4. Speerfalle *(elüṇ)*.

Sie wird für Elefanten angelegt, und zwar dort, wo deren Wechsel zwischen zwei geeigneten Bäumen hindurchführt; sie besteht aus einem schweren, eisernen Speer, den man durch ein Tau unmittelbar mit dem Klemmer verbindet und derart über einen Ast hängt, daß er den Elefanten in den Nacken trifft, wenn dieser die Schnur, die als Verlängerung des Klemmstockes ausgespannt ist, berührt. Meist trifft der Speer den Elefanten nicht tödlich, das Tier läuft dann weiter und entgeht oft dem Fallensteller.

5. Einfache Schlingen.

Man unterscheidet

1. Freischlingen:
   a) Bodenschlinge *(aśṭmá-o-si,)*,
   b) Baumschlinge *(aśṭmá-o-jɔb)*;
2. Handschlinge oder Zugschlinge *(nsṇm)*.

Die Bodenschlinge *aśṭma-o-si*, (*o-si*, = unten) (Abb. 72), wird besonders auf den Wechseln des Zwergböckchens **Neotragus batesi** Winton *(odźüe)* befestigt und zwar an einem Querholz *a*, das auf zwei gut verdeckten Gabelstützen *b* liegt. Erbeutet werden in den Bodenschlingen auch noch Hühnervögel (Perlhuhn, Frankoline) und die Nachtralle (**Himanternis**).

Auf Bäumen, deren Früchte gern von Vögeln gefressen werden, insonderheit der **Afzelia africana** Smith *(orɔ̀n)*, stellt man mit großem Geschick eine ganze Anzahl Schlingen auf, die *aśṭma-o-jɔb* (*o jɔb* = oben) heißen und sich von selbst zuziehen. Besonders werden Nashornvögel und der blaue Haubenturako **Corythaeola cristata** Vieill. *(kunük IV)* darin gefangen. Hin und wieder gerät auch einmal eine Meerkatze hinein.

---

l) Fallengatter = *ndźṭbega-osáḃ* von *a dźṭḃ* = schließen, *osáḃ* = Gitterschlagfalle;

m) Brücke im Gang = *akán* von *akán* = Boden;

n) Gang = *abɔ́k* von *abɔ́k* = Lager.

Anders als die beiden vorigen Schlingen ist die aus Buschtau hergestellte Handschlinge für Papageien *(nsụm I)*. Sie besteht aus einer Schleife, die um einen Ast herumgelegt und mit dem einen Ende hier festgeknotet ist, mit dem anderen bis auf die Erde reicht, wo ein Mann sie in der Hand hält und anzieht, sobald ein Tier den Kopf durchsteckt. Der Papagei wird an den Ast gedrückt und kann gegriffen werden. Diese Papageischlinge wird besonders in den dicht belaubten **Myrianthus**-Bäumen (*mangə̄me III* F., *engükə̄m* Nt., J.) aufgestellt, deren Früchte die Papageien lieben, und die trefflich geeignet sind, um sich unter ihnen zu verstecken. Die Ausübung des Papageienfanges ist hauptsächlich Sache der Knaben, doch vergnügen sich auch Erwachsene damit.

Abb. 72. Bodenschlinge *asima-o-si.*

6. Zugfallen.

a) Bodenzugfallen.

Von ihnen unterscheiden die Pangwe nicht weniger als neun Arten und zwar

I. Fallen, die über einer Grube errichtet sind:
   1. *eisụma,*
   2. *nsọ̄ḅə̄ I* Nt., *nsọ̄ḅk* F., *nsọ̄ḅogə̄* F.,
   3. *ngə̄[k]-olàm;*

II. Fallen ohne Gruben:
   4. *ndàkie, III,*
   5. *olàme-zé,*
   6. *ṣign* F.,
   7. *olame-nsṛṇ.*
   8. *ejàga, apfàḍ,*
   9. *ewudṣ.*

Alle diese Bodenzugfallen, ebenso wie die Baumzugfalle und die Halbaffenfalle, zeichnen sich dadurch aus, daß ein elastisches, in den Boden gestecktes Stämmchen, der Zugstock (*mìgge* F.), durch den Klemmer festgehalten wird und, befreit, die Schlinge im Aufschnellen zuzieht. Die Bodenzugfallen sind im allgemeinen für größeres Wild, wie Antilopen, berechnet und unterscheiden sich untereinander durch kleinere Verschiedenheiten in Form und Aufstellung, durch Vorhandensein oder Fehlen einer verdeckten Grube, die es dem Tier erschwert, sich zu befreien, usw. Nahe verwandt sind die ersten drei Formen, *eisụma, nsọ̄ḅə̄* und *ngə̄[k]-olàm*, die alle eine Grube zeigen. Als

Abb. 74. Antilopenfalle *nsobogo*. Abb. 73. Antilopenfalle *esuma*.

Beispiel sei die *esuma* hier genauer beschrieben (Abb. 73). Sie besteht aus einem starken, elastischen Stämmchen *f*, an dem oben durch ein Tau *d* der Klemmer *c* und die bei diesen großen Fallen aus Raphiapiassave gedrehte Schlinge *g* angebracht werden. Der Klemmer hält den Zugstock, der beim Aufstellen der Falle heruntergebogen wird, durch die schon von den Schlagfallen her bekannte Auslösevorrichtung (in der Abbildung seitlich angebracht) fest. Die Schlinge, die vor der Grube zwischen den Haltestöcken *k* aufgestellt wird, ist außerdem durch ein Tau *h* mit dem oft doppelten Fallenbogen verbunden. Über die Grube werden nun Stöcke auf den Klemmstock gelegt. Das Ganze, vor allem die Grube mit den Stöcken und der am Boden liegende Teil der Schlinge, wird sorgfältig mit trockenem Laub usw. bedeckt, über das Ende des Zugstockes, dort, wo Klemmtau und Schlinge befestigt sind, wird noch besonders ein trockenes Blatt gebunden, darzum, in zunutzgerechter Weise die ganze Falle den Augen des Wildes möglichst entzogen. Tritt nun ein Tier auf die Blätter, so drücken die Stöcke *e* den Klemmstock *b* nieder, der Klemmer *c* fliegt hoch und der Zugstock mit der Schlinge, die sich zuzieht, schnellt in die Höhe, jedoch nur soweit, als es das Tau *h* gestattet. Dadurch wird das gefangene Tier an den Fallenstock gedrückt und so erstickt, zumal es noch halb in der Grube hängt. Je nach der Stärke ist die Falle geeignet für Antilopen, Wildschweine, den kleinen Leoparden **Felis servallus** Puch. *(ebrú)*, Zibeth- und Ginsterkatzen.

Von voriger Falle unterscheidet sich die *nsobogo* (Abb. 74) nur dadurch, daß die Schlinge bei dem Klemmer an das Klemmertau geknüpft und unter

einem Haltestock *h* durchgeführt, außerdem aber direkt auf die Erde gelegt wird. Deshalb wird das Tier hier meist an den Vorderbeinen gefangen.

Die *ngä[k]-olam* ist — könnte man sagen — eine kleine *nsõbogo*, nur für Quastenstachler berechnet und wird von Jungen gestellt, wenn sie sich die Stacheln für ihre kleinen Angelhaken *(ngäk)* verschaffen wollen, daher der Name; es fangen sich aber auch Zwergantilopen und Perlhühner darin.

Abb. 75. Antilopenfalle *ndakie*.

Eine andere Art der Auslösung lernen wir bei den Zugfallen *ndakie*, (Abb. 75) und der Spitzotterfalle *olame-zè* (Abb. 76) kennen. Hier stößt das Tier — ähnlich wie bei der Elefantenspeerfalle — gegen eine Schnur, die die Verlängerung des Klemmerstockes bildet *(ndakie)*, oder gegen diesen selbst *(oläme zè)*. Statt des Fallenbogens wird oft — wie in der Abb. 75 — ein Galgen angebracht. Der Name *ndakie* bedeutet eisernes, d. h. ganz festes Haus (*ndä* = Haus, *ekiei* = Eisen), sein Gebrauch schwankt indes und wird in einigen Gegenden auf ähnliche Fallen, wie z. B. die *ziegn*, übertragen. Für den merkwürdigen Spitzotter *(zè)* **Potamogale velox** Du Chaillu allein berechnet ist die *olame zè*. Aus der Zeichnung (Abb. 76) wird wohl auch ohne Beschreibung die Bauart klar. Merkwürdig ist dabei die Ausnutzung der Eigentümlichkeit des Spitzotters, seine Losung immer an ganz bestimmten Stellen am Ufer abzusetzen; diese werden nun im Halbkreis mit einem Zaun *(e)* umgeben, während die Schlinge und dahinter die Verlängerung des Klemmstockes die freie Seite abschließt.

Abb. 76. Spitzotterfalle *olame-zè*.

Die Falle *zègn* (Abb. 77) unterscheidet sich von den vorigen dadurch, daß das Tier unter der in Form eines hohen Galgens errichteten Auslösevorrichtung durchzuschlüpfen hat, hierbei die Schnur berührt, die von der

Abb. 77. Zugfalle für Antilopen *zègn*.

Abb. 78. Ginsterkatzenfalle *olame e nsin.*

Mitte des Klemmerstockes (oben) nach einem in den Boden gesteckten Pflock gespannt ist *(e)*, und die Klemmvorrichtung auslöst. Auch bei dieser Falle wird das gänzliche Zurückschnellen der Schlinge durch die Haltetaue *h* verhindert. Die *vien* schließt sich — was die zu fangenden Tiere anbetrifft — der *esuma*, der *nsobogo* und der *ndakie* an, daher auch wohl die Übertragbarkeit des Namens *ndakie* auf diese „Antilopenfallen".

Nach Muster der *vien* ist die *olame-nsin* gebaut (Abb. 78), nur wird sie immer an einer kleinen Bodenerhebung errichtet, und diese unter ihr ausgehöhlt. Auf den Boden der kleinen Höhle legt man eine Ratte als Köder, durch ein Loch in der Decke führt man die Schlinge und das am Klemmstock angebrachte Tau, das um die Ratte gebunden ist, ein.

Die *olame-nsin* wird, wie der Name sagt (*nsin* = Ginsterkatze), vor allem zum Fang der Ginsterkatze **Genetta aubryana** Pucheran, deren Felle beliebte Schmuckstücke sind, verwendet, daneben ergibt sie oft eine Ausbeute von Fleckenrollern **Nandinia binotata** Reinwardt *(mvgi)*, Zierrollern **Poiana poensis** Waterhouse *(ojan)* und Zibethkatzen **Viverra civetta** *(zoe)*. Auch hier gewöhnt man das Wild durch Auslegen von Ratten erst vor, dann in der Höhlung an die Stelle, wenn man nicht die Höhle der Tiere selbst benutzen kann.

Schließlich sind noch zwei kleinere Zugfallen für Feldmäuse bzw. für Vögel zu erwähnen, nämlich die *efuga* und *ewuas*, bei denen die Schlinge mit Hilfe eines Stockes *i* um den Fallenbogen *a* gelegt wird, so daß das Tier an diesen geklemmt wird (vgl. Abb. 79); die *efuga* ist für Mäuse und andere kleine Nager bestimmt und in der Art der Spitzotterfalle vor einem umfriedigten und mit einem Köder (Kassave) belegten Platz errichtet. Ferner sucht man sich mit dieser Falle des lästigen Hühnerräubers **Dryotriorchis batesi** Sharpe *(ngbawga III* Nt.*)* zu entledigen. „Wenn der Vogel ein Huhn gefangen hat und es nun beim Hinzueilen der Leute wieder fallen läßt, so macht man schnell die Falle und legt das Huhn hinein; dann kommt vielfach der Räuber zurück, um das Huhn zu holen, und fängt sich dabei in der Falle."

Die Vogelfalle *ewuä,s* (*wuä,s* = lautnachahmend für das Zuziehen der Schlinge), Abb. 79, ist genau ebenso gebaut, nur daß die Umzäunung fehlt, und für Tauben, Perlhühner, Frankoline und Nachtrallen bestimmt.

b) Baumzugfalle.

Die häufigste Falle für kleinere Vögel ist die Baumzugfalle *nkpwä,s* (*nkpwä,s* = lautnachahmend für das Zuschlagen der Falle oder der Hand zum Fang), Abb. 80. Sie wird auf Bäumen angebracht, und daher ist der Fallenbogen *a* an einen Zweig *x* angebunden. Neu ist hier, daß der Klemmstock an seinem sonst freien Ende, die Verlängerung — wie wir es genannt haben — in der Gabelung eines Halters *i* (*nṭębe-oṡą̀ III* von *a tebe* = stehen, *oṡą̀* = vor, also Vorsteher) festgeklemmt wird, ferner die Einrichtung der Schlinge, die aus zwei Tauen aus den Stengeln des **Sarcophrynium velutinum** K. Sch. (*okiaikui*, Stengel = *ndenan*) hergestellt wird. Die beiden Taue werden am Ende zusammengeknotet und an einen Zweig, der den Zugstock vertritt (*l*), angebunden, dann schlingt man einen Bindfaden *h* um den Ast *x* und knotet ihn lose an die Schlinge *g* (in *y*), so daß er auf ihr verschiebbar ist. Die Enden der Schlinge werden nun um die Verlängerung des Klemmstockes gelegt, darauf wird in *z* der Köder angebunden, und die Falle ist fertig. Der Vogel, der sich auf den Klemmstock in *z* setzt, drückt diesen unter dem Klemmer heraus, die Schlinge zieht sich zu, der Vogel wird mit den Füßen in *y* festgehalten und so meist lebendig gefangen.

Abb. 79. Schreitvogelfalle *ewuas*.

Diese Vogelfalle wird hauptsächlich von Jungen aufgestellt, denn sie bringt ja nur kleinere Vögel. Als Lockspeise dienen für Honigsauger (Nectariniidae) neben Blüten der **Canna bidentata** Bertol (*ekonefok*) die des **Aframomum hanburyi** K. Sch. (*obä[a]-adśom*, Blüten = *atsą[k]*), aber auch anderer Scitamineen; für Webervögel, **Ploceus cucullatus** (St. Müll.) (*npä*), **Spermospiza guttata** Vieill. (*ka-o-śi,*), **Spermestes poensis** Fras. und **Estrilda**-Arten (*edśble*), Gräser, wie **Panicum sulcatum** Aubl. (*ekpk*) und

Abb. 80. Vogelzugfalle *nkpwas.*

Panicum ovalifolium Poir. *(obůlebedzŏle)*; für **Andropadus**-Arten *(olŭ,k)* und andere Haarvögel, wie **Phyllastrephus leucopleurus** Cass. *(ngŏmedźŏ)* und den Bülbül **Pycnonotus gabonensis** Sharpe *(nkŏgĕlŭŏ)* Pfeffer **Capsicum** *(okálŏŏ)* und **Heckeria subpeltata** (Wild.) Kunth. *(abŏmedzŭŏ).* Von sonstigen Vögeln, die in den Baumzugfallen gefangen werden, sind zu nennen: Bartvögel (Capitonidae), z. B. **Gymnobucco bonapartei** Verr. Hartl. (*orŏ* Nt.), **Buccanodon duchaillui** Cass. *(ejŏle)*, **Barbatula**-Arten *(omvŏg)* und **Trachylaemus purpuratus** Verr. *(ekŏkŏ)*, ferner außer den oben genannten Haarvögeln noch **Ixonotus guttatus** Verr. (*esă,sa*, F., *edźăndźă* Nt.), Tauben **Chalcopelia afra** L. *(odŏ)* und **Turtur semitorquatus** Rüpp. *(źu,m)*, Glanzstare **Lamprocolius**-Arten *(kpŏŏ)*, Nashornvögel **Lophoceros fasciatus** Shaw. *(okŏgbwŭ,)* und **camurus** Cass. (*nkukue I* Nt.). Für sie alle dienen als Lockspeise die Früchte der Euphorbiacee **Alchornea cordifolia** Muell. Arg. (*abŭi* Nt., *abuĭ* F.), der Guttifere **Harongа paniculata** (Pers.) Lodd. *(atŭ,r)*, der Euphorbiaceen **Antidesma laciniatum** Muell. Arg. *(okŏbezŏ)* und **Hasskarlia didymostemon** Baill. *(efŭŏle)*, des **Ficus preussii** Warb. und **laurentii** Warb. und anderer **Ficus**-Arten *etob-o-job* F., *ejŏ,* Nt.). Überall sieht man die Fallen in dem **Alchornea**-Gebüsch oder auf lichten Plätzen, wo die eben genannten Bäume wachsen, aufgestellt; wenn sich ein Junge Mühe gibt und bei der Falle aufpaßt, so kann er bis zu zehn Vögeln an einem Tage in einer Falle fangen. Die Beute bringt er seiner Mutter, die die größeren Vögel, z. B. die Tauben, für sich behält und die kleineren den Kindern läßt.

c) Halbaffenfalle.

Eine sehr kunstreiche und fein ausgedachte Falle ist die Halbaffenfalle *mbúń I*, *ebǵs I*, von *bń* = liegen, *mbuń* = Querbalken, d. h. ein Balken, der auf anderen liegt, so genannt, weil die Falle an einen Stamm, welcher über eine Lichtung gelegt ist, angebaut wird (Abb. 81). Sie (Abb. 82) ist eine echte Zugfalle mit dem Zugstock *f*, dem Klemmer *c* am Klemmertau *d* und zwei am Zugstock befestigten Schlingen *g*. Die an dem liegenden Stamm *τ* angebrachte Vorrichtung bedarf dagegen der Erläuterung. Sie besteht aus einem Raphiablattstielstück, das mit dem einen Ende in die Erde gesteckt, am anderen gespalten und so unter den Ast geschoben ist, daß dieser in den Spalt zu liegen kommt, beide Hälften werden, wie Fig. 2 zeigt, später miteinander verschnürt *(y)*. Oberhalb des Stammes wird jede der beiden Gabelenden zu fünf Zinken eingeschnitten (Abb. 82, 1—5), von denen die mittelste (3) ein ganzes Stück länger gelassen ist als die übrigen. Beide Mittelzinken (vgl. Fig. 2) sind durch einen Stock miteinander verbunden und bilden so den Galgen für die Klemmvorrichtung. Zwischen die oberen Enden der Zinken werden Querstöcke *(n)* geklemmt und fest verschnürt. An das Tau *y* wird dann die Auslösevorrichtung (Fig. 2 *z*) angeknüpft, ein Maschenwerk, das *y* mit dem Klemmstock *b* verbindet. Die Einstellung der Falle ist aus der Fig. 2 zu ersehen. Der Klemmer *c* wird hinter dem Galgen *a* herumgeführt, vorn zwischen *a* und Klemmstock festgeklemmt, dann je eine Schlinge vorn zwischen den Querstäben *n* 1 und *n* 2 und hinten zwischen *n* 3 und *n* 4 hindurchgeführt (vgl. Fig. 1) und in die Öffnung gelegt. Reichliches trockenes Laub verdeckt die Falle. Das Tier klettert über den Ast,

Abb. 81. Halbaffenfalle (*mbuń*).

Abb. 82. Halbaffenfalle.
Fig. 1 von der Seite. Fig. 2 von vorne.

um von der einen Seite der Lichtung zu der anderen zu gelangen und gerät in die Falle, die oft so vorzüglich arbeitet, daß das Tier von beiden Schlingen zugleich erfaßt und mit großer Kraft an die Stäbchen gedrückt wird.

Diese Falle wird in erster Linie für nächtlich lebende Halbaffen[1]) und den Fleckenroller, **Nandinia binotata** Reinw. (*mvə̱,v* F., *mvɛ̱,v* Nt.), aufgestellt, und zwar in lichter Gegend, z. B. wo sich längs des Weges ein Buschstreifen zieht, durch welchen die Tiere hindurchwechseln. Man schlägt eine Bresche hinein und legt quer über sie den zum Bau der Falle nötigen Ast. Es werden dann meist drei bis sieben Fallen nebeneinander aufgestellt.

Nebenbei verwendet man große Fallen derselben Art für Meerkatzen und dann nur im Urwalde über Wegen oder Lichtungen.

7. Frankolinfalle.

Bei der Frankolinfalle *(ndə̱,ń)* (Abb. 83) ist, wie bei den Fallen der vorigen Klasse, ein Zugstock vorhanden, indessen ist die Art der Klemmvorrichtung völlig verschieden. Der bodenständige Teil der Falle ist nichts weiter als ein rundes, nicht sehr tiefes Loch in der Erde; in der Wand stecken sich gegenüber zwei horizontale Raphiastäbchen *a*, unter die der Klemmer *c* mit dem — wie bei der Falle *nsə̱,bogə̱* — unmittelbar daran befestigten Schlingentau[2]) geschoben ist; die Schlinge wird um das Loch herum gelegt. Ein paar Maiskörner

[1]) Potto, **Perodicticus katesi** Winton *(awrn)*; **Arctocebus aureus** Winton *(mazirdi I u. III)*; Spitznagelmaki **Euotlemur elegantulus** Leconte *(nagi, I)*; Stumpfnagelmaki **Sciurocheirus gabonensis** Gray *(omdm)* und Zwergmaki **Hemigalago demidoffi** Fischer *(ozəm, oddəm)*.

[2]) In diesem Falle wird auch ein- und dasselbe Tau, das um den Klemmer geknotet ist, benutzt.

oder Erdnüsse sind als Köder um und in das Loch gestreut; der Frankolin steckt seinen Kopf hinein, berührt dabei den Klemmer, der hochfliegt und zugleich dem Vogel die Schlinge über den Kopf zieht. Außer dem Feldfrankolin, **Francolinus squamatus** Cass. *(ogbwə̄)*, geraten noch Tauben in diese ebenso einfache wie ergiebige Falle.

Dabei mag nebenbei erwähnt sein, daß man auch Hühner, wenn sie sich nicht greifen lassen, durch eine solche ad hoc errichtete Falle einfängt oder aber durch eine Blatttüte, in die ein Maiskorn hineingelegt wird. Das Huhn stülpt sich dabei die Tüte über den Kopf und wird dann, bevor es sich freimachen kann, eingefangen[1]).

Abb. 88. Frankolinfalle *ndon.*

8. Bogenfallen.

Sie haben die Form eines Bogens, der beim Zurückschnellen eine Schlinge zuzieht. Solcher Fallen gibt es drei Arten:

---

[1]) Die technischen Ausdrücke für die Teile der Zugfallen sind außer den bei den Schlagfallen erwähnten:

a) Fallenbogen = Fallengalgen (siehe unter Schlagfallen);
b) Klemmstock (siehe unter Schlagfallen).;
c) Klemmer (siehe unter Schlagfallen);
d) Klemmertau (siehe unter Schlagfallen);
e) Klemmerstockstäbe oder Klemmerstocktau = *ndgneja IV, ndgmejə IV*;
f) Zugstock = *mídge* F., *mgejá III* Nt.;
g) Schlinge = *ekə̄ə*, Nt., *ekwə*, F., *nkib I*;
h) Schlingenhalter = *mkgio-ekwə*, F.;
i) Schlingenstütze = *sadá-ekə̄ə* Nt.;
k) Pflock = *engbá*;
l) Einfriedigung (bei *ofogo* usw.) = *ndáib I* von *a dáib* = schließen.

Bei der Halbfallenfalle:

m) Fallenstock = *ofgá*;
n) Querstäbchen = *ofj* Nt., *ofé* F.;
o) Köder.

Bei der Baumzugfalle:

Ast, auf dem die Falle errichtet = *obímega*;
b) Klemmerstock mit der Fortsetzung = *ofgmejá*;
c) Klemmerstockhalter = *ofíbe-ofə III*;
d und e) Klemmertau mit Klemmer = *okgleja*.

1. *ekígle*,
2. *bögö III*,
3. Bogenfalle der Jaunde: *ebǝ́de*.

Die *ekígle* ist am weitesten verbreitet (Abb. 84 Fig. 1). An ein wagerecht verlaufendes Lianenstück oder einen Ast *a* wird der Bogen *b* angebunden, an dessen unterem Ende in *c* zwei Taue befestigt werden, das Klemmertau *d* mit dem Klemmer *e* und das Schlingentau *g*, das auf dem anderen Bogenarm in *h* in einer Durchziehschleife angeknotet wird. Der Bogen wird dadurch gehalten, daß der Klemmer *e* einen kurzen Klemmstock *f* an das obere Bogenende und das Klemmertau festdrückt. Unten auf den Bogen wird als Köder Kassave gelegt und über das Ganze eine Blatttüte gestülpt. Weitere auf die Liane *a* gelegte Kassave dient dazu, das Tier an den Weg nach der Falle zu gewöhnen. Wenn nun ein Tier von hier aus durch die Schleife läuft, berührt es den Klemmstock, die Auslösung erfolgt, und die Schleife zieht sich zu. Die Falle wird hauptsächlich im Urwald für Mäuse und andere kleine Nager aufgestellt, nebenbei auch im Hause zum Fang von Ratten.

Für die gleichen Tiere wird die zweite Bogenfalle der Fang, *bögö*, verwendet (Abb. 84 Fig. 2 *a-c*). Sie ist fast noch einfacher als die *ekígle*; an dem einen Bogenende wird eine Blatttüte angebracht *(b)*, durch welche die am anderen Ende angeknüpften Taue *c* und *d* an verschiedenen Stellen durchgeführt werden. Das vordere Tau *(d)* legt man als Schlinge um die Öffnung der Tüte; das hintere *(c)*, das den Bogen spannen soll, zieht man durch das hierfür durchbohrte Bogenende und sichert es dahinter durch einen Knoten. Hinter diesem Haltetau — wenn man von vorn in die Tüte sieht — befindet sich an einem Stöckchen ein Stück Kassave *(e)*. Das Tier nagt, um zum Köder zu kommen, das Haltetau durch, der Bogen schnellt zurück, und die Schlinge zieht sich zu, so daß die Ratte an den oberen Teil der recht festen Blatttüte gedrückt und erdrosselt wird.

Eine sehr hübsche und geschickte Erfindung ist die Bogenfalle der Jaunde *ebǝ́de* (Abb. 84 Fig. 3). Sie unterscheidet sich wesentlich von den vorigen; wir sehen hier an einem gebogenen Raphiastreifen *a*, wie eine Sehne angebracht, das Klemmertau *b*, das — wie bei der Frankolinfalle — in der Mitte des Klemmers *c* mit einem Knoten befestigt ist und dann weiter in die Schlinge *d* ausläuft. Diese Schlinge endet in einen Knoten, an dem wieder das Haltetau *e*, das den Bogen umschlingt, angeknotet ist. Wird die Falle aufgestellt, so schiebt man den Klemmer mit der Spitze unter den Knoten, während er andererseits durch ein zweites Haltetau *f* und durch den Druck auf die Innenseite des Bogens vor dem Zurückgleiten bewahrt wird; sobald aber eine Ratte durch die Schlinge läuft, zieht sich diese etwas herunter, die Klemmerspitze gleitet unter dem

Abb. 64. Bogenfallen.
Fig. 1 *ebiede*. Fig. 2 bogo in ganz, b unterer Teil von der Seite, c derselbe von vorne.
Fig. 3 Bogenfalle *ebude*.

Knoten heraus, ebenso unter dem Haltetau *f*, und die Schlinge zieht sich um die Ratte zu.

Die Falle wird im Hause hinter den Betten oder wo sonst die Ratten gern herumlaufen, aufgestellt.

8. Zibetkatzenfalle *(nline-ñ)ñ)*.

Wer im Pangwegebiet reist, wird häufig in Dörfern quer über den Platz eine Schnur ausgespannt sehen, an deren Mitte eine hölzerne Hundeglocke oder ein Bündel leerer Schneckengehäuse hängt. Das ist nicht etwa, wie man denken könnte, eine Medizin gegen böse Geister oder eine Signalvorrichtung, sondern eine Alarmfalle für Zibetkatzen, Viverra civetta peertmannii Pucher. *(ñ)ñ IV)*. Während die Schnur an dem einen Ende an eine freistehende Stange geknüpft ist, ist sie an dem anderen hinter dem Hause des Besitzers an einen Baumstumpf gebunden und etwas über der Erde mit

einigen toten Ratten behängt. Schnappt die Zibetkatze des Nachts eine Ratte weg und reißt dabei an der Schnur, so ertönt die Glocke, oder es klirren die Schneckenschalen und wecken den Hausherrn.

V. Jagd.

So geschickt die Pangwe als Fallensteller sind, so schlecht schneiden sie ab, wenn es auf die weidgerechte Ausübung der Jagd ankommt. Den Namen eines Jägervolkes können sie nimmer in Anspruch nehmen, ja mit den Küstenvölkern oder gar den Pygmäen verglichen, erscheinen sie als klägliche Sonntagsjäger. Nur da, wo sie ein großer Gewinn lockt, nämlich bei der Jagd auf Elefanten, geben sie sich mehr Mühe und erzielen deshalb einen Erfolg, der bei der Einfachheit ihrer Jagdwaffe (Steinschloßgewehr mit Eisenstückchen oder Speer (Abb. 85) als Geschoß) beachtenswert ist. Sonst leisten die Pangwe auch mit besseren Jagdgewehren nicht viel, z. B. erlegte von den vielen mit modernen Gewehren ausgerüsteten Fangjägern, die ich im Laufe von drei Jahren in meinem Dienst hatte, nur einer einmal eine Antilope, während ein Pygmäe später in einer Woche fünf Antilopen, einmal sogar zwei an einem Tage, geschossen hat; die schönen Schopfadler, **Lophaetus occipitalis** Daud. *(ebéjek)*, und viele andere Tiere, die ihres scheuen Wesens wegen einen guten Jägersmann erfordern, erlegten meine Herren Jäger niemals. Meist zu bequem, um allein in den Wald zu gehen, lieben sie laute, ungezwungene Unterhaltung und fröhliches Lachen auf dem Jagdzuge, das sie natürlich bald dem Wilde verrät; nicht vereinzelt, sondern viele Male ist es mir vorgekommen, daß meine Jagdbegleiter vor dem Wild, das ich gerade beobachtete, mit weit vernehmbarer Stimme riefen: *e ne nie!* — he be him! (da ist er!), und noch heute erinnere ich mich mit Vergnügen daran, wie mein getreuer Ajong Boka eine ahnungslose Meerkatze, auf deren günstigere Schußstellung ich wartete, mit dem Rufe anbrüllte: „Mama, *ofák, ofák!*" (*ofák* = rotschwänzige Meerkatze), und wie das erschreckte Tier in wahnsinnigen Sprüngen davonstürzte.

Abb. 85. Steinschloßgewehr (rechts) und [illegible] Gewehr ab[illegible] [illegible] nat. Größe.

Bei der von weidmännischen Grundsätzen nicht angekränkelten Natur der Pangwe ist natürlich an ihren jeglichen Mißerfolgen das Gewehr oder — das Weib (siehe Abschnitt XVIII, Geschlechtsleben) schuld, und unzählige Jagd- und Gewehrmedizinen, auf die ich in Abschnitt XIII zurückkomme, sehen wir in verwirrender Fülle auf uns eindringen. Neben den großen, an die Kulthandlungen anschließenden, von der gesamten Dorf-

einwohnerschaft ausgeführten Medizinen *(malón, ongusgu)* habe ich an hundert kleinere Medizinen, die den einzelnen Mann wieder auf die „Jägerbeine" bringen sollen, aufgezeichnet.

Unter den verschiedenen hier zu besprechenden Formen der Jagd ist die niedrigste, die Treibjagd, die ja nichts weiter ist als ein Hineinjagen der Beute in Fallen, am meisten ausgebildet. Wir haben da zu unterscheiden:

1. Treibjagd auf niedere Tiere in Körbe,
2. Treibjagd auf Hochwild in Netze.

Bei der Treibjagd auf niederes, in Höhlen lebendes Wild, insbesondere auf Quastenstachler *(ngém)*, werden längliche Körbe *(nkiṛ-ngém)* aus den Stengeln des **Sarcophrynium velutinum** K. Sch. *(okiélkui)* (Abb. 86, Fig. 1) verwendet, die man an die verschiedenen Ausgänge der Höhle legt. An einem stellt sich der Jäger selbst auf und läßt einen Hund in den Gang oder klopft mit einem Stocke auf den Boden. Das geängstigte Tier flüchtet einem der übrigen Ausgänge zu und gerät in den Korb, wo es sich festklemmt und wegen seiner Stacheln nicht so schnell zurückkann. Ein flugs herbeieilender Mann tötet das Tier mit dem Speer.

Eine zweite Art von Körben, nur entsprechend dünner (Abb. 86, Fig. 2), wird an Rattenlöcher gelegt. Die Tiere werden in einem förmlichen Treiben, an dem sich die ganze Jugend des Dorfes beteiligt, in den Korb gejagt und getötet. Diese Körbe werden *nain* genannt.

Was diese mit großem Hallo betriebenen Rattentreibjagden für die Jungen sind, das ist dem Erwachsenen die Treibjagd auf Wild *(nigm I, ekim)*. Aneinandergereihte Tiernetze *(ngi)* von oft 16 m Länge werden an geeigneten Stellen im Busch, oft in weit sich hinziehenden Schneisen, aufgestellt; gegen diese scheuchen die Treiber, unterstützt von Hunden, die hölzerne Glocken *(nkpo-myé I, mygao IV, ongin e myé, ekin e myé, ongiṛ-myé, ekwgie)*, Abb. 87, um den Hals tragen, die Tiere, die sich in den Maschen verwickeln und von den dort aufgestellten Jägern geschossen werden. Übrigens ist diese Treibjagd ein großes Unternehmen und allgemeines Volksfest. Ausführlicher zu beschreiben ich mir allerdings versagen muß. Bemerken will ich nur, daß auf diese Weise oft eine erkleckliche Anzahl von Antilopen und anderem Wild gefangen wird, und es verdient immerhin Anerkennung, daß die Fangwe dieses Unterfangen, das in dem schlechten und unwegsamen Urwaldgebiet in der Tat nicht einfach ist, mit Glanz zu Ende führen; sogar das Treiben von Elefanten in große umzäunte Plätze ist den Fang nicht unbekannt und soll früher, als das Gebiet noch reicher an diesen Dickhäutern war, häufiger ausgeübt worden sein.

Die Verteilung des Fleisches der auf Treibjagden erbeuteten Tiere ist geregelt; erlegt z. B. ein Jäger ein Stück Wild so, daß es auf der Stelle verendet,

Abb. 8. Korbfallen.

so muß er dem ersten Jagdgenossen, der hinzukommt, Fleisch von einem Vorderfuß abgeben, läuft dagegen das Wild noch weiter, so hat er Anspruch auf den ganzen Vorderfuß, der zweite auf die Schulterstücke *(abar)*[1]) der einen Seite, der dritte auf die Außenseite der Schenkel *(ebarn)*; derjenige endlich, welcher das Tier fortträgt, kann die Halsknochen mit etwas Fleisch *(ebö,ŏ)*[2]) beanspruchen.

Bei dem leicht erregbaren und stürmischen Charakter der Pangwe ist es kein Wunder, daß manche bei dieser Jagd, wo überall aus den Büschen das begehrte leckere *fil* (*fil* = Fleisch und Wild) hervorspringt, den Kopf vollständig verlieren und blindlings auf alles, was sich bewegt, losschießen. Dabei kommt es denn sehr häufig vor, daß so ein wilder Nimrod einen Jagdgenossen oder einen Treiber über den Haufen schießt. Jagdunfälle sind an der Tagesordnung und machen den unglücklichen Jäger der Familie des Getöteten gegenüber haftpflichtig. Um sich in diesem Rechtsstreit mildernde Umstände zu sichern, versteckt man sich zur Entschuldigung hinter den Glauben, daß einige „böse" Menschen oder Zauberer sich in Antilopen verwandeln können und sich in solcher Form schießen lassen, um — des Lebens müde — noch zuletzt ihrem Feinde Ungelegenheiten zu bereiten. Der Jäger erklärt, das wäre auch im Augenblick des Schusses der Fall gewesen; er hätte eine Antilope gesehen, auf sie geschossen, und nun läge ein Mensch da, er sei also ohne Schuld. Diese Ausrede hilft ihm in der Sache wenig, da die gemeine Handlungsweise des Opfers den Pechvogel keineswegs der Verpflichtung, ein ausreichendes Sühnegeld für den Getöteten oder Verwundeten zu bezahlen, enthebt, aber sie verkleinert doch seine Schuld.

Übrigens werden auch einzelne Tiere, deren frische Spuren der Hund aufgefunden hat, in Netze getrieben. Man stellt dabei durch Einkreisen *(a kiŏ e fil)* den Aufenthaltsort der Tiere fest und jagt sie mit Hilfe der übrigen Dorfbewohner in das Netz.

---

[1]) Vom Stamme *bi* teilen; diese Stücke werden meist zuerst verteilt, weil das Tier mit den Schultern zuerst auf die Erde (die ja auch gemeinsames Gut ist) fällt.

[2]) Denn er trägt das Tier auch am Halse (über die Schultern gelegt): *a bŏŋ je bŏŏ* — tragen.

Abb. 87. Blasebälgchen.

Auf der Einzeljagd *(ełłpał)* versagen die Pangwe — wie im Anfang angeführt — mehr oder weniger. Ein eigenes Wort für Jäger gibt es nicht, *npał a npá III* heißt: „der mit der Flinte schießt", und muß das Wort Jäger ersetzen, dagegen ist *nłłpmr III* einer, der Tiere und Fische „fängt". Von der gewaltigen Menge der jagdbaren Tiere des waldbedeckten Landes werden nur die wenigsten ohne Hilfe von Fallen, Netzen und Treibern erlegt, von größeren am meisten noch — außer Elefanten — wegen ihres Wertes Schweine und Leoparden[5]). Früher jagte man auch Büffel, die es allerdings nur an den großen Flüssen (Kampo usw.) gibt, und deren Haut man zu den bekannten Schilden gebrauchte; seit die letzteren mit Einführung des Steinschloßgewehres wertlos geworden sind, scheidet dieser Beweggrund aus, allein des Fleisches wegen sie zu jagen, dazu ist die Jagd zu gefährlich; ebenso wenig lohnend ist die auf Gorilla und Schimpanse, und einen reinen Jagdsport kennen die Leute, mit verschwindenden Ausnahmen, nicht. Die Birsch auf Antilopen ist den Pangwe ohne Stellnetze zu schwierig und mühsam. Meerkatzen, deren Jagd abwechslungsreich, nicht allzu schwierig — obgleich manche Affen recht-scharfe Augen und Ohren haben — und lohnend ist[6]). Eichhörnchen und kleinere Vögel werden mit der Armbrust geschossen.

Daß die Armbrust europäischen Vorbildern nachgeahmt sei, halte ich selbst für eine verfehlte Annahme; wie sollte denn wohl ein Neger darauf kommen, das Vorbild so umzumodeln und gar noch — wie es die Bassi am Sanaga tun — das Vorderende zu einem schaftartigen Fortsatz zu verlängern und ihm zuweilen eine echte Speerklinge mit Tülle aufzusetzen. Mir liegt der Gedanke, daß man Speer und Bogen vereinigt und so selbständig eine neue Waffe geschaffen hat, näher. Schließlich ist nicht-nachweisbar, daß von der Westküste

---

[5]) Ein Leopard war früher so viel wert wie eine Frau.

[6]) Die Affen werden durch Blasen auf einer durchlöcherten Frucht, dem Affenlocker *(ełpa, ełpj)*, Abb. 88b, die Vögel mit einem, *złje IV, zł* genannten, mörserartigen Instrument, Abb. 88a, angelockt.

Abb. 91. Leopardenfalle a der Affen, b der Vögel

Afrikas aus, mit Ausnahme der letzten Jahrzehnte des 19. Jahrhunderts, überhaupt europäischer Einfluß bis zu den Pangwe gedrungen ist.

Die Armbrust (*mkpa II*), Abb. 89, besteht aus zwei Teilen, dem Schaft (*ngwa[a]-mb.*)[7] und dem Bogen (*ndi[i]-mb.*)[8] mit der Sehne. Der Schaft ist ein 1—1½ m langes, im Querschnitt plattelliptisches Holz, das sich am oberen Ende eisenkopfförmig verdickt und hier mit einem quer durchgehenden quadratischen Ausschnitt für den Bogen versehen ist. Der ganze andere Teil des Schaftes ist durch einen mittleren Längsschnitt in zwei Blätter geteilt, von denen das obere etwa handbreit unterhalb des verdickten Schaftendes kreuzförmig eingeschnitten ist, so daß der Querarm des Kreuzes nur durch die halbe Dicke des Holzes geht, also eine Kerbe bildet, der Längsarm durch die ganze Dicke geht, also einen Ausschnitt bildet; in diesen faßt ein entsprechend geformter Zapfen des unteren Blattes. Die Kerbe ist für die Sehne des Bogens bestimmt. Vor ihr ist eine 6—8 cm lange Längsrinne in den Schaft eingeschnitten, die mit Bienenwachs ausgefüllt wird und das Lager für den Pfeil bildet.

Zum Spannen der Armbrust nimmt man den Schaft unter den rechten Arm, stemmt das eine Knie gegen den Bogen, faßt die Sehne mit den Händen und zieht sie in die Kerbe, wobei der Zapfen und mit ihm das ganze untere Blatt etwas nach unten gedrückt wird.

Bei der Schußabgabe (Abb. 90) hebt man die Armbrust bis zur Schulterhöhe, stützt sie etwa in der Mitte mit der linken Hand und drückt mit der rechten die beiden Schaftblätter hinten zusammen. Dadurch schnellt sich der Zapfen in den Ausschnitt und drückt die Sehne hervor, die das Geschoß mit großer Kraft fortschleudert.

[7] Für den Schaft werden die Hölzer folgender drei Ammacrem bevorzugt: **Neoscyphidium lepidotum** Engl. et Diels (*ewjem*), **Xylopia aliaria** Engl. (*mefuna IV*) und **Brachylaena ankolibiba** Engl. (*mepfere III*).

[8] Für den Bogen werden wegen ihres starken Holzes genommen: 1. **Olea gramandii** Engl., Ioeinaceae, (*ellem*); 2. Sapindaceae: **Pancovia pedicellata** Radlk. et Gilg und **Placodiscus sparsus** Radlk. (*ipik*); 3. Violaceen **Rinorea longipyala** Engl. (*ipikwel*) und **R. welwitschii** (Oliv.) O. Ktze. (*mepelik*); 4. Rubiaceen **Rondia acuminata** Bth. und **microcalyx** K. Sch. (*ejiri*); 5. Annonaceen **Trichoscypha** spec. (*ipik e mekum*); 6. Rubiaceen **Gardenia latifolium** K. Sch. (*ebelem*), scheint nicht so sehr geeignet zu sein; 7. Polygalaceen **Carpolobia alba** Don. (*ensik*); 9. eine Rubiacee (*ngi*).

Abb. 80. Armbrüste.
a von oben, b oberer Teil des Schaftes von der Seite, c Bogenteile von unten, d Kugelgewichtchen, e Kinderarmbrust mit Zahnrädern der Pfeile, f Köcher, g Pfeile.

Die kurzen Pfeile *(ebej)* (Abb. 8y g), die in kölnischen Köchern *(kojo IV)* aus Tierfell (Abb. 8y f) oder in Rindenschächtelchen mitgeführt wurden, sind aus Kaphickhartriebstücke und kurz vor dem unteren Ende gespalten, so daß

Abb. 96. Jäger mit einer Armbrust.

ein dreieckiges Blattstück *(ndé-ndjo IV)* aus dem Blatte der Monopetanoe Preussiana langfiniae Mieve. *(ndé-ndjo)*, seltener der Phacostiaceae, Lindackeria dentata (Olive.) Gilg *(ngim e ndé)*[9]), im äußersten Notfalle auch des Sarcophyrium als Flugsicherung eingeschoben werden kann. Die Spitze ist mit einer Salbe aus zerriebenen Strophanthus-Samen[9]) vergiftet.

Obwohl diese Waffe in den Händen der Eingeborenen viel gefährlicher ist als ein Vorderlader, so wird sie doch im Kriege nie benutzt, weil auch vor Einführung des Gewehrs keine Kriegswaffe gewesen sein.

---

[9]) *ngim* = Mann, d. i. männliche *ndé (ndum)*.
[9]) Wohl Strophanthus kombé Olive. *(ngm,)*.

Abschnitt VI.

Nahrungs- und Genußmittel.

1. **Nahrungsmittel.** Rohmaterialien: Fleischkost (Menschenfleisch, erlegtes Wildtier und anderes Tier); — Pflanzenkost (wilde Pflanzen mit eßbaren Blättern, Früchten); — Gewürze (Pfeffer, Salz und seine Gewinnung); — Öl; — Küchenzubereitung. — Küchen- und Kochgeräte (Mahlsteine, Mahlbretter, Pfannenbäcker, Kochtöpfe, Bratpfannen und andere Löffel der Frau, Kochtöpfe). — Zubereitung: 1. Kaumus (Kaumusvorräte; Kaumusarbeitsplatz; gekochte Kaumusvorräte; menstruierte, in ausgiebigstübung gebrauchte Blätter gekochte Kaumus, geklingelte Kaumus). 2. Pfeifen. 3. Erbsen (Erbsenbaum, Erbsenbrücke), Erbsenbrei, Erbsenkuppel). 4. Spiele. 5. Mais (Maisbaum, Maisuppe, Maisbrei, Maisbrei). Andere Getränke und Fleisch. — Mahlzeiten. — Essen. — Tischgeräte, Eßlöffel und seine Formen.

2. **Getränke und Genußmittel.** Getränke: Wasser, Trinkgefäße, Wasserkam. — Genußmittel: Zerkauvorrath, Bananenwein, Palmwein (Vorkommen der palmweinliefernden Palmen, Gifte des Palmweins, Ausgaben und Gewinnung, Gewinnungsmethoden, Haltbarkeit) — Tabakmöglichkeit. — Tabak (Ahnen der Tabakpflanzen, Rauchen, Tabakpfeifen, Pflege der Tabakpflanzen, Behandlung der Blätter).

Einer der höchsten bildlichen Genüsse ist dem Pangwe das Fleisch (*ntí*, gekochtes Fleisch: *ntindjwan* = *ti* von *a nidin* = kochen). Vom Menschen an bis herab zur kleinsten Termite erscheint ihm kaum etwas ungenießbar.

Es gilt als erwiesen, daß die Südpangwe bei Gelegenheit Menschenfleisch essen (Abb. 91), die Pangwe in der Gesamtheit kann man indes nicht als Menschenfresservolk bezeichnen. Bei den nördlichen Unterstämmen wird eingeräumt von Kannibalismus berichtet, und die Eingeborenen behaupten, daß er auch früher nicht bei ihnen bekannt gewesen sei. Bei den mittleren Fang in Spanisch-Guinea und im französischen Gebiet dagegen werden anscheinbarweise von einigen die gefallenen Feinde verspeist; das geschieht angeblich keineswegs aus religiösen Gründen, sondern stellt einen bis zum äußersten durchgeführten Rachakt dar, durch den der Feind an einem Tier herabgewürdigt und wie ein solches verspeist wird. Daß Verwandte oder Angehörige derselben Sippe geschlachtet und verzehrt würden, habe ich nie gehört und wäre auch in den Augen der Fang ein unglaubliches Verbrechen. Gegen im Süden, besonders nach Südostens zu, wo die Pangwe durch Mischung mit ihren Nachbarstämmen im Wesen verändert sind, mag die Menschenfresserei etwas häufiger sein; wahrscheinlich ist sie überhaupt

[p. 143]

Abb. 91. Messer aus einer Speerklinge zum Zerlegen eines geschossenen Bovariers.

von den in dieser Beziehung berüchtigten östlichen Grenzstämmen, insonderheit den Njem, übernommen.

Den Hauptfleischbedarf decken also die Tiere, und hier macht der Pangwe nicht einmal vor der dicken Haut des Elefanten halt; fast alles ist ihm genießbar. Nicht gegessen werden von Säugetieren nur Spitzmaus, Hausratte und das Zwergeichhörnchen **Sciurus pamilio** Leconte *(mɔnɔ-ɛdɔ)*, von Reptilien Chamäleon, die Eidechse **Lygosoma fernandi** Burt. *(ebɔmɔkɔkɔ)* und die **Agama colonorum** Daud. *(ngɔdɔ III)*, von Amphibien die Kröten: **Bufo superciliaris** Blgr. *(mɔgɔ IV)* und **Bufo latifrons** Blgr. *(dɔgɔ*, Mehrz: *bɔgɔ, mɔgɔ)* sowie der Frosch **Rana macrovinensis** D. et B. *(nkɔgɔ I)*. Die Gründe, weshalb diese Tiere niemals gegessen werden, werde ich zusammen mit den Speiseverboten in Abschnitt XIII besprechen.

Die Bezeichnung für die einzelnen Teile des geschlachteten Tieres (Ziege) sind aus Abb. 92 ersichtlich.

Von wirbellosen Tieren werden gegessen: die Larven *(ɛjɔ IV)* des Palmenrüsslers **Rhynchophorus phoeniciis** Fabr. und des Nashornkäfers **Augosoma centaurus** F. Pl. (Larve = *ɔkɔm)*; von den Jaunde die großen Elefantenmistkäfer, **Copris** (*ɔjɔdɔk* J.), selbst; 21 verschiedene Raupenarten, meist **Saturniden** (*nkɔn I* = eßbare Raupe); Libellenlarven und Termiten (*ɛkɔm IV* Nt., *kɔp* J.); Taschenkrebse und Garnelen, Schnecken, mit Ausnahme der Nacktschnecken, und eine Flußmuschel.

Von den genannten niederen Tieren verdienen die in den Blattstielen der Raphiapalme lebenden Nashornkäferlarven auch die Beachtung der Europäer, da sie gebraten recht wohlschmeckend sind, ja fast als Leckerbissen gelten können (man denke an den Genuß der Römer!); auch den Termiten könnte man Geschmack abgewinnen, wenn sich durch irgendein Verfahren die unangenehmen langen Flügel beseitigen ließen. Im Mwelegebiet bei Simekna sah ich die in den Pflanzungen stehenden Termitenhaufen der *kɔp* genannten Art sorgfältig umbogt; die in Massen ausfliegenden Tiere wurden in Körben gefangen und zum Teil lebendig, mitsamt den Flügeln, gegessen, zum Teil von den Frauen zubereitet. Die Tierchen schmecken nach rohem Eiern und würden zu einer Art Brot verbacken gar nicht übel sein, wenn nicht, wie gesagt, die Flügel eine unerwünschte Zugabe wären.

Wenn sich die Pangwe nicht in der Ausübung des Weidwerks so stümperhaft zeigten, wenn sie nicht einen wahren Horror vor dem Schlachten der Haustiere hätten, und wenn sie die Fallenstellerei etwas eifriger und geregelter be-

treiben wollten, so würden sie bei dem Wildreichtum ihres Landes an frischem Fleisch keinen Mangel leiden. So aber bildet die Pflanzenkost ihre Hauptnahrung.

Abb. 92.
Namen der Fleischteile eines Schlachtschweines.
1. Kopf = [illegible].
2. Hals = [illegible].
3. Vorder = [illegible].
4. Lende = [illegible].
5. Bug = [illegible].
6. Hinter und Vorderbeine = [illegible].
7. Bibbenstück = [illegible].
8. Kronenstück = [illegible].
9. Schwanzstück = [illegible].
10. Speck = [illegible].
11. Schicke über den Geschlechtsteilen = [illegible].
12. Kinnbacken und Hinterbeine = [illegible].

Die Genußpflanzen sind, soweit sie angebaut werden, bereits im vorigen Abschnitt erwähnt; die wildwachsenden kommen unter gewöhnlichen Verhältnissen nur zum Teil ständig auf den Tisch, in Hungerzeiten aber, oder wenn sonst einmal das Essen knapp geworden ist, dienen sie dem Pangwe häufig als Nahrung.

Zu nennen sind da von Palmen die Ölpalme, die Raphiapalme und besonders **Ancistrophyllum**, dessen jüngste Blätter (Palmkohl) gegessen werden; von Begoniaceen **Begonia poggei** Wrbg. *(mfo e kij* Nt.) und **B. silhetensis** Wrbg. *(ewu e kijio)*; von Amaranthaceen **Celosia argentea** L. *(nsum ompha, nsum ojjo)*, **C. lanata** Schum. usw. *(nsum e jjijim)* und **Pupalia lappacea** L. *(nsum e kijit)*; von Acanthaceen **Justicia insularis** T. And. *(jiji)*, **Endosiphon oblongus** Clke. *(nsum ndzij, mantmongimo III)* und **Pseuderanthemum nigrillanum** (T. And.) Radlk. *(ndzij I)*; von Urticaceen **Urera laevenii** de Willd. *(mjio I)* und **Fleurya aestuans** (L.) Gaud. *(ngaigu IV)*; von Euphorbiaceen **Micrococca mercurialis** (L.) Benth. *(ojji)*; von Tiliaceen **Corchorus olitorius** L. *(ngbiki-ligmo IV)*; von Melastomataceen **Dissophora spennerodim** Bth. *(mfo-oli)* und **Dissotis decumbens** (P. B.) Tr. *(ojjolo-bongpo-k'ojjo)*; von Moraceen **Myrianthus arborens** P. B. *(mangimo III F., ongnkipo* Nt., J.); von Araceen **Rhektophyllum mirabile** N. E. Brown *(ndio IV, kiju IV)*; von Dioscoreaceen **Dioscorea prehensilis** Bth. *(mfo)*; von Farnkräutern *(ofu IV)* endlich besonders **Dryopteris tamentella** C. Chr., **Dr. megaphylla** (Mett.) C. Chr. *(mojji m'ohjji)*, **Dr. parasitica** (L.) O. Ktze. *(ondinda ohj)*, **Dr. gongylodes** (Kuhn) O. Ktze. *(mpio)*, **Nephrolepis gaiacensis** (Kuhn) *(ohindmo III)*, **Aleuphila cumorensis** Diels *(ntufu-ojiji)* und **Diplazium silvaticum** (Borg.) Sw. *(mfi)*.

Früchte werden sehr wenig kultiviert. Von ihnen ist die Banane die einzige altsudanische, während neuerdings eingeführt sind die Ananas *(ekokojiro I F., ekomonji* Nt. ¶), die über das ganze Gebiet verstreut, wenn auch nur in spärlicher Anzahl angepflanzt wird, die über einen schmalen Küstenstreifen kaum hinausgekommene **Papaya Carica papaya** *(pipiji* J., *ekikkontiogan* Nt., F.) ¶, deren Bäumchen sich zählen lassen, Ananas, kleine Zitronen, Citrus

¶ *ekoi* Zucker, *ojiio* Liliaceen, Cyperaceen; *ekoi* Cyperus (von den Mwele), wegen der den Cyperaceen ähnlichen Blätter.

¶ *ekiki* = **Mimusops djave** (Lam.) Engl. *e ntongio* des Weißen.

Bassam Risso *(ofjs F., ofjo Nt., ofjambés IV)* und für Europäer fast ungenießbare Apfelsinen.

Kokospalmen (*mbéa I, ofjmo I*, Nt., *F., ovgondp IV* J.) gibt es nur am Meeresstrande und auch dort nur in geringer Anzahl.

Vielleicht angepflanzt wird die einheimische „Buschpflaume" **Pachylobus edulis** E. Don., **var. mubafo** Engl., Burseracee (*ozd* Nt., *ofjgod F.*), die man nur in oder bei Dörfern antrifft. Die wundervoll lilablau oder leuchtend rosa gefärbten Früchte werden auf dem Feuer geröstet, das gelbe, ganz wohlschmeckende Fruchtfleisch wird warm gegessen.

Alle anderen Früchte, die von den Pangwe gegessen werden, wachsen wild. Der Buschpflaume in Gestalt und Geschmack der Früchte verwandt ist **Pachylobus trazielleliss** Engl. *(ozzf, Früchte ozf IV)*, die auch ebenso zubereitet wird. Sehr wichtig sind die ölhaltigen Früchte der Sapotacee, **Mimusops djave** (Lam.) Engl. *(ddzob, Früchte ebje)*. Sie gleichen einem großen Apfel; das Fruchtmus, in dem die zwei bis vier Samen eingebettet sind, ist sehr klebrig, aber recht wohlschmeckend; die Samen werden zur Ölbereitung benutzt. Nächst diesen besitzt eine große Bedeutung die **Irvingia barteri** Hook. f., Simarubacee *(andjt, Früchte ndjt IV)*. Merkwürdigerweise wissen die Pangwe den Saft des gelben Fruchtfleisches, der außerordentlich duftig und erfrischend ist — vorausgesetzt allerdings, daß die Früchte gerade im richtigen Reifezustand sind — nicht zu schätzen, wie sie überhaupt, im Gegensatz zu den Küstenstämmen, vielen Waldfrüchten (z. B. den Früchten des Kardamoms, der Palme **Podococcus barteri** u. a.) wenig Bedeutung beimessen oder sie nicht zu nutzen verstehen. Der nahrhafte Inhalt des Kernes wird getrocknet gegessen oder zu einer Art Brei verarbeitet. Eine so schmackhafte Tunke aus den Früchten zuzubereiten wie die Bassi, verstehen die Pangwe nicht; auch ist das Nußbrot der Mpongwe ihnen unbekannt. Weitere wichtige eßbare Nüsse sind **Cola edulis** Baill., Olacinacee *(ewogmo F., ondgmo Nt., Früchte kromb* bzw. *bógmo)*, **Panda oleosa** Pierre *(ofjmo[k], Früchte jómo[k])* und eine mir unbekannt gebliebene Art *(andp, Früchte ndp IV)*. Sehr schmackhaftes und erfrischendes Fruchtfleisch liefern folgende Bäume: Burseracee **Pachylobus macrophyllus** (Oliv.) *(dodzipm Nt., ofjpm F., Früchte ndzipm IV Nt., ifjm IV F.)*, Annonaceen **Trichoscypha** spec. *(omydi, Früchte mydi IV)* und *(ongjn, Früchte ngjn)*; etwas säuerlich, aber recht erfrischend ist das Mus (Pulpe), in dem die Kerne verschiedener **Landolphia**-Arten eingebettet sind, und zwar von **L. owaricae** K. Sch. *(ovjm)*, **L. pierrei** Stapf *(dzó III)* und zwei anderen Arten *(ofjpdo F.* und *kpmo III)*. Alles übrigen Früchten — soweit ich sie gekostet habe — kann der Europäer kaum besonderen Reiz abgewinnen, ja, einige, wie **Lecoudieria** und **Pseudospondias**, sind von geradezu scheußlichem Geschmack und — wie man in Westafrika sagt — good for blackmen, no good for whitemen. Ihre Namen sind: **Parinarium immaculatum** Engl., Rosaceae *(ofjet)*, **Chrysophyllum lacourtianum** Engl., Sapotaceae *(ndzm I)*, **Pachylobus lacourtianum** Engl., Burseraceae *(ngo-ongjiingd)*, **Lecoudieria spinosissima denticulata** Radlk., Sapindaceae *(ntetjo)*, **Pseudospondias microcarpa** (Rich.) Engl., Anacardiaceae *(ofjo)*, **Pseudospondias lacourtianum** Engl., ebenso *(ongjiigo)*.

Sub Scientia Phoenix

1. MALOPEGIA ACUMINATA R. BR. FAM. ZINGIBERACEAE.
2. CYRTOSPERMA SENEGALENSE (SCHOTT) ENGL. FAM. ARACEAE.

[facing p. 116]

Pentaclethra macrophylla Benth., Leguminosae *(ebǝ̂)*, **Cola acuminata** (P. B.) R. Br., Sterculiaceae *(abí)*, **Carpolobia alba** Don., Polygalaceae *(ongǝ̂, ŋgonk)*, **Rhododendron africanum** Muell. Arg., Euphorbiaceae *(ezǝŋʌ́ŋ)*, **Myrianthus arboreus** P. B., Moraceae *(mangǝ́ne III F., engǝ̂kǝm* Nt., J.), **Desbordesia glaucescens** Engl., Simarubaceae *(alǝ̂)*, **Dubosia macrocarpa** (?) Bocq., Tiliaceae *(ahǝk e sʌ́n)*, **Ongokea gladulosa** Stapf, Apocynaceae und **Tylostemon mimiflorus** Stapf, Lauraceae *(dǝ̂-odí,dǝ́ik* bzw. *bodǝ́ibodí,dǝ́ik)*, **Tristemma hirtum** Vent., Melastomataceae *(abé-ofǝ́,e)*, **Cassia sarcoliana** Gilg, Connaraceae *(ebǝ́n e ndǝ́ik)*, **Vitex bipindensis** Gürke, Verbenaceae *(ayǝ́bn)*, **Anonidium mannii** Oliv., Anonaceae *(ebǝ́m ebí)*, **Sarcocephalus cambucinus** (K. Sch.) *(alǝ́ma, alǝ́ma* und *akǝ́ndǝ́,m)*, die Palme **Podococcus barteri** M. et W. *(mimaŋine)* sowie verschiedene **Aframomum**-Arten, z. B. die in Band II abgebildete **Afr. alboviolaceum** K. Sch. *(edǝ́ǝm*, Früchte *eǝ́,n)*.

Schließlich spielen Pilze, von denen die Fang zwanzig eßbare Arten unterscheiden, im Haushalt eine wichtige Rolle; giftige Bodenpilze scheinen, mit Ausnahme einer übelriechenden, mit einer Art Schleier überdeckten Morchel, nicht vorzukommen.

Von Gewürzen sind Pfeffer und Salz bekannt, beide den Pangwe zur Zubereitung der Speisen unentbehrlich. Pfeffer, **Capsicum** *(ekǝ́lǝ́n IV, endǝ́ndǝ́ III)*, wird in drei Arten und vielen Abarten hinter den Häusern oder dicht beim Dorfe angebaut und findet sich verwildert überall in der Nähe menschlicher Ansiedlungen, wo seine grünen, in der Reife roten Früchte jedesmal frisch abgepflückt werden, wenn man sie braucht; sie werden ganz oder auf einem Stein zerrieben an die Speisen getan.

Sehr Umstände macht das Salz. Wenngleich heute das von Europa eingeführte schon fast das ganze Gebiet überschwemmt und, mit dem Tabak zusammen, geradezu einen Wertmesser bildet, so wird an entlegenen Stellen im Innern vielfach noch die schwierige Herstellung aus Sumpfpflanzen nach alter Weise geübt.

Die beiden Hauptsalzpflanzen sind die auf Tafel X abgebildeten **Halopegia azurea** K. Sch., Marantaceae *(nǝ́bn I)* und **Cyrtosperma senegalense** (Schott) Engl., Araceae *(ebǝ́ŋǝ́bǝ́ŋǝ)*; außerdem werden in kleineren Mengen die Wedel der Raphiapalme hinzugetan. Im Fanggebiete werden **Halopegia** und **Cyrtosperma** stets zusammen verwendet, nie eine ausschließlich; an anderen Stellen, z. B. im Ntumgebiet, nimmt man noch folgende Sumpfpflanzen dazu: die Loganiacee **Anthocleista zenkeri** Gilg *(ejǝ́ndǝ́ǝ́n III)*, die Zingiberacee **Renealmia alboroseu** K. Sch. *(edǝ́ǝ́ǝ́ǝ́mǝ́ǝ́m)*, die Urticacee **Boehmeria platyphylla** D. Don. *(ǝ́f[e]-dǝ́ǝ́m)*, die Acanthacee **Brillantaisia vogeliana** Bth. *(ebǝ́ǝ́ǝ́ǝ́n)*, die Araceae **Anchomanes heterophyllus** Engl. *(ǝ́ndǝ́)*, eine Composite *(ǝ́ǝ́f[i]-ǝ́ǝ́n)*, die Commelinaceen **Palisota schweinfurthii** C. B. Cl. *(ǝ́ǝ́ǝ́ǝ́ǝ́ǝ́-ǝ́ǝ́n)* und **Pellia condensata** C. B. Cl. *(ǝ́ǝ́-ǝ́ǝ́,e)*, außerdem da, wo Sumpfpflanzen fehlen, die Marantacee **Phrynium confertum** (Benth.) K. Sch. *(nǝ́bn ǝ́ǝ́n I)* und die schlingende Araceae **Rhektophyllum mirabile** N. E. Brown *(ndǝ́n)*.

Zur Salzgewinnung gehen die Männer in den Sumpf *(ɛpm)*, schlagen die salzliefernden Pflanzen ab und lassen sie zum Trocknen einen Monat an der Sonne liegen. Dann bringt man sie unter ein in der Nähe errichtetes Schutzdach und verbrennt die Blätter und Blattstiele auf offenem Feuer. Die Pflanzenasche, verunreinigt durch die Reste der Feuerscheite, wird ins Dorf gebracht und auf dem Hängeboden über der Feuerstelle im Hause drei Wochen lang zum Trocknen aufbewahrt. Die letzte Arbeit der Männer hierbei ist die Anfertigung eines großen Trichters, den sie aus den Stengeln der Marantacee **Trachyphrynium violaceum** Radlk. *(nkɔmokɔ́mo I)* ziemlich roh zusammenflechten *(ŋpɛ́ɔ́n nkɔ́ IV)*; das weitere übernehmen die Weiber. Sie stellen den Trichter, den sie mit Stangen stützen, innen- oder außerhalb des Hauses auf und legen ihn derart mit Blättern von **Sarcophrynium** aus, daß das unterste Blatt — trichterförmig zusammengefaltet — gerade in die Spitze paßt und die anderen Blätter dachziegelartig die Wand bedecken. Unten schließt man den Trichter durch ein Knäuel aus Gras, **Paspalum** *(ɔbɔ́)*, oder Blättern der **Phyteleaea dodecandra** C. Her. *(ɔlɔ́)*[1] zu einem Filter ab, tut die Asche hinein und gießt Wasser darauf, das ziemlich rasch durch den Filter in ein darunter gestelltes Gefäß sickert. So läßt man das Ganze eine Nacht stehen, gießt am Morgen etwas frisches Wasser nach, um das letzte Salz auszuziehen, und trocknet nun die erhaltene gelbbraune Sole so lange, bis alles Salz *(nkɔ́ I)* ausgefallen ist[2].

[1] Vom Stamm *ɔl* — durchsinken, durchtröpfeln, weil die Sole durch das Kraut hindurchtröpfeln muß.

[2] Die Untersuchung des Salzes, über die Herr W. Lenz vom Pharmazeutischen Institut der Universität Berlin berichtet, ergab folgendes: „Das Buschsalz selbst besaß braune Färbung und ein feuchtkrümeliges Aussehen. Es schmeckte scharf salzig, seine Lösung reagierte stark alkalisch. Die von Herrn Regenstein ausgeführte chemische Untersuchung ergab folgende Zusammensetzung:

43,33 %	KCl (Kaliumchlorid)
27,50 %	K_2SO_4 (Kaliumsulfat)
16,46 %	K_2CO_3 (Kaliumkarbonat)
0,85 %	NaCl (Natriumchlorid)
8,72 %	H_2O (Trockenverlust bei 180°)
3,34 %	Unlösliches (Differenz)
100,00 %	

Das Kalium wurde als Kaliumplatinchlorid vom Natrium getrennt. In dem Unlöslichen wurden Kalzium, Magnesium, Eisen, Aluminium, Mangan, Phosphate, Silikate, Karbonate nachgewiesen und 0,7 % des Salzes SiO_2 (Siliziumdioxyd) bestimmt.

Auffällig ist der hohe Gehalt des Buschsalzes an Chloriden und Sulfaten sowie die Verwendung des überwiegend aus Kaliumsalzen bestehenden Salzgemisches zum Würzen der Speisen, also an Stelle von Kochsalz."

Neben den Gewürzen brauchen die Pangwe als Zutat zu Speisen Öl, das sie aus der Ölpalme, **Elaeis guineensis** L. *(elin)* und der **Mimusops djave** (Lam.) Engl. *(ndidi)* gewinnen, aber so selten, daß seine Verwendung in der Küche gegen diejenige in der Hautpflege ganz zurücktritt. Die Ölgewinnung bespreche ich deshalb bei der letzteren.

Die Küche der Pangwefrau befindet sich, wie beschrieben, im Hause unter den Hängeböden. Einen eigentlichen Herd gibt es nicht; bei den Mwai vertreten ihn drei Steine, sonst aber wird der stets fußlose Topf auf eine Topfscherbe oder unmittelbar auf die geschickt zurechtgelegten Feuerscheite gestellt. Wenn einmal mehr zu kochen ist, z. B. nach einer erfolgreichen Elefantenjagd, so wird der tägliche Feuerplatz zu klein, und man richtet einen zweiten hinter dem Hause her.

Zum Kochen tun — wie jedes kleine Pangwemädchen schon weiß — drei Dinge not: Holz, Wasser und Feuer. An Holz mangelt es nicht; jeden Tag bringt die Hausfrau die nötigen Scheite aus der Pflanzung (Abb. 51) mit. Wasser ist ebenfalls in Menge vorhanden; es braucht nur am Fluß in Kaletassen *(ndjè IV)* oder — bei den Ntum und Okak — in tönernen Wasserflaschen (Abb. 92), P.: *ekapf*, geschöpft zu werden (daher der Name *ekè*, lautnachahmend für das unter Glucksen eindringende Wasser, so auch *e-kèk* = Wasserfall); von dem Feuer haben wir schon in vorigem Abschnitt gesprochen.

Das Küchengerät der Frau ist sehr einfach. Überall vorhanden ist der Mahlstein *(ekpè)* mit dem dazugehörigen kleinen runden Reibstein *(epyè IV)*; jener ist unregelmäßig flach, durch das Reiben glatt gescheuert und liegt meist auf der Erde, wo die Frau bei der Arbeit davorkniet. Bei den Mwai, die in der Kochkunst überhaupt etwas weiter vorgeschritten sind, steht der Stein auf vier kleinen Pflöcken, gleich einem Tischchen, was ihn im Ansehen bedeutend „hebt". Auf dem Mahlstein werden Erdnüsse, Ngon usw. durch Hin- und Herrollen des Reibsteines zerrieben. Demselben Zweck dient ein fast runder Holzteller von der Form eines gestielten Blattes mit erhöhtem Rand *(ezjo-ndjè, ejyè-nd.)* für die Kerne der Irvingia barteri Hook. f. *(andjè, Früchte ndjè IV)*, Abb. 93 sowie als Reiber dazu eine kugelrunde, harte Frucht *(ekrè)*.

In sehr sauberer Weise entfernt die Pangwefrau mit dem halben Schulterblattknochen eines Tieres, z. B. eines Affen (Abb. 94a), mit einem Stück Raphiaeisengel oder einem Bambusspan (Abb. 94b) die Reste der zerriebenen Nüsse oder Kerne vom Mahlstein. Nur selten geschieht dies mit der Hand.

Zum Zerstampfen von Kassavablättern und anderem Gemüse wie zum Entfleischen der Ölpalmenfrüchte dient ein an beiden oder nur an einem Ende

kolbig verdickter Stößel *(ntʌm e mbʌ̄k)* in einer Mulde *(mbʌ̄k I)*, die meist die Gestalt eines Einbaumes (Kanus) mit einem oder seltener zwei Griffen (Abb. 95) hat. Im Mwai- und südlichen Fang gibt es nicht mangelnde Mulden von viereckiger Gestalt und kleine Holztröge mit oder ohne Griff (Abb. 96), *ondin*.

Abb. 95. Tessmann Wassergefäßen.

Die Planten werden mit einem Plantenschäler *(mbʌ̄l)*, Abb. 97, geschält, indem man die Schale stückweise abspringt und abstößt. Er besteht aus einem schmalen Stück Raphiabastrippe und ist öfter mit Rittmustern bläuch verziert.

Der flache Korbteller *(dʌ̄pd*, Mehrzahl *ntpd)*, vgl. Abschnitt VIII, den wir bereits unter den Ackerbau- und Fischfanggeräten kennen gelernt haben, spielt auch in Haus und Küche eine große Rolle, wo er gleichzeitig als Schüssel, Schale, Teller usw. dient. Die Frauen haben eine ganze Auswahl von größeren *(dʌ̄pd)* und kleineren *(ovʌ̄k)* solcher Teller zur Hand. Bisweilen sieht man auch Holzteller oder, besser gesagt, Holzmöpfe von der gleichen Form wie die Korbteller[1].

Der Küchen- oder Rührlöffel *(mbʌ̄ I, ebʌ̄m)*, der streng vom Eßlöffel unterschieden werden muß, ist aus Holz flachgeschnitten (Abb. 98) und dient zum Umrühren von Speisen, Verreiben von Gewürzen und Zerteilen von Brei.

Abb. 98. Holzlöffel zum Umrühren der Speise von Bringa.

Abb. 99. Schnitzereien eines Löffels [illegible] Bemalung ist vom Kunstmaler des Kunstkabinett von Bringa.

Über dem Feuerplatz hat die Frau ihre Eß- oder Schöpflöffel, mit denen sie die Speisen beim Kochen schmeckt und beim Essen aus dem

[1] Aus dem Holz der *Alstonia congensis* Engl. *(ebʌ̄)*, Apocynaceae, oder der Ceiba pentandra (L.) Gärtn. *(dom)*.

Topf herausschlägt. Es gibt verschiedene Formen, von denen die einfachste ein Sarcophryniumblatt ist, das in Lederform zusammengefaltet und nur einmal gebraucht wird. Dieser Blattlöffel heißt *mpwa I*. Eine höhere Stufe stellen der Kalebassenlöffel *(ngwete)*, verfertigt aus einer halb durchschnittenen kleinen Frucht

Abb. 78. Löffel aus Holz.

den Kalebassenkürbis (Abb. 99 und 100), und der Schneckenlöffel *(ekiwa, ekikiwa)*, Abb. 101 dar, der aus der großen Achatina marginata Sw. *(kuf)* hergestellt wird, indem man ein Stück aus der Schale herausschneidet. Sie sind die eigentlichen Gebrauchslöffel der Frau und entsprechen als solche dem hölzernen Eßlöffel *(ngo)* des Mannes. Die Frau gebraucht niemals Schöpflöffel aus Holz.

Das wichtigste Küchengerät ist der Kochtopf *(mvet I, 11/8, Mekwaki 11/5)* aus Ton *(11/8)*, von dem jede Frau eine Reihe größerer *(mvet, 11/8)* und kleinerer *(ekiki)* und dem Topfboden *(ekala o mvet)* besitzt. Durch den Fabrikmißbrauch sind bereits einzelne, mit drei Füßen versehene Töpfe *(mekiwa III)* überaus verbreitet.

Abb. 79. Stampfer aus Holz.

Durch diesen allgemeinen Ver-

bemerkungen gebe ich der Beschreibung der Zubereitungsweisen der hauptsächlichsten Küchengewächse über. Die für die Erzählung wichtigsten seien noch einmal der Reihe nach aufgeführt: Kassave, Plantie, Erdnuß, Ngon, Mais, Taro, Yams[1]) (Fanggebiet).

Abb. 91. Pfeilmesserhälfte.

1. Kassave.

Die Wurzel wird auf fünferlei verschiedene Weisen, wenn ich von unbedeutenden Unterschieden absehe, zubereitet. Zwei von ihnen, nämlich zerstiebene, in einer steighügelförmig gebogenen Blattrolle gekochte Kassave *(nkpwo-mkpe)* und geknüpfte Kassave *(ananaa-mkpe)* — wenig schmackhaft und wenig sorgfältig zubereitet — sind in der Hauptsache Fruerspeise. Die drei übrigen sind im wesentlichen für Männer bestimmt, nämlich Kassaverollen, sogenannte Kanke[2]) *(ebibi)*, ihrer handlichen Form wegen auf Reisen die ausschließliche Nahrung. Kassaverschnitzel *(ssa,-mkpe)* und endlich gekochte Kassaveworzeln *(ngbwo,wo-mkpe)*. Im ganzen Gebiete herrscht in puncto Kassavespeisen Übereinstimmung, mit der alleinigen Ausnahme, daß jene steighügelförmigen Blattrollen bei den Nzua und Fang auch einmal hier und da von Männern gegessen werden.

Dem europäischen Geschmack sagt die Kassave, die vielleicht unsere Kartoffel ersetzen könnte, wegen ihres scharfen Geruches wenig zu, zumal in den Formen, wie die Neger sie bereiten. Am ehesten können uns noch — trotz des kleisterartigen Geruches — die wurstförmigen Kassaverollen im Norden, wo die Wurzeln vorher in reinem, fließendem Wasser gelegt werden, behagen, wenn man sie nach europäischer Weise in Scheiben schneidet oder zerstiebene mit einem Ei vermischt und in Butter brät. Ganz schlimm sind die Kanke im Süden, weil dort die Wurzeln vor der Zubereitung eine Zeitlang in den Sumpf gemischt werden und dadurch einen ganz widerwärtigen Modergeruch annehmen.

α) Kassaverollen oder Kassavebrote *(mkpe l-mk., ebibi)*.

Sie erfordern zur Zubereitung längere Zeit, nämlich 4—5 Tage. Die Wurzeln werden so, wie sie aus der Pflanzung kommen, also mit der Rinde und unzerkleinert (mit Ausnahme von ganz großen Wurzeln, die durchgeschnitten

[1]) Kleinere Wiederholungen sind in den einzelnen Abschnitten der Deutlichkeit halber nicht ganz zu vermeiden. Der Leser möge sie gütigst entschuldigen.

[2]) Die Herkunft dieses Wortes ist mir nicht klar geworden; ich weiß nicht, ob es ein aus anderen Negersprachen übernommenes oder im Kletzenzeglich verdorbenes europäisches Wort ist.

Abb. 90. [illegible]

Abb. 91. [illegible]

Abb. 92. [illegible]

werden), in Wassertöcher gelegt, um ihre giftigen Stoffe auszuziehen. Auf die Beschaffenheit des Wassers legen die Frauen der Ntum und Fang keinen Wert, ja sie scheinen mit Vorliebe gerade sumpfige Stellen, z. B. Raphiasümpfe, auszuwählen. Man sieht da häufig auf dem vollständig trüben Wasser und am Rande der Pfützen die Reste der Kassave, über der eine Unzahl von Schmetterlingen, insbesondere von Blaulingen, Weißlingen, Papilio-Arten, darunter der große blaue Zebraweis, einer Wolke gleich, schweben. Diese gleich stark nach Moddo und Kassave riechenden Löcher sind für den Sammler wertvolle Fundplätze. Im nördlichen Gebiet, bei den Jaunde, Bene und vielen Bule, pflegt man dagegen die Kassave nicht in die Moddo, sondern auf den Sandgrund kleiner Bäche zu legen, und zwar nahe am Ufer, wo das Wasser langsamer fließt; auch macht man sich die Mühe, einen Bach so weit abzudämmen, daß nur wenig Wasser durchsickern kann, und steckt die Wurzeln unterhalb des Dammes in den Grund. Vielleicht kommt das von der Seltenheit der Raphiasümpfe im nördlichen Gebiet; jedenfalls muß die Kassave in stehendem oder nur ganz schwach fließendem Wasser 3—4 Tage liegen, 3 Tage bei jüngeren, 4 Tage bei älteren, starken Wurzeln. Nach Ablauf dieser Zeit nimmt die Frau die Wurzeln heraus und zieht mit der Hand die Rinde nebst der darunterliegenden festeren Faserschicht ab, was keine Schwierigkeiten bietet; dann wäscht sie die Wurzeln an Ort und Stelle leicht ab, zieht die Mittelrippe heraus, drückt die Kassave im Wasser mit beiden Händen zu einem Ball, wobei ein weißlicher Saft ausfließt, und tut die Bälle in einen mit Blättern ausgelegten Korb. Die weitere Zubereitung geht im Hause vor sich; dort wird die Kassave auf dem Mahlstein zerrieben und das Gemahlene auf Blätter geschüttet, welche die Frau auf der Rückseite vom Stampf gepflückt hatte. Im Süden sind es die Blätter der bereits mehrfach erwähnten Marantaceen Sarcophrynium valvatum (Baker) K. Sch. (*ekiéj*[1]*kɔ*, *ekiéj*[1]), Tafel XI, mit der Absicht gleichzeitig I. e o o.

[1] *ekiéj* = Blatt, *e kɔ* = umhüllen, Stamm *kɔ*, vgl.: *kɔ́ʃʃ*, die Schildkröte wegen des Panzers, *e kɔ-i* = klopfen, aufklopfen, d. h. verursachen, daß sich etwas entfaltet.

SARCOPHRYNIUM VELUTINUM (MIQ.) K. SCHUM., FAM. MARANTACEAE.

Maria Thomson, del. Pinxit

Printed and published by Dean Thomson & Co., Suva.

[facing p. 154]

(andrma), im Norden (Jaunde) die der (Stengyne ochwinfurtkiana K. Sch. *(ombji)*. Jeden Tag bringen die Frauen große Bündel solcher Blätter vom Felde mit, da sie sich ihrer nicht nur zur Umhüllung von Kassave- und Maisbroten, sondern auch als Unterlagen und Teller bedienen.

In diesen Blättern wird die Kassavemasse durch leichtes Kneten zu einer Wurst geformt, darauf das Blatt gerollt, an dyo Enden, wie bei einem Paket, umgeschlagen und mit einem Teil aus den Stengeln derselben Pflanze umwickelt, welche die Blattbälle geliefert hat (die Stengel der Pflanze heißen *ndjo IV ndjoan IV*). Diese Rollen werden in einem verschlossenen Topf mit etwas Wasser eine Stunde lang gekocht und dann zum Kaltwerden beiseitegestellt, nur in seltenen Fällen sofort warm gegessen (Abb. 102). Sie halten sich so 3 Tage. Gewöhnlich sind sie 35 cm lang, etwas länger in Jaunde, und 5 cm dick, im ganzen etwas größer im Bulugbiete.

Ein solcher „Kank" gilt überall im Gebiete ein Blatt Tabak (Handelstabak) oder einen Löffel Salz, was einem Stück Spiegeln oder 7 Pfennigen entspricht, und ist als Verpflegung für Träger und Angestellte der Weißen wegen der Handlichkeit, der sich stets gleichbleibenden Menge und der Beliebtheit bei den Eingeborenen allgemein üblich.

Getrocknete Kassaverollen *(ongwut-nd.)*.

Da sich die gewöhnlichen Rollen nicht länger als 3 Tage halten, so wendet man für längere Reisen oder für Fälle, wo man die Rollen nicht immer wieder neu herstellen kann oder will, ein besonderes Verfahren bei der Zubereitung an. Dabei werden die Kassavebälle, nachdem sie umgewaschen sind, ungefähr für einen Monat auf den Trockenboden gelegt und dann erst verarbeitet d. h. auf Steinen zerrieben, in Blätter gewickelt und gekocht. Mitunter werden auch die Bälle selbst mit auf die Reise genommen und dann, wenn man sie benutzen will, in Wasser aufgeweicht, gekocht und kalt verzehrt. Beide Arten bezeichnet man als *ongwut-ndjo*.

b) Kassaveschnitzel *(ont-nd., ngl-nd. IV)*.

Eine sehr bittere und zugleich giftigere Abart der Kassave wird zu Kassaveschnitzeln verarbeitet. Die Wurzelstücke werden dann mit einem Messer abgeschält, der Länge nach halbiert oder geviertelt und in einem mit Pflanzenblättern ausgelegten Topf mit 1½ l Wasser eine Stunde lang gekocht. Nun werden die Wurzeln herausgenommen, wie ein Brot in Scheiben geschnitten, in einem mit Blättern ausgelegten Korb einen Tag lang in fließendem Wasser gehängt, dann noch auf dem unter Fischfang, S. 110, beschriebenen Netz tüchtig am Fluß ausgewaschen und so kalt gegessen.

Getrocknete Kassaveschnitzel *(ddd[a]-mb.)*.

Sie werden nach dem Kochen, bevor man sie im Wasser hängt, in der Art wie *engena-mb.* getrocknet und in gleichen Fällen verwandt.

c) Gekochte Kassavewurzeln *(ogbud,mo-mb.)*.

Eine verhältnismäßig wenig giftige Abart unserer Pflanze, die deshalb einer langen Auslaugung im Wasser nicht bedarf, wird ebenso wie die vorige zurechtgeschnitten, eine Stunde gekocht, und die sehr fade und faserige Wurzel heiß gegessen.

d) Zerriebene, in steigbügelförmig gebogenem Blatt gekochte Kassave *(nkgné-mb. I)*.

Von der Wurzel wird mit dem Hauer ein Streifen Rinde abgesplissen und von hier aus das Innere mit einem rauhen Stengelstück aus den Stämmchen der Schlingpalmen **Acrostrophyllum acutiflorum** Becc. *(nkgne)* oder **Calamus deerratus** M. et W. *(ndi,a)* herausgerieben. Die Spänchen fallen auf ein untergelegtes Blatt und werden dann auf dem Mahlstein zerrieben. Die Masse wird jetzt in einem mit einem Blatt ausgelegten Korb- oder Holzteller mit dem Rührlöffel tüchtig durchgeknetet, unter Zusatz von Wasser, das man über ein in einem Blatttrichter befindliches verkohltes Stück Plantenschale laufen läßt, wodurch das Wasser und damit die Kassavemasse schwärzlich gefärbt wird, angeblich, weil die weiße Farbe den Weibern nicht gefällt. Die Masse wird nun in ein steigbügelförmig gebogenes, gerolltes Blatt (Abb. 103) gefüllt, wie die Kassaverollen mit wenig Wasser aufgesetzt und eine Stunde lang gekocht.

Abb. 102. Kassaverolle.

Abb. 103. Steigbügelförmig gebogenes Blatt.

Die Speise ist leimartig zäh und schwärzlich, von häßlichem Aussehen und wenig angenehmem Geschmack.

e) Gedämpfte Kassave *(amdné-mb.)*.

Zerriebene Masse, wie sie zu den Kassaverollen benutzt wird, oder auch gekochte Wurzeln werden zwischen zwei Blätter, die über einen Topf gebunden sind, gelegt. In dem Topf selbst werden Makabohblätter gekocht, und so zugleich die Kassave gedämpft (eine Stunde lang).

Neben den Wurzeln werden die Blätter der Kassave *(mandépé*, Mehrzahl) häufig gegessen, und zwar hauptsächlich von Weibern. Man zerstampft die Blätter gehörig in einer Holzmulde (Abb. 104), setzt sie in einem offenen Topf mit etwas

WOHNHAUS IN BERAI (FAM. ASSAMOU, NYUNGABIET).

Adolf Tennmann, die Fangen

Vorlage und gedruckt bei Emil Wunsch A.-G., Berlin.

[Facing p. 156]

Wasser auf, gießt später Wasser durch und läßt sie nicht weniger als 3½ Stunden kochen; dann werden sie mit Pfeffer oder Salz verrührt und aufgetischt. In dieser Form heißt das Gemüse *mbób I*, schmeckt zwar nicht schlecht, gilt aber als minderwertig und wird von den Männern nur genommen, wenn nichts anderes da ist.

8. Planie.

Sie wird in Bisé verschiedenen Zubereitungsformen genommen, und zwar nimmt man zu denen von ihnen unreife, zu den übrigen reife Früchte.

a) In Asche geröstete Planten *(ngpó-ekpu I)*.

Eine unreife geschälte Plante wird in ein Blatt eingewickelt und neben das Feuer in die Asche gelegt, die etwas durchgeglüht wird. Nach einer halben Stunde ist das Gericht fertig. Die Plante ist außen weißlichgelb, innen dunkelgelb und schmeckt recht trocken.

b) Gekochte Planten *(nkéy ekpu I)*.

Die unreifen Planten werden geschält, von den Rippen und anhaftenden Schalenteilchen gereinigt und 20 Minuten in Wasser gekocht.

c) Zerstampfte Planten *(ntíyme ekpu I)*.

Ebenso wie vorige zubereitet, aber zerstampft als Brei genommen.

d) Gekochte reife Planten *(mfejó-ekpu I, mfej-mis I)*.

Die Schale von reifen Planten wird mit dem Plantenschäler geölet und in einen Topf gelegt. Darauf kommen ganz oder zerstückelt die Früchte, darüber wieder Schale, dann gießt man Wasser zu, bis das Ganze bedeckt ist, und kocht es ½ Stunde lang; man ißt die Planten ganz oder mit kaltem Wasser zu Brei verrieben.

e) Roke reife Planten *(mét III)*.

Die reifen Früchte werden roh oder in Asche geröstet gegessen.

9. Erdnuß.

Sie wird mitunter als ganze Nuß *(kób IV-ewupe, ollie -ew.)* geröstet gegessen, sonst auf viererlei Art, teils als Suppe, teils als Mus zubereitet. Für alle heißt es zuerst die Erdnüsse mit der Hand aufbrechen (Tafel XII), wobei oft die ganze Familie mithilft; dann werden die Nüsse von der Frau auf dem Erdnußröstbett einige Minuten über Feuer schwach geröstet und auf dem Mahlstein zweimal durchgerieben. Nach dem zweiten Durchreiben heißt die Masse *ebé(e)-ew.* (*be* = teilen, davon *e-bé-b* = das Abgeteilte, z. B.

Fig. 66. Eingeborene [illegible] Kanu-[illegible] in einer Bucht an Upolu.

Rindenstückchen, die vom Baum abstehen, und *ebeje* – die Schuppen, weil das Zerriebene etwas auseinanderfällt und wie Schuppen vom Stein fällt. Aus ihr bereitet man zum folgende Speisen.

a) Erdnußmus *(vuiyaloa)*.

In einem Topf wird Wasser erhitzt und das heiße Wasser bis auf einen kleinen Rest in ein Schüsselchen abgegossen. Nun nimmt man den Topf vom Feuer, schüttet die Erdnußmasse hinein, rührt mit einem Küchenlöffel unter 3—4maligem Zugießen von heißem Wasser tüchtig um, streut Salz hinein, rührt noch einmal gut um, und das Gericht ist fertig. Auch kocht man wohl die Masse mit wenig Wasser im Topf selbst.

b) Erdnußbündel *(vuiyaloa. I)*.

Wie bei a) wird Wasser in einem Topf aufgesetzt; nachdem der Topf vom Feuer genommen ist, wird Erdnußmasse hineingeschüttet und unter Zugießen von etwas Wasser verrührt. Dann wird der Brei in ein Pflanzenblatt gefüllt, das man durch Feuer gezogen hat, um es geschmeidig zu machen, das Blatt zu einem Bündel zusammengebunden und mit kaltem Wasser im Topf aufgesetzt. Der Topf muß oben mit Blättern angebunden werden. Wenn die Erdnüsse nicht mit heißem Wasser angerührt, sondern, wie in diesem Falle, kalt auf Feuer gesetzt werden, müssen sie stets ½—1 Stunde lang kochen.

c) Erdnußbrei (*ndyɔ*).

Erdnußmus — wie oben vorbereitet — wird in einem Topf mit kochendem Wasser geschüttet und durchgerührt, dann kurze Zeit — 2 Minuten — auf Feuer gesetzt und mit Salz verrührt.

d) Erdnußsuppe (*ngɔ́ŋɔ́ ɔ́-ma*).

Sie unterscheidet sich von dem vorigen nur durch Zugabe einer größeren Menge Wasser, so daß eine Suppe daraus wird. Sie wird als Beigabe zu Fleisch verzehrt, nicht allein genommen.

4. Ngon.

Der Ngon wird nur in zwei Formen, als Brändel (*ɔmɔ́ɔn ngɔ́n*) und als Suppe (*ɔmɔ́-ngɔ́n I*), zubereitet, die den bei der Erdnuß aufgeführten entsprechen.

5. Mais.

Er wird in viererlei Gestalt gegessen, nämlich die grünen Kolben geröstet (*ndɔ́p-ɔ́ɔn I*), als Maissuppe (*ɔmɔ́-ɔ́ɔn I*), als Maisbrei (*ngɔ́ɔn*) und als Maisbrot (*bɔ́ɔnɔ́ III*).

a) Die grünen Kolben.

Wie die Pflanzen frisch in Asche geröstet.

b) Maissuppe (*ɔmɔ́-ɔ́ɔn I*).

Die Körner werden aus den Spindeln alter Kolben herausgebrochen und in einem halbvollen Topf mit Wasser weich gekocht (½ Stunde lang), dann zerrieben und mit zerschnittenen Blättern der Kanave und des Amarantus (*ɔndɔ́n-ɔkɔ́*) 1 Stunde gekocht. Wenn sie gar sind, wird kaltes Wasser zugegossen, durchgerührt und die Suppe angerichtet.

c) Maisbrot (*bɔ́ɔnɔ́ III*).

Man entkörnt alte Maiskolben und schüttet die Körner in einen Topf mit Wasser, damit sie etwas quellen, dann schöpft die Frau jedesmal einige mit dem Löffel heraus, legt sie auf den Mahlstein und zerreibt sie unter öfteren Zugießen vom Wasser zu Mehl (ein halber Korb Maiskolben ergibt einen gehäuften Korbteller voll Mehl, woraus drei Brote gemacht werden). Das Mehl wird in einem mit Blättern ausgelegten Korbteller mit Wasser zu Brei verrührt, dem Salz, Pfeffer, oft auch noch Garnelen und Libellenlarven beigefügt werden. Dieser Brei kommt, wie bei der Fruchtkanave *ndɔ́ɔn ndɔ́n*, in ein steighöhenförmig gebogenes Sarcophrynumblatt, wird so in einem Topf mit wenig Wasser 1 Stunde lang gekocht und ergibt eine zwar schwere, aber ganz wohlschmeckende Speise.

d) Maisbrei *(ngbwēt)*.

Er wird aus frischem Maismehl hergestellt, das gekocht eine weiße, breiige Suppe darstellt. Da ich jedoch die Herstellung nicht genauer beobachtet habe, kann ich die Einzelheiten nicht angeben.

Die übrigen Nutzpflanzen, wie Taro, Makabo, Yams usw. sind nicht wichtig genug, um in bezug auf verschiedene Arten der Zubereitung hier erörtert zu werden. Wie ich glaube, wird der Leser sich aus den bisherigen Angaben ein Bild von der vielseitigen Verwertung der pflanzlichen Nahrungsstoffe durch die Pangwe machen können.

Fleisch wird in Töpfen für sich gekocht — ebenso Fische, die man, wie wir, ausnimmt und schuppt — oder im Blattbündel mit Erdnuß und Ngon zusammen. Von anderen Zubereitungsweisen kennen die Pangwe das Rösten, wenden es aber nur an, um die Speise haltbar zu machen und aufbewahren zu können.

Die Mahlzeiten sind recht ungeregelt und schlecht verteilt:

„Ikiitimo ajiii ang, kumul ebem e ekjii,
Morgens ein Häckchen für den Mund, (mit)tags ein Darlehn für den Kinnbacken,
ebi kepfan"
nachts ganz voll.

Morgens nimmt man gleich nach dem Aufstehen meist etwas kalte Kassavespeise oder ähnliches, was die Frauen den Abend vorher gekocht hatten, da sie meist früh in die Pflanzungen müssen. Im Laufe des Vormittags begnügt man sich mit einem kleinen Imbiß von Kassavekost, Bananen und dergl. Dann folgt das warme Mittagessen, das, je nach der Rückkehr der Frau aus der Pflanzung, zwischen 12 und 5 Uhr stattfindet. Die Hauptmahlzeit, die ziemlich reichhaltig ist, fällt auf den Abend; es bleibt aber nicht bei einer, sondern die Frauen müssen zwei- und mehrmals, ja sogar noch mitten in der Nacht, frisch kochen, um die hungrigen Magen zu befriedigen. Von dieser „Regel" weicht man freilich häufig ab; gibt es viel Vorrat und wenig Arbeit, so wird den ganzen Tag gegessen, andererseits läßt man ebensogut Mahlzeiten aus oder fastet einen ganzen Tag, wenn irgend etwas dazwischenkommt.

Die Mahlzeiten bestehen im wesentlichen aus Kassave und Plante; daneben ißt man von den anderen erwähnten Speisen, was man gerade hat.

Männer und Weiber essen gewöhnlich getrennt; die Frau versorgt sich schon während des Kochens, auch mit der Männerspeise, die nicht für sie bestimmt ist, oder *sie* ißt mit ihren Töchtern und kleineren Söhnen, nachdem *sie* das Mittagessen ihrem Manne ins Versammlungshaus, wo sich auch die reiferen Knaben einfinden, geschickt hat. Die späten Abendmahl-

seiten pflegt dagegen der Gemahl zu Hause im Familienkreise einzunehmen, da er dann schon zu halt oder einmal im Versammlungshause geworden ist.

Durchweg läßt der männliche Pangwe ruhig und würdig, wenngleich unter behaglichem Schmatzen und Schwatzen. Gieriges Essen *(o ŋkhan a dzi)* erscheint dem Pangwe lächerlich und unsinnlich und ist ihm ein Zeichen schlechter Erziehung. Viele der guten Lehren, die der Vater seinem Sohne gibt, bewegen sich in dieser Richtung, und in Sprichwörtern und Märchen (z. B. in den netten Märchen von Bismann Fredgier, in der Geschichte vom Fechmeck usw.) kehrt dieselbe Auffassung wieder.

Das Tischgerät ist sehr dürftig, wie man nicht anders erwarten wird. Bei flüssigen Speisen wird der Kochtopf, falls er klein ist, gleich vom Feuer in die Mitte der Gesellschaft gestellt, falls er groß ist, sein Inhalt in einen kleineren umgegossen; jeder nimmt seinen Löffel und schöpft sich aus dem gemeinsamen Gefäß. Speist der Mann abends im Hause, so wird für ihn meist ein eigener Topf hingestellt. Feste Speisen, z. B. Plantes und Kassavekuchenteil, werden auf einem Bananenblatt aufgetragen, und jeder nimmt sich davon mit der Hand. Als feiner gilt es, das Blatt auf einen Korbteller zu legen oder das Essen ohne Unterlage auf dem Korbteller zu reichen.

Der Löffel der Männer ist aus Holz *(ŋsi*, Mehrzahl *IV* oder unregelmäßig *mesiŋ)*, Abb. 105, und kommt in vier verschiedenen Formen mit je zwei Abarten vor. Die erste Form ähnelt unseren Salatlöffeln; sie hat entweder *(a—c)* eine kreisrunde bzw. breit-ellipsige Muschel und einen platten Stiel, der etwas unterhalb ihrer Außenfläche ansetzt — diese Form ist von Norden gekommen, vielleicht von den Jaunde und Bene, bei denen sie sehr verbreitet und beliebt ist, vielleicht von noch weiter nördlich sitzenden Stämmen, und wird im Süden bei den Bulu noch häufig, bei den Ntum ziemlich viel, bei den Fang nur mehr selten gesehen — oder *(d)* sie hat eine birnenförmige Muschel, und einen breiteren, tiefer ansetzenden Stiel (mir nur von den Fang bekannt).

Die zweite Form *(e—f)* besteht aus einer ziemlich kreisrunden, tiefen Muschel und einem an ihrem Rande ansetzenden breiten, über die Fläche giebelig geknickten Stiel, der sich meist gegen das Ende verbreitert und mit Kerbschnittmustern verziert oder mit gepunztem Messingblech beschlagen ist — so nur bei den Fang, und wegen der runden Form der Muschel *ɛsɔmo-gɔdɔŋɔdɔ* — Nest des Bülbüls (Pycnonotus) genannt.

Einen Übergang zwischen der ersten und zweiten Form zeigt *g*, bei der der schmale, unverzierte Stiel der ersten Form in der Weise der zweiten Form giebelig geknickt ist — so nur in Jaunde.

Abb. 30. Schöpflöffel der Männer.

Die dritte Form *(h—k)* hat eine schmal-ovale, flache Muschel, die mehr oder weniger allmählich in den kurzen, meist platten, seltener runden Stiel übergeht — so nur bei den Fang.

Eine vierte Form *(l—n)* besteht eigentlich nur aus einer muldenförmigen Muschel, an der der Griff nur durch eine stufenartige Absetzung angedeutet ist [der Form nach daher *bôi-ndzób* — Blatt der Bimanepe djave (Lan.) Engl. genannt], nur bei den Fang.

Die Löffel der Frau, Blattlöffel, Kalebassenlöffel und Schneckenlöffel, sind oben erwähnt; es mag hier hinzugefügt werden, daß auch der Mann, besonders wenn er keinen Holzlöffel bei der Hand hat oder auf Reisen, diese Löffel gelegentlich benutzt. Meist führt freilich jeder ein oder zwei Stück des nützlichen Gerätes in seiner Umhängetasche aus Ananasfasern *(mjôk)* mit sich.

Getränke und Genußmittel.

Das gewöhnliche Getränk des Pangwe ist Wasser; er trinkt es aus kleinen Töpfen, in die es aus der Tonwasserflasche gegossen wird, oder aus den Kalebassen *(mbjè IV)*, die neben den Tonwasserflaschen auch zum Wasserholen benutzt werden, oder aus eigenen, halb durchgeschnittenen (Mwele) bzw. mit einem Ausschnitt versehenen (Jaundé) Trinkkalebassen. Unterwegs benutzt er ein oder mehrere in der Art des Blattütteln trichterförmig zusammengelegte Blätter oder die rechte Hand, mit der er das Wasser aufschlürft und sich in raschen Schleuderbewegungen in den Mund wirft.

In dichten Urwäldern, wo man keinen Bach in der Nähe weiß — allerdings ein seltener Fall, z. B., wenn man sich verirrt hat oder wenn plötzliche Erkrankung mit Durst eintritt oder dergleichen —, kann man sich mitunter einen verborgenen Quell in der Wasserliane, **Dickapetalum** **kalmeriorum** Engl. *(engl.-prantl-ndch. III 70., eg.-ndl. III F.)*, erschließen, die aber leider nicht überall vorkommt. Sie zieht sich unmittelbar von der Erde bis zu den höchsten Wipfeln der Bäume, kann die Dicke eines Oberschenkels erreichen, mißt aber meistens nur 40 cm im Umfang. Um Wasser zu bekommen, braucht man nur die Liane so hoch, wie man eben reichen kann, durchzuhauen, was mit einem Hieb geschehen ist, und von der unteren Hälfte ein Stück abzuhauen. Dieses wird senkrecht gehalten, damit das Wasser nicht ausfließen kann, und über ein Trinkgefäß, z. B. trichterförmig zusammengelegte Blätter, langsam gewiegt. Das Wasser, das — wie die Neger versichern — gut für den Magen sein soll, fließt nun unter Zischen in dickem Strahle aus. Es ist ganz erstaunlich, welche Mengen die Liane enthält; ein armlanges Stück genügt, um den heftigsten Durst zu stillen, und faßt nach meiner Schätzung 1½ l. Braucht man mehr, so schneidet man sich weitere Stücke ab, und da das Wasser wegen des Luftdruckes aus der durchschnittenen Liane nicht ausfließen kann, so hat man immer genug, selbst für große Karawanen.

Von Genußmitteln kennen die Pangwe Zuckerrohrsaft, Bananenwein, Palmwein und Tabak, sie sind aber in ihrem Gebrauch im allgemeinen durchaus mäßig. Hierin hätte die Einführung von Rum sicher einen Wandel zum Schlechteren geschaffen, wenn nicht 1906 das Verbot des Spirituosenhandels dazwischen getreten wäre.

1. Zuckerrohrsaft.

Der Saft, den das Zuckerrohr in sich birgt, wird dadurch gewonnen, daß man die Rinde mit einem Messer abspättert und das Fleisch ausmagt, oder daß man den Saft auspreßt und ihn dann als „Zuckerwein *(map/[k] me ukrè)*" trinkt. Letztere Art der Gewinnung kommt nur im Südpangwegebiete vor.

und zwei in zwei Formen. Die erste ist so: Man zerschneidet das Rohr in 6—8 cm lange Stücke und entfernt das Fleisch dadurch, daß man den stachelligen Stengel von **Trachypyrium desertimaianum** Brongn. et K. Schm. (vgl. 1) hindurchzieht und eine Zeitlang hin und her reibt (Abb. 108). Um den Gerstbast wegzulassen, legt man ein Blatt unten, später tut man es in einen Korbteller und preßt es mit bloßen Händen aus. Ein zweites, feineres Verfahren besteht darin, daß man das Rohr mit dem Messer entrindet und in einer Mühle zerstampft; die so erhaltene Masse tut man in eine Zuckerpresse (*ayeyo*), die aus **Arundinaria** (*ekpoe*) hergestellten groben Flechtwerk von rechteckiger Form, das an den Schmalseiten in Schlaufen ausläuft, durch die zwei Stücke geschoben werden. Der eine von diesen wird durch zwei in den Boden gerammte, in der Mitte durchlochte Pfähle gesteckt, der andere oben auf die beiden Pfähle gelegt. Soll die Presse gebraucht werden, so stellt man ein Gefäß (Topf) darunter, nimmt den oberen Stock ab, legt die Zuckerrohrmasse in das Flechtwerk, dreht den Stock mit beiden Händen um, und wringt so die Presse aus. Der Saft, der gleich getrunken werden kann, wird meist nur für ältere Leute, die das Zuckerrohrfleisch nicht mehr recht zerkauen können, bereitet, sondern noch für medizinische Zwecke.

Abb. 108.
Ein Tessmann reibt mit einem stachligen Gerstbast den Fleisch von dem Stockholze des Zuckerrohrs herunter, um daraus Zuckerwasser zu gewinnen.

1. Bananenwein.

Er wird aus reifen Bananen oder Plantains gewonnen, die abgeschält und halb durchgeschnitten in einen mit Wasser gefüllten Topf getan werden. Den Topf bindet man mit einem durchlöcherten Blatt zu und setzt ihn einen Tag lang der Sonne aus. Dann wird die Flüssigkeit vorsichtig abgegossen, in eine Kalebasse gefüllt und wieder für kurze Zeit in die Sonne gestellt. In Jaunde wird dieser nur im Nordpangwegebiete bekannte Bananen- oder Plantainwein (letzterer soll noch besser sein) sehr geschätzt und dem Palmenwein gleichgestellt, was unter anderem daraus hervorgeht, daß die als Feinschmecker bekannten ältesten Häuptlinge ihn besonders gern trinken. Das Getränk ist in der Tat gar nicht übel und übrigens auch bei Weißen beliebt.

2. Palmwein.

Der Palmwein wird von den Pangwe hauptsächlich aus der Ölpalme, *Elaeis guineensis* L. *(ndzu)*, in ganz seltenen Fällen aus der Raphiapalme, im äußersten Norden auch aus der Dattelpalme bereitet, infolgedessen entspricht seine Häufigkeit und Güte der größeren oder geringeren Verbreitung der Ölpalme, d. h. es kommt eigentlich nur das südliche Pangwehinterland, hauptsächlich das Mwete-, Jaunde- und Bengebiet in Betracht, in ganz geringem Maße auch das Bulugebiet. Im Süden dagegen ist die Palmweinbereitung daheim unbekannt, hier stehen die Ölpalmen so vereinzelt, daß sie als besondere Merkwürdigkeit den nahen Ortschaften ihren Namen gegeben haben (Kilu, Kalin). Wein aus Raphiapalme, der bitter und wenig angenehm schmecken soll, ist nach Hörensagen den Südpangwe bekannt, mag auch vereinzelt hergestellt werden, ich sah und trank ihn aber nie, dagegen ist der Wein aus der Dattelpalme, **Borassus flabellifer** var. **aethiopum** Mart. *(Mw.: ewui)*, die in ganz vereinzelten Stücken in den nördlichsten Teil des Pangwegebietes hineinreicht (von mir zwischen Elandi und Abandakudi bemerkt) ganz vorzüglich und mit Recht hochgeschätzt, wenn er auch nicht die eigenartige Blume des Ölpalmenweines hat. Ich habe mir auf meiner Reise durch das Mweteland erzählen lassen, daß die Palme abstirbt, wenn man den Blütenstand zur Weinbereitung abschneidet, und sah auch eine ganze Reihe der riesenhohen Stämme gleich Masten kahl zum Himmel ragen; ich fand aber, muß ich gestehen, als ich in Simekou die dortige Kehle mit diesem Getränk erquicken konnte, den Preis — die Palmenleiche — fast nicht zu hoch dafür.

Für die Pangwe ist Jaunde das klassische Land des Palmenweines oder Minlu, wie er auf Pidgeonenglisch heißt. Durchzieht man das Jaundegebiet in der richtigen Jahreszeit, so sieht man fast an jeder Ölpalme einige Kalebassen hängen, die anzeigen: „Hier gibt es Palmwein."

Die Güte des Weins hängt von verschiedenen Umständen ab, wirklich vorzüglichen, der sehr wohl einen Vergleich mit den weniger guten Sektsorten aushält, bekommt man nur höchst selten zu trinken.

Abgesehen von der Gewinnungsart, spielt das Alter des Baumes eine Rolle, man kann aus den Blütenstielen junger Palmen keinen guten Wein gewinnen, auch dürfen zum Auffangen des Weines nur alte Kalebassen, in denen schon öfters Palmwein aufbewahrt war, verwandt werden. Wovon aber sonst der bessere oder schlechtere Geschmack abhängt, vermag ich nicht zu sagen; gewiß ist, wie bei unserem Weinen, Boden und Klima von Wichtigkeit, so haben sich meine Jaunde im Süden die erdenklichste Mühe gegeben, mir einen guten „Stoff" vorzusetzen, aber es war allemal — wie sie selbst zugaben — ein Getränk, von dem man nur sagen konnte: „'s sieht aus wie Wein, ist's aber nicht, man kann dabei nicht singen, dabei nicht fröhlich sein." Jedenfalls tut ihm der unrecht, welcher nach der ersten Probe einen vielleicht nur mäßig geratenen Weines den Palmweinbest überhaupt verurteilt — man muß sich erst an seine Eigenart gewöhnen —, und jeder, der sich, wie ich, von Doala durch das Bakoko- und Bamiland, durch Jaunde und Mvele bis zu der Nordostgrenze des Pangwegebietes nach Kombokoeto hindurchgetrunken hat, weiß, daß man einen wirklich guten Tropfen nur zu suchen braucht, um ihn auch zu finden, und daß zu einer dazu zum Besten gehört, was es im Pangwelande an kulinarischen Genüssen gibt.

Gewöhnlich ist der Palmwein gelblichweiß, herbe oder mehr oder weniger süß, der beste fast durchsichtig im Glas, perlend wie Schaumwein, schwachsüß und sehr stark berauschend, weniger guter ist trüber, eine recht mäßige Sorte, die — wie später beschrieben — aus dem Stamm gewonnen wird, ist undurchsichtig, mit Schaum bedeckt wie Seifenwasser, so das es auch im Geschmack etwas erinnert, alle aber haben eine eigenartige und feine Blume, an die man sich, wie gesagt, zuerst gewöhnen muß, die man aber dann nie vergißt. Wenn ich die Blätter meines Tagebuches durchlese, die von den Reisetagen in Jaunde erzählen, so scheint sie mir daraus hervorzuströmen und alles in sich zu schließen, was das tropische Westafrika in der Erinnerung Schönes und Eigenartiges birgt.

Es gibt drei Arten der Gewinnung, von denen die zwei ersten das Fällen einer etwa fünfjährigen Palme verlangen und deshalb im Pangwegebiete nicht sehr gebräuchlich sind[1]).

Die erste, die den besten Wein liefert und in Jaunde *mapə/k] me mbgo* heißt, wird so ausgeführt, daß man die Blätter der niedergelegten Palme, zumal die oberen, abhaut und die Kalebasse oben an das Herz der Palme legt.

Bei der zweiten Art — *mapə/k] me nkpt* — Palmwein aus dem niedergelegten Stamm — wird in der Mitte des Stammes ein viereckiges Loch

[1]) Im Bamilande, wo die Palmen so zahlreich sind, daß sie in dieser Weise verschwendet werden können, sind sie häufiger.

bis in das Mark, etwa 15 cm tief, eingeschnitten, jedoch erst, nachdem der Stamm einen Tag lang gelegen hat, und zum Schutz gegen Insekten mit den alten, wie Rinde aussehenden Blattscheiden bedeckt, die wieder mit Blattstielenden u. a. beschwert werden. In diesem Loche sammelt sich der Palmwein an und wird täglich einmal eingeschöpft. Dies dauert 4—5 Tage und ergibt im ganzen fünf oder mehr Flaschen eines nicht sehr guten Weins.

Am häufigsten ist die dritte Art der Weingewinnung, nämlich die aus den männlichen oder weiblichen Blütenständen erwachsener, also mehrjähriger oder älterer Bäume (einfach: *mapɔ́ʃɔ́ m'ɛ́ɛn* — Wein aus der Ölpalme genannt), ein Verfahren, das freilich lange nicht so einfach ist wie die beiden vorigen, da der Mann auf die Palme hinaufklettern und, im Halteseil pendelnd, längere Zeit arbeiten, insbesondere die Blätter abhauen muß; es kommt dabei häufig vor, daß er im Eifer das Halteseil durchhaut und zu Boden stürzt, dann braucht er noch gar nicht einmal so tief in eine palmweingefüllte Kalebasse gesehen zu haben.

Auf einer Palme werden wenigstens zwei, meist drei oder vier, seltener bis zu sechs Blütenständen gleichzeitig angezapft, da einige Stände mehr, andere weniger oder gar keinen Saft liefern, so z. B. sind bei vier Ständen nur zwei, bei sechs nur vier ergiebig.

Man geht nun so vor, daß man von unten her die Blätter der Krone ringsherum entfernt bis zu dem Blatt, in dessen Achse der Blütenstand eingefügt ist. Dieses wird nur zum Teil entfernt, sein unterer Rand und die dem Blütenstand abgewandte Hälfte des unteren Stielendes bleiben stehen, weil sonst der Blütenstand abbrechen und herunterfallen würde. Zwischen den Blütenstand einerseits und das stehengebliebene Stück des Blattes und das Nachbarblatt andererseits wird ein Stab geklemmt, der den des Halses beraubten Blütenstand stützt. Erst am nächsten Tage arbeitet man weiter, schneidet mit einem zweischneidigen Messer aus der Hülle von oben nach unten einen rechteckigen Ausschnitt bis etwa 6 cm über dem Ansatz heraus, trennt hier den Stiel des Blütenstandes durch und nimmt letzteren heraus, so daß jederseits nur noch die Blütenstandhüllen stehen. Jetzt kann man den Stab entfernen, da eine Stütze nicht mehr nötig ist. Nach zwei Tagen kann man den Palmwein auffangen. Dazu wird eine dünne Schicht von dem stehengebliebenen Blütenstandstiel abgeschnitten und die leeren Hüllen an der Spitze mit zerknüllten alten trockenen Hüllen verstopft; dann macht man aus fünf Blattfiedern der Ölpalme eine langgestielte, pfeifenähnliche Tüte, die man mit dem „Kopf" nach unten und der Spitze nach außen an den unteren Teil des Ausschnitts legt, an den sie durch ein Stäbchen aus Rinde des Ölpalmblattstieles, das jederseits durch die Blütenstandhülle gesteckt ist, festgedrückt

wird. Die ganze Vorrichtung bezweckt, Insekten, wie Gelbfieberfänger, Palmenläufer, Rosenkäfer, Bienen, Fliegen usw., von dem Eindringen in die Blütenstandhüllen abzuhalten. Um ferner zu verhindern, daß der Wein an der Tüte vorbeiläuft, verstopft man da, wo sie dem Stäbchen aufliegt, die Ritzen mit der Wolle von Ölpalmblattscheiden. An dem Stäbchen, welches den Tütenteil fesselstützt, wird eine Kalebasse, der ein kleiner Blattrichter aufgesetzt ist, so aufgehängt, daß das untere Ende der Tüte in den Trichter reicht, damit auch hier kein Weg für ungebetene Gäste aus dem Insektenreich bleibt.

Abb. 97. Tütenpflücker aus Holz.

Man muß nun eine neue Stabtüte und einen neuen Trichter machen. Der jedesmalige Anzapfung eines Baumes währt drei Tage und ergibt z. B. bei vier Zapfstellen 6—8 Flaschen Wein. Nach dieser Zeit wird der Baum mindestens ein halbes Jahr in Ruhe gelassen, damit er sich erholen kann, je nach längere, wenn man genügend andere Palmen zur Verfügung hat.

Zur Verbesserung — den Jaunde erdige —, zur Verschönerung — wie ich meine — legen die Jaunde vielfach die Rinde einer glücklicherweise nur im Westgebiet wachsenden Baumart, nannen ere'ma J., die sie sich von dort holen, in die Kalebassen. Diese Rinde macht den Palmwein „stark", wie sie sagen, d. h. gibt ihm berauschende Eigenschaften; wenn ihm auch möglicherweise eine ganz geringe Menge der Rinde zuträglich sein mag, so schadet doch das Zuviel der Jaunde dem schönen Palmweingeschmack. Besonders erinnere ich mich an einen Streich meiner Jungen, die mir zum Essen einige viertelvolle Kalebassen zusammengegossen hatten. Der Wein war schon in jeder einzelnen viermal so kräftig wie gewöhnlich und das ganze Gemisch so stark, daß es heftigen Schwindel und Kopfschmerz verursachte.

Abb. 98. Pfeifenköpfe für die Tabakpfeife aus Baumwollstengeln. a von Mbongpfeifen mit einem Gebiß Elfenbeinbeschlag, b—d aus Ton.

Der Palmwein, der aus dem Mark des niedergelegten Stammes gewonnen

[illegible]

wird *(mapfi)-okok*), hält sich im Hause 14 Stunden lang, der aus dem Blütenstängel herausfließende dagegen höchstens einen halben Tag, bei großer Hitze verdirbt er — wie ich beobachtete — sehr schnell, ebenso wenn man ihn unterwegs mitnimmt. Ich habe deshalb im Palmweingebiet die Regel befolgt, guten Wein immer gleich oder möglichst bald auszutrinken.

Wie gesagt, sind die Pangwe im allgemeinen mäßig, es gibt aber auch tüchtige Zecher, die sich im Palmwein regelrecht betrinken. Ob die im Nordpangwegebiete verbreitete Fallsucht *(ekejel)* eine Folgeerscheinung übermäßigen Palmweingenusses unter der Hitze ist, muß dahingestellt bleiben.

6. Tabak.

Der Tabak, **Nicotiana tabacum** L. *(ipe IIII)*[1], findet sich im Pangwegebiet in vier Abarten; früher gab es auch eine Sorte, die Asbau ist aber aufgegeben

[illegible] Tabakpfeifen aus Eisen.

worden. Die Abarten sind, mit Ausnahme zweier sich sehr ähnlicher, leicht an den Blättern zu unterscheiden. Der Schlüssel für die Bestimmung lautet:

A. Blätter nicht gefiedert, Blattstiel lang, deutlich: *ewo ewo* wegen der Ähnlichkeit der Blätter mit **Ficinus ceboderifis** L.

B. Blätter gefiedert,

a) Blätter schmal, lanzettlich: *ejoep IV*,

b) Blätter breit, ellipsig,

1. Blüten hellrosa, fast weißlich, Blätter im Verhältnis breiter, als bei der folgenden: *ewjebewo I*.

2. Blüten dunkelrosa bis rot, Wuchs gedrungener: *ekkwetebo I*.

Ursprünglich ist der Pangwe im allgemeinen kein leidenschaftlicher Raucher, wenn man auch in jedem Dorf alte Leute trifft, die ohne ihr Pfeifchen nicht leben können. Im ganzen Gebiete, namentlich im Norden, wo der Einfluß der Weißen schon mehr vorherrscht (z. B. in Jaunde), nimmt der Tabakgenuß sehr schnell zu, viel mögen dazu die Güte des eingeführten Tabaks und die mannigfaltigen gefälligen Formen der in den Faktoreien eingelegten Pfeifen

[1]) Vielleicht entstanden aus tabaco.

Abb. 270. Tabakpflanzung auf einem Dorfplatz.

beitragen. Neben dem Salz ist der „Trafetabak" einer der Hauptimportartikel.

Der Tabak wird nur aus Pfeifen geraucht, Kauen oder Schnupfen kennt man nicht. Die Fangwo unterscheiden drei Formen von Pfeifen, nämlich kurze, aus einem Stück geschnitzte Holzpfeifen (nur bei den Fang), *ekak-mvíák* (Abb. 107), zweitens Bananenblattstielpfeifen *(nsés I, Kopf: ebét)*, die aus einem über meterlangen Stück Blattstiel oder -rippe der Banane und einem durchgebohrten Kopf aus dem Kern der Raphiafrucht, aus Messingblech oder Ton besteht (Abb. 108). Der Stiel bedarf von Zeit zu Zeit der Erneuerung. Diese Pfeife liegt fast in jedem Versammlungshause an der Wand über zwei Haken und kreist häufig unter den Männern, wobei der Häuptling als erster einen bis drei tiefe Züge tut und sie dann an den Nächsten weitergibt. Der Letzte legt die Pfeife wieder an ihren Platz zurück. Die dritte Form *(mvó-ise)* setzt sich aus einem Tonkopf und einem etwa 30 cm langen Holzstiel zusammen, der zum Teil mit Messingdraht sauber umsponnen ist (Abb. 109). Sie soll früher in Jaunde die Länge eines Armes gehabt haben.

Der geringen Verbreitung des Rauchens entspricht die geringe Sorgfalt und Liebe, mit der die Tabakpflanze und ihre Blätter behandelt werden. Wo viel Tabak durch die Handelshäuser eingeführt wird, vernachlässigt man den Anbau ganz.

Die Tabaksamen werden in irgendeiner beliebigen Pflanzung zu derselben Zeit mit ausgesät, wenn die Hauptfrucht des Feldes geplanzt wird, also z. B. mit Kolbenhirse zusammen zweimal im Jahr. Oft wird dicht am Dorf ein kleines Tabakbeet angelegt, oder die Samen werden bei den Häusern, mitunter auf dem Dorfplatz, ausgesäet (Abb. 110).

Haben die Pflanzen eine gewisse Höhe erreicht, so pflückt man die Blätter bis auf die obersten ab, die man stehen läßt, damit die Pflanze weiter treiben und Blüten und Früchte hervorbringen kann. Dann erntet man zum zweitenmal die Blätter und die zur nächsten Aussaat bestimmten Früchte ab, sammelt zugleich — da die Hauptfeldfrucht inzwischen abgeerntet ist und das Feld darum aufgegeben wird — die jungen Tabakpflanzen, die sich aus früh gereiften Samen entwickelt haben, mit nach Hause und pflanzt sie in der Nähe der Häuser an.

Die weitere Behandlung der Blätter besteht einfach darin, daß sie im Hause getrocknet werden, und zwar entweder auf den Trockenböden (1 oder 2 Tage) oder unter dem Dach, unter denen Matten sie mit dem Stiel gesteckt werden, so daß sie frei herabhängen (je nach dem Abstande vom Feuer 3—5 Tage). Von einer Fermentation haben die Pangwe natürlich keine Ahnung, vielleicht mag sie einmal zufällig eintreten, wenn die Blätter zusammengebunden in einem Korb aufbewahrt werden. Gewöhnlich finden sich aber soviel Brüder, Freunde und Sippengenossen ein, daß die ganze Ernte aufgeteilt wird. Der Tabak gilt nämlich sozusagen als gemeinschaftliches Eigentum; wie die Pfeife im Versammlungshause von allen gemeinsam benutzt wird, so gelten auch die Tabakblätter als Gemeingut, und es ist Sitte, bei jeder Ernte den Dorfgenossen abzugeben.

Trotz der rohen Behandlung des Tabakblattes soll der einheimische Tabak, wie ich mir von Rauchern habe versichern lassen, gar nicht so ganz schlecht sein.

---

1. Tracht.

Die einheimische Tracht der Männer ist der zwischen den Beinen durchgezogene und vorn und hinten über einen Gürtel geschlagene Zeugstreifen von ungefähr 90 cm Länge und 70 cm Breite aus der Rinde verschiedener Feigen-

[1]) Das Lübecker Museum für Völkerkunde schreibt Tatanierung.

[p. 172]

bäume (Abb. 111). Das Rindenzeug wird entweder naturfarben gelassen und zeigt dabei alle Abstufungen vom fast reinen Weiß bis zum dunklen Rotbraun, oder mit Rotholz leuchtend rot gefärbt und ist oft trefflich bereitet, so daß man es nur bei genauerem Hinsehen von europäischem Stoff unterscheiden kann.

Heute sind durch den Handel die europäischen Tuche überall verbreitet und verdrängen die ursprüngliche, so kleidsame Tracht. Sie werden mitunter ebenso wie das Rindenzeug getragen, meist aber mit oder ohne Gürtel glatt um die Lenden gelegt (vgl. Abb. 111).

Nur einmal sah ich an Stelle des Rindentuches einen schmalen Schamschurz aus Affenfell, der mit seinem oberen Ende auf die Hüftschnur gezogen war und im übrigen in langen Streifen herunterfiel *(etöb-mabäs)*.

Abb. 112. Bastgürtel. b mit Kaurischnecken verziert.

Der Gürtel *(kärnä IV)* besteht aus Faserschnüren mit und ohne Perlen, geflochtenem Palmband (Abb. 112) oder Fell. Die einfachen Schnüre sieht man nur bei Jungen oder Leuten, die wenig auf sich geben; die Perlengürtel sind, im Gegensatz zu denen der Frauen, Einzelschnüre, die geflochtenen Gürtel (Abb. 113) *(bärb IV F.)* scheinen nur im Süden vorzukommen, die Fellgürtel sind entweder schmale Bänder, meistens aus Affenfell, oder breite Antilopenfellgurte, deren Haarseite zuerst gleichmäßig kurz geschoren, dann zu allerlei Mustern verschnitten wird. Als minderwertigste Gürtel, die nur von ganz nachlässigen Leuten getragen werden, dürfen solche aus Stengeln der Winde (*abödembé*, d. h. die Schlechtkleidende, *böl* = kleiden, *mbé* = das Schlechte) gelten.

Abb. 113. Geflochtener Gürtel.

Die Kleidung der Frauen ist nach Form und Material wesentlich anders als die der Männer. Sie besteht aus zwei Stücken, dem Vorderschurz und dem Hinterschurz, die beide durch das Hüftband aus Fellstreifen, Bast, Perlenschnüren oder europäischem Zeug an den Leib gedrückt werden. Der Vorderschurz besteht in seiner einfachsten Gestalt, die bei den Nordpangwe vorkommt, aus einem langen, schmalen, trockenen Bananenblatt, das zwischen den Beinen auf Scham und Damm liegt und vorn zu einem dreieckigen Zipfel gefaltet ist, der über die Hüftschnur geschlagen wird. Sonst besteht er entweder aus Rindenzeug oder einem Fellstück. Der Hinterschurz ist bei den Fang ein kleines, bescheidenes Rindenstoffkleidchen, das in zwei Formen vorkommt, einmal als 3½ m langes, 23 cm breites, aus vielen (8—9) Stücken zusammengenähtes

Band, das durch Fältelung auf eine kleine Schürze von 24 cm Länge, 13—27 cm Breite verkürzt und durch eine längs der oberen Kante durchgezogene Schnur fächerförmig gerafft ist, zweitens aus 2—8 kleinen viereckigen Rindenzeugstückchen zusammengesetzt, die oben fächerförmig zusammengerafft hintereinander in einen Klemmer *(abás)* gesteckt sind (Abb. 114); dieser besteht aus 5—8 Holzstäbchen, die an dem Ende mit Messingdraht oder -blech umwickelt, wie ein Rost nebeneinandergelegt und mit Palmband zusammengebunden sind.

Abb. 114. Hinterschurz der Fang-Frauen aus Rindenzeug.

Bei den übrigen Pangwe ist der Hinterschurz aus Raphiabast verfertigt und hängt wie ein richtiger, abgestutzter Pferdeschwanz herunter (Abb. 115). Name: *mſö,kI*, *mſö,ö-zäm* (*zäm* = Raphiapalme), *elä,ĩ*, *azö,m*, *azöṅ*, *ebä'ı*, *ekö'm*.

Während der Arbeit in den Pflanzungen, beim Fischen usw. legen die Frauen die Raphiaschwänze und Rindenschürzen ab, um sie zu schonen, und stecken dafür ein weichblättriges Kraut, wenn möglich die **Brillantaisia** *(ebägebö'ṅ)* oder Farnkraut unter den Gürtel. Mit diesem Arbeitskleid sieht man sie oft auch noch auf dem Heimweg zum Dorf, und Raphiaschwanz oder Rindenschürze prangen oben auf dem mit Feldfrüchten oder Feuerholz gefüllten Korb. Männer tragen niemals, auch nicht bei der Fischerarbeit Blätter.

Kleine Kinder gehen in den ersten Lebensjahren meist nackt, und zwar Mädchen bis zum fünften, Knaben bis zum siebenten Jahre; die Beschneidung der Knaben bildet hierbei keine bestimmte Grenze, insofern man unbeschnittene bekleidet und beschnittene nackt sehen kann; lange über diesen Zeitpunkt hinaus wartet man aber nicht gern. Es kommt auch vor, daß die Kinder, besonders Mädchen, schon wenn sie anfangen zu laufen, mit einem Zeuglappen bekleidet werden.

Abb. 115. Hinterschurz der Ntum-Frauen aus Raphiabast.

Eine einheitliche Haartracht der Pangwe gibt es heute nicht; wir begegnen bei ihnen einer Fülle verschiedener Formen — selbst innerhalb desselben Dorfes —, die zeigen, daß der Pangwe es, wie alle Neger, liebt, in der Behandlung seines Haupthaares zu Schmuckzwecken seiner Laune die Zügel schießen zu lassen.

Kindern wird meist schon früh der Kopf rasiert, entweder ganz glatt oder

Tafel XIII.

[Facing p. 174]

Abb. 116. Haartrachten.

mit Stehenlassen eines Schopfes vorn oder hinten oder einer Raupe. Halbwüchsige Jungen tragen das Haar lang oder in Mustern ausrasiert.

Bei Erwachsenen ist es entweder ganz lang und ungepflegt (Tafel XIII) oder ganz glatt wegrasiert oder halblang abgeschnitten und sorgfältig gepflegt oder kurz geschnitten, und zwar entweder gleichmäßig kurz (vgl. Abb. 6) oder so, daß ein Schopf, *akik*, vorn oder eine Raupe, *ongöm*, über dem Scheitel stehen bleibt, oder das Haar wird kurz geschnitten und in allerhand Mustern ausrasiert (vgl. Abb. 3), die *pfee, III* (*a tab bopfee*, = in Schmuckformen rasieren) heißen und ein ganzes Buch füllen würden, wenn man sie alle aufzeichnen wollte. Einige wenige habe ich in Abb. 116 gebracht.

Das Non-plus-ultra aller dieser Haartrachten bildet die mit Perlen, Kauri, Knöpfen und Messingnägeln reichverzierte Haarfrisur von der Form eines Helmes, die den Pangwe vor allen anderen Völkern des tropischen Westafrika auszeichnet (Abb. 117). Im Norden, wo diese Mode nie die Vervollkommnung wie im Süden erreicht hatte, ist sie infolge europäischen Einflusses wieder aufgegeben, bei den Ntum und Fang dagegen blüht die Kunst der Helmfrisurenherstellung üppig (Abb. 118); es werden hierbei die Haare durch untergelegte Stützen aus Raphiamark oder Palmstreifen hochfrisiert, und die Locken durch eingeflochtene Baststreifen zu Zöpfen umgebildet, die wieder untereinander verflochten ein gleichmäßig dickes Polster bilden. Da die Herstellung geraume Zeit erfordert, einen Monat und länger, laufen die Eingeborenen lange mit

Abb. 117. Assoko aus Alén (Fam. Essúuong). Span. Guinea.

Abb. 118. Nium beim Zaberelten von Schmuckbeimfrisuren. Akonangi, Süd-Kamerun.

Abb. 119. Helmmützen.

eben angefangenen oder mehr oder weniger unfertigen Frisuren umher, so daß man zunächst glaubt, lauter verschiedene Haartrachten vor sich zu haben, so sind Abb. 8 u. 13 nur zwei verschiedene Entwicklungsstufen ein und derselben Frisur.

Neben diesen aus dem Kopfhaar geformten Frisuren gibt es abnehmbare Mützen, die in genau derselben Weise und genau denselben Formen (Abb. 119) verfertigt werden wie jene, so daß man nur bei eingehender Untersuchung entscheiden kann, ob es sich um eine Frisur oder um eine Kopfbedeckung handelt. Sie sind aber nicht häufig und werden nur von den Ntum und wenigen Fang (Okak) hergestellt; die festen Frisuren überwiegen durchaus, was erwähnt sein möge, da man nach dem Museumsmaterial zu einem anderen Schluß kommen könnte. Die hier gegebenen Abbildungen zeigen sämtlich Frisuren.

Von 25 verschiedenen, mit eigenen Namen belegten Formen wird etwa die Hälfte von beiden Geschlechtern unterschiedslos, die übrigen entweder nur von Männern oder nur von Weibern getragen. Bei den Fang gleicht sich Männer- und Frauenschmuck häufiger als bei den Ntum, und sie werden deswegen öfter die Zielscheibe des Spottes.

Helmfrisuren und Schmuckmützen werden dauernd getragen, nur als Zeichen der Trauer werden beide — die ersteren manchmal auch vor einem Jagdzuge — abgelegt.

Zur Herstellung seiner Schmuckmützen *(edʊ̄ban, elũ̄ʒ)* nimmt der Ntum ein Fell von Meerkatzen, Zwergantilopen, jungen Ziegen oder Schafen. Das Fell wird vom Fett gereinigt, mit der Innenseite nach außen über die Rundung eines halbkugelig behauenen Plahtenwurzelstocks gezogen, an seiner Grundfläche mit einer Schnur festgebunden und am Rande auf dem Boden festgepflockt. So gespannt, muß das Fell an der Sonne und später noch über Feuer austrocknen.

Ferner hat man geschwärzte Baststreifen der **Triumfetta** nötig, die folgendermaßen gefärbt werden: Stücke von der Rinde gewisser Pflanzen [1]) werden zerkleinert, in einen Kochtopf gelegt und zwar derart, daß zu unterst eine Schicht Rinde kommt, dann die Baststreifen und darüber wieder Rindenstücke folgen. Nun wird eine Stunde lang gekocht, um bestimmte Stoffe aus der Rinde auszuziehen, dann trägt man den Topf zum Fluß und knetet die Baststreifen abwechselnd im Lehm des Ufers und in dem Rindenauszug durch, und zwar fünf- bis siebenmal hintereinander. Die Streifen haben nun eine schwärzliche Farbe, die im Hause beim Trocknen bis zur tiefsten Schwärze nachdunkelt.

Nun zur eigentlichen Mützenanfertigung: Das getrocknete Fell wird vom Block heruntergenommen und auf der Innenfläche durch drei kreuzweis untergelegte Bügel gestützt, die aus acht der Länge nach aneinandergelegten und mit Triumfettabast verflochtenen Palmstreifen bestehen. Angenehm können die kantigen Bügel und das schwere Gestell beim Tragen kaum sein, doch der dicke Wollschädel des Negers merkt davon wohl nichts.

Auf der Außenfläche wird zu beiden Seiten der Scheitellinie in zwei parallelen Längsreihen das Fell je vierzehnmal durchbohrt für sieben doppelt durchgezogene Ananasschnüre von ½ m Länge. Mit diesen werden aus je drei von den oben erwähnten schwarzgefärbten Bastbändern hergestellte Zöpfe verflochten, die von der Mitte angefangen, in der Sagittalrichtung zum vorderen und zum hinteren Rande verlaufen, etwas darüber hinausragen und in einem Knoten enden [2]). Solcher Längsflechten werden zwölf dicht nebeneinander gelegt. Den Raum zwischen diesen und dem Rand der Mütze füllen ebenso hergestellte, aber senkrecht zu jenen verlaufende Flechten aus, die am Rande durch drei bis vier Reihen ringsherum verlaufender Flechten überlagert und mit dem Fell vernäht werden.

---

1: Tessmann

FH9 Fang

[facing p. 178]

Dazu braucht man eine Nadel aus Rinde, deren Spitze im Feuer gehärtet, und deren anderes Ende für den Faden aus Bast geschlitzt wird. Die am Rande überstehenden Flechten werden abgeschnitten. Über den Scheitel der Kappe legt man eine Raupe *(mbǫm)* aus einem Stück Raphiamark, das von den beiden Schmalseiten her eingeschnitten wird, damit es sich besser biegt, darüber näht man einen Zeuglappen, auf den ein gleichbreiter, mit Messingnägeln beschlagener Bügel aus Palmstreifen — wie sie oben von der Innenfläche der Mütze beschrieben sind — aufgesetzt wird. Zu beiden Seiten der Raupe verlaufen einige Längsreihen roter auf Raphiapiassave gereihter Perlen. Ein weiterer Schmuck der Mützen besteht in seitlich angenähten, mit Kauri oder weißen Knöpfen benähten Lederstücken, an denen Fransen aus Ananasschnüren mit aufgereihten Perlen hängen (vgl. Abb. 118 im Vordergrund).

Die Schmuckmützen der Fang sind nicht aus Fell, sondern aus gleichlaufenden Palmstreifen hergestellt, die mit geschwärztem Triumfettabast so zusammengeflochten werden, daß immer ein Streifen überschlagen wird und so ein Schachbrettmuster entsteht.

Die älteren Leute tragen meist keinen Perlenschmuck im Haar — wofern noch von einem solchen bei ihnen die Rede ist —, sondern einfachere Frisuren, die übrigens früher mehr Mode gewesen sein sollen.

Von Kopfbedeckungen sind nur Kappen aus dem Fell von Affen, Zibethkatzen oder des Ichneumons, **Bdeogale nigripes** Puch., sowie eingeführte rote Kappen, die von Häuptlingen und sonstigen älteren „Respektspersonen" getragen werden, zu erwähnen. Hüte, aus Grashalmen **(Paspalum)** zusammengenäht, gleichen in der Form unseren gewöhnlichen Strohhüten und sollen nach einer Angabe europäischen Vorbildern nachgeahmt sein.

Eine Barttracht ist bei den Pangwe selten, da die meisten sich die Haare — gleich vielen anderen Negern — ausreißen; vereinzelt gibt es Männer mit schönen Vollbärten (Abb. 11) oder mit Spitzbärten, deren Ende in ein kleines Zöpfchen gedreht und mit Kauris oder Perlen besetzt wird, andere machen zwei, noch andere eine ganze Anzahl Zöpfe aus ihrem Bart (Abb. 12); Schnurrbärte sieht man selten und auch dann nur ganz unbedeutende.

2. Schmuck.

Der Verschönerungstrieb beherrscht bei den Pangwe Mann und Frau in gleichem und erheblichem Maße, Schmuckbehang der verschiedensten Art wird von ihnen an allen möglichen Stellen des Körpers angebracht. In die Haare (Abb. 120) steckt man eine Feder, die oft in Mustern ausgeschnitten ist *(a, b)*, einen Quastenstachlerschwanz *(c)*, einen Pfeil aus Holz, Knochen

Abb. 120. Haarschmuck.

(d) oder spiralig gewundenem Messing *(e)*, einen Steckkamm (vgl. Abb. 139) sowie in seltenen Fällen — meist zum Tanzvergnügen — auch Blumen, so z. B. von **Costus** *(miẽn)*, und hübsche oder wohlriechende Blätter, so von der Leguminose **Cryptosepalum** aff. **staudtii** Harms *(andũ)* und des Krautes *(afun)*, letztere zwei nur von Weibern getragen, und zwar meist in zwei Büscheln hinter dem Ohr, dessen Läppchen nur bei einigen Mwai durchbohrt und mit Schmuck versehen ist.

Nasenschmuck (Abb. 121) erfreut sich dagegen einer großen Beliebtheit, und zwar wird er in einer Durchbohrung der Scheidewand, nicht an den Nasenflügeln, angebracht. Die dazu nötige Operation wird bei Kindern von 6—8 Jahren vollzogen. Vorher drückt sich der Betreffende die Blätter des **Afrамomum** *(adẽõm)*, die im Feuer erwärmt sind, an die Nasenscheidewand, um sie weicher zu machen. Dann nimmt der Medizinmann einen Raphiastengelstab, einen Stachel vom Quastenstachler oder ein anderes spitzes Werkzeug und durchbohrt damit die Wand, nachdem er mit dem Zeigefinger der anderen Hand die richtige Stelle ausgesucht hat. Auf die Spitze des Stachels schiebt er nun ein kleines Stengelstück des **Trachyphrynium violaceum** (Stengel: *nkömokõmo I*, Blätter: *dzẽdekiai IV* Nt.) und zieht beide zusammen zurück, bis der Stengel in der Scheidewand liegt. Er soll das Loch für den späteren Schmuck offen halten. Die weitere Behandlung ist ganz sachgemäß: alle zwei Tage wird die Wunde ausgewaschen und der Stengel erneuert.

Abb. 121. Nasenschmuck.

Nach zehn Tagen wird er endgültig entfernt und durch die bleibenden Schmuckstücke ersetzt. Die Gegenstände, die man dazu nimmt, sind kaum alle aufzuführen: Stengel, Blätter, Blüten von **Gomphrena globosa** L. *(ngŏn)*, die wir schon als Zierpflanze kennen gelernt hatten, Federn[1]), Papierrollen, mit Perlen bereihte Holzstäbe, Raphiastäbe, mit Messingdraht umwundene Stäbe oder Knochen, Messingringe mit einer großen Perle, die gerade auf die Oberlippe zu hängen kommt (vgl. Abb. 132) und vor allem Perlenschnüre, deren Enden hinter den Ohren an der Frisur festgeknüpft werden, und die so zugleich einen Wangenschmuck bilden.

Abb. 122. Stirnbänder aus Perlen.

Abb. 123. Halskette aus Früchten von Coix lacryma (Hiobstränen).

Stirnschmuck findet sich als Perlenschnüre, Perlenbänder, die im Süden des Fanggebietes oft sehr hübsch gemustert sind (Abb. 122), als Streifen aus schwarzem Schaffell *(tuʌ IV)*, und bei Frauen zuweilen als nett geflochtene und mit Büscheln versehene Bastbänder.

Abb. 124. Nymphen aus Aléa (Fam. Essandum).

Reichlich ist der Hals, den man selten ohne irgendein Bändchen oder eine Schnur läßt, mit Schmuck bedacht. Früher waren die Früchte des Grases **Coix lacryma** L. *(mrʌ̀andá III)*, die bekannten, an so vielen Stellen der Erde als Schmuck verwen-

[1]) Besonders sind die roten Schwanzfedern des Graupapageien und Sichelfedern des Hahnes beliebt, beide Tiere spielen in der Religion eine große Rolle.

Abb. 123.
Halskette aus Hunde- und Meerkatzenzähne.
Abb. 124. Halskette mit nachgemachten Zähnen aus den Samen der *Podococcus Barteri*.

deten Hiobsträne (Abb. 123) und aufgereihte Stengelstücke des Farnes **Lygodium smithianum** Presl. *(ozǭk)* beliebt, deren Name *ozǭk* sich dann auf die länglichen, roten Perlen übertragen hat, sind heute aber, nach Einführung der Glasperlen, die jetzt das Bild beherrschen, längst nicht mehr fein genug. Daneben finden wir bei Frauen die Früchte der **Mucuna flagellipes** Vogel *(kondǭǭ-zam III)*, da sie ein Symbol der Treue sind, freilich wohl ohne die bestimmte Absicht, sich Treue zu gewinnen oder zu erhalten [1]). Weiterer Halsschmuck sind aufgereihte Reißzähne von Meerkatzen und Hunden (Abb. 124/125), als Anhänger auch solche von Leoparden und Hauer von Wildschweinen (Abb. 127), nachgemachte aus den weißen, etwas zugespitzten Samen der Palme **Podococcus barteri** Mann et Wendl. *(niamvine)* (Abb. 126) oder aus Knochenstücken als Anhänger, nachgemachtes Horn aus entsprechend geschnitzten und mit Messingdraht umwundenen Ebenholzstückchen (**Diospyros**-Arten), Abb. 128, endlich eine Kralle des großen Kampfadlers, **Spizaetus** *(ndǭǭ IV)* (Abb. 129) [2]). Ebenso hübsche, wie einfach herzustellende Halsbänder werden aus Streifen von **Oncocalamus mannii** Wendl. *(nlon)* oder **Trachyphrynium violaceum** *(nkomokomo)* gemacht, die durch ein zierliches Geflecht aus **Rhektophyllum**fäden zusammen gehalten werden. Bemerkenswert ist ein Halsschmuck aus den wohlriechenden Wurzeln der Urticacee **Trymatococcus africanus** H. Baillon *(ngǭna IV)*, der bei den Ntum nur von Frauen, bei den Fang von beiden Geschlechtern getragen wird, namens

Abb. 127.

Abb. 129.
Halskette mit der Kralle eines Kampfadlers.

[1]) Das Symbol der Treue ist diese Liane deshalb, weil sie sich nur um einen Baum schlingt, nicht, wie die meisten tropischen Lianen und Schlinggewächse, alle erreichbaren Bäume und Sträucher überwuchert.

[2]) Auch europäischen Tand, z. B. Patronenhülsen, Schlüssel und Vorhängeschlösser sieht man bei den Pangwe als Anhänger.

egbwɛ̄r, ngɔ̄na IV F., oder *azɔ̄m-e-si*, Nt. (vgl. Saf. XII). Die Wurzeln werden, längshalbiert und getrocknet, in eine doppelte Schnur eingeknotet als Halsband (Abb. 131 *a*) oder schneckenartig zusammengerollt als büschelförmiger Anhänger (Abb. 131 *b*) getragen, meist noch mit Rotholz gefärbt. Nicht sehr häufig ist eine von beiden Geschlechtern getragene Halskrause aus Bast, ihres Aussehens halber *etɔ̄ganiɔ̄ma* = Schafmähne genannt (Abb. 131 *c*), ebensowenig ein Basthalsschmuck für kleine Mädchen (*ngɔ̄ne*).

Abb. 130. Halskette mit den Früchten von Chrysophyllum tessmannii Engl (*mbam*).

Eiserne Halsringe sind heute recht selten, um so häufiger solche aus Messing (*mrɔ̄l I*), die in schweren und leichten Arten mit eingravierten Mustern versehen (*mrɔ̄le zɔ̄si*, vgl. Abb. 14). Die Herstellung wird beim Messinggu ß beschrieben werden. Es ist nicht leicht, einen solchen bis drei Pfund schweren Ring zu tragen, ebensowenig, ihn umzulegen; er wird nämlich von neuem im Feuer weich gemacht und ausgegossen werden. Erstere zeigen zweierlei Formen. Die einen haben gesimsartig vorspringende Kanten und keine Verzierung (Abb. 132), die anderen sind im Querschnitt dreieckig und in der Mitte der beiden Vorderflächen, oft auch noch auf dem oberen Rand einandergebogen, damit sich sein glücklicher Besitzer mit dem Hals hineinzwängen kann, und dann auf dem Schmiedestein wieder zusammengeklopft. Noch schwieriger ist es, ihn abzunehmen. Dazu legt sich der Betreffende auf den Rücken, das eine Ende des Ringes wird fest an einen Baumstumpf geknüpft, das andere mittels einer Schlinge mit einem Hebel verbunden und durch diesen abgebogen; vorher ist nicht zu vergessen, den Hals tüchtig mit Öl oder mit dem Saft aus den Blättern des Clerodendron

Abb. 131. Halsschmuck.

Abb. 132. Fang (Fam. Omwang), Span. Guinea.

büttneri G ü r k e *(marúlu-ndźik III)* einzureiben. Als einen beliebten raschen und billigen Ersatz benutzen die Diener der Europäer Konservenbüchsen, die sie durch Abnehmen von Deckel und Boden in einen Halsring verwandeln. Ebenso sind ihnen europäische Kragen eine äußerst sympathische Kulturerrungenschaft, die sie sich zu eigen machen, oft schon, bevor sie sich Hosen und Hemden anschaffen.

Brustschmuck kommt hauptsächlich bei Frauen vor, und zwar in Form von lang herunterhängenden Perlen- und groben Messingketten, die — wie sich denken läßt — nur für ältere Damen zu empfehlen sind.

Nicht weniger reichlich werden, besonders von Frauen, die Arme und Beine mit Schmuck behängt. Ober- oder Unterarm oder beide sieht man mit Spiralen aus eingeführtem Messingdraht oder mit Reifen aus eingeführten Messingröhren geschmückt (Abb. 133). Für den Oberarm sind die Spiralen kürzer, für den Unterarm meist so lang, daß sie ihn ganz einhüllen. Seltener sind Oberarmringe aus dicht aneinandergelegten **Laccosperma**- oder **Trachyphrynium**streifen, die durch ein zierliches Geflecht aus **Rhektophyllum** verbunden sind (Abb. 134); nur bei Männern finden sich am Oberarm Streifen aus schwarzem Schaffell, die den Stirnbändern aus demselben Material entsprechen. Ringe oder Bänder um das

Handgelenk gehören mit zu dem beliebtesten Schmuck. Schon Kinder legen sich die Stengel der Rubiacee **Megalopus mannii** K. Sch. *(ngóne III)* spiralig um den Arm, Erwachsene — Männer und Frauen — tragen Ringe aus den Stengeln einer Liane, aus geflochtenem Palmband (Abb. 135) aus Elefantenschwanzhaaren, aus gegossenem Messing oder Messingdraht, dessen Enden sich wie zwei Ranken umeinander schlingen *(nkrb I*, Abb. 136a), oder feinem, um sich selbst gewundenen Messingdraht (Abb. 136 b), Bänder aus **Oncocalamus** geflochten und dicke Ringe aus Elfenbein bzw. Elefantenknochen *(ekǒm e ńǫk)* oder eine Nachahmung aus Holz der **Alstonia** *(ekǎk)* namens *ńǫ[k] ekǎk* = Elefant (d. h. Elfenbein) aus Alstonia. Alle drei Sorten werden besonders von Häuptlingen getragen. In Jaunde gibt es hübsch gearbeitete, dünne Armreifen aus Elfenbein.

Abb. 135. Nismfrau aus Akoasangi (Fam. Essandum).

Fingerringe (Abb. 137), sind aus Elfenbein *(a)*, in Raphiapalmöl geschwärztem Horn[1]) *(b)* und Messing gearbeitet, von letzteren gibt es Spiralen *(c—d)*, einfache dünne Ringe, die mit den Enden etwas übereinandergreifen *(e)*, Bänder und dickere oft etwas verzierte Reifen *(f)*.

Der Beinschmuck entspricht im großen und ganzen dem der Arme, auch hier sind kürzere Messingspiralen über dem Knie, bei Frauen auch dicht unter dem Knie und, gleichfalls nur bei ihnen, längere, die von der Mitte der Wade bis aufs Fußgelenk hinunterreichen, am häufigsten. Außerdem tragen beide Geschlechter massive oder hohle Messingringe sowie an den Knöcheln die eigenartigen, feinverzierten Messingfußstulpe *(ebǫt, ngǒb IV)*.

---

[1]) Der Schwarzsteiß-Schopfantilope, **Cephalophus callipygus** Ptrs. *(mǫ́n IV)*.

Abb. 134.
Armband aus Palmenstreifen.

An den Zehen, vielfach an allen fünfen, stecken Ringe, wie sie an den Fingern getragen werden.

Durch all diesen Zierat wirken besonders die Frauen überladen und unschön (Abb. 138, vgl. auch Abb. 133), zumal er ihren infolge des Tragens schwerer Lasten watschelnden Gang, den schon von weitem ein taktmäßiges Klirren ankündigt, noch ungeschickter und plumper macht — der göttlichen Muse Terpsichore müßten diese Schönen samt und sonders ein Greuel sein —, außerdem ist er ihnen selbst wegen seiner Schwere mehr als lästig, z. B. scheuern die Knöchelringe die Haut wund und werden dann mit einem eigenen Band an die über den Waden getragenen angebunden.

3. Körperpflege.

Man kann die Pangwe im großen und ganzen als ein sehr reinliches Volk bezeichnen, reinlicher als manches europäische. Die Mehrzahl wäscht und badet sich häufig, und wie man einen Schmutzfinken beurteilt, zeigt das Sprichwort:

otə[k]-mʃóò a dʒ́ònə: kə́ mə́ò̀ a bʃ́de ma,
Alte-Tasche[1]) sie sagte so: wenn nun schon Regen er benetzt mich,
ngbə́nə a wʃ́ban e mədʒ́ʃ́m a bè ma anə́
Zeit zu waschen im Wasser, es war mir gerade!

d. h.: „Da kam der Regen gerade recht, es war auch die höchste Zeit zu baden."

Die vielen Hautkrankheiten, von denen besonders häufig jüngere Personen befallen werden, scheinen andere Ursachen zu haben als Unreinlichkeit, wenn

[1]) Häufiger Schimpfname für Männer, ähnlich wie bei uns: alte Schachtel für Frauen.

Tafel XV.

FRAU AUS BERAI (FAM. ESSENG), NTUMGEBIET.

Günter Tessmann, die Pangwe Verlegt und gedruckt bei Bruno Wasmuth A.-G., Berlin.

[facing p. 186]

auch zugegeben werden muß, daß bei vielen Negern eine unglaubliche Gleichgültigkeit in bezug auf Körperpflege, Wundbehandlung und Schmarotzer besteht. Im allgemeinen aber kann man den Pangwe wegen ihrer Sauberkeit nur Lob zollen.

Für das Waschen von Rindenzeug war früher sogar Seife aus einer Rubiacee (*ogbwərm* F., *ogbwɛ̃me* Nt.) üblich.

Menschenflöhe gibt es nicht, dagegen massenhaft Läuse, die man absucht und zerbeißt — die Frauen schlucken sie dabei auch hinunter —, außerdem durch besondere Medizinen tötet. Dazu setzt man dem Raphiapalmöl, mit dem man sich die Haut einschmiert, und das die Läuse sowieso nicht lieben, verkohlte und zerriebene Plantenschale oder zerriebene und dann getrocknete Wurzeln der Apocynacee **Dogcanga diplochlamys** K. Sch. (*ojɛ̃metõõ* Nt.), zerriebene Blätter und Blüten der Simarubacee **Quassia africana** Baill. (*iõõŋ-elɛ*), zerriebene Blätter der Malpigiacee **Heteropteris africana** A. Juss. *mfõm-endɛ̃k IV*) und der Simarubacee **Odyendea gabunensis** (Pierre) Engl. (*ozõk*) zu, ferner tut man die Leguminose **Tephrosia vogelii** H. f. (*ndõwõlõ III*) und die Ochnacee **Lophira alata** Banks (*akɛ̃ga*), auf die Frisur.

Abb. 138. Nimfrau aus dem Kampogebiet.

In den Helmfrisuren, unter deren dickem Polster man den Läusen nicht beikommen kann, tötet man sie durch ein besonderes Verfahren: Man stülpt aus Plantenblättern gefertigte dichtschließende „Laushauben" über den Kopf, nachdem man abgeschabte und feucht gemachte Rinde der Flacourtiacee **Caloncoba welwitschii** (Oliv.) Gilg (*mɛ̃gmegõmo III*) hineingetan hat.

Die Frisuren werden stets mit Öl eingefettet, ebenso wird das kurz getragene Haar sehr sorgfältig gepflegt, mit Öl benetzt und ausgekämmt. Es gibt zwei

Sorten Kämme *(mṛ́ds IV)*, ganz aus Holz geschnitzte (Abb. 139*b–d*) und aus Stäbchen von Raphiablattstielrinde zusammengesetzte (Abb. 139*a*). Dem Öl wird vielfach ein wohlriechendes Haarpulver *(akụ́l)* zugesetzt, das von beiden Geschlechtern benutzt, aber nur von Frauen hergestellt wird. Sie mischen dazu die Wurzeln folgender vier Pflanzen:

1. Cyperacee **Cyperus articulatus** L. *(anddk)*,
2. Moracee **Dorstenia scabra** (Bureau) Engl. (*azbm* F.),
3. Urticacee **Trymatococcus africanus** H. Baillon *(ngǫnd III)*,
4. eines unbestimmten Grases namens *niasdda*

Abb. 139. Kämme, *a* aus Raphiablattstiel, *b–d* aus Holz.

Abb. 140. Rasiermesser, *c* mit Scheide aus Raphiamark.

Abb. 141. Zweischneidige Messer der Fang mit Scheiden.

oder wenigstens zwei bis drei von ihnen, wenn nicht alle vier zu bekommen sind. Die Wurzeln müssen zwei Monate lang in der Hütte trocknen, werden dann ganz — bei **Trymatococcus** nur die Rinde — zerrieben und durch einen Korbteller mittels Klopfen mit einem Messer (*a kal* = klopfen) durchgesiebt; sie ergeben ein angenehm duftendes, gelbliches Pulver.

Ebenso ungern wie im Gesicht sieht der Pangwe die Haare am übrigen Körper. Die Achselhaare werden „wegen des üblen Geruches", die Schamhaare, weil sie angeblich leicht Jucken erzeugen, von beiden Geschlechtern mit einem Rasiermesser (Abb. 140) wegrasiert. Natürlich gibt es immer genug Menschen, die, wie der gute Otu-Mföö, auch für diese Art der Körperpflege nichts übrig haben.

Abb. 142. Messer der Fang mit einfacher Schneide.

In derselben Weise, wie bei uns Taschenmesser gebraucht werden, benutzt der Eingeborene

selbstgeschmiedete ein- oder zweischneidige Messer *(okón)* (Abb. 141 u. 142), die er in Scheiden aus Messing, Leder, Fell usw. am Gürtel trägt.

Je weiter nach Norden im Gebiete, desto eifriger putzt der Pangwe seine Zähne, und zwar mit Hilfe eines oben zersplissenen Stockes (Abb. 143), der mitunter mit Messingdraht hübsch umflochten ist und oft zugleich als Spazierstock dient. Trotzdem haben die Pangwe lange nicht so gute Zähne als man glauben sollte, unter den Fang wenigstens sah ich ein tadelloses Gebiß bei Erwachsenen noch nie, die Backenzähne sind oft erstaunlich schlecht, die doch vielfach zugespitzten vorderen Zähne dagegen, vielleicht weil sie allein ordentlich geputzt werden, besser erhalten.

Das wichtigste Toilettengerät beider Geschlechter ist unbestritten das Öltöpfchen. So oft es geht, salben sich die Pangwe vom Kopf bis zum Fuß mit Öl, hauptsächlich aber bedenken sie das Haar bzw. die Frisur. Ein Grund dafür ist — wie sie sagen — der, daß ihnen der Geruch des Öles angenehm ist, ein zweiter, daß die Haut geschmeidiger und widerstandsfähiger wird, also hygienischer Natur. Hierzu kommt, daß — wie oben erwähnt — das Raphiapalmöl den Läusen offenbar unangenehm ist und sie davon zurückhält, mit ihrem „Wirt" allzu intim zu werden, bei Hautkrankheiten (Krokro und Krätze) und Sandflohwunden wird es sogar als Heilmittel verwendet.

Abb. 143. Zahnbürste.

Das Öl *(mbǫ́n)* wird hauptsächlich aus Palmen, im Norden nur aus der Ölpalme, im Süden selten aus ihr, hauptsächlich aus der Raphiapalme, gewonnen; mitunter stellt man es auch aus den Kernen der **Mimusops djave** (Lan.) Engl. *(ádźáb*, Früchte: *ebǫ́n*, Kerne: *ngón IV-ebǫ́n)*, denen der **Carapa procera** D. C. *(engáń)* und nur ganz nebenbei aus Erdnüssen (vgl. S. 92) her.

Das Öl der Raphiapalme wird ausschließlich, das der Ölpalme zum größten Teil zur Hautpflege, nur zu $^1/_6$—$^1/_5$ als Speiseöl benutzt.

a) Raphiapalmöl.

Die noch nicht ganz reifen Früchte *(aźṹź)* werden in Körben an dem Sumpf ins Dorf gebracht und dort sechs Tage lang unter Bananenblättern und -stammstücken aufbewahrt, dann wird der Schuppenpanzer, soweit er nicht schon von selbst heruntergefallen, abgelöst und die ölreiche Schicht, welche sich zwischen dem Panzer und Samen befindet, mit dem Finger oder mit Hilfe einer Schuppe des Panzers abgeschält. Auf letzteres Verfahren bezieht sich das Rätsel:

Abb. 144. Ölpresse, auf der Raphiapalmöl ausgepreßt wird. Links wird das ölhaltige Fruchtfleisch über Feuer erhitzt.

ma vüi mot oko, okǒn, o mbe a nie abum
Ich tötete (einen) Menschen dort, (das) Messer, es war ihm (am) Bauch
a si, o wo ma ba nie a oa
unten, mit dem ich zerteile ihn für dich!

Mit dem Messer, welches er unten am Bauche hatte, zerteile ich ihn für dich.

Dieser ölhaltigen Masse setzt man etwas Wasser zu, rührt sie um und legt sie auf einem Rindenstück einige Tage lang an die Sonne. Dann kommt sie auf ein Gestell (Abb. 144, links) und wird durch ein darunter angezündetes Feuer ½—1 Stunde lang tüchtig erhitzt. Hierauf füllt man sie in ein eigens zu diesem Zwecke gemachtes Körbchen *(ekůt aźñ,ĩ)* aus **Aneistrophyllum** *(nkgne)*, das nun auf der Ölpresse *(ekvle-maźñ,ĩ, eſdĩ-aſ.)* ausgepreßt wird. Diese Presse, die zwar von einem Manne allein gemacht ist, aber von allen Dorfbewohnern frei benutzt werden darf, findet sich in den meisten Dörfern beim Versammlungshause aufgestellt und besteht aus einem Rahmen — zwei in einigem Abstand in den Boden gesteckten Pfählen mit zwei daran festgeschnürten Querstöcken — und einem nach unten zugespitzten Brett, das seitlich an dem Rahmen befestigt ist, und zwar so, daß es einfach an den oberen Querstock angebunden (so in Abb. 144) oder durch einen schräg auf die Erde gestellten Stab gehalten wird, der durch eine Durchbohrung am oberen Ende hindurchgeht; zur Sicherung ist das Brett mit dem

unteren Querstock verschnürt. Mitunter sieht man statt des Brettes gleichlaufend dicht nebeneinander gelegte Stöcke, die dann natürlich oben und unten an den Rahmen geschnürt sind.

Das Pressen selbst *(a krle mazü,r)* zeigt Abb. 144. Das Körbchen mit der Fruchtmasse wird entweder über den schrägen Stock oder über das obere Ende des Brettes (Abb. 144) gehängt, so daß es vor dieses zu liegen kommt, und nun mit Hilfe von Stöcken ausgepreßt. Das geschieht so ,daß man von oben nach unten einen Stock nach dem andern quer über das Körbchen legt und an dem einen Ende hinter den entsprechenden Rahmenpfosten steckt, an dem anderen vor ihm entlang führt und an ihm festbindet, Dadurch wird das Körbchen gedrückt und der Inhalt nach unten gepreßt.

Vorher hat man unter das Brett, an dem das Öl beim Pressen herabrinnt, ein Gefäß gestellt mit einem Blattfilter oder einem alten Korb darüber, der die größeren Unreinlichkeiten zurückhält. Während der Regenzeit ergeben die Früchte mehr wässeriges Öl, während der Trockenzeit ein Öl, das sehr bald nach dem Auspressen fest wird.

b) Ölpalmöl.

Entsprechend der von Norden nach Süden abnehmenden Verbreitung der Ölpalme hat das Ölpalmöl dort weit größere Bedeutung als hier, dort wird es — wenn ich an dieser Stelle von ihm als Nahrungsmittel reden darf — besser, wenn auch nicht so gut wie bei den Küstenstämmen, hier schlechter zubereitet, auch gibt es dort vier, hier nur drei Arten der Gewinnung und dementsprechende Ölsorten. Es sind dies

Abb. 145. Palmölgewinnung aus den Früchten der Ölpalme.

1. Gepreßtes Palmöl (*mowá* Pl.), zum Salben und Essen,
2. Gekochtes Palmöl (*nnyáman e mbǒn*), nur zum Salben,
3. Gewaschenes Palmöl (*šoń*), Jaunde und Mwele, zum Salben und Essen,
4. Palmkernöl (*mbǒn e mbań, maniaṅga* J.), nur zum Salben.

In der angeführten Reihenfolge von 1—4 nimmt die Häufigkeit der Herstellung ab, das gepreßte Öl wird also am häufigsten, das Palmkernöl am seltensten hergestellt, für die Südpangwe ist die Reihenfolge ebenso, nur fehlt bei ihnen das gewaschene Öl überhaupt.

1. Gepreßtes Öl.

Die reifen Fruchtstände werden vom Baum abgenommen, mittels Axt und Hauer auseinandergeschlagen und unter einer Decke von Bananenblättern zwei Tage liegen gelassen. Dann löst man die Früchte selbst los, kocht sie in einem mit Blättern zugebundenen Topf mit wenig Wasser ungefähr eine Stunde lang, zerstampft sie in einer Mulde mit einem Holzstößel und liest die Nüsse heraus (Abb. 145). Das Fruchtmus wird nun auf der Ölpresse ausgepreßt. Das Öl hat die bekannte gelbrote Farbe und kommt bei Europäern mit Fleisch, Makabo- oder Taroknollen zusammen als „Palmoilchop" auf den Tisch, wird aber von den Eingeborenen nur zum geringen Teile (1/4, im Süden noch weniger) gegessen.

2. Gekochtes Öl.

Das gepreßte Öl kocht man so lange, bis es ganz hell wird, ein Grad, der am besten zu erkennen ist, wenn man einige Tropfen Öl auf ein Stück Raphiamark fallen läßt. Während des Kochens taucht man etwa eine Minute lang einige zusammengebundene Blätter des Fiebergrases, **Andropogon schoenanthus** (*ośim e nlaṅgan*), das einen eigenartigen Geruch hat, hinein. Hat das Öl lange genug gekocht, so nimmt man den Topf vom Feuer, tut Blätter und Rindenstücke der Buschpflaume, **Pachylobus edulis** E. Don. (*asá* Nt., *ośǝ̄nga* F.), auf etwa drei Minuten hinein — angeblich, weil sie einen angenehmen Geruch haben — und gießt dann das durchscheinende, schmutzig-weiße Öl ab.

3. Gewaschenes Öl.

Man behandelt das Öl zuerst wie das gepreßte. Nach dem Stampfen wird Wasser in die Mulde gefüllt und das Fruchtfleisch tüchtig durchgeknetet, wobei zugleich die Nüsse entfernt werden, dann wird das Wasser vorsichtig abgefüllt. Dieses Durchkneten des Fruchtfleisches im Wasser wiederholt man noch zweimal, dann wird das Fleisch entfernt und das auf dem Wasser in der Mulde schwimmende Öl abgeschöpft. Es ist von derselben Beschaffenheit wie das gepreßte, auch gelbrot, und wird ebenso benutzt. Auch dieses Öl kann gekocht werden und entspricht dann genau dem gekochten Preßöl.

4. Palmkernöl.

Die Palmnüsse werden auf einem Stein aufgebrochen (Abb. 146), und die Kerne in einem Topf ohne Wasser über Feuer erhitzt. Dann zündet man die Kerne an, treibt dadurch das in ihnen enthaltene Öl heraus, schüttet dann die Kerne nebst Öl auf eine doppelt durchlöcherte Scherbe und läßt das Öl in ein darunter gestelltes Gefäß sickern. Das Palmkernöl ist ganz dunkel und undurchsichtig.

Abb. 146. Ölpalmnüsse werden zur Ölgewinnung aufgeklopft.

Schließlich mag erwähnt sein, daß Kinder — Erwachsene nur, wenn gerade kein Öl vorrätig ist — mitunter die Palmfrüchte einfach zwischen die Feuerscheite legen und dann die warmen Früchte in der Hand hin und herreiben. Das austretende Öl reiben sie sich sodann auf die Haut.

Außer dem Einsalben mit Öl ist bei den Pangwe für bestimmte Gelegenheiten das Beschmieren des Körpers mit Farbe beliebt, und zwar wird hauptsächlich rot, seltener weiß, nur ausnahmsweise schwarz verwandt, weitere Farben gibt es überhaupt nicht. Rot ist die Farbe der Freude, weiß die des Todes, des Bösen. Daraus ergeben sich die Fälle, bei denen die betreffenden Farben verwandt werden. Bei festlichen Gelegenheiten, Tänzen, Hochzeits- und Geburtsfeiern nimmt man rot, das mitunter (z. B. beim Liebestanz) durch weiße, selten schwarze Sonnen und Kreise belebt wird; auch bringt man rauten-

förmige Flecke (*bendö[k] be ba* = Rauten aus Rotholz) auf die Haut oder läßt auf der roten Bemalung rautenförmige Flecke frei, beides mit Hilfe einer Schablone, das ist eines Blattes, aus dem ein rautenförmiges Stück herausgeschnitten ist. Bei Trauerfällen und bei den Kulten, die dem „Bösen" gelten, wird dagegen weiß getragen.

Abb. 147. Reiber für Rotholz (Schote der Pentaclethra).

Die rote Farbe (*bǫ III, esi,*) wird aus dem Kernholz des Rotholzbaumes, **Pterocarpus soyauxii** Taub. (*mrö' IV* F., *mrē IV* Nt.), einer Leguminose, gewonnen. Mit Vorliebe sucht man sich alte, gestürzte, außen schon verrottete Bäume, schlägt ein handliches Stück ab und reibt mit ihm als Reiber (*nıd,k-esi, IV*) auf dem Reibblock (*nɛ̄,-esi,*), dem Stamme, hin und her, indem man von Zeit zu Zeit feinen Sand dazwischen streut; einmal sah ich die Schote der Leguminose **Pentaclethra macrophylla** Benth. (*ebgi,*) (Abb. 147) als Reiber gebraucht. Wo der nächste Rotholzbaum zu weit entfernt liegt, als daß man immer dorthin laufen könnte, nimmt man sich einen kleinen Block samt einem Reiber mit in die Hütte, um die beliebte rote Farbe immer leicht herstellen zu können. Zum Aufbewahren hat man sehr niedliche kleine Gefäße in Form von Töpfchen, Mulden, Tellern oder Schemeln (Abb. 148).

Abb. 148. Gefäße zum Aufbewahren von Rotholz.

Weiße Farbe (*rū,ok IV*) wird aus dem gleichnamigen weißen Ton, einer Abart des gewöhnlich dunkleren Töpfertones, gewonnen. Er wird mit Wasser verrührt aufgestrichen. Schwarze Farbe wird aus gestampfter Holzkohle unter Zusatz von Wasser bereitet (Farbe und Kohle = *pfi'di III*).

4. Körperverzierung.

Während wir bei dem Behängen des Körpers mit Gegenständen das reine Schmuckbedürfnis, beim Beschmieren mit Farbe den Wunsch, persönliche Stimmungen zum Ausdruck zu bringen, als Triebfeder

erkannten, spielen bei der dauernden Veränderung des Körpers ursprünglich wohl religiöse Gründe mit, so beim Zahnanspitzen und bei der Beritzung des Körpers. Natürlich sind diese uralten Anschauungen heute vergessen, der Schmuckgedanke hat den religiösen Hintergrund meist vollständig überwuchert.

Im Pangwegebiete kommen vier Arten der eigentlichen Körperverzierung vor, Brandnarben, Ziernarben, Bemalung und Tätowierung. Diese Reihenfolge möchte ich auch zeitlich, entwicklungsgeschichtlich verstanden wissen. Ich halte die Brandnarben für die ältesten, zuerst unabsichtlich entstanden infolge des Umgangs mit dem Feuer, dann absichtlich hervorgerufen durch Betupfen mit glühender Kohle. Diese Brandnarben hat man später durch „Schnitt"-narben, d. h. mit dem Messer hervorgebrachte Ziernarben ersetzt, da das Messer eine feinere und kunstvollere Linienführung gestattete. Vielleicht täuschten nun jüngere Leute aus Furcht vor dem Schmerz die Brandnarben dadurch vor, daß sie entsprechende Punkte oder Striche auf dem Körper mit erkalteter Kohle zogen. Damit war der Anfang der Bemalung gefunden, die später dann mit anderem, besserem Material weiter entwickelt wurde. Eine Verbindung von Ziernarben und Bemalung ist die Tätowierung, bei der die Wunden mit verkohltem Harz eingerieben werden.

Alle genannten Arten der Körperverzierung haben also meines Erachtens eine gemeinsame Wurzel, nämlich das Feuer; in dieser Beziehung ist eine kurze sprachliche Betrachtung von Wert: *kä* ist, wie ich bereits S. 8 angedeutet habe, der Urstamm zur Bezeichnung der feindlichen Hin- und Herbewegung, für Schmerz und Gefahr, für Kälte und Hitze (denn beide wirken gleich), infolgedessen auch für das Feuer, wo seine Wirkung betont werden soll, so *n-kä-bä* = die Flamme; *e-kä'ba* = was man zur Flamme braucht, Fackel; *a kä-d-an* = Feuer mit einer glühenden Kohle anlegen *(an)*; *-ka-d?* = glühende Holzkohle (vgl. Meinhof, Grundriß einer Lautlehre der Bantusprachen S. 160, im Pangwe mir nicht bekannt); *me-kä eli* = Name eines Baumes, der Holzkohle liefert, wörtlich: Kohlenbaum; *a kä-ń* = kohlenzeichnen, zeichnen, schreiben, brandmalen, malen (mit schwarz); *e-kä'-ń* = Tätowierung; *n-kä'-ń* = die Gezeichnete, das Perlhuhn (auch heilig, I. Vorsilbenklasse, siehe Kult Mekang).

Ob in allem Anfang das Feuer in seiner profanen Wirkung als Herdfeuer den Anstoß gab zu der besprochenen Entwicklung oder das Feuer in seiner religiösen Bedeutung als heiliges, göttlich verehrtes Element, wie ich glaube, kann ich hier nicht entscheiden.

Einfache Brandnarben *(ndätölö III)*, reihenweise angeordnet, machen sich heute nur Kinder und halbwüchsige Jungen oder Mädchen auf den Unterarm, seltener an andere Körperstellen. Ein kleiner, bereits flüchtig verkohlter Splitter aus Raphiablattstielrinde wird mit der Spitze auf die Haut

gedrückt und oben angezündet; er brennt dann langsam ein Loch in die Hand, das eine etwas erhöhte, oben glatte, rundliche Narbe hinterläßt.

Die Ziernarben scheinen bei den Fang, bei denen man sie am häufigsten und kunstvollsten findet, alteinheimisch zu sein, sich aber nicht sehr weit nach Norden verbreitet zu haben; sieht man sie bei den Ntum noch häufiger, so findet man sie bei den Bulu nur mehr selten, bei den Bene nur an einigen älteren Leuten und bei den Jaunde überhaupt nicht. Neuerdings fangen sie auch im Südpangwegebiete an zu schwinden, da man sich lieber der kürzlich eingeführten, bei weitem weniger schmerzhaften Tätowierung unterzieht. Die Ziernarben werden von den Ntum *mrə́n* (Mehrzahl), von den Fang *endə̄n* genannt und kommen bei beiden Geschlechtern vor. Man braucht dazu einen kleinen, eisernen Haken, (*tsə̄ə́ III* Nt., *endə̄n* F.), mit dem die Haut etwas hochgezogen wird, und ein Messer, Abb. 149 *(okə̄n e mrə́n)*, mit dem senkrecht auf den Haken die hochgehobene Falte eingeschnitten wird (Abb. 150 u. 151). Die Wunde läßt man heilen, ohne daß irgend etwas eingerieben oder ein Verband daraufgelegt wird. Diese Ziernarben finden sich nur auf dem Körper und dem Oberarm, selten im Gesicht und dann nur auf der Stirn.

Abb. 149.
Messer zur Herstellung von Ziernarben.

Die Bemalung ist auf das Ntum- und Fanggebiet beschränkt und fehlt im Jaundegebiet, angeblich, weil dort der Baum, aus dem der Farbstoff gewonnen wird, nämlich die **Randia malleifera** (Hook). Benth., die bei den Fang *obə̄ndə̄m*[1]) oder *ɟrna IV*[2]), auch *mɟrna*, bei den Ntum *abə̄ndə̄m* oder *kə̄demə̄n IV* heißt, nicht vorkommt.

Abb. 150. Führung der Ziernarbenschnitte.

Mit dem Namen *ɟrna (mɟrna)* und *kə̄demə̄n* wird auch die Bemalung selbst bezeichnet.

Die **Randia** ist ein zur Familie der Rubiaceen gehöriger dünner Baum, der besonders in der Nähe von Flüssen wächst. Die großen weißlichen Blüten hängen von den Enden der Zweige oder von den Astgabelungen herab; die Frucht ist eine Beere und mit einer Anzahl von oben nach unten verlaufender Wülste besetzt. Zur Gewinnung des Farbstoffes wird ein Stäbchen aus Raphiablattstielrinde in die Ansatzstelle der Frucht gebohrt und der Inhalt umgerührt. Zieht man das Stäbchen heraus, so klebt an der Spitze ein weißlicher, etwas dicklicher Saft, der gleich mit demselben Stäbchen in den gewünschten Mustern auf

---

[1]) Entstanden aus *abə̄*, **Cola acuminata** P. B., und *ndə̄m* = lang, schwankend, wegen der Schlankheit des Baumes.

[2]) Vom Stamme *rɟn* = dunkel, schwarz; *e-rɟn-di mət* = Schwarzer (Mann), Neger.

den Körper aufgestrichen wird und nach kurzer Zeit tief blauschwarze Farbe annimmt. Die Zeichnung hält sich drei bis vier Tage auf der Haut, bei öfterem Waschen nur zwei, nachher verschwindet sie von selbst.

Heutzutage bemalen sich nur kleine oder halbwüchsige Jungen aus Spielerei; früher aber taten es die jungen Leute beiderlei Geschlechts, um aufzufallen und dadurch eine Wirkung auf das andere Geschlecht zu erzielen. Damals verwandte man infolgedessen große Sorgfalt auf die Muster, heute kommen bei der kindlichen Ungeschicklichkeit nur verschmierte heraus.

Abb. 131. Ziernarbenkünstler bei der Arbeit. Bébai, Span.-Guinea.

Das Erbe der Bemalung hat die vor rund 20 Jahren eingeführte Tätowierung angetreten, die von jener den Namen *fjne* und *kudemän*, bei den Fang auch den Namen für Ziernarben, *mrän*, bekommen hat, bei den Ntum außerdem noch *ekän* (siehe oben), bei den Jaunde *otü* heißt (von *otü* = Harz, das in die Wunden gerieben wird und das bleibende Muster hervorbringt). Da die Tätowierung, nach Angabe der Fang, Anfang bis Mitte der neunziger Jahre von Norden her zu ihnen gekommen ist, und da man bei den Bene, die sie zuerst wahrscheinlich von Osten her erhalten haben, auch nur jüngere Leute tätowiert sieht, so folgt, daß sich die Kunst im ganzen Pangwegebiete mit außerordentlicher Schnelligkeit ausgebreitet haben muß, zum Teil vielleicht unter dem Einfluß kriegerischer Ereignisse; so wird erzählt, daß die

Ntum in den Kämpfen mit den Bulu die Tätowierung an den Leibern der Erschlagenen gesehen und sich von den Gefangenen die Kunst hätten zeigen lassen.

Wie früher die Bemalung dient heute die bei beiden Geschlechtern, besonders aber dem männlichen, vorkommende Tätowierung den jungen Leuten dazu, sich zu schmücken, um dadurch bei der Liebeswerbung anderen den Rang abzulaufen. Schmuck und Liebeswerben ist eine Sache, ein- und dasselbe *(a ne dzám eda eda)*, wie der Pangwe sagt, und sicher können hübsche Muster so in die Augen stechen, daß man unwillkürlich ein größeres Gefallen an dem Besitzer oder der Besitzerin findet, als es ohne eine solche Beeinflussung des Schönheitsgefühles der Fall gewesen wäre.

Schon die kleinen Jungen lassen sich tätowieren, und zwar meist ein halbmondförmiges Muster auf die Stirn, aber es pflegt nur schwach eingeritzt zu sein und daher wieder zu verbleichen, so daß von ihm unter den später darüber aufgetragenen Mustern kaum etwas sichtbar bleibt. Von der Zeit der Geschlechtsreife an läßt man sich eifriger tätowieren, und mit 25 Jahren, wo die Ausschmückung etwa ihren Höhepunkt erreicht hat, ist die Anzahl der Muster schon eine recht erhebliche. Tätowiert wird durchweg Gesicht, Schulter, Brust und Bauch bis zum Nabel, häufig der Rücken — dieser dann meist nur in der oberen Hälfte — und der Arm bis unter das Ellbogengelenk, selten Hände und Unterarm und der Bauch vom Nabel abwärts[1]). Aus Gründen der Schamhaftigkeit bleibt Gesäß und Oberschenkel von jedem Ritzschmuck verschont, da es ja zu unanständig wäre, durch die Muster den Blick auf diese bei der ursprünglichen Tracht „leider" vielfach unbedeckten Körperteile zu lenken; nur ausnahmsweise sieht man bei einzelnen Weibern der Jaunde, Bulu und Küstenmwai auch die Oberschenkel tätowiert, ein Brauch, der, von den lockeren Jaunde mitgebracht, vom Volksbewußtsein allgemein als schamlos empfunden und damit entschuldigt wird, daß „es ja dafür nur Weiber seien, und Männer sich schämen müßten, in dieser Weise herumzugehen" (ähnlich, wie sich bei uns auch nur Frauen „dekolletieren").

Die bei den Pangwe bis ins äußerste entwickelte Arbeitsteilung und Spezialisierung aller Gebiete künstlerischen und geistigen Könnens tritt auch bei der Tätowierkunst, die vielleicht nur einer von hundert versteht, in die Erscheinung. Die Operation, die übrigens recht unangenehm, wenn auch lange nicht so schmerzhaft ist wie bei den Ziernarben, wird im Versammlungshause ohne irgendwelche Förmlichkeiten vorgenommen, der „Patient" sitzt oder liegt dabei (Abb. 152). Zunächst stellt man sich Ruß her, indem man Harz *(oto)*, vgl. S. 80, verbrennt und den Qualm sich auf einer Topfscherbe niederschlagen läßt. Dann zeichnet der Künstler das Muster auf dem Körper vor, indem er

[1]) Hals nur in Jaunde und selten.

Abb. 152. Tätowierkünstler bei der Arbeit. Nikolentángan, Span.-Guinea.

die krummen Linien mit einem biegsamen, feucht in Asche gelegten Grashälmchen, die geraden mit einem ebenso behandelten Raphiastäbchen abklatscht; überstehende Linien werden mit dem nassen Finger sorgsam fortgewischt. Für das „Spinnenwebemuster" bedient er sich eines Stempels aus dem handförmigen Blatt des Schirmbaumes (Musanga), dessen Rippen nach der Entfernung der Spreiten 1 cm vom Stielansatz abgebrochen werden. Auf den vorgezeichneten Linien macht er mit dem Messer dicht an dicht kleine, schräge Einschnitte, wischt das langsam herausquellende Blut, wenn es stört, fort und reibt die Wunden mit dem Harzruß ein, den er mit dem Daumen oder Zeigefinger gut hineinwischt. In anderen Fällen wird das zerriebene Harz selbst, dann nur das von der Anonacee Xylopia aethiopica (Dun.) V. Rich. *(ojaŋ)* in die Wunden gebracht. Der tätowierte Körperteil wird jetzt oberflächlich gewaschen, um Blut und Ruß abzuspülen; später wird das Einreiben mit Harz noch einmal wiederholt. Mitunter kommt es vor, daß sich

Abb. 153 u. 154. Griffloses Messer zur Tätowierung (ekut).

Abb. 155. Messer zur Tätowierung (fendolo).

an den Wunden kleine Fleischwucherungen bilden, die die Schönheit des Musters beeinträchtigen; meist aber heilen die Wunden in kürzester Zeit glatt aus.

Man unterscheidet zwei Arten von Tätowierungen, die allgemein verbreitete, *ekụt*, und die außerdem bei den Fang gebräuchliche, *endǫlǫ*. Die erste wird mit einem schmalen, grifflosen Messer *(nsǭṇ-bekụt I)*, Abb. 153, ausgeführt und zeigt, je nach der Tiefe der parallelen Einschnitte, die Linien aus deutlich hervortretenden Schnitten zusammengesetzt oder mehr verwaschen, gleichmäßig dunkel. Zur *endǫlo*-Tätowierung nimmt man ein gewöhnliches Rasiermesser *(okǭṇngǭṇ)*, vgl. Abb. 140, bzw. ein eigenes, skalpellartiges Messer *(ǭkǭṇ e mṛdṇ)*, Abb. 155. Ihre Muster sind durch Kreuz- und Querführung der Schnitte gekennzeichnet lassen sich indes in späteren Jahren von den *bekụt* kaum mehr unterscheiden, zumal beide mit dem Alter verbleichen.

Die Tätowierkünstler werden, wenn es sich um die eigenen Sippenmitglieder handelt, gewöhnlich nicht bezahlt; von Fremden verlangen sie aber oft unverschämt hohe Preise. So wurde der in Abb. 218 Fig. c dargestellte Mann, wie aus den in Anmerkung [1]) erwähnten Zahlen hervorgeht, tüchtig hochgenommen, wobei allerdings bemerkt werden muß, daß er wegen seiner Tätowiermanie von einigen „für nicht ganz normal" gehalten wurde. Echt negerhaft wird die Kostenfreiheit damit begründet, daß der Tätowierte seinen Schmerz nicht so fühlt, als wenn er obendrein noch bezahlen müßte. Jedoch sind diese Verhältnisse örtlich sehr verschieden; in Jaunde ist allgemein Bezahlung üblich, oft sogar eine verhältnismäßig hohe.

Zahnverstümmelung kommt überall bei beiden Geschlechtern vor, und zwar an den oberen vier Schneidezähnen. Das hat neben dem Schmuckgedanken wohl noch einen tieferen religiösen Grund, der jedenfalls uralt ist und noch in den Negern lebt, die — wie mir einmal gesagt wurde — ihre Zähne nicht wie Tierzähne erscheinen lassen wollen [2]). Da nun tatsächlich bei keinem

[2]) Siehe auch die gleiche Ansicht bei den Malaien und den Sudannegern (nach Frobenius).

großen Säugetier die Vorderzähne (denn um diese handelt es sich)[1]) spitz sind, so erscheint dieser Grund glaubhaft, obgleich für uns gerade die zugespitzten Zähne einen tierischen Eindruck machen, weil wir an das von den vorspringenden Reißzähnen beherrschte Bild des aufgesperrten Rachens denken. Der Pangwe sieht in erster Reihe die Vorderzähne und findet namentlich bei den Horntieren eine überraschende Ähnlichkeit mit seinen eigenen heraus. In dieser vergleichenden Betrachtung stört es ihn auch nicht, daß es sich bei jenen nur um die Vorderzähne des Unterkiefers — im Oberkiefer haben die Wiederkäuer meist keine — handelt, denen die Vorderzähne seines Oberkiefers ähneln. Wie menschlich, fast allzu menschlich selbst für uns die Vorderzähne z. B. unseres Rindviehes erscheinen, das lehrt uns ein Blick auf die Tierkarikaturen unserer Witzblätter. Nun spielt das Horntier, zahmes (Ziege und Schaf) wie wildes (Antilope), eine große Rolle in der Religion der Pangwe, insofern es wegen seiner Hörner mit dem Monde in Verbindung gebracht wird. Der Kult des Mondes aber ist der Kult des Bösen, und so ist die Zahnverstümmelung ein Symbol der Abwendung, Entähnlichung vom Bösen; andererseits deutet sie zugleich positiv auf eine Anähnelung an das Gute; denn das ist die Sonne (bzw. Gott *[e-sá-mbe]*, der sich in der Sonne zeigt), und deren Strahlen sollen die Zähne ähnlich gemacht werden. Die Zahnverbildung besteht darum nicht im Herstellen einer regelrechten „Spitze", die im Gegenteil etwas Unangenehmes und Schlechtes (in *n-sǫ́-ń I* = Spitze steht der Stamm *sǫ́*) sein würde — es mag sein, daß etliche Völker deshalb ihre Vorderzähne alle oder zum Teil ausschlagen —, sondern darin, daß die Zähne nur verschmälert und in eine Form gebracht werden, wie sie Abb. 156 zeigt; sie werden gewissermaßen „gestreckt", einem Strahl geähnelt, daher der Ausdruck *a sá-m-ān masǖń* von *a sá-m* = ausstrecken (*n-sá-m-ba* = die Reihe, Linie, eigentlich Strahl). Der vielfach übliche Ausdruck „Zahnspitzen" trifft nur das Richtige, wenn man ihn nicht zu wörtlich nimmt: die Schneide wird nur verschmälert, nicht zugespitzt; der Ausdruck „Zahnfeilen", dem man gleichfalls öfter begegnet, ist nicht angängig, da die Zähne abgesplittert, nicht gefeilt werden. Im Pangwe sagt man außer *a sáman*

Abb. 156. Verstümmelung eines Vorderzahnes. Das Schraffierte wird abgeschlagen.

Abb. 157. Meißel zum Abstemmen der Vorderzähne.

---

[1]) Siehe die Ausdrücke für Zahnbehauen weiter unten, in denen für Zahn stets *asǖń* = Vorderzahn steht; ein Wort für Zahn im allgemeinen gibt es nicht, dagegen für Eckzahn, Reißzahn bei Tieren *(ſǫ́ III)* und Backenzahn *(ekǒ̈k)*.

masǔn noch *a sá-n masǔn* von *a sá-n* = schnitzen, behauen, verzieren; *zá-n IV* = Schnitzerei, Schnitzmuster, Stamm *sa*[1]).

Die Operation wird so ausgeführt, daß sich der „Patient" lang auf den Rücken legt und fest mit den Vorderzähnen auf eine Holzrolle beißt. Der Zahnkünstler setzt einen kleinen Eisenmeißel *(zán e masǔn IV)*, Abb. 157, auf den Zahn, nimmt ein Stück Holz als Hammer und splittert die Kanten in kleinen Stückchen ab. Die Schmerzen dabei sind nicht gering, und man kommt deshalb hier und da von der alten Sitte zurück, ein Entwicklungsgang, der unter europäischem Einfluß beschleunigt wird.

Abschnitt VIII.

Handfertigkeit und Werkzeug.

Allgemeines.
Erster Teil. Rindenarbeiten. a) Rohrinde. Verwertung: Rinde für den Hausbau, Schmuckrinden, Rindengefäße (ihre Herstellung, Bedeutung des Namens), Sarg. b) Rindenstoff. Klopfer. — Rindenstofflieferende Baumarten. — Herstellung.
Zweiter Teil. a) Fäden und Nähen. Fasern des Rekthophyllum, der Ananas. b) Seile und Knüpfen. Seile aus Ananas und Banane, Raphiabast und seine Herstellung, Raphiabastseile, Gärtnerabastseile, Triumfettabastseile. — Knoten. c) Bänder und Flechten. Allgemeines. I. Zöpfe aus Bast. II. Tragbänder und Mattengeflechte. III. Trockenbretter und Kästen. IV. Vorratskörbe. V. Körbe (Arten, Material, Schlingpalmen und ihre Bedeutung). VI. Korbnäpfe der Mwele. VII. Korbteller. VIII. Gürtel. Körbe (Stoffe, Korbarten, Preise), Messerscheiden.
Dritter Teil. Holzarbeiten. Allgemeines. — Erzeugnisse der Holzschnitzerei. — Herstellung von Hauerscheiden, Schemeln, Rührlöffeln, Eßlöffeln, Pulverfläschchen. — Andere Holzarbeiten.
Vierter Teil. Metallarbeiten. a) Eisengewinnung. Gebiete der Gewinnung, Häufigkeit. — Schmelzmedizin. — Enthaltsamkeitsgebot und Medizinen. — Eisenstein. — Schmelzhütte. — Schmelzarbeit: Vorbereitung, Arbeiter und ihr Handwerkszeug, Errichtung des Ofens, Beschickung, Arbeit der Blasebalgzieher und des Medizinmannes. — Abreißen des Ofens. — Verteilung des Roheisens. — Erträge. b) Eisenverarbeitung. Stellung des Schmiedes, Schmiedehütte und Einrichtung der Werkstätte, Medizinen, Handwerkszeug, Holzkohle, Schmiedearbeit. c) Messinggießerei. Herkunft des Messings, Schmelzen, Guß und Zubereitung der Halsringe.
Fünfter Teil. Töpferei. Allgemeines, Erzeugnisse. Preis und Herstellung der Töpfe. Verzierung. Herstellung der Düsen.

Handwerke in unserem Sinne gibt es bei den Pangwe nicht; alle Handfertigkeiten werden nur beiläufig neben den wirtschaftlichen Arbeiten Ackerbau, Fischfang, Fallenstellerei, ausgeübt. Die ganz einfachen sind jedem bekannt und geläufig; darüber hinaus fängt die in allem Können der Pangwe zu verfolgende Spezialisierung an, und die geht so weit, daß z. B. nicht einmal die Tragbänder für Kinder, die nur aus zwei zusammengenähten Lederstreifen bestehen, von allen Familienvätern gemacht werden können, und daß einer, der Eßlöffel herstellt, keine anderen Holzarbeiten, nicht einmal einen Rührlöffel, machen kann. Ein Schemelmacher versteht nur Schemel zu machen, ein Armbrustschnitzer nur Armbrüste, einer, der Männertragkörbchen *(ebg'de)* macht, nur Männertragkörbchen usw. Da es in einem Dorfe oft nur einen oder zwei Leute gibt, die ein Handwerk verstehen, so müssen die Einwohner dieses Dorfes die nicht bei ihnen herstellbaren Gebrauchsgegenstände aus allen Himmelsrichtungen zusammenkaufen, und es kann vorkommen, daß weite Wege, ja Reisen gemacht werden müssen, um sich einen Schemel, eine Armbrust und dergl. zu besorgen.

[p. 204]

1. Rindenarbeiten.

Baumrinde findet im Haushalt der Pangwe vielseitige Verwertung, und zwar in zwei Formen, roh und zu Stoffen verarbeitet.

a) Rohrinde.

Sie wird zu folgenden Zwecken benutzt:

1. zur Hauswandbekleidung und als Tür [1]),
2. zu Schmuckrinden,
3. zu Schachteln,
4. zum Sarg bzw. zur Unterlage des Toten im Grabe,
5. zum Bespannen des Resonanzbodens der Harfe (siehe Musikinstrumente, Abschnitt XX).

Die nötigen Stücke werden so gewonnen, daß der Baum oben und unten geringelt und dazwischen mit Kreuz- und Querhieben des Hauers eine Zickzacklinie eingeschlagen wird, von der aus der Rindenmantel leicht abgehoben und losgelöst werden kann (Abb. 158); dabei durchkreuzen sich oft zufällig die schrägen Schnitte, so daß Rauten entstehen. Diese Rauten haben dann ein wichtiges Ornament abgegeben, worauf ich später noch zurückkomme.

Abb. 157. Abtösung der Baumrinde zum Hausbau.

Für die Hauswände werden die abgelösten Rindenplatten zum Teil ohne weiteres verwendet, und zwar entweder ganz roh oder nach Abschälen der äußersten Schicht — so machen es die Jaunde —; die Ntum und Fang aber tun das höchstens bei **Xylopia aethiopica** *(ojaŋ)*;

[1]) Zum Hausbau wird die Rinde von etwa 15 Bäumen benutzt, deren wissenschaftliche Namen, soweit feststellbar, aufgezählt seien:

Flacourtiaceae Homalium buchholzii Warb. *(oṛŏŏ-e-sŭk)*,
Sterculiaceae Stercula tragacantha Lindl. *(edzŭle)*,
Borraginaceae Cordia odorata Gürke (*ebę*, F., *ebḑi*, Nt.),
Bignoniaceae Markhamia tomentosa K. Sch. *(edzidzŏŏ)*,
Rhamnaceae Maesopsis tessmannii Engl. *(nkáŋ I)*,
Bombaceae Ceiba pentandra (L.) Gärtn. *(dŭm IV)*,
Anonaceae Xylopia aethiopica (Dun.) A. Rich. *(ojaŋ)*,
„ **Cleistopholis staudtii** Engl. et Diels *(oṛŭm, ṛŏmŏ III)*,
„ **Isoloma** spec. *(ovŭk)*,
Sterculiaceae Stercula tragacantha Lindl. *(edziḭḅ, edziḭḅk)*.
Triplochitonaceae Triplochiton tessmannii *(ojŏŋ)*.

im übrigen trocknen sie lieber die Stücke fünf oder mehr Tage über Feuer im Versammlungshause oder an der Sonne, da sie sonst leicht ziehen oder Risse und Löcher bekommen.

Die Schmuckrinden werden ebenso behandelt und ganz besonders gut getrocknet, da sie nicht, wie die Hauswände, durch beiderseitige Latten gehalten werden. Man kann zur Gewinnung von Schmuckrinden alle in der Anmerkung S. 78 genannten Bäume benutzen; besonders geeignet aber ist **Cordia odorata** Gürke (*ebę* F.) und **Triplochiton tessmannii** (*ajéń*), da man von ihrer Rinde nach dem Trocknen verschiedene Schichten abziehen und jede für sich benutzen kann. Das bedeutet eine Arbeitsersparnis, die dem Neger ebenso wertvoll erscheint wie uns. Es sind rechteckige Platten, mit Figuren und szenischen Darstellungen bemalt oder in farbigen, rechteckigen, dreieckigen und bogenförmigen Feldern gemustert. Die Einfassungen der eckigen Felder bestehen aus meist diagonal verlaufenden Raphiablattstielstreifen, die der bogenförmigen aus Streifen von Schlingpalmen; beide sind durch Bohrlöcher gezogen, die mit einem Pfriemen (*nsuv*), Abb. 174 c, gestochen werden, und mit feinen Palmenbändern aufgenäht. Auf die Muster komme ich im nächsten Abschnitt zu sprechen.

Während man für Haus- und Schmuckrinden eine ganze Anzahl Bäume zur Auswahl hat, werden die Rindenschachteln — wenigstens im Südgebiet — nur aus der Rinde eines einzigen Baumes, einer Tiliacee (*ekób*) hergestellt. Sie sind sauber gearbeitet und sehen neu wegen ihrer gleichmäßig gelbgrauen Farbe, die später infolge des Rauches in der Hütte und des Alters eine dunkelbraune bis schwarze wird, sehr gut aus. Die Herstellung ist folgende: Das nötige Stück Rinde wird in der gewünschten Größe abgeschnitten und die äußerste Schicht über Feuer angesengt, so daß sie sich mit dem Messer abschaben läßt. Nun wird es zu einem Zylinder so weit zusammengebogen, bis die Ränder in schmalem Streifen übereinanderliegen, und zwischen die Hälften eines bis zur Mitte längsgespaltenen Stockes geklemmt, die ober- und unterhalb durch eine Verschnürung wieder aneinandergepreßt werden. Die Ränder werden nunmehr in zwei Nähten durch Spleißen der Stiche mit Palmband aufeinandergenäht, für das mit einem Pfriemen Löcher gebohrt werden; der überstehende Rand wird abgeschnitten. Der Deckel besteht aus einem ebenso hergestellten Reifen aus derselben Rinde und einer tellerförmigen Platte aus Schirmbaumholz, wie sie auch als Boden im Gefäß eingesetzt wird.

Man stellt Schachteln in allen Größen her, von den niedlichsten Schächtelchen bis zur riesigen Tonne; in einem sind sie aber alle gleich, nämlich darin, daß nur Wichtiges darin aufbewahrt wird, z. B. die vergifteten Pfeilchen für die Armbrust, die Schädel der Vorfahren, vor allem Medizinen, alles Dinge,

die mit dem Tode in Verbindung stehen; daher heißen sie auch *nsʊ̀k I* [1]), denn in *n-sʊ́-k*, entstanden aus *n-so-ak*, steckt der Stamm *sʊ́*, der den Tod in religiöser Beziehung bezeichnet; in das Rindengefäß tut man eben etwas, was mit dem Tod *(sʊ́)* zusammenhängt (aktive Handlung, da man zuerst nach einem Behälter z. B. für die Schädel der Toten gesucht hat, um sie darin unterzubringen, daher Nachsilbe *aka*). Ein Rindengefäß ist gleichsam auch das Grab *(n-so-ā)*, denn in ihm liegt der Tote in einer Mulde aus Rinde, die manchmal mit einem gleichen Deckel verschlossen ist (passiv, da zuerst einfach die Stelle, wo der Tote geradelag, sei es im Hause, sei es im Freien, *n sʊ́ʊ́* genannt wurde, daher passive Nachsilbe *ā*).

b) Rindenstoff.

Die Verarbeitung der Rinde zu Stoff geschieht durch Klopfen mit einem Schlägel (Abb. 159) aus dem Ende eines Elefantenzahnes *(d)*, einer halben Elefantenrippe *(b, c)*, dem Horn einer Weißrückenschopfantilope, **Cephalophus longiceps** Gray *(mvẹ IV)*, oder dem Holz der Leguminose **Eurypetalum tessmannii** Harms *(andzṭtsjʊ́)* *(a)*. Es wird dazu nicht das Holz eines frisch gefällten Stammes, sondern das härtere rote von alten, längst gestürzten genommen. Der Holzschlägel hat etwa die Form des Holzhammers unserer Zimmerleute und besteht aus einem geraden Stiel und einem walzenförmigen Schlagteil, der in seinem ganzen oder halben Umfang geriffelt ist.

Abb. 159. Schlägel, bei der Rindenbereitung gebraucht. *a* aus Holz, *b* und *c* aus Elefantenrippe *d* aus einem Elefantenzahn.

Zu Rindenstoffen eignet sich nur die Rinde von Feigenbäumen (*etʊ́b* = Feigenbaum [**Ficus**] und Stoff, Kleidung) [2]).

[1]) Daneben kommt *nkʊ̀b I* vor, daher der Name des Baumes: *ekʊ̀b*.

[2]) Folgende Arten kommen im Pangwegebiete dafür in Betracht:

Ficus globicarpa Warb. var. *(embʊ̀ʊ́)*,
„ cfr. **wildemaniana** Warb. *(adʊ́ab-etʊ́b)*,
„ **bubu** Warb. *(akʊ-etʊ́b)*,
„ **stellulata** Warb. *(etṭṭʊ́, Stamm lo(b)* verdoppelt),
„ **preussii** Warb. u. **laurentii** Warb. *(etʊ́b, etʊ́b-o-jab, ejg', akam)*,
„ **barteri** Sprague *(andmentʊ̀mo F., andmentʊ̀ʊ́me Nt.)*,

ferner die von den Pangwe *abʊ́ʊ́, andʊ̀m, undʊ̀m* und *ngus* genannte Arten.

Abb. 159. Herstellung von Rindenstoff durch Klopfen der Bastschicht eines Ficusstammes. Uelleburg, Span. Guinea.

Die verbreitetsten Arten sind **Ficus globicarpa, stellulata, preussii** und **laurentii, barteri,** *abäṇ* sowie *andüm*. Den besten Stoff — er ist fast reinweiß — liefert **F. globicarpa** Warb. *(embiöṇ)*, der früher bei Dörfern angepflanzt wurde; ihn bevorzugen besonders die Frauen, die „mehr auf Kleidung geben" als die Männer.

Es werden möglichst glatte junge Baumstämme, nicht dicker als 8 bis 10 cm, ausgewählt, man schlägt ein Stück aus dem Stamm heraus, läßt es einen halben oder einen ganzen Tag im Freien liegen, sengt es dann über einem schwachen Feuer gleichmäßig an und befreit es durch Schaben von der Borke, bis die Bastschicht blosliegt. Dann schneidet man diese der Länge nach auf, lockert sie durch Klopfen mit dem Schlägel und zieht sie mit den Fingern oder einem untergeschobenen Holz ab. Die abgezogene Bastschicht wird nun auf irgendeiner Unterlage, z. B. auf einem Baumstamm oder einer Holztrommel, in der ganzen Länge von links nach rechts weitergehend, geklopft, ohne daß der Schlägel seine Stellung (d. h. die Richtung der Rillen) verändern darf (Abb. 159), zusammengefaltet, auf der Rückseite geschlagen, nochmals gefaltet und geklopft und schließlich quergefaltet ebenso bearbeitet. Durch diese Behandlung hat sich das Stück ungefähr um das Doppelte seiner Länge ausgedehnt, dagegen in der Breite nicht verändert, es wird nunmehr auseinandergefaltet, einige Male durch Wasser gezogen und dann ausgedrückt.

Aus den Arten **F. bubu**, *andum* und *undum* bereitete Stoffe brauchen nicht gewaschen zu werden.

Die einzelnen in der beschriebenen Art und Weise hergestellten Stoffstücke sind nur schmal; es müssen daher mehrere mit den Längsseiten aneinandergenäht werden, z. B. wenn man einen Lendenschurz machen will, für Männer sechs, für Knaben vier.

2. Faserarbeiten.

Sie gehören mit wenigen Ausnahmen zu den Beschäftigungen der Männer, und zwar zu ihren häufigsten und liebsten. Hieraus erklärt sich die Geschicklichkeit im Nähen, Flicken usw., die der Europäer zu seiner Freude bei den schwarzen Dienern entdeckt.

a) Fäden und Nähen.

Das einfachste Material für Faserarbeiten sind Fäden *(klẹ̈s IV, ndẹ̈s, IV)*, die aus der schlingenden Aracee **Rhektophyllum mirabile** N. E. Brown *(klẹ̈s IV, ndẹ̈s IV)* gewonnen werden, und zwar so, daß die Luftwurzeln abgeschlagen und die Leitbündel herausgezogen werden, die äußerst haltbar und oft recht lang sind und als Nähmaterial, für Kinderangeln *(ngä,k)*, nebenbei als Bindematerial für Kämme aus Raphiablattstielstreifen und Halsbänder aus Schlingpalmenband (bzw. Marantaceenstreifen) benutzt werden.

Abb. 160. Schnurwickler mit Schnur.

Auch die Blattfasern der Ananas werden roh verwendet, um Rindenstoffe zusammenzunähen usw.

b) Seile und Knüpfen.

Häufiger als zu Fäden werden die Pflanzenfasern in Form von Schnüren (Abb. 160) verwendet, die genau wie bei uns der Pechfaden des Schusters, durch Rollen mit der flachen Hand auf dem Oberschenkel zusammengedreht werden. Die hierzu benutzten Pflanzen sind Ananas, Plante, Raphia, Gaertnera und Triumfetta.

Von der Ananas werden die Leitbündel der Blätter benutzt; ihre Schnüre sind recht haltbar — nur im Wasser nicht, so daß keine Angelschnüre aus ihnen gemacht werden — und ziemlich fein, so daß sie sich besonders als Perlenschnüre eignen. Niedlich gemacht sind aus ihnen geknüpfte Umhängetaschen *(mſõk I)*, in denen allerlei kleine Habseligkeiten, Medizinen usw. Platz finden, und die hauptsächlich von den Männern auf Reisen mitgenommen werden.

Aus der Plante werden sehr schöne weiße Fasern *(ndẹ̈[s]-ekgn)* gewonnen, indem der Stamm abgeschlagen, Blätter und äußere Blattscheiden entfernt und

Abb. 161. Zubereitung von Bast aus einem jungen Raphiapalmblatt. Nkolentängan, Span. Guinea.

die Leitbündelfasern aus den inneren Blattscheiden herausgezogen werden; man verflicht sie zu dünnen, aber nicht sehr haltbaren und deshalb wenig benutzten Schnüren.

Von der Raphiapalme ist es der Bast der Blätter, der zu Seilen verarbeitet wird (Abb. 161). Ein ganz junges, noch geschlossenes Blatt (die Eingeborenen gebrauchen wegen der spitzen Form dafür die Bezeichnung *ntǫ̀n* = Horn, *ntǫ[ṅ] ndzǎga*, d. h. ein junges (hornartiges) Raphiablatt) wird abgeschlagen und auf die Erde geworfen, damit die Fiedern sich lockern und leicht abgerissen werden können. Die zusammengefalteten Spreiten der Fiedern sind gelblich, nur an den umgebogenen Rändern, die bei geschlossenem Blatte allein von außen sichtbar sind, grün. Letztere werden nicht verwendet, sondern abgerissen. Dann zieht man eine Spreite von der Spitze her bis kurz vor den Grund ab, knickt sie hier ein, legt sie nach oben um und reißt sie unter Festhalten des Falzes darunter weg. Nun schlägt man ihr unteres Ende gegen die Blattrippe, damit sich die allein verwendbare mit der Epidermis eng verwachsene Bastschicht der Oberseite vom Mesophyll lockert, und zieht sie ab. Den Bast läßt man trocknen und benutzt ihn dann flüchtig gezwirbelt oder zu richtigen Schnüren verarbeitet, für verschiedene Zwecke (Nähen von Rindenstoff, Aufreihen von Perlen usw.).

Die haltbarsten Seile (Abb. 162) liefert der Bast der Rubiacee **Gaertnera paniculata** Benth. (*esǔ̄mǭ* F., *eśǔ̄me* Nt., *ngǫ́n* Nt., Bu.). Die Schößlinge

Abb. 162. Herstellung von Schnüren aus Gaertnera paniculata.

dieses Baumes werden abgehauen und ihre Rinde mittels eines Raphiastengelstreifens *(ngaʼ)* abgeschabt. Dann werden sie an dem einen Ende ein Stück weit längsgevierteilt und einen Tag lang getrocknet, darauf die oberen vier Zipfel eingeknickt, wobei sich die Bastschicht vom Holz löst, die nun in vier Streifen abgezogen wird. Die Schicht besteht aus einem feinen, weichen Fadengewebe, das ohne weiteres verarbeitet werden kann und bräunlich gefärbte Seile ergibt, die wegen ihrer Stärke zu Angelschnüren, Wild- und Fischnetzen, Armbrustsehnen und zum Aufreihen der Schmuckkauri benutzt werden.

Die **Triumfetta cordifolia** Guill. et Perr. (var. **tomentosa.**), *okuu* ist ein strauchartiges Gewächs, das übermannshoch werden kann, an den dunkelgrünen, unten silberweiß schimmernden, weichbehaarten Blättern und den gelblichen Blütenrispen leicht kenntlich ist und, wenn auch nicht überall gleich häufig, an lichten Plätzen in der Nähe von Dörfern und an Stellen, wo früher Dörfer gestanden haben, vorkommt. Diese leichte Erreichbarkeit der Pflanze hat zur Folge, daß ihr Bast häufiger zu Seilen verwendet wird als der anderer Pflanzen. Um den Bast zu gewinnen, schlägt man den Stengel in 1 m Höhe ab und schneidet ihn am oberen Ende viermal ein; dann werden die äußeren Schichten vom Holz abgezogen und nun erst die Rinde von der Bastschicht getrennt. Diese wird zuletzt noch von ihren Zellen befreit, indem man sie unter der Schneide eines fest aufgedrückten Messers hindurchzieht (der Neger sitzt dabei auf der Erde und benutzt die eine Ferse als Unterlage). Der so gewonnene Bast wird getrocknet und zu Seilen verarbeitet, die in gleicher Weise wie die Gaertnera-Seile verwendet werden.

Abb. 163. Knoten der Pangwe.

Anhangsweise seien nach der beigegebenen Abbildung 163 die Namen und Erklärungen der im Pangwegebiete üblichen Knoten angeführt:

Fig. 1: *solufumo*, zusammengezogen: *sofumo* von *a šulân* = sich auflösen, *fum* = in nichts. Da sich durch Ziehen an dem langen Ende der Knoten sofort auflöst, so benutzt man ihn, um Sachen, die man öfters zu gebrauchen pflegt, im Hause aufzuhängen, und für Halsbänder.

Fig. 2: *atšiṅ e lödölŋ* von *atšiṅ* = Knoten, *lödölŋ* = fest, stark. Der Knoten wird — wie bei uns — am Ende eines Fadens angebracht, um zu verhindern, daß dieser sich zurückzieht (z. B. bei Körben), oder daß aufgereihte Perlen abfallen.

Fig. 3: *atšiṅ e mbiân* von *mbiân* = Haltetau, mit dem man die Bäume erklettert, zum Zusammenknoten zweier Taue, besonders für die Haltetaue.

Fig. 4: *atšiṅ e zöṅ* (*zöṅ* = fest, stark?). Ebenso wie der vorige benutzt, ferner auch für Hals- und Stirnbänder, die man längere Zeit benutzen will.

Fig. 5: *dši/s]-aŋŋl, dši s* = Auge, *aŋŋl* = Stellnetz. Knoten für Stellnetz und Hängematte. Fig. 5 zeigt den Knoten offen.

Fig. 6: *atšiṅ e nkpwâ,s* (*nkpwâ,s* = Baumzugfalle für Vögel), bei Vogelfallen, Fischwehren, auch wohl sonst verwendet.

Fig. 7: *nia atšiṅ* = richtiger, eigentlicher Knoten. Fig. 7 a offen, Fig. 7 b zugezogen.

Fig. 8: *mŋakulu* (*mŋus* = Rücken, *kulu* = Schildkröte, also Schildkrötenrücken), nur zur Verknotung der Netzmaschen.

e) Bänder und Flechten.

Im Gegensatz zur Seilerei, die zu Schnüren gedrehte Pflanzenfasern verknüpft, vereinigt die Flechterei Streifen nebeneinanderliegender Fasern, die ich Bänder nenne. So angeordnet kommen sie in der Natur vor in Blättern, Rinde, Bast oder Holz, die man zu Streifen schneidet.

Hergestellt werden

I. Zöpfe aus Bast.

Man nimmt zwei Baststreifen, legt einen doppelt und den zweiten dazwischen, so daß die obere Hälfte außerhalb bleibt und später zur Befestigung dienen kann; es entstehen also drei gleichartige Flechtelemente, die zu einem Zopf miteinander verflochten werden (Helmmützen und -frisuren, vgl. auch Topfaufhängevorrichtung der Mwele Abb. 164).

Abb. 164. Aufhängevorrichtung für Kochtöpfe. Mwele.

II. Tragbänder und Mattengeflechte.

Erstere sind aus **Triumfetta**-Baststreifen geflochten (2 unter, 2 über), letztere aus Blattstreifen vom Schraubenbaum, **Pandanus** (*awürba, kübuga*, zusammengez.: *akü,ä*), die sich schachbrettartig umschlingen; Matten kommen nur im südlichen Grenzgebiet vor und sind wohl eingeführt. Aus gleichem Geflecht wie die Matten und aus demselben Stoff besteht ein kahnartiges Täschchen für die Neulinge des Jaunde-Mondkults (vgl. Abschnitt XI).

Abb. 165. Vorratskorb für Erdnüsse.

III. Trockenbretter und Kasten.

Bei jenen werden die Böden durch ein Geflecht von Raphiastengelstreifen (4 unter, 3 über), bei diesen Boden und Teile der Seitenwände aus einem Palmbändergeflecht (3 unter, 3 über) hergestellt.

IV. Vorratskörbe.

Der Vorratskorb (*angǎ,n* J., *angunda* Mw.) bildet insofern eine Übergangsform vom Kasten zum Korb, als das Grundmaterial aus nebeneinandergestellten Brettchen von Raphiamark (Abb. 165) gebildet wird, die durch umgeschlungene Stengelstreifen von **Sarcophrynium** aneinandergehalten werden. Die Vorratskörbe dienen zum Aufbewahren von Lebensmitteln, z. B. Erdnüssen, Maiskolben usw., im Hause.

V. Körbe.

Ihr Geflecht besteht entweder aus ein und demselben Material oder einer Verbindung zweier verschiedener. Das erstere ist der Fall bei den

1. Hängekörben der Frauen (*nkǎn I*), die im Gegensatz zu den meisten anderen auch von Frauen hergestellt werden, und zwar aus Streifen der Stengelrinde von **Sarcophrynium velutinum** K. Sch. (Stengel *ndẹ̀n, ndẹ̀nàn IV*). Sie zeigen in Größe und Muster reiche Abwechslung (Abb. 166).

Abb. 166. Hängekörbchen der Frauen.

2. Tragkörbe (*nkö,ẹ̀ I*) für einmaligen Gebrauch werden aus Stengeln von **Sarcophrynium** weitmaschig von Männern und Frauen geflochten, wenn sie ihre eigentlichen Tragkörbe nicht oder nicht in genügender Anzahl zur Hand haben oder schonen wollen, z. B. um das blutige Fleisch eines eben erlegten Elefanten ins Dorf zu tragen, und dergl.

3. Ölpreß- und Erdkörbe (*ekǎt, ekǎt-aẹ̀ñ,ẹ̀* = Ölpreßkörbe, *ekǎt-ebê* = Erdkörbe). Erstere dienen dazu, die ölhaltige Masse der Öl- oder Raphiapalmfrüchte (*aẹ̀ñ,ẹ̀*) auszupressen, letztere, die bei der Herstellung von Gruben (*ebẹ̀*) ausgehobene Erde beiseitezuschaffen; beide sind aus **Ancistrophyllum acutiflorum** Becc. (*nkǎne*) geflochten.[1])

Die zweite Klasse der Körbe zeigt Verschiedenartigkeit der Flechtelemente: ein biegsameres aktives (Geflechtstreifen)[2]), das den Boden des Korbes bildet und von hier aus aufsteigend um das zweite, steifere passive (Geflechtstrang),

[1]) Einmal sah ich eine Messerscheide ganz aus Buschtau (**Oncocalamus**) geflochten (Abb. 167). [2]) Im Anschluß an J. Lehmann: Systematik und geographische Verbreitung der Geflechtsarten. Leipzig 1907.

Flechtmattetal liefernde Schlingpalmen.

[facing p. 214]

das, spiralig gelegt, die Wand bildet, geschlungen wird. Ihrer Herkunft nach verhalten sie sich folgendermaßen:

Die aktiven entstammen entweder den **Sarcophrynium**-Stengelstreifen, den **Pandanus**-Blättern oder — und das ist das Vorwiegende — der äußeren Holzschicht der Schlingpalmen. Für sie ist heute der Sammelname *nlöṅ l* üblich, ein Wort, das vom Stamme *a lóṅ* = flechten, schlingen (vgl. *a lóṅ ndä* = ein Haus zusammenflechten, bauen, *a lóṅ nkögʼ* = Körbe flechten) kommt und zugleich für das aus ihnen gewonnene „Buschtau" gebraucht wird. Früher bezeichnete *nlöṅ* allein die **Eremospatha macrocarpa** M. et W., die außer im Küstenstrich westlich vom 11° nur im Norden bzw. Nordosten des Pangwegebietes vorkommt, und wurde später, als die Pangwe nach Süden kamen, auf die beiden hier vorkommenden, zu demselben Zweck benutzten Schlingpalmen, nämlich **Eremospatha tessmannii** Becc. *(ongám)* und besonders die hier wichtige **Oncocalamus mannii** Wendl. *(ebögdögö* F., *ebögdök* Nt., jung *aköʼlöl)*, Taf. XIV, Fig. 1, übertragen[1]).

Der passive entstammt namentlich der Schlingpalme **Ancistrophyllum acutiflorum** Becc. *(nkane*, seltener *eka)*, Taf. XIV, Fig. 2, die sich von **Oncocalamus mannii** durch große Stacheln auf der Oberseite der Hauptblattrippe, feinere auf der Mittelrippe und an den Seiten der Fiederblätter, durch endständigen Blütenstand und durch abweichend gefärbte Früchte unterscheidet[2]). Als

---

[1]) Genannte Schlingpalmen finden außer in der Flechterei Verwendung:
1. im Hausbau als grobe Bänder zum Zusammenbinden des Gerüstes, als feinere Bänder zum Zusammenbinden der Latten der Seitenwände, der Raphiablattstiele, aus denen die Schlafbänke bestehen, und — ganz feine — zum Zusammenbinden der Dachmatten;
2. im Brückenbau als Geländertaue;
3. als Umwicklung an abgenutzten oder schlechten Holzgriffen (Hauer und Messer) und Griffen von Fliegenklatschen und Besen;
4. als Band, z. B. um beschädigte Gewehrschäfte und Holzteller zusammenzuhalten, um die über den Resonanzboden der Harfe gespannte Rinde aufzubinden, usw.;
5. für Frauenhinterschurze aus Bast als Hauptstrang, an dem die Bastbüschel befestigt werden;
6. als Sehne zum Musikbogen *(elém)*;
7. als Vogelschlingen;
8. bei Herstellung der Rindenschachteln (siehe oben);
9. als Schmuckstreifen für Arm- und Halsbänder *(ekät)*;
10. als Formenstempel, um ein Muster auf Töpfen herzustellen.

[2]) Außer für Flechterei verwendet
1. zu Schmuckstreifen für Arm- und Halsbänder *(ekät)*;
2. zu Spazierstöcken;

Ersatz nimmt man für einige Korbsorten (große Tragkörbe der Frauen und Tragkörbchen für Männer) **Calamus deerratus** Mann et Wendl. *(edźi,ń)*[1]).

Hergestellt werden nun folgende Arten von Körben mit verschiedenartigem Geflecht:

1. Deckelkorb der Jaunde *(afǫn)*, hauptsächlich von Frauen hergestellt. Geflechtstrang aus Palmenband, Geflechtstreifen aus Pandanusblattstreifen, schachbrettartig (1 über, 1 unter) geflochten.

2. Große Tragkörbe zur dauernden Benutzung *(nlʼö,ḡ I, nkbʼ I* F.), in denen die Frauen nimmt sie auf Reisen mit, um Lebensmittel darin zu verpacken. Im Hause werden Raphiaschurze und andere Gegenstände darin aufbewahrt, in der Pflanzung verwendet man sie, um Erdnüsse und anderes hineinzutun.

Abb. 167. Messerscheide.

5. Tragkörbchen der Männer *(ebḡʼda)* (Abb. 169). Bei ihnen ist der Geflechtstrang entweder aus **Calamus** Holz und Feldfrüchte heimtragen. Geflechtstrang aus **Ancistrophyllum** *(nkāne)*, seltener aus **Calamus deerratus**, Geflechtstreifen aus **Oncocalamus** *(nlöń)*.

3. Kleine Tragkörbe *(okökö,ḡ* = kleiner Tragkorb und *engāʼne)* (Abb. 168) aus demselben Material wie vorige, nur kleiner, oft mit einem feiner geflochtenen Rand, dessen aktiver Teil neben Bändern auch aus Schnüren bestehen kann; meist ist außerdem der Hauptgeflechtstrang in der Mitte, ein kleines Stück weit, durch einen geschwärzten ersetzt, der *ekáńa nśāt* heißt (*b*). Diese Körbe gelten als besonders fein; die Frau

Abb. 168. Kleine Tragkörbe.

oder aus **Ancistrophyllum.** In letzterem Falle fand ich sie außen verstärkt durch schräg eingeflochtene Stäbchen aus demselben Material.

6. Rasselkörbe *(ngōt)*.

---

3. zur Zuckerpresse;
4. als Spanntaue für Trommelfelle;
5. als Band, Ersatz für Buschtau;
6. Kassave-Reibstöcke.

Die verwandte **Ancistrophyllum opacum** M. et W. *(egbwḡʼs)* liefert Trommelfellspanntaue, Netzreifen und Schlingen.

[1]) Außerdem noch benutzt für Flöten *(ndźi,ń I)* und Kassave-Reibstöcke *(akö-edźʼ,ń)*.

Sie kommen in zwei Formen vor: die erste, größere, besteht aus demselben Material wie die Tragkörbe, die zweite, kleinere, hat in der Wand dieselben Verstärkungsstäbe wie die vorigen, als Boden ein Stück Kalebassenschale (über Gebrauch siehe Abschn. XX, dort auch Abbildung).

Abb. 169. Tragkörbchen der Männer mit Fell- und Perlkettenschmuck.

VI. Korbnäpfe der Mwele *(ekätä)*.

Bei ihnen (Abb. 170) gibt es ebenfalls aktive Geflechtstreifen und einen passiven, spiralig gewundenen Geflechtstrang wie bei den echten Körben der zweiten Reihe, aber im Gegensatz zu ihnen fängt die Spirale in der Mitte des Bodens an, bildet also Boden und Wand und wird durch rechtwinklig eingeflochtene Geflechtstreifen zusammengehalten. Diese Näpfe, die vielleicht infolge nördlichen Einflusses (Haussa?) entstanden sind, dienen den Mwele zum Aufbewahren von Maismehl und als Teller für feinere Speisen.

VII. Korbteller *(dźäd* Mz. *biäd)*.

Hier treten (Abb. 171) an die Stelle eines spiralig verlaufenden Geflechtstranges zahlreiche Geflechtstränge aus Streifen des **Ancistrophyllum acutiflorum** Becc. *(nkäne)* oder der Marantacee **Trachyphrynium violaceum** Radlk. *(nkömonkömo* F.*)*, welche die viereckige Bodenfläche und das Grundmaterial des Randes (oder, wenn man will: der Wand) bilden. Um den Rand zu dichten und zusammenzuhalten, wird ein Geflechtstreifen — Band aus den Stengeln des **Oncocalamus mannii** Wendl. *(nlüń)*, der Orchidacee **Myrsacidium productum** Kranzl. *(okö-o-jöb*[1]*), anźüma)*, der Apocynacee **Motandra** spec. *(okö-e-si,)*[1]) oder aus einem Raphiamarkstreifen *(nkö-eśüśü)* — eingeflochten. Die Lage der Geflechtselemente zueinander verhält sich also gerade umgekehrt wie bei den echten Körben der zweiten Reihe.

---

[1]) *okö* vom Stamme *kö* = Band, Tau, *o jöb* = oben, weil die Orchidee eine auf Bäumen wachsende Schmarotzerpflanze ist, *o si,* = unten, weil die Apocynacee in der Erde wächst.

Abb. 170. Korbnäpfe der Mwele.

Die Herstellung ist folgende: Man legt vier Streifen der Länge nach dicht nebeneinander auf die Erde und hält sie mit dem Fuße fest, in einiger Entfernung davon und parallel zu ihnen wieder vier Streifen und so zehnmal, im ganzen 40 Streifen. In diese werden ebenso zu vieren angeordnet 36 Streifen quer eingeflochten, so daß jeder dieser Querstreifen immer abwechselnd über und unter dreien der Längsstreifen verläuft, aber diese Längsstreifen bei jedem Quereinschlag andere sind, z. B.:

Querstreifen 1 liegt unter Längsstreifen 2—4, über 5—7 unter 8—10 usw.,
Querstreifen 2 liegt unter Längsstreifen 3—5, über 6—8, unter 9—11 usw.

Sind alle Streifen verflochten, so schiebt man sie stramm aneinander und hat nun eine feste viereckige Fläche, die durch ein oder zwei kreuzweis darüber geschnürte Bänder zusammengehalten wird, und von der seitlich die noch nicht durchflochtenen Enden der Streifen abstehen. Diese werden zu den Geflechtsträngen des Tellerrandes, indem sie mehr oder weniger — je nachdem der Teller tiefer oder flacher werden soll — aufgebogen und spiralig von einem Geflechtstreifen durchflochten werden, der immer 1—3 von jenen überspringt,

Abb. 171. Korbteller.

wobei durch Abwechseln gewisse Musterungen entstehen können, und fest angezogen wird. An den Ecken entstehende Lücken werden durch Einsetzen selbständiger, kurzer, doppelt gebogener Geflechtstränge ausgefüllt. Der Rand wird oben abgeschlossen durch einen Reif aus **Aneistrophyllum** *(nkąne)*, an dem die Geflechtstränge von außen hakenartig herumgelegt und mit Triumfetta-Bast oder einer Schnur festgebunden werden.

Die Korbteller führen je nach der Größe verschiedene Namen, die kleinen heißen *fá III* F. *(a, b)*, die etwas größeren *orọ̄k*, die gewöhnlichen großen *dźā,d*, *niā dźā,d* = richtige, eigentliche Korbteller *(c)*.

Über ihre Verwendung siehe S. 150.

VIII. Gürtel *(bab IV)*.

Bei ihnen besteht das Geflecht aus einer Anzahl übereinandergelegter Streifen aus **Aneistrophyllum** *(nkąne)*, die mit Buschtau, **Oncocalamus**, durchflochten werden (vgl. Tracht und Schmuck S. 67).

3. Holzarbeiten.

Die Holzschnitzerei ist bei aller Wichtigkeit, die sie im Haushalt der Pangwe besitzt, auf einer verhältnismäßig niedrigen Stufe stehengeblieben und kann keinen Vergleich mit den Leistungen anderer Naturvölker, z. B. der Melanesier, aushalten. Ihre Formen zeigen eine gewisse nüchterne Zweckdienlichkeit, eine Starrheit und Gleichförmigkeit, der alles Bewegte und Spielerische fremd ist. Zur figürlichen Plastik erhebt sie sich nur selten. Darstellungen ganzer Menschen finden sich hauptsächlich in den Ahnenfiguren, selten an Häuptlingsstöcken, Köpfe außerdem nur an Versammlungshauspfählen (nur in einem Falle gesehen), an Ruhebankpfosten im Versammlungshause, am Gedächtnisspiel und in der Maske zum Mondkult (Sso).

Die Zahl der aus Holz gefertigten Gegenstände ist sehr groß, wie aus folgender Liste hervorgeht:

1. Grabstöcke.
2. Schaufeln.
3. Hacken- und Axtstiele.
4. Pfähle fürs Versammlungshaus.
5. Ruhebankpfosten fürs Versammlungshaus.
6. Haustüren.
7. Einbäume.
8. Ruderblatt.
9. Mulden.
10. Stampfer.
11. Reibbrett für Irvingiakerne.
12. Rührlöffel.
13. Eßlöffel.
14. Holzteller.
15. Töpfe für Öl.
16. Fläschchen für Pulver.
17. Schalen für Rotholz.
18. Häuptlingsstöcke.
19. Spazierstöcke.
20. Gewehrständer.
21. Rindenklopfer.

22. Pfeifen.
23. Hauerscheiden (veraltet).
24. Blasebälge.
25. Hundeglocken.
26. Schemel.
27. Armbrüste.
28. Speerstiele.
29. Schilde.
30. Sprechtrommeln.
31. Felltrommeln.
32. Harfen.
33. Holzmirlitons.
34. Holzflöten.
35. Xylophontasten.
36. Schwirrhölzer.
37. Jaundespielmarken.
38. Holzpenisse.
39. Stelzen.
40. Gedächtnisspiele.
41. Armringe.
42. Ahnenfiguren.
43. Masken für den Mondkult.

Die Herstellungsweise für alle diese Gegenstände im einzelnen zu besprechen, ist innerhalb des gegebenen Rahmens nicht möglich. Ich greife als Beispiele die Hauerscheiden, Schemel, Rühr- und Eßlöffel heraus.

Die jetzt abgekommenen Hauerscheiden — so nennt sie der Eingeborene, im Grunde decken sie den Hauer nicht, sondern sie sind nur ein Lager, in dem er getragen wird — haben die Form eines Rechtecks mit konkaven Längsseiten und werden folgendermaßen hergestellt: Man schlägt aus Schirmbaumholz ein längeres, ungefähr 1 cm dickes Brett, das in zwei gleiche Rechtecke zerlegt wird. Dann werden mit einem glühend gemachten Hauer die Schmalseiten glatt geschnitten, die Längsseiten eingebuchtet und ebenfalls geglättet. Die Brettchen werden auf der einen Fläche rechteckig ausgehöhlt, an den Ecken mit einem glühenden Gewehrladestock durchbohrt, mit den beiden ausgehöhlten Flächen aufeinandergelegt und mit Buschtau zusammengebunden. Die Außenfläche wird oft noch mit einfachen, eingebrannten Mustern verziert. Zuletzt wird die Scheide mit einem Trageband aus Tierfell versehen.

Der Schemel ist ein wertvolles Stück im Hausrat, ein Luxusgegenstand, für den etwas ausgegeben wird. Deshalb ist auch seine Herstellung ein wichtiger Zweig der Holzschnitzerei, und die Verfertiger gut gearbeiteter, künstlerisch verzierter Schemel sind berühmte und gesuchte Leute, die, wenn sie wollten, ebensowohl erhebliches Geld mit ihrer Kunst machen, wie diese selbst höherbringen könnten. Bei ihrer angeborenen Faulheit gehört aber immer ein besonderer Anlaß dazu, bis sie sich zu einer neuen Arbeit bequemen. Jemand ist z. B. als Gast im Hause eines solchen Künstlers, sieht dort einen schöngeschnitzten Schemel und sagt: „Oh, welch' ein schöner Schemel, so einen könntest du mir auch machen." Vielleicht haben andere denselben Wunsch geäußert, und so rafft sich denn endlich mal der Künstler auf, geht in den Busch und fällt einen Stamm der Apocynacee **Alstonia congensis** Engl. *(ekak)*, des einzigen Baumes, der sich für Schemelherstellung eignet; es muß ein Stamm gewählt werden, der — nach Abzug der Rinde — denselben Durchmesser hat wie der zukünftige Schemel

(Abb. 172). Den Stamm nimmt er mit ins Dorf und zerteilt ihn hier quer in etwa 5—7 Scheiben, die so dick sind, wie der Schemel hoch werden soll. Dann zieht er mit dem Hauer, etwa in der Mitte, ringsherum eine Linie, die den unteren Rand der Sitzfläche angibt, und haut von hier aus nach unten drei radial verlaufende Furchen, vertieft sie mit dem Deissel *(ngbwák IV)*, Abb. 173, und bildet so drei Füße. Dann wird die Sitzfläche geglättet und über Feuer gehalten, bis sie schön braun wird, und der Rand mit den rauhen Blättern des **Ficus exasperata** Vahl (*ekōkū* F., *akō* Nt.)[1]) sauber abgerieben. Rand und Füße werden mit Rotholz gefärbt und eine Stunde lang an der Sonne getrocknet, endlich mit eingeschnittenen Mustern verziert, eine künstlerische Zutat, die nicht überall gleich gut ausfällt.

Abb. 172.
Zur Herstellung des Schemels.

Gewöhnlich stellt ein Schemelmacher 2—3 Stücke an einem Tage fertig; der Preis ist so niedrig (je 2 Speer = 14 ₰), daß man nicht begreift, wie überhaupt der Mann dafür arbeiten kann. Der Grund liegt, wie in den in einem späteren Abschnitt mitgeteilten Erziehungsgrundsätzen offen ausgesprochen wird, in einer Art Gegenseitigkeitsprinzip, d. h. der Verkäufer rechnet damit, daß er seinen Käufer, der selbst wieder Spezialist für irgendeinen anderen Artikel (Korbteller z. B.) ist, später nötig hat und dann erwartet, ebenso glimpflich behandelt zu werden. Jeder ist infolge der übertriebenen Arbeitsteilung auf den anderen angewiesen, und diese Abhängigkeit hält die Preise niedrig. Wo sie fehlt, gehen die Preise in die Höhe, Europäer z. B., mit denen ein derartiges stillschweigendes Übereinkommen nicht besteht, zahlen ganz bedeutend mehr, das Zehn- oder Zwanzigfache, und müssen sich dabei noch schlechtere Arbeit gefallen lassen.

Im Grunde sieht man im Verkauf der als Hauswerk hergestellten Sachen auch gar keinen Erwerb, denn als ich einen befreundeten Schemelmacher fragte, was nun bei seinem Geschäft herauskäme, mußte er erst lange nachdenken und sagte schließlich, er mache monatlich etwa 10 Schemel zu 2 Speeren = 14 ₰, und verdiene also 20 Speere = 1,40 ℳ; davon habe er sich Messingschmuck gekauft und das übrige als Heiratsgeld beiseite gelegt, aber das sei ihm ganz gleich, seine Kunst sei Ehrensache.

Abb. 173. Deissel.

[1]) Stamm *kū* = reiben, vgl. *a-kū-k* = Mahlstein.

Die Herstellung der Rührlöffel *(mbŏb)* ist, ihrer Form entsprechend, ziemlich einfach. Man schlägt aus einem Baumstamm[1]) ein flaches Scheit heraus und haut es mit dem Buschmesser roh zurecht. Dann wird der Löffel ausgehöhlt, indem mit einem Meißel *(ojen)*, Abb. 174, und einem einfachen schweren Holzstück als Hammer zwischen Mulde und Stiel eine Querrinne eingestemmt und das Holz durch gegen sie gerichtete Schläge stückweise abgenommen wird. Die feinere Bearbeitung geschieht durch Schaben mit Meißel oder Messer. Der fertige Löffel pflegt mit Rotholz eingerieben zu werden. Warum, wissen die Leute selbst nicht. Mein Freund Nto-Ndanga gab als Antwort folgende Bemerkung zum besten: „Sieh mal, ich bin selbst ein Schwarzer, aber Schwarze haben keinen Verstand. Ich habe mich selbst schon lange gefragt, warum die Rührlöffel mit Rotholz eingerieben werden, dadurch kommt doch Schmutz (d. h. das Rotholz) ins Essen!" Die verschiedenen Formen der Rührlöffel sind in Abb. 98 dargestellt.

Etwas mehr Mühe erfordert die Herstellung der Schöpflöffel *(tŏk)* (Abb. 175). Sie werden hauptsächlich aus dem Holz des **Carpodinus tessmannii** Gilg *(ebärm)*, seltener aus der **Kiekxia elastica** Preuss *(emṛila)* gefertigt. Aus dem Baumstamm wird ein Klotz von der Form eines längshalbierten Zylinders herausgeschlagen und durch vorsichtiges, schichtenweises Abtragen des Holzes (siehe Abb. 176) zuerst mit dem Hauer *(a)*, dann mit dem Deissel *(b)* zu der Form des Löffels zurechtgeschnitten, darauf wird die Mulde mit dem Löffelschaber *(fŏnege-tŏk)* (Abb. 177) weiter vertieft, zuletzt samt dem Stiel mit den rauhen Blättern von **Ficus exasperata** glattgerieben.

Die Pulverfläschchen *(ndŏk e pfidi)* werden in sehr mühsamer Arbeit aus dem Holz des **Alstonia congensis** *(ekŭk)* und der **Kiekxia elastica** hergestellt (Abb. 178), indem man zuerst eine massive Flasche formt und ringsherum schön glättet, sie dann durch einen Längsschnitt in zwei Hälften spaltet, jede einzelne Hälfte innen mit dem Deissel aushöhlt und den Hals in der gewünschten Länge abhaut. Zuletzt werden die beiden Hälften wieder aufeinandergepaßt und durch eine darübergenähte Tierhaut, meist vom Nilvaran, in ihrer Lage zusammengehalten.

Recht schwierig herzustellen sind auch die Teller aus dem Holz der **Alstonia congensis** oder **Ceiba pentandra**, weil sie schon während der Arbeit am Rande leicht spalten. Man macht sie in solchem Falle trotzdem fertig und flickt sie dann mit Buschtau.

Hundeglocken werden aus **Alstonia congensis**, aus der **Alchornea caloneura** und aus **Pterocarpus soyauxii** Taub (*mṛĕ IV* Nt.), Blasebälge aus **Alstonia congensis** und **Musanga smithii** R. Br. *(asŏn)* hergestellt, Einbäume aus **Musanga**, aus **Ceiba pentandra** *(dum)* und aus der Combretacee

[1]) Folgender drei Pflanzen: **Alchornea caloneura** Pax *(ndămabā, III)*, **Hasskarlia didymostemon** Baill. *(efŭŏle* Nt., *dẓ̄ III, nyŭle III)* oder **Kiekxia elastica** Preuss *(emṛila)*.

Abb. 174. *a* Meissel. *b* Säge und *c* Pfriemen.

Terminalia superba Engl. et Diels *(akǫ̃m)*, Sprechtrommeln aus **Cordia odorata** Gürke *(ebǫ̃ĩ)* und **Rinorea dentata**, Felltrommeln aus **Alstonia, Cordia, Rinorea** und **Musanga.**

Speerstiele werden aus den leicht spaltbaren Stämmen einer Anonacee (?) *(otunga)* und einer Flacourtiacee *(osǫ̃,bẽ,ỹ)*[1]) hergestellt. Man spaltet das

Abb. 175. Herstellung des Schöpflöffels.

Holz in ebenso viele Teile, wie man Speerstiele machen will, nimmt zuerst die durch das Spalten geschaffenen Kanten mit dem Hauer grob herunter und bearbeitet dann jeden einzelnen Teil mit dem Zugmesser solange, bis ein runder Stock von der Dicke des Speerstieles übrig bleibt. Das Zugmesser *(awǫ̃ṅ)*, Abb. 179 und 180, besteht aus einem winkelig gebogenen Stück Holz (Astgabel), dessen Schenkel in der Mitte zu einem kurzen Schlitz ausgeschnitten sind. Hier hinein steckt man entweder ein gewöhnliches Messer (vgl. Abb. 179) oder — und das ist meist der Fall — eine besondere Klinge mit zwei Schneiden, von denen die eine messerartig, die andere sägeartig ist (Abb. 180). Diese sehr praktische Zusammensetzung erlaubt

Abb. 176. Zur Herstellung eines Schöpflöffels. Längsdurchschnitt.

[1]) *sõ*-spalten, *bẽ,ỹ*-Fingernägel; Baum, der mit den Nägeln gespalten werden kann.

es, mit demselben Werkzeug die Längsrillen in den Speerschaft zu graben: es wird einfach die Klinge herausgenommen und umgekehrt, d. h. mit der ausgezähnten Schneide nach unten, wieder eingesetzt.

4. Metallarbeiten.

a) Eisengewinnung.

Die Gewinnung des Eisens, sicher eine der bewundernswertesten Errungenschaften der Neger, wird im Pangwegebiete nur noch südlich des Kampo von den Fang und einigen wenigen Ntumsippschaften betrieben, während Spuren alter Schmelzen beweisen, daß sie in früherer Zeit weiter nach Norden verbreitet

Abb 178. Herstellung der Pulverflasche aus Holz.

war. Heute kaufen die Bulu das Eisen von den Ntum im Süden, die Jaunde und Bene von den Etun. Die Hauptplätze der Eisengewinnung liegen im Woddo- und Kjegebiete sowie am oberen Uelle, doch sind sie im Verhältnis zu den Fundstellen des Eisensteines selten. Die Leute verstehen sich zwar meistens auf die Technik, aber nur wenige geben sich wirklich mit ihr ab. Der Grund mag zum Teil in der Mühseligkeit des Betriebs liegen, in der Hauptsache aber muß er in den abergläubischen Anschauungen gesucht werden, die sich an die Eisenbereitung knüpfen, und die eine Mitwirkung des Medizinmannes, den Ankauf kostspieliger Medizinen und strenge Befolgung von Enthaltsamkeitsgeboten erheischen. Das Eisen hat durch die seltene und schwierige Kunst, es aus dem Gestein herzustellen und dann in die Form von Werkzeugen und Waffen zu schmieden, eine besondere Bedeutung gewonnen, vielleicht auch, weil es zu beidem des Feuers bedarf, des heiligen Elementes, das

Abb. 179. Zugmesser für Speerstiele.

die Pangwe im Ngikult verehren. Die Verhüttung des Eisensteins erfolgt daher unter Leitung und Aufsicht des Medizinmannes, er allein kann, genau wie bei den Kulten, mittels seiner Medizin den ihm zustehenden Einfluß auf den Vorgang anderen übertragen oder, besser gesagt, diese anderen können sich erst durch Ankauf einer Medizin die Fähigkeit, das Eisen zu schmelzen, vom Medizinmann erwerben. Diese Schmelzmedizin *(bíáń akúǵ, abǭb-akúǵ)*[1]) kostet fünf Schafe, fünf Hühner und fünf Stück Messingdraht, was zusammen ungefähr einem Werte von 120 Mark in unserem Gelde entspricht; sie wird in einem kleinen, mit den weichen Blättern der **Triumfetta** *(okǫń)* ausgelegten Töpfchen aus Holz oder Ton oder einem Körbchen aufbewahrt und besteht aus einem Blattbündel mit Gehirnmasse von einem Vorfahren, einigen darumgelegten Ahnenschädelstückchen, Stückchen abgeschabter Rinde der Leguminose **Macrolobium straussianum** Harms *(abǒm, bǒme IV)* oder des Farns **Marattia fraxinea** Sm. *(ezɪzǒń)* und Gift *(nśǭ)*. Die Schädel und das Gehirn als Sitz des Wissens sollen darauf passen, daß der Schmelzprozeß gelingt, das **Macrolobium** soll bewirken, daß die Luppe so voll und fest in der Schmelzgrube liegt (*ekiai a bǒme o si*, = das Eisen ist fest [wie eingestampft] unten drin), wie dieser Baum ohne Brettwurzeln dasteht (daher der Name *abǒm* von *a bǒm* = fest einstampfen, einrammen und fest eingestampft sein); der Farn soll machen, daß das Eisen so schön zusammengeballt ist, wie die jungen Farnblätter.

Abb. 180. Zugmesser (zugleich Reiber) für Speerstiele.

Mit dieser Medizin kann man nun leider noch kein Eisen machen, man muß selbst wohl oder übel wirkliche Arbeit leisten und braucht dazu Arbeitsleute. Diese sind an und für sich nicht so schwer zu bekommen, da sie am Gewinn beteiligt werden, aber die erwähnten Enthaltsamkeitsgebote, namentlich geschlechtlicher Art, die letzten zwei Monate vor und die Zeit während der Arbeit — im Übertretungsfalle würde das Eisen mißraten — halten viele zurück. Diese hochpeinliche Vorschrift im Verein mit der teueren Medizin steht einer größeren Verbreitung des Schmelzbetriebes recht im Wege, und man zieht es selbst an Plätzen, wo bereits eine Eisenschmelzhütte besteht, vor, das Eisen von anderen zu kaufen, wenn das eigene mehrfach mißraten ist, denn man führt dies Mißgeschick auf Versagen des Feuers infolge der geschlechtlichen

[1]) *bíáń* = Medizin, *akúǵ* = Eisenschmelze, *abǭb* = Spinne, die eine Rolle in den Erwerbsmedizinen spielt und meist — nicht immer — in der Schmelzmedizin vorhanden ist.

Unreinheit eines oder einiger der Beteiligten zurück. In neuerer Zeit gibt die Einfuhr europäischen Eisens der einheimischen Industrie den Todesstoß. Die Furcht, etwas Unreines, als welches in erster Linie alles Geschlechtliche gilt, in Berührung mit dem reinen Feuer zu bringen, geht soweit, daß diejenigen Mitwirkenden, deren Frauen während der Schmelzarbeit menstruieren, eine Medizin machen. Diese besteht in einer Rautenfigur, die an den Stützbalken der Schmelzhütte auf der dem Ofen zugewandten Seite aus der Rinde herausgeschnitten ist und das weibliche Geschlechtsorgan vorstellen soll; das Zeichen wird mit Rotholz, das von dem betreffenden Weibe zerrieben ist und ihren Blutfluß darstellt, eingerieben und mit einem Blatte von **Myrianthus arboreus** P. B. (*mangame III F.*) bedeckt, um anzuzeigen, daß man alles Unreine verborgen und dadurch unschädlich gemacht wissen will; zugleich soll die Pflanze bewirken, daß das Eisen so gut zusammenwächst, wie die einzelnen Früchte zu einer Sammelfrucht vereinigt sind. Auf Tafel XV sieht man ein Stück des Blattes am vorderen Stützpfahl links oben, außerdem (etwas tiefer)-eine Rindenschachtel, die Ahnenschädelstücke enthält, einige Antilopenhörner und etliche andere Medizinen, die später gebraucht werden. Daß man die Leute, welche sich mit dem Ahnenkult abgeben, für besonders geeignet hält, dem Werke einen glücklichen Ausgang zu geben, geht auch daraus hervor, daß nur sie allein berechtigt sind, das Feuer zu schüren (vgl. Abb. 183).

Die Verhüttung des Eisens steht also vor allem im Zeichen des Feuerkults, sie ist aber auch eng mit der Verehrung der Ahnen verbunden, die für das gute Gelingen, soweit es in ihren Kräften steht, eintreten.

Das Eisen liegt in Form von Brauneisenstein *(sfi IV)*[1]) zu Tage und wird einfach gesammelt und weggetragen. Die Eisenerzgruben (*ebê-asfi* von *asfi* = eisenhaltiges Gestein) haben für die Pangwe an sich keine besondere Bedeutung, sind allgemeines oder vielmehr herrenloses Gut, das von jedermann in Anspruch genommen werden könnte. Dagegen findet die Erzverhüttung in besonderen Schmelzhütten statt, die meist im gemeinsamen Besitze mehrerer Dorfbewohner sind; sie allein können das Eisen herstellen, und zwar aus dem Eisenstein, den sie sich selbst aus den Gruben geholt haben. Die anderen Leute im Dorfe dürfen die Schmelzhütte nicht benutzen und müssen das Eisen von ihnen kaufen. Wegen der Schwierigkeiten des Betriebes finden die Schmelzungen nur in

---

[1]) Die auf Veranlassung von Herrn Professor Dr. Pufahl (Kgl. Bergakademie in Berlin) von Herrn du Bois ausgeführte Untersuchung ergab, daß das Erz „außer den üblichen Bestandteilen wie Kieselsäure, Eisenoxyd, Tonerde, Wasser und geringen Mengen von Mangan, einen nicht unbeträchtlichen Titangehalt, etwas Schwefel, Spuren von Phosphorsäure, geringen Kalkgehalt und auch geringen Magnesiagehalt aufweist."

EISENSCHMELZE IN BEBAI (FAM. SCHUMU), SPAN. GUINEA.

1: Tessmann

FH9 Fang

[facing p226]

weit auseinanderliegenden Zeiträumen statt, in jedem wird rasch hintereinander der Ofen so oft beschickt, als Hüttenbesitzer vorhanden sind. Jeder Besitzer hat also das Anrecht auf das bei einer Ofenbeschickung gewonnene Eisen.

Die Schmelzhütte *(ndä-akúạ, ndäi,-akúạ)*, Abb. 181 u. 182, ist ein einfaches, 3—4 m hohes Schutzdach, dessen First von zwei Stützbalken getragen wird. In ihrer Mitte ist eine Grube (Abb. 182, Fig. 5 c) von 78 cm Tiefe und 1,86 m Durchmesser in den Boden gegraben und darüber der Ofen aufgebaut. Von der Sohle der Grube geht noch ein ca. 60 cm tiefer Schacht (Fig. 5 b) nach unten, auf dessen Grund der erwähnte Topf mit der Schmelzmedizin gestellt ist (Fig. 5 a). Über die Medizin werden verfaulte Plantenblattscheiden gedeckt, damit die Schädel hübsch kühl bleiben, und dann wird der ganze Schacht mit Blättern ausgefüllt.

Wird eine neue Schmelzung beabsichtigt, so müssen sich, wie erwähnt, alle Beteiligten, d. h. der Medizinmann, der oder die Hüttenbesitzer und die gemieteten Arbeiter, zwei Monate lang des Geschlechtsverkehrs enthalten. Man schleppt während dieser Zeit das Erz in Körben herbei, häuft es in der Schmelzhütte auf und besorgt sich Holzkohle *(miẽ, mẽi)*. Sie muß besonders „stark" sein und wird deshalb nur aus folgenden fünf Bäumen gewonnen: 1. **Pentaclethra macrophylla** Benth., Leguminosae *(ebạ̃ị)*, 2. **Erythrophloeum guineense** Don., Legum. *(eṭũn)*, 3. **Cylicodiscus gabunensis** Harms, Legum. *(edạm)*, 4. **Eurypetalum tessmannii** Harms, Legum. *(andzịtsịń)*, 5. **Irvingia grandifolia** Engl., Simarubaceae *(ngũn IV)*. Das Holz wird in kleinen Stößen beim Dorf aufgeschichtet, dann angezündet und, wenn verkohlt, noch glühend mit Wasser gelöscht, das in den Mund genommen und geschickt wie eine Brause ausgespritzt wird.

In Bebai, Fam. Schumu (Woddogebiet), wo ich die Verhüttung gesehen habe, stand neben der Schmelzhütte noch eine kleinere (Abb. 182 Fig. 2), die nichts enthielt als eine Schlafbank *(p)*, einen Schürhaken *(q)* und einige Ersatzdüsen *(r)* für den Ofen; in ihr hielt sich der betreffende Hüttenbesitzer, für den am nächsten Tage geschmolzen werden sollte, die letzte Nacht auf, um nicht noch zu guter Letzt in Versuchung zu geraten, das erwähnte Gebot zu übertreten. Diese Vorsichtsmaßregel zeigt, wie standhaft sich der Pangwe gegen die vielen Gebote in Wirklichkeit verhält.

Am Morgen erscheinen die Arbeiter mit ihrem Handwerkszeug, den Düsen *(ńõń IV)* und Blasebälgen.

Der Blasebalg *(nkũm I)* hat die bekannte Kameruner Form — Gefäßblasebalg ohne Ventil —, aber, im Gegensatz zu ihr, keine Holzstäbe als Handgriffe. Er ist aus weichem Holz (vgl. S. 222) hergestellt, von den beiden schalenförmigen Verbreiterungen (P.: *alõ,-nkũm* = Blasebalgohren) führen getrennte

Abb. 181. Schmelzhütte in Bébai (Fam. Schumu, Span. Guinea).

Gänge in die Spitze (P.: *ndźŭ,r-nkŭ,m* = Blasebalgnase). Die Schalen sind mit Tierfell, das mit der Haarseite nach Innen gelegt ist, oder — nur in Jaunde — mit Blattscheiden von der Banane, die zu einem Schopf aufgebunden sind, bedeckt. Da die Felle direkt mit den Händen, nicht durch Stäbe bewegt werden, so kann man nur weiche Felle gebrauchen und nimmt deshalb die der Meerkatzen, des Potto, der Zibethkatze und des Zwergböckchens **Neotragus batesi** Winton.

Die Grube in der Schmelzhütte wird nun mit Blättern des Schirmbaumes bis an den Rand fest vollgestopft, damit nach Beendigung des Schmelzprozesses die Grube leicht wieder von Holzkohlenresten gereinigt werden kann und die unten liegende Medizin nicht beschmutzt wird, dann werden im Kreise um die Grube herum mannshohe Planten- oder Bananenstämme *(d)* dicht nebeneinander aufgestellt, durch Querstifte aus Raphiablattstielrinde untereinander verbunden und mit Tauen und Pflöcken an dicke, außerhalb eingerammte Stöcke befestigt. Das Ganze wird mit Tauen aus der Cissusranke, *nla* genannt, oben und unten zusammengehalten und mit kleineren Plantenstämmchen (Fig. 4 *f*) oder Stücken von solchen sorgsam gedichtet. Durch Auskerben je zweier benachbarter Plantenstämme schneidet man dicht über dem Boden Löcher — in Bebai waren es 17 — für die Düsen ein. Die Löcher werden vorläufig durch einen der Düsendicke entsprechenden 1,25 m langen Führungsstock

(*ntɨ̂m e zɔ̂ɔ̂* eigentlich Düsenstock) (Fig. 4 *h*) ausgefüllt, den man unten durch ein Stück Plantenstamm (Fig. 4 *g*) stützt, oben durch ein Stück Plantenblattscheide, *ngɔ̂ɔ̂* = Schuh genannt (Fig. 4 *i*), abdeckt. Später braucht man dann bloß den Stock herauszunehmen und an seiner Stelle die Düse hineinzuschieben. Ist der Ofen soweit hergerichtet, so wird er beschickt. Ein Mann steigt von oben hinein, läßt sich Holzkohle reichen und schüttet davon eine Lage, doch so, daß die Mitte freibleibt, über die Grube, um den Raum zwischen Boden und Führungsstöcken auszufüllen, ordnet diese strahlenförmig, gegen die Mitte zu gerichtet, an (Fig. 1 *k*) und füllt weitere Holzkohle nach, wobei er gleichzeitig die Innenwand mit Blattscheiden der Plante bedeckt, damit das Feuer nicht gar zu schnell an die Stämme und durch die Ritzen nach außen dringt (Fig. 3). Die Blattscheiden liegen in zwei Schichten, in der äußeren senkrecht (*ngoo* = Gitterwand, Fig. 3 *l*), in der inneren wagerecht (*mvom* = Riesenschlange) (Fig. 3 *m*) angeordnet. Die Kohle wird bis zu einer Höhe von 60—70 cm aufgeschichtet, dann kommt Eisenerz darauf, das inzwischen von anderen Leuten zerkleinert und vier Stunden auf einem tüchtigen Feuer geröstet war [1]), und dessen größere Stücke nochmals zerschlagen werden, bevor sie in den Ofen wandern. Das Erz wird so aufgeschichtet, daß, wie Fig. 5 *n* zeigt, ein Trichter in der Mitte leer bleibt, und so, daß es die Planten nicht berührt, sondern von ihnen durch einen Zwischenraum getrennt bleibt, der mit Holzkohle ausgefüllt wird. Zuletzt wird das Eisenerz bis an den Rand des Ofens mit Kohle bedeckt [2]).

[1]) „Es ergab folgende Werte:

Feuchtigkeit (bei 100° C)	0,51	v. H.
Glühverlust	2,36	„ „
Kieselsäure	8,21	„ „
Titansäure	6,97	„ „
Eisenoxyd	67,98	„ „
Tonerde	11,82	„ „
Manganoxydoxydul	1,03	„ „
Kalk	Spuren	
Magnesia	0.17	„ „
Phosphorsäure	0,05	„ „
Schwefel	0,19	„ „
Alkalien	Rest.	

Auffallend ist hier der recht erhebliche Gehalt an Titansäure, wodurch der Schmelzprozeß unangenehm beeinflußt wird, da eine schwerschmelzige Schlacke entsteht." Nach du Bois.

[2]) O. Zenker beschreibt einen ganz anderen Schmelzofen aus Jaunde. „Die Schmelzhütten," sagt er, „in denen das Eisen auch gleich geschmiedet wird, fallen durch ihre hohen spitzen Dächer und Holzverschalung und an den vor ihnen liegenden Eisensteinen und Schlacken auf. In der Mitte dieser großen

Abb. 182. Grundriß einer Schmelzanlage in Bebai.
Fig. 1. Schmelzhütte nebst anliegender Düsenhütte (Fig. 2). Fig. 3. Querschnitt eines Teiles der Wandung des Ofens. Fig. 4. Ausschnitt aus der Wandung zur Einführung des Düsenstockes. Fig. 5. Längsschnitt durch den Schmelzofen.

Nun setzen die Blasebalgzieher *(nsüe-nkü,m)* ihre beiden mitgebrachten Geräte an, stecken in der bereits angedeuteten Weise die Düse an Stelle des Führungsstockes in den Ofen, so daß das trichterförmige Ende außen etwa 10—12 cm hervorragt, legen den Blasebalg (Fig. 1 *o*) so an, daß seine Mündung 2—3 cm von der Düse entfernt bleibt, und klemmen ihn zwischen zwei Paare in den Boden gesteckter Stöcke, *mrdk* genannt (vgl. Abb. 183). Diese einfache Vorrichtung hat den Anstoß zu folgendem Sprichwort gegeben:

bokui bo rode akad o mrdk =

Die Pygmäen, sie verzweifelten am Schmelzen wegen (der) Haltestöcke (die sie nicht anzubringen wußten),

das gebraucht wird, wenn irgendeine große Sache an einer Kleinigkeit scheitert.

Nun setzen sich alle auf Baumstämme rings um den Ofen, ein glühendes Kohlenstückchen wird durch eine der Düsen in ihn eingeführt, und das Blasebalgziehen beginnt (Abb. 184). Es geschieht so, daß man mit den Händen abwechselnd das eine und das andere Fell oder, wenn man mit Hochdruck arbeiten will, beide Felle zugleich auf und nieder zieht, eine anstrengende und eintönige Arbeit, die man sich nach Möglichkeit durch Gesang, den der Medizinmann (auf Tafel XV der Herr rechts mit verschränkten Armen) einleitet, mit Juchzen, Lachen, Plaudern und Geschichtenerzählen verkürzt, vor allem pflegen dabei die Eingeborenen im Takte zu zischen, was ihnen größere Stärke verleiht, wie sie sagen. Richtiges Pfeifen ist aber streng verboten, denn es ist nach Meinung der Eingeborenen etwas Böses (vgl. Vorsilben S. 28). An dem ganzen Lärm nimmt der Medizinmann hervorragenden Anteil, er läutet alle Augenblicke mit einer eisernen Schelle, bläst auf einem Antilopenhorn,

---

Hütten steht der Schmelzofen und vier große Holzsäulen. Der Schmelzofen ist viereckig und wird bei jeder Schmelze neu errichtet. Seine Außenwände bestehen aus Pisang-(das sind Planten. D. Verf.)stammstücken, er ist etwa 1 m hoch und umfaßt ungefähr 1½ qm Bodenfläche. Am Boden in der Mitte befindet sich eine mit Ton ausgeschmierte Höhlung, in der sich beim Schmelzen das flüssige Eisen sammelt. Der ganze Kasten ist mit Holzkohle, die Mitte jedoch mit einem Gemisch von Eisenstein und Holzkohle gefüllt. Vor der Füllung wird an jeder Seite eine trichterförmige Tonröhre hineingesteckt, welche dazu dienen, mittels eines Handblasebalges, von der auch in anderen Teilen des westlichen Afrika gebräuchlichen Form, Luft hineinzublasen. Die diese Arbeit verrichtenden, meist halberwachsenen Personen sitzen auf den schon erwähnten, etwa 2 m hohen Holzsäulen. Zum Schutze des Daches ist über dem Schmelzkasten ein starkes Holzgitter angebracht. Die Arbeit des Schmelzens nimmt einige Stunden in Anspruch. Das gewonnene, sehr weiche Eisen wird zerklopft und dann geschmiedet." Aus „Mitteilungen von Forschungsreisenden und Gelehrten aus den deutschen Schutzgebieten" von Fr. v. Danckelman. Jahrg. 1895, S. 63.

singt, schreit und tobt, kurz, gibt sich alle erdenkliche Mühe, die Leute anzufeuern, vielleicht will er damit auch irgendwelche böse Wesen abwehren. Dann und wann schlägt er mit einem Strauß der Violacee **Rinorea gracilipes** Engl. oder der Leguminose **Bandeiraea tenuiflora** Benth. (beide *orǒn̂ e ndźik*)[1]) zwischen die Blasebälge, um alle schädlichen Einflüsse durch die Macht der Ahnen auszuschalten. Erlahmt trotzdem der Eifer bei der Arbeit, so folgt verdoppelter Radau, und nach kurzer Zeit erholt sich die Mannschaft und stößt die Felle mit erneuter Kraft mit fast krampfhafter Schnelligkeit unter heftigem Zischen und taktmäßigem Wiegen des Oberkörpers auf und nieder. Am Abend, wenn die Leute müde werden, nimmt man, um sie durch ein regelrechtes Konzert anzufeuern, Fell- und Holztrommeln zu Hilfe und singt Lieder, bei denen der Medizinmann den Ton angibt. Am Ende der Arbeit, die z. B. in Bebai von 1 Uhr mittags bis ½10 Uhr abends gedauert hatte, tritt der Medizinmann an den Ofen und macht bei jedem Blasebalgzieher eine Bewegung, als ob er etwas oben in den Ofen und unten in den Trichter legt, hinter ihm geht sein Gehilfe, der ein mit einem Quasterstachlerschwanz versehenes geschlossenes Medizinhorn trägt. Welchen Sinn dies hatte, war nicht zu erfahren.

Am nächsten Tage reißt man den bis auf die Grube ausgebrannten Ofen ab und sammelt die zuoberst liegenden, nicht ausgebrannten Eisenschlacken *(eśǫm)* ein, die zerkleinert als Gewehrladung dienen[2]). Dann ruft der Medizinmann die Blasebalgzieher an die Grube und schlägt mit seinem Schmiedeeisen die der Luppe locker aufsitzenden Eisenstücke *(obǫ'-ekiǫi)*[3]) los. Die größeren Stücke nimmt er sich selbst, die kleineren verteilt er an die Leute, so daß jeder ein kleines Pulverfaß voll bekommt und damit für seine Arbeit abgefunden ist. Der Medizinmann behält dagegen fast doppelt soviel für sich. Auf dem Boden der Grube findet sich die Luppe, ein großer, fester, runder bis länglicher Eisenklumpen *(mpfạn-ekiǫi I)*[4]); sie gehört demjenigen Hüttenbesitzer, für den die

---

[1]) Wegen der Ähnlichkeit der Blätter mit denen der **Copaifera tessmannii** Harms *(orǒn̂)*, des Baumes, in dem die Seelen im Zwischenreich wohnen, *orǒn̂ e ndźik* (*ndźik* = Liane) genannt. In Ermangelung der **Copaifera** gebraucht.

[2]) Es ist nach du Bois „eine schlecht geflossene, stark eisen- und titanhaltige, poröse Schlacke, die noch Holzkohlenstücke einschließt".

[3]) *bǫ* = teilen, *e-bǫ'-s* = Schuppe, *ekiǫi* = Eisen.

[4]) Vom Stamme *pfa* Nt. (*fa* F.) = einengen und eingeengt sein, hier zusammengezogen, zusammengeballt sein. Vgl. *pfa-n* = Engpaß; *a pfa-n* = einengen; *pfa-k(akl.)* = eingeengter Weg oder Platz, im besonderen zwischen Haus und Plantenpflanzung im Dorf; *a pfa-n̂* = umwickeln, umschnüren. Die Luppe ist nach du Bois „als ein schmiedbares, stark mit Holzkohlenstücken durchsetztes Schweißeisen mit niedrigem Kohlenstoffgehalt anzusprechen, das erst durch Schmieden in brauchbares Material umgewandelt werden kann".

Schmelzung stattgefunden hatte, mit Ausnahme eines etwa kopfgroßen Stückes, das er an den Medizinmann abzugeben hat. Die Luppe wird an Ort und Stelle von den Leuten in kleine Stücke geschlagen (Abb. 185), wobei sie das Recht haben, sich die dabei abfallenden Splitter mitzunehmen; der Besitzer selbst kümmert sich nicht weiter darum. Jene Stücke *(epfụs-ekiẹi)*[1]) sind das Endergebnis der Eisenschmelzerei und bilden dort einen richtigen Handelsartikel, wo der europäische Tauschhandel noch nicht allzu stark entwickelt ist.

Abb. 188. Blasebalgzieher und Gehilfe des Medizinmannes, der das Feuer schürt. Eisenschmelzerei in Bétai (Fam. Schumu), Span. Guinea.

Noch einige Ziffern über die Unkosten und den Reingewinn. Ich nehme dabei — wie in Bebai — eine Schmelzperiode von fünf Schmelzungen bei fünf Besitzern der Schmelzhütte an. Die Arbeiter können die Blasebälge für 10 Speere (= 70 ₰) von dem Blasebalgmacher kaufen oder sie umsonst geliefert bekommen, falls sie dem Mann den nötigen Holzblock vor die Tür bringen. Das Fell müssen sie sich, soviel ich weiß, in jedem Falle selbst besorgen. Die Tondüse kostet ebenfalls 10 Speere (= 70 ₰), so daß jeder Blasebalgzieher Auslagen von 20 Speeren (= 1,40 ℳ) hat. Der bzw. die Besitzer der Schmelzhütte haben für die Medizin eine einmalige Auslage von ca. 120 ℳ, abgesehen von der Arbeit des Hüttenbaues und des Herbeischaffens des Erzes. Aus dem ihm als Lohn überlassenen Eisen gewinnt jeder Blasebalgzieher bei einer Schmelzung nur 15—20 Speere (= 1,05—1,40 ℳ), bei fünfmaligem Schmelzen ergibt sich also für ihn der Gewinn von 5—7 ℳ, wovon die einmalige Ausgabe

[1]) *pfü-i* = abschlagen (stückweise).

Abb. 184. Schmelzofen in Bétsi (Fam. Schumu), Span. Guinea.

von 1,40 ℳ abzurechnen wäre. Besser steht sich der Medizinmann, denn er kann aus seinem Anteil von lockerem Eisen 30 Speere (= 2,10 ℳ), an Kerneisen 50 Speere (= 3,50 ℳ), zusammen also 5,60 ℳ gewinnen, im ganzen nach den fünf Schmelzungen also 28 ℳ verdient haben. Was den Besitzer anbelangt, so stellt sich für ihn die Luppe auf 500 Speere (= 35 ℳ). Insgesamt beliefe sich der Ertrag einer Schmelzperiode auf:

(17 × 17 Sp. + 80 Sp. + 500 Sp.) × 5

17 Arbeiter zu 17 Sp. + Medizinmann + Besitzer in 5 Schmelzungen, oder (nach deutscher Währung, die natürlich nicht genau den Wert der Speere für die Eingeborenen wiedergeben kann):

(20,23 ℳ + 5,60 ℳ + 35 ℳ) × 5 = 304,15 ℳ.

Diese Zahlen schwanken in den verschiedenen Gegenden, sie geben aber doch ungefähr einen Begriff von der Größe und Verteilung des Gewinnes.

b) Eisenverarbeitung.

Aus den Sagen der Schöpfungsgeschichte geht hervor, daß die Pangwe als Nachkommen Mode-Sama's seit uralter Zeit das Schmieden verstehen, wenn sie auch in der Kunst von anderen Negervölkern, den Nachkommen Ngomwenio's (vielleicht Stammvater der Okande?), des zweiten Sohnes Sama's, übertroffen wurden.

1: Tessmann

FH9 Fang

SCHMIEDE IN BEBAI (FAM. ESSENG), NTUMGEBIET.

Verlegt und gedruckt bei Ernst Wasmuth A.-G., Berlin.

[facing p. 234]

Abb. 186. Gewonnenes Eisen (Luppe) nach Abbruch des Schmelzofens. Bébal (Fam. Schumu).

Eine soziale Ausnahmestellung des Schmieds gibt es bei den Pangwe nicht, er wird weder gering geschätzt, wie bei manchen Völkern, noch genießt er irgendwelche Vorrechte oder ein Ansehen, das über die Wertschätzung seines Könnens hinausgeht. Seine Geschicklichkeit *(akö'n)* wird anerkannt und über diejenige anderer Handwerker gestellt, aber weiter nichts. Der Schmied arbeitet, wie der Holzschnitzer, nur nebenbei und auch nur, wenn Bedarf vorliegt, nie auf Vorrat. Er treibt also keinen Handel, sondern arbeitet auf Bestellung und wird für die Arbeit bezahlt, nicht für die fertige Ware (jeder muß dem Schmied das Eisen bringen, das zu den gewünschten Gegenständen nötig ist). Er bekam zu meiner Zeit z. B. für die Herstellung von Speergeld 10 % von dessen Wert.

Der Schmied (*nlü,ı III* von *a lü,r* = schmieden) hat seine Werkstätte meist im Versammlungshause, dem Schauplatz der meisten männlichen Arbeiten, wo dann (s. Abb. 27,b, b) an Stelle einer Schlafbank eine T-förmige Grube in den Boden gegraben ist, über der der Blasebalg und mitunter auch dessen Düse hängt, seltener in besonderen Hütten *(abφ-lü,r)*. Diese sind entweder einfache Schutzdächer und ringsum offen oder mit Seitenwänden aus Knüppeln versehen, nach Art der vorläufigen Versammlungshäuser. Eine Schmiedehütte der ersteren Form zeigt Tafel XVI, den Grundriß einer solchen der zweiten

aus dem Ntumdorfe Okö (südlich des Kampo) Abb. 186. Sie enthält einen Baumstamm *(m)* und eine Holztrommel *(k)*, die an den Wänden liegen und als Sitz für die Zuschauer dienen, einen Steinamboß *(b)*, in einer T-förmigen Grube *(eje̱, lü,ɪ)* das Schmiedefeuer mit dem Gebläse *(e–g)*. Der Schmied *(a)* sitzt stets rechts von dem Feuer und etwas vor dem Blasebalgzieher *(d)*, damit er mit der linken Hand bequem das glühende Eisen erreichen, aus der Grube nehmen und auf dem vor ihm liegenden Amboß *(b)* bearbeiten kann.

Auch beim Schmieden geht es nicht ohne Medizinen ab. Ähnlich wie in der Schmelzhütte unter dem Ofen, wird hier beim Herrichten der Schmiede, wenn auch nicht immer, eine Medizin unter dem Amboß vergraben, die in Hahnenfedern, Blütenrispen der Labiate **Plectranthus** (*kólgt IV* F., *kǫ̀t IV* Nt.) und Blättern und Stengeln der Commelinacee **Aneilema aequinoctiale** Kth. *(nlàt I)*[1]) besteht. Die beiden genannten Pflanzen sind Kletten und drücken aus, daß die Eisenteilchen beim Schmieden so fest zusammengefügt werden sollen, wie sich die Früchte des **Plectranthus** und die Stengel bzw. Blätter der **Aneilema** aneinanderkletten — häufig sieht man auch, daß der Schmied beim Schmieden ein paar **Plectranthus**früchte in die Düse wirft. — Der Hahn gehört zum Kult des Guten bzw. des Feuers, und seine Federn sind deshalb der wichtigste Bestandteil der Medizin. Zur Erhöhung der Wirksamkeit wird er außerdem geschlachtet, sein Fleisch zusammen mit den Blättern der Acanthacee **Asystasia macrophylla** (T. And.) *(elǫ̀bokǭī)*, der Connaracee **Manotes zenkeri** Gilg *(nkd-ndzīk I)*, der Ebenacee **Diospyros fragrans** Gürke bzw. **staudtii** Gürke (*mrīfɪn IV* F., *mrīpfɪm IV* Nt.) und der Tiliacee **Desplatsia dewevrei** Burset *(afǭnǭk)* gekocht und vom Schmied gegessen. Die erwähnten Pflanzen haben starke und biegsame Stengel bzw. Zweige (*nkīb* = Rute, Peitsche), und man wünscht, daß das Eisen, insonderheit das Speergeld, ebenso fest und biegsam sei.

Schließlich sei erwähnt, daß in einer neu eingerichteten Schmiedehütte kein Roheisen, sondern nur bearbeitetes Eisen als Erstes eingeschmolzen werden darf.

Handwerkszeug ist:

1. Großes Schmiedeeisen *(ngǭ,n[d]ǭ III)* von der Form wie Abb. 187, Fig. 1, das für gröbere Arbeiten als Hammer, für feinere als Amboß dient und dann mit dem spitzen Ende in die Erde gestoßen wird. Sein Wert ist 1000 Speere oder 70 ℳ.
2. Kleines Schmiedeeisen *(edǭ)*, Abb. 187, Fig. 2 zum Ausklopfen von Speerblättern usw. (Wert 50 Speere oder 3,50 ℳ.)
3. Aufasser (*abī* von *bī* = fassen), ein einfacher, gegen das Ende etwas spatelförmig verbreiterter Eisenstab, an einem Holzgriff, der an das im Feuer glühende Eisen gehalten und mit ihm verschweißt wird, so daß man beide

[1]) *a lǭ,-t* = zusammenfügen, daher *nlàt* = **Aneilema** (vgl. auch *a-lǭ-t* = die Ente, weil sie paarweise lebt).

Abb. 186. Grundriß einer Schmiede im Dorfe Okö, Ntumgebiet.

zusammen herausholen kann. Bei der Bearbeitung geht das Ende dieses Anfassers in dem geschmiedeten Gegenstand auf und muß deshalb bei jedesmaligem Gebrauch von neuem hergerichtet, d. h. am Ende breitgeklopft werden.

4. Meißel *(zàne)*, Abb. 188, der in einen geschlitzten Kardamomstengel gesteckt und mit dem Hammer eingetrieben wird, um dünne Verbindungen zu sprengen, überflüssige Ränder abzustemmen, Rillen zu ziehen usw.
5. Feile *(ewǔ,ŋ)* zum Glätten.
6. Zange *(abǎs)*, Abb. 189, Fig. 2, aus einem am Ende gespaltenen Kardamomstengel.
7. Spritzer *(amǒ,m, amè,m)*, Abb. 189, Fig. 1, aus einem Kardamomstengel [1], der am Ende gesplissen ist, und mit dem die Kohle von Zeit zu Zeit — wie bei uns — angefeuchtet wird.

Soll geschmiedet werden, so legt man die Düse des Gebläses in die Mitte der Schmiedegrube, häuft darüber Holzkohle, die ebenso hergestellt wird, wie S. 127 beschrieben [2], auf diese die einzuschmiedenden Eisenstückchen und

[1] Kardamom (Aframomum) als Fackel vgl. S. 80, als heilige Pflanze des Feuers vgl. Abschnitt XI.

[2] Und zwar von folgenden Bäumen:
Leguminosae **Dialium guineense** Willd. *(ogbǔ,ŋ-elī)*,
„ **Platysepalum tessmannii** Harms *(ogbǔ,ŋ-elī)* (vgl. S. 238),

entzündet sie durch eine glühende Kohle, die man in die Düse hineinwirft. Dann setzt der Gehilfe den Blasebalg in Tätigkeit (vgl. S. 231). Brennt die Kohle, so legt der Schmied den Anfasser (Abb. 186 *i*) in den Seitenarm der Grube, häufelt die Kohlen *(h)* über den Eisenstückchen an, wartet, bis das Eisen glühend ist, holt es mit dem Anfasser heraus und schmiedet es auf dem Amboß. Ist das Eisen in der Rohform fertig, so wird es mit dem Meißel vom Anfasser losgeschlagen, mit der Zange gefaßt und der weiteren Bearbeitung unterzogen.

c) Messinggießerei.

Das Messing *(ngŭs IV, mŭt IV)* kommt als Röhren oder Draht von der Küste her seit langem ins Pangwegebiet und hat wegen seiner Weichheit und seiner glänzenden Farbe das Eisen, soweit es als Schmuck gebraucht wurde, fast vollständig verdrängt. Die Röhren werden nicht weiter verändert, der Draht wird dagegen zu Hals-, Arm- und Fingerringen, zu Fußstulpen und Beinringen verarbeitet.

Der Draht wird in kleine, ca. 3 cm lange Stückchen geschlagen und so in einer Topfscherbe oder in einem eigens dazu angefertigten Tongefäß, Abb. 190, das man auf das Schmiedefeuer stellt und ganz mit Kohlen bedeckt, mit Hilfe des Gebläses geschmolzen. Sobald die blauen Flammen herausschlagen, entfernt der Schmied die Kohlen über dem Topf, faßt diesen mit der Zange und gießt das flüssige Metall in Formen, das sind halbierte Raphiablattstiele, in deren Mark das entsprechende Negativ eingeschnitten ist (Abb. 191). Dann reinigt er es von Kohlenstückchen, die etwa mit hineingefallen waren, und gießt Wasser darauf. Nach dem Erkalten wird das Messing aus der Form herausgenommen und unter Erhitzen weiter bearbeitet, d. h. die gröberen Unebenheiten werden zuerst mit dem großen Schmiedeeisen heruntergeschlagen. Bei den gravierten Halsringen (vgl. Abb. 14) werden nun die beiden Enden

Flacourtiaceae **Petersia minor** Niedenzu *(abĭn)*.

Abb. 187. Hammer und Stampfeisen.

mit dem Stampfer ausgeklopft und durch leichte Schläge über die Fläche umgerollt, die Flächen sodann mit dem Stampfer sorgsam geglättet. Das ist eine ziemlich langwierige Arbeit, da die Stange immer wieder für einige Zeit ins Feuer gelegt werden muß. Jetzt wird durch geschicktes Aufschlagen der Innenfläche auf die Kante des Schmiedesteines der Ring gebogen, auf dem über zwei Stützen gelegten großen Schmiedeeisen völlig zusammengehämmert, endlich mit einer Feile glatt gefeilt, wodurch an Stelle der bisherigen schwarzen die glänzende gelbe Messingfarbe zum Vorschein kommt, und mit Hilfe dreier verschieden starker Meißel (Abb. 192) und anderer Werkzeuge in Mustern graviert (Abb. 193).

5. Töpferei.

Im Gegensatz zu den bisher erwähnten Fertigkeiten liegt die Töpferei in den Händen der Frauen, nur Tabakspfeifen und Düsen werden von Männern hergestellt. Sie ist recht wenig entwickelt, die Formen sind dürftig, Verzierungen selten. Die Haupterzeugnisse der Töpferei sind auf Abb. 194 vereinigt:

Abb. 188. Meißel zu Eisenarbeiten.

1. Wasserflaschen *(eśugä)*,
2. große und kleine Kochtöpfe *(mvi IV* und *obébe)*,
3. Schmiedetrichter *(śóṣ IV)*,

außerdem werden noch

4. Tabakspfeifen und
5. Messingschmelztöpfe

hergestellt. Damit ist die Reihe der Gebrauchsgegenstände aus Ton erschöpft.

Abb. 189. Spritzer und Zange des Schmiedes.

Die Frauen, von denen etwa der vierte Teil (bei den Jaunde etwa die Hälfte), die Töpferei versteht, treiben ihre Kunst zumeist als Hauswerk und machen die Flaschen und Töpfe für ihren eigenen Haushalt oder für den von Bekannten und Verwandten, die sich aus Bequemlichkeit oder Ungeschicklichkeit nicht damit befassen, außerdem verkaufen sie ihre Erzeugnisse an fremde Frauen, die nicht töpfern können oder wollen. Die Preise für Töpfe schwanken, je nach der Größe, zwischen 2 und 4 Speeren (14—28 ℳ), in Jaunde zwischen 5 bis 30 Jaundespeergeld (5 bis 30 ℳ); ganz große Jaundetöpfe, wie sie die Fang nicht kennen, kosten 40 Jaundespeere (= 40 ℳ). Die tönernen Flaschen, die nur den Fang eigentümlich sind und den Kampo kaum nach Norden überschreiten, kosten 10 Speere (= 70 ℳ). Im großen und ganzen sind die Jaundefrauen bessere und betriebsamere Töpferinnen; sie stellen mehr Ware her, wodurch der Preis freilich sinkt, und bringen hübschere zustande als die Ntum- und Fangfrauen, die vielleicht nur ein Drittel bis ein Viertel aller Kochtöpfe verzieren. Wasserflaschen werden nur ausnahmsweise verziert.

Abb. 190. Tongefäß für Messinggeld.

Abb. 191. Form eines Messinghalsringes in einem halbfertigen Raphiastäbchenbündel.

Die Herstellung ist folgende: Der weiße Töpferton *(ekǒn, vǔ,ǒk*, Mehrzahl *lǒk)* wird auf einem Stück Rinde trocken oder, wenn nötig, mit Wasser versetzt mit einem Stößel *(ntum e vǔ,ǒk)* eine Zeitlang gestampft. Dann rollt die Töpferin den Ton zu Würsten aus, legt zwei oder drei davon in der Hand in schneckenförmige Windungen zusammen, die den Boden des zukünftigen Topfes bilden, und tut das Ganze in einen Korb- oder Holzteller. Nun baut sie die Wandung des Topfes auf, indem sie die übrigen Würste unter Drehen des Tellers, der als Töpferscheibe dient, schneckenartig aneinanderlegt. Dann glättet sie ihn mit einem feuchten Raphiastäbchen, buchtet ihn durch leichten Druck dicht unter dem Rande ein, schneidet diesen selbst *(mbɛ 1)* mit einem feinen Grashalm glatt, reibt ihn mit einem nassen Blatt ab und zieht ihn mit dem Stäbchen aus. Die fertigen Töpfe müssen auf dem Topfboden *(akɔ́ɔ e mɛ́)* fünf Tage trocknen und werden dann gebrannt, was auf dem Dorfplatze geschieht,

Abb. 192. Model zur Herstellung der Mustor auf Messinghalsringen.

Abb. 435. Gallerbambus vorne: einen Blasebalgbehälter.
Abwangi, Süd-Kamerun.

indem man einfach unter und rings um den Topf Feuerholz oder Reisig anhäuft und in Brand steckt.

In der Zeit des Trocknens werden die Verzierungen angebracht, die Töpfe werden etwas mit Wasser befeuchtet und dann die Muster mit einem spitzen Raphiahlattstielsplitter eingeritzt. Ein gewisses Muster, obügéli genannt, erzielt man so, daß man einen sorgsam geflochtenen vierkantigen Formenstempel (Abb. 436) von oben nach unten abrollt.

Die Tondüse des Gebläses stellen die Männer folgendermaßen her: Man löst die Rinde eines Raphiahlattstiels bis kurz vor das eine Ende in Streifen ab und bindet diese am anderen Ende in ihrer natürlichen Lage wieder zusammen, so daß es den Eindruck macht, als sei die Rinde in der Mitte von innen her in lauter Streifen aufgeplatzt. Dann steckt man den Blattstiel mit dem Ende, an dem man die Streifen ganz abgelöst und wieder zusammengebunden hatte, senkrecht in den Boden und legt den Ton in Form eines Trichters darum, biegt den oberen Rand nach außen um und läßt das Ganze drei Tage an der Sonne trocknen. Nun löst man die Umschnürung, trennt die Streifen vollständig ab, zieht sie einzeln heraus, nimmt die Düse herunter und trocknet sie noch eine Zeitlang im Hause. Die Düsen werden nie verziert; nur als ich

einmal in Bebai der Herstellung einer solchen beiwohnte, konnte es sich der kunstsinnige Schöpfer nicht verkneifen, sein Machwerk mit einigen Ritzmustern zu versehen, vielleicht mir zu Ehren, weil er annahm, ich könne unmöglich einer „so einfachen" Sache wegen gekommen sein, sondern erwarte von ihm besondere Kunstleistungen, und er müsse nun ein übriges tun.

A. Ornamentik.

Alle Schöpfungen der ornamentalen Kunst, die wir bei den Pangwe treffen, lassen sich auf einige wenige Formengebilde zurückführen, die mit technischen Vorgängen unmittelbar verbunden, aus ihnen entstanden sind und sich noch heute dabei täglich mit derselben Naturnotwendigkeit ergeben. Von ihnen ist zu irgendeiner Zeit ein ästhetischer Eindruck ausgegangen; sie wurden als selbständige Form erfaßt und mit diesem Augenblicke zu Vorbildern, die man absichtlich — losgelöst von ihrer ursprünglichen, im wesentlichen praktischen Bedeutung — zuerst in spielerischer Weise nachahmte und darauf nachschuf, um sie als ornamentales Beiwerk zu verwerten, sie wurden zu künstlerischen Motiven. Solange die Vorbilder unverändert in die Ornamentik übernommen wurden, entstanden Muster, die ihren Ursprung jederzeit und ohne weiteres wiedererkennen ließen, und die ich daher als Grundmuster bezeichnen möchte. Sie führen zum Teil Namen, die, mit einer einzigen Ausnahme (Varan), von den Leuten nicht oder nicht sicher erklärt werden konnten, wenn sie nicht einfach das Material bezeichneten. Allmählich trübte sich unter dem Einfluß häufiger Wiederholungen und wechselnder Materialien die Reinheit dieser einfachen Grundmusterformen; ihre Elemente teilten sich, verschoben sich gegeneinander oder gruppierten sich zu doppelten Anordnungen oder neuen Verbindungen. So entstanden abgewandelte Muster.

[p. 243]

Abb. 136. Grundmuster der Rindenzierkunst.

In die Muster hat der Pangwe später konkrete Dinge der Umwelt hineingesehen und sie nach ihnen benannt. Es scheint dieser Vorgang eingetreten zu sein mit der Änderung des Materials, mit alleiniger Ausnahme der Tierfiguren, die schon in das Muster des ursprünglichen Materials, d. h. desjenigen Materials, auf das das Vorbild erstmalig übertragen wurde, hineingesehen worden sind. Hiermit sind es stehende Muster der Ornamentik geworden. Ich unterscheide von ihnen zwei Formen: gleichartige und ungleichartige, je nachdem sie eine Abwandlung desselben Musters bilden oder aus einer Verbindung verschiedener Muster entstanden sind. Verbindungen von ihnen dagegen, deren Teile den ihnen beigelegten Namen und Sinn behalten, nenne ich zusammengesetzte Muster.

Art und Entwicklung der Muster wechseln mit dem Material, als welches Rinde, Holz, Raphiastengel, Ton, Metall und die menschliche Haut in Betracht kommen; doch scheint zwischen Rinde und Holz einerseits, zwischen Metall und der menschlichen Haut (Ziernarben) andererseits eine gewisse Beziehung zu bestehen, die in verwandten Musterungen zum Ausdruck kommt. Die eingehende Beschreibung der Muster soll daher unter dem Gesichtspunkte des Materials erfolgen.

1. Rindenmuster.

Im Pangwegebiet gibt es eigentümliche Rindenplatten, die von Raphiablattstielstreifen bzw. Palmbändern eingefaßte bemalte Felder zeigen und die an der Außen- oder Innenwand der Versammlungshäuser, seltener an der Außenwand der Wohnhäuser angebracht sind. Diese Schmuckrinden sind weit verbreitet, aber nicht häufig und lange nicht in jedem Dorf anzutreffen, denn auch der Kunstsinn für Rindenornamentik ist eine Spezialität, und die betreffenden Künstler sind dünn gesät. Über die Herstellung dieser Platten habe ich bereits S. 205 das Nötige gesagt und hole nur nach, daß als Farben (s. S. 194 u. 195) rot, weiß und schwarz, wie überall bei den Pangwe, genommen werden. Nur in einem einzigen Falle beobachtete ich ein helles Blaugrau, das von einer so gefärbten Tonerde stammte.

Die Felderung zeigt eine Reihe von Mustern, die dem beim Hausbau verwendeten Material entsprechen, es sind

Viereck = Rinde, Linie = Palmband,
Dreieck = Raphiablattstielstreifen, Gräte = Palmblättern.

Das Viereck kommt in drei Formen vor, als Rechteck, als Raute und als Varan.

Das Rechteck ergibt sich von selbst aus der natürlichen Gestalt des Rindenmantels (Abb. 196 a).

Die Raute entstand und entsteht noch täglich bei der Ablösung von Baumrinde, wie schon bei den Rindenarbeiten (S. 205) auseinandergesetzt wurde. Ich erinnere daran, daß dabei der Baumstamm oben und unten geringelt und die Rinde in einer Zickzacklinie durchtrennt wird, die, wie die Beobachtung lehrte, das Ablösen erleichtert. Bei den Kreuz- und Querhieben des Hauers entsteht, wenn sich die Schnitte treffen, wie Abb. 158 zeigt, das Bild der Raute. Überschneiden sie sich einmal, so sind die Ansätze zu neuen Rauten gegeben, und diese werden in spielerischer Weise ausgezogen und so Gruppen über- und nebeneinanderliegender Rauten geschaffen. Später schnitt man solche in beabsichtigter, heute noch viel beliebter Spielerei in die Rinde ein und betonte dann schachbrettartig die einzelnen Rautenfelder, indem man die Rinde bis auf das Holz aushob.

Abb. 197. Varanmuster auf Zierrindenplatten.

Von hier aus war es kein weiter Schritt bis zur Übertragung des Musters auf Rindenplatten (Abb. 196 b).

Der Varan *(nkaak III)* entsteht, wenn sich beim Rindenablösen zufällig zwei verschieden große Rauten übereinander bilden, in die man Kopf und Leib des Nilvarans, **Varanus niloticus**, hineinsieht. Ebenso wie die Raute wird der Varan als Spielerei in die Rinde von Bäumen eingeschnitten, wobei dann durch einfache Striche Beine und Schwanz angefügt sind, und später von hier aus auf die selbständigen Schmuckrinden übertragen (Abb. 196 c, 197).

Auf die Ähnlichkeit mit diesem Tier kam man, weil man es täglich über die Rinde der Bäume kriechen sah, weil es dann — wie viele Eidechsen — annähernd eckige Umrisse zeigte und vor allem, weil es — wie ich vermute — früher einmal eine ebensolche Rolle in der Religion der Pangwe gespielt hat wie bei den alten Ägyptern, die den Varan deshalb verehrten, weil er Krokodileier fraß. Das Krokodil aber galt offenbar — da es im Sumpf bzw. Wasser

lebte (vgl. Abschnitt XI) und außerdem den Menschen gefährlich wurde — als Vertreter des bösen Prinzips, infolgedessen der krokodilvernichtende Varan — der in der Luft, d. h. auf Bäumen lebte — wahrscheinlich als Vertreter des guten. Deshalb ist wohl auch der Varan bei den Pangwe in die Menschenklasse befördert worden, ebenso wie das **Sciurus wilsoni** *(küe III)*, das gleichfalls Eier von Tieren, die im Sumpfe leben, frißt. Ein Gegenstück zu diesen beiden ist das Ichneumon, das Hühnereier verzehrt und, da das Huhn ein heiliges Tier ist, weil es das gute Prinzip versinnlicht (vgl. Abschnitt XI, 4), geradezu „Verbrecher" = *nsǫm I* genannt wird.

Abb. 198. Blatt der Sumpfpalme, **Sclerosperma manii.**

Das Dreieck haben wir in zwei Formen, als Scheiteldreiecke und als rechtwinkliges Dreieck. Erstere sind die häufigsten, kommen überall auf Rindenplatten vor und entstehen, wenn beim Hausbau zwei diagonal gekreuzte Raphiablattstielstreifen in die Erde oder unter die Latten gesteckt werden, um die als Tür dienenden bzw. zum Verstopfen von Löchern vorgelegten Rindenstücke festzuklemmen, eine Befestigungsart, die in früheren Zeiten wahrscheinlich häufiger und bei den Hauswänden selbst angewendet wurde (Abb. 196 d). Wie bei der Raute ist auch hier der Übergang von den technischen Formgebilden zum stehenden Ornament noch zu beobachten: man steckt vielfach zum Schmuck Kreuze aus kurzen Stengelstreifen einzeln oder in größerer Zahl nebeneinander unter die Latten der Hauswände.

Wurde statt der zwei gekreuzten nur ein Diagonalstreifen über die Rindenplatte gelegt, so war das rechtwinklige Dreieck da (Abb. 196 e).

Die Linie kommt vor als Parallellinien, als Schlangenlinie und als Bogen.

Die Parallellinien ergeben sich aus den bündelweise aus dem Wald auf den Hausbauplatz geschafften Palmenstämmchen, **Oncocalamus** *(nlǫn I)*, wenn die Bündel hier gelöst werden, und die glatten und elastischen Stämmchen mehr oder weniger stark wellenförmig gekrümmt parallel zu liegen kommen (Abb. 196 f). Die gleiche Lagerung kommt bei den aus den Palmenstämmchen hergerichteten Bändern zustande, nur daß diese weniger elastisch sind und daher gerade Linien bilden (Abb. 196 g). Beide Arten der Parallellinien, sowohl die wellenförmigen wie die geraden, sind von hier aus auf die Schmuckrinden übertragen.

Abb. 199. Kistenmuster auf einer Zierrindenplatte.

Die Schlangenlinie denke ich mir herausgesehen aus der Nahtlinie, in der Latten und Rindenplatten der Hauswände miteinander vernäht sind, und zwar dann, wenn diese Latten dicht an dicht übereinander liegen. (vgl. Abb. 35). Das Tau wird hierbei gleichlaufend so um die Latten geführt, daß es eine einzige, zusammenhängende und, von der Seite gesehen, wegen der natürlichen Rundung des längs halbierten Raphiablattstiels stark wellenförmige Linie bildet (Abb. 196 h).

Der Bogen erscheint als ein Teil der Schlangenlinie, gebildet von der Umschnürung der einzelnen Latten, zumal da, wo sie nicht dicht übereinander, wie im vorigen Falle, sondern in weiten Zwischenräumen angebracht werden (Taf. XII) oder als ein Abschnitt der schon auf die Schmuckrinde als Ornament übertragenen Schlangenlinie (Abb. 196 i).

Die Gräte gibt die hübschen, in Bau und Form völlig symmetrischen Blätter der Sumpfpalme, **Selerosperma mannii** M. et Wendl. *(akōda)*, Abb. 198, wieder, die mattenartig verflochten an Stelle von Rinden zu Hauswänden usw. (vgl. Abb. 106, Taf. 24) benutzt werden (Abb. 196 k).

Die genannten Grundmuster kommen nun auf den heutigen Schmuckrinden nicht in gleicher Häufigkeit (Rechteck allein gar nicht, rechtwinkliges Dreieck und Gräte nur einmal, Schlangenlinie selten) und nicht mehr überall in derselben Reinheit vor, sondern sind zum Teil verändert, d. h. zu gleichartig abgewandelten Mustern geworden.

Das Rechteck habe ich nur einmal abgewandelt gesehen, und zwar so, daß mehrere verschieden große Rechtecke ineinandergelegt waren (Abb. 200 Reihe *a*, 199). Man nannte es Kistenmuster (*ezima* = Kiste). Es wurde nur ein einziges Mal beobachtet, und das beweist mir mit der Unvollkommenheit der Ausführung, daß die Entwicklung nicht bei den Schmuckrinden, sondern bei der Holzschnitzerei entstanden und später gleichsam versuchsweise auf jene übertragen worden ist.

Bei den Scheiteldreiecken kann es vorkommen, daß der Schnittpunkt wegfällt oder gewissermaßen in zwei Punkte auseinandergezogen wird, vielleicht, weil bei Mangel an Material jede Diagonale aus zwei Stücken zusammengesetzt wurde (Abb. 200 Reihe *b*). Dadurch entsteht ein Muster, als dessen Name mir bei den Schemelverzierungen, wo es auch vorkommt, Hauerscheidenmuster *(abōm nkpwēda)* angegeben wurde, und das in der Tat einer Hauerscheide (vgl. Abschnitt XVII) ähnlich sieht, es ist jedoch nur selten.

Das einfache spitzwinklige Dreieck entsteht einmal durch Trennung der Scheiteldreiecke im Schnittpunkt (Abb. 200 Reihe *c*), das andere Mal beim Aneinanderlegen zweier diagonal geteilter Rechtecke (Abb. 200 Reihe *d*) durch Weglassen der gemeinsamen Längskante.

Abb. 200. Entwicklungsreihe der abgewandelten Muster der Rindenzierkunst.

Sämtliche Dreiecke, sowohl die Scheiteldreiecke und das einfache spitzwinklige Dreieck, als auch das rechtwinklige, werden meist als *elòn akòò* = halber Speer, d. h. Speerklinge, bezeichnet.

Die Parallellinien wandeln sich so ab, daß bei der Befestigung der Palmbänder auf den Rinden scharfe Knickungen entstehen, und die Wellenlinien dadurch zu gebrochenen Linien werden (Abb. 200 e). Sie wurden mir dann in manchen Fällen als Winkelflechtmuster bezeichnet; auf Pangwe: *benige be nkòn* oder *mabòge me nkòn*, d. h. Winkel (Knicke) des Aufbewahrungskörbchens für Frauen, womit das ähnliche Flechtmuster gemeint ist (vgl. Abb. 166).

Die Schlangenlinie bildet sich zum abgewandelten Muster um durch Verdoppelung, wobei die beiden Linien sich überschneiden (Abb. 200 f), und weiterhin zu dem stilisierten Bilde eines Leoparden *(zō)*, Abb. 200 g, wobei der psychologische Vorgang dem bei dem Varanmuster beschriebenen entspricht (Abb. 201). Die eigentümliche, sonst nicht verständliche Zeichnung neben dem Schwanze

in Abb. 201, links, läßt die Entwicklung noch erkennen. Hier liegt der Ausgangspunkt für eine Reihe weiterer Tiermotive der Pangwe-Ornamentik, z. B. Abb. 201 unten, die wahrscheinlich ein Chamäleon *(dzingbwö)* darstellt.

Der Bogen kommt gleichfalls doppelt vor, und zwar entweder mit den Wölbungen einander gegenübergestellt (*epfoa* = Maske beim Ssokult), Abb. 200 Reihe *h*, oder mit der Grundlinie aneinandergelegt, dann entsteht durch Fortfall der gemeinsamen Basis der Kreis (Abb. 200 Reihe *i*), oder endlich zu zweien übereinander auf derselben Basis errichtet, so daß dazwischen ein halbmondförmiges Feld entsteht (*epfá ngomendan* = Halbmond), Abb. 200 Reihe *k*). Mehrere solcher Halbmonde werden übereinander gestellt und abwechselnd rot und weiß bemalt, zu Reihen vereinigt, von denen zwei oder mehrere nebeneinandergestellt ein beliebtes und hübsches Muster ergeben.

Abb. 98. Leopardenmuster, unten Chamäleonmuster auf Zierrindenplatten.

Aus der Verbindung von Grundmustern oder abgewandelten Mustern ergeben sich — wie schon gesagt — die zusammengesetzten. Für die vorkommenden Formen verweise ich auf die Abb. 202 und bemerke nur, daß die häufigste Verbindung das Scheiteldreieck mit dem Bogen ist, der meist auf der Grundfläche des spitzwinkligen, seltener auf derjenigen des stumpfwinkligen steht.

Eine vereinzelte Erscheinung unter den Schmuckrinden ist die zu einem Kopf mit zwei Hörnern zurechtgeschnittene der Abb. 204 geblieben, eine stilisierte Wiedergabe der beim Mondkult gebrauchten Maske *(epfoa)*, deren Einzelheiten durch bogen- bzw. schlangenförmige Windungen von Palmbändern angedeutet sind.

Abb. 202. Zusammengesetzte Muster der Rindenzierkunst und ihre Entstehung.

2. Kerbschnittmuster.

Mit Kerbschnitt sind die Schemel, die in Schemelform gearbeiteten Rotholzbehälter, die Stiele vieler Rühr- und mancher Schöpflöffel und schließlich die Felltrommeln verziert.

Die Schemelmuster sind wahrscheinlich die ältesten; sie werden rings um den Rand des Schemels so angebracht, daß ihn ein Band von acht bis zwölf rechteckigen oder quadratischen nebeneinandergestellten Feldern umzieht, deren jedes ein Muster für sich bildet, das von dem benachbarten scharf getrennt ist. Der Schemelrand entspricht, wie wir bei der Technik sahen, dem Rund des Baumstammes, aus dem er gemacht wird, so ist auch die Verzierung, die ursprünglich auf der Rinde angebracht wurde, später auf das Holz übertragen worden, und wir begegnen hier denselben Grundmustern wie dort, nämlich dem Rechteck, der Raute, dem Varan, den Scheiteldreiecken, dem ungleichseitigen Dreieck, den Parallellinien — mit der Einschränkung, daß die Parallellinie nicht als gewellte, sondern nur als gerade vorkommt, als solche aber in verschiedenen Abarten (Abb. 205) —, dem Bogen und der Gräte. Die Schlangen-

Abb. 208. Zierfaden.

linie ist aufgegeben, dagegen tritt neu auf das Schachbrett, der Speer mit Widerhaken und schließlich noch ein nicht genauer bestimmbares Ellipsenmuster.

In dem Schachbrettmuster (*abön nkoo* = Zuckerrohrstengelglieder genannt) begegnen wir dem ersten Grundmuster, das nicht bei der Arbeit des Hausbauens, sondern bei der Flechterei erfunden ist (Abb. 206). Beide Tätigkeiten sind aber eng verwandt, gewissermaßen zwei verschiedene Formen einer Technik, nämlich des Flechtens im weiteren Sinne, das Haus„flechten" = *a lön ndä* ist die ältere, einfachere, das Körbe- (bzw. Matten-)flechten = *a lön nkö,g* die jüngere, fort-

geschrittenere, zu beiden wird in der Hauptsache das gleiche Material: Palmbänder *(nlów)* benutzt. Die einfachste Art der Geflechte ist die, daß die Geflechtstreifen einer Richtung, reihenweise abwechselnd, einmal unter und einmal über die der anderen Richtung, die genau rechtwinklig zu jener verläuft, geführt werden.

Abb. 34. Zierrinden in Form von „Masken".

Dadurch entsteht ein Würfelmuster, das bei gleichartigem Material einfarbig (Matten, Ssokörbchen), bei ungleichartigem wie unsere Schachbretter verschiedenfarbig ist (Aufbewahrungskörbchen der Jaundefrauen, Abb. 207, Gestell für Helmmützen). Man vergleicht die abwechselnde Folge dunkler und heller Quadrate in den einzelnen Reihen mit dem Zuckerrohrstengel, dessen Glieder in der oberen Hälfte heller zu sein pflegen als in der unteren (Abb. 208).

1 2 3 4 5

Abb. 36.

Der Speer mit Widerhaken *(ngam akoń)* kann, im Gegensatz zu den vorigen Mustern nicht aus der Technik abgeleitet werden, ich glaube auch gar nicht, daß er ursprünglich ein Schnitzmuster ist, zumal er auf den Schemeln selten vorkommt (Abb. 40), sondern ich vermute, daß er bei der Ziernarbenritzung zuerst auftauchte und sich später wegen seiner gefälligen Form auch einen Platz unter den Schnitzmustern eroberte.

Abb. 37. Aufbewahrungskörbchen der Jaundefrauen aus Blattstreifen des Schraubenbaumes.

Abb. 206.

Ein einziges Muster, aus Ellipsen bestehend, konnte von keinem Schemelschnitzer erklärt werden; man sagte, nur der Spezialist, der das Muster anzufertigen verstehe, könne es wissen. Diesen aber habe ich nicht getroffen, und so muß ich es späterer Forschung überlassen, hier Aufklärung zu schaffen (Abb. 212, Fig. 27).

Abb. 208. Stücke des Zuckerrohrstengels.

Abb. 209.

Auch bei den Schemelmustern findet sich eine Entwicklung der Grundmuster und zwar ist sie zum kleineren Teil auf der Stufe der Schmuckrinden stehen geblieben und zeigt genau dieselben Bilder wie dort, zum größeren Teil ist sie erheblich weiter gediehen und hat eine reiche Fülle von neuen Bildern hervorgebracht. zu abgewandelten Mustern,

Es kehren wieder das Kistenmuster *(eźima)* — rein oder in verschiedenen Abarten (Abb. 209 a) —, die aus aneinandergesetzten Rauten bestehende Schachbrettfläche *(ndōk)*, das Hauerscheidenmuster *(abə́m nkpwē,da)* — rein und in einer Abart (Abb. 209 b) —, das spitzwinklige Dreieck, Speerklingenmuster *(etǎn akǎn)*, das Winkelflechtmuster *(benige be nkǎn)*, Abb. 209 c, und das Maskenmuster *(epfoa)*.

Von gleichartig abgewandelten Mustern treten neu auf:

Das Feilenmuster (*zane wís* von *zane* = Eingravierung, *wís* = Feile) aus aneinandergesetzten kleinen Rauten, die nicht betont sind (Abb. 211 a). Der Künstler sieht nicht das Feld, sondern die Umrisse und vergleicht diese deshalb mit den eingravierten, sich regelmäßig schneidenden Linien der gerauhten Feile.

Das Kauristrangmuster *(nlǎn e mvama)*. Auf der Fläche der Rauten wird jede zweite Reihe der übereinanderstehenden Rauten durch einen Längsstreifen halbiert, ursprünglich eine Vereinigung von Raute und Parallellinie (Abb. 211 b), in die man aufgereihte Kauris hineingesehen hat. Die Ähnlichkeit beider zeigt Abb. 210. Es erscheint mir möglich, daß hierbei noch eine andere Beziehung der Kauri zur Raute mitspricht. Die Togoneger z. B. (nach mündlicher Mitteilung des Herrn Missionars C. Spieß) erkennen in der Kauri das Bild der Vulva wieder, den Pangwe war als solches von jeher die Raute vertraut, sie erkannten deshalb nach Einführung der Kauri sofort die Ähnlichkeit mit der Raute und übertrugen auf jene die Symbolik der letzteren. Wie in Togo gilt sie bei den Pangwe als glückbringendes Zeichen und wird als solches auf Medizinhörnchen angebracht oder an Stellnetzen als Jagdmedizin aufgehängt. Ein ebenso glückbringendes Zeichen ist ihnen die Raute, die sie sich mit Rotholz (glückbringende Farbe!) auf die Haut malen oder als bleibendes Muster tätowieren. Wir haben hier einen bemerkenswerten Widerspruch der Anschauung. Der Geschlechtsakt wurde, wie wir gesehen haben, bei der Ngonaussaat als ein Fruchtbarkeit fördernder Vorgang ausgeübt,

Abb. 210.
Kauristränge.

Abb. 211. Entwicklungsreihen der abgewandelten Muster der Kerbschnittkunst.

bei der Eisenverhüttung im Gegenteil als ein störender streng verboten. Die unglückbringende Bedeutung alles Geschlechtlichen überwiegt durchaus, und ich glaube daher, daß wir es hier mit zwei zeitlich verschiedenen Anschauungen zu tun haben, einer, die nur noch in Resten erkennbar ist, älteren vom Einfluß und von der Beeinflussung der Fruchtbarkeit und einer später entstandenen oder hinzugekommenen von der Sündhaftigkeit des Geschlechtsverkehrs.

Das Pfeilblattmuster (*esigele ndu* = Blatt der Flugsicherung an den Armbrustpfeilen).

Das Spitzenmuster (*mesön* = Spitzen oder *mesön m'egbwe̱le* = Spitzen des Eisengeldes).

Beide bestehen aus einer Anzahl von Dreiecken, entstanden entweder als Endglieder der Entwicklungsreihe *c* (Abb. 211), ausgehend von den Scheiteldreiecken, oder der Reihe *d*, ausgehend von dem rechtwinkligen Dreieck. Sind die Dreiecke breitbasig, und zwar entweder leer oder mit ineinandergestellten, auf derselben Grundfläche errichteten Dreiecken ausgefüllt, so heißen sie „Pfeil-

blätter", sind sie schmalbasig, „Spitzen"; auch findet man besonders für letztere Form, wenn die Dreiecke groß sind und infolgedessen nebeneinander, nicht reihenweise übereinander stehen, die Bezeichnung „Speerklingen" *(elan akon)*.

Das Schuppentierschwanzmuster *(ngem e ka')* entwickelt sich aus dem breitbasigen, spitzwinkligen Dreieck durch Übereinanderstellen mehrerer paralleler Reihen kleinerer Dreiecke (Abb. 211 e).

Das Kerbmuster *(zan e mrot* von *zan* = Schnitzerei, Kerbschnitt, und *mrot* = Raphiainstrument, dessen Steg gekerbt ist) entwickelt sich aus dem diagonal geteilten Rechteck durch Aneinandersetzen mehrerer Reihen von solchen mit gleichgerichteten Diagonalen, in denen durch Ausheben der einen Hälfte die entsprechenden Dreiecke betont sind (Abb. 211 f).

Das Regenbogenmuster (*metartem* = Regenbögen). Zwei Bögen werden mit der Wölbung einander gegenübergestellt, in jeder werden weitere Bogenlinien konzentrisch eingefügt und die Zwischenräume meist abwechselnd betont (Abb. 211 g).

Das Fischgrätenmuster *(okan e ks)* entsteht aus dem Sumpfpalmenblattmuster durch Vereinfachung der Bänder zu Linien (Abb. 211 h).

Von ungleichartig abgewandelten Mustern treten auf:

Der Dreieckspeer *(mba[s]-akon)*, eine Zusammensetzung von Scheiteldreiecken und Linie, als Ergebnis einer Entwicklung, die Abb. 211, Reihe *i* zeigt.

Das Spinnennetzmuster *(ndanebobo)*, eine Zusammensetzung von Scheiteldreiecken und Kreis (vgl. Abb. 210 Reihe *k*).

Wie auf den Schmuckrinden werden auch im Kerbschnitt, nur viel häufiger, die Muster zu zusammengesetzten vereinigt, sei es, daß man zwei aneinandersetzt (z. B. Bogen- und Fischgrätenmuster, Abb. 212 Fig. 9, und Sumpfpalmenblatt- und Rautenmuster, Abb. 212 Fig. 26) oder ineinandersetzt, so zeigen Abb. 212 Fig. 16 das Kistenmuster, darin ein zusammengesetztes Tätowiermuster (Scheiteldreiecke und Linie), Fig. 8 dasselbe, darin ein Tier, das meistens als Katze erklärt wurde, Fig. 40 dasselbe, darin ein Dreieckspeer. Sehr häufig ist die Verbindung von Dreieck und Bogen, und zwar wird entweder der Bogen auf die Grundlinie des meist langausgezogenen spitzwinkligen Dreiecks, in dieses hineingestellt (Abb. 212 Fig. 3 u. 45), oder umgekehrt das Dreieck wird in den Bogen gesetzt, so daß seine Spitze in die Mitte der Bogenbasis und die Dreiecksbasis in die Bogenlinie fällt (Abb. 212 Fig. 45).

Gern füllt man ein Dreieck oder einen abgeflachten Bogen mit dem Fischgrätenmuster (Abb. 212 Fig. 11, 13) aus oder vereinigt zwei der letzteren miteinander, oder man teilt ein Muster in zwei Hälften und schiebt ein zweites

Abb. 212. Schemelmuster.

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

Abb. [illegible] Muster von Feltrommeln (abgerollt).

dazwischen, wie in Abb. 212 Fig. 44, wo ein Kauristrangmuster in ein anderes, und Fig. 43, wo ein Sumpfpalmenblattmuster in ein Schachbrettmuster eingeschoben ist. Besonders an letzterem Beispiel ist sehr gut zu erkennen, daß das eine Muster tatsächlich eingeschoben ist, und nicht etwa oben und unten zwei andere Muster an das erste gesetzt sind.

Alle genannten Muster sind, außer auf den Schemeln, auf den Stielen der Rührlöffel — nur in Anpassung an den Raum kleiner und weniger sauber ausgeführt —, sehr selten an denen der Schöpflöffel angebracht. Dagegen sind manche Felltrommeln in hervorragend künstlerischer Weise verziert, vielleicht darf man sagen, daß das erste Feld von Fig. 1 Abb. 213 einen Triumph der Kerbschnitzerei darstellt. So wie bei dieser sind bei allen großen Felltrommeln der Pangwe die Schnitzmuster auf erhabenen Dreiecksfeldern zwischen oberem und unterem Trommelring (der oft in gleicher Weise verziert ist) angebracht. Diese Felder reichen bei den Ntum und Fang über den ganzen Mantel des Trommelzylinders, so daß ihre Basis oben, ihre Spitze unten liegt; bei den Mwai wird die Mantelfläche durch einen Ring in zwei Hälften geteilt, die mit nach der Mitte gerichteten Dreiecken ausgefüllt sind (Abb. 214). Die Verzierung selbst ist bei ihnen viel einfacher.

Bei den Mwai sah ich übrigens einen Hauspfahl, der mit ähnlichen Mustern in gleicher Anordnung wie die Trommeln beschnitzt war.

Abb. 214. Trommel der Mwai aus Makên (Fam. Sebö), Neu-Kamerun.

3. Ritzmuster.

a) Ziernarben.

Die Muster der durch Schnitt entstandenen Ziernarben sind nicht reichhaltig, es gibt nur etwa ein Dutzend. Sie kehren ständig in derselben Form wieder und zeigen keine Neigung zu wesentlicher Abwandlung.

Von den ursprünglichen Grundmustern sind auf sie übernommen worden das von einer Diagonale durchzogene Rechteck (hier *esń[s]-mrńń* = Halbmuster genannt), Abb. 215 Fig. 9, die geraden Parallellinien (hier *mekön* = Führungsstöcke genannt), Abb. 214 Fig. 10, oft vereinfacht zur einfachen Linie *l*, und der Bogen *a* (hier *makṣ* = Bögen genannt); von gleichartig abgewandelten Mustern das spitzwinklige Dreieck *b* (*ndü-mbön* = Pfeilblatt) und der Kreis *c* (hier *alṇk* = Strudel genannt); von ungleichartig abgewandelten Mustern der Dreieckspeer *d* (*mbṇ[s]-akönń*). Bekannt ist uns auch der Widerhakenspeer *e* (*ngam-akönń*), von dem ich bereits gesagt habe, daß er bei den Ziernarben entstanden ist, und zwar wahrscheinlich aus einer

ABB. 215. Ziernarben. Fig. 1 Essabok, von vorne. Fig. 1a ders., Bauch von der rechten Seite. Fig. 2 Jaunde, Nacken und Rücken. Fig. 3 Essanong unter der Brust. Fig. 4 Schumu, linke Rückenhälfte. Fig. 5 Schumu von vorne. Fig. 6 Okông von vorne. Fig. 7 Okông, Brust. Fig. 8 Schumu. Fig. 9 Essong. Fig. 10 Jemandschim. — Fig. 1, Fig. 4 und Fig. 6 sind z. T. tätowiert.

Verbindung der Linie (der abgewandelten geraden Parallellinie) mit der Figur des in ein Dreieck gesetzten Bogens (vgl. Abb. 212 Fig. 3), dessen Basis wegfällt. Neu sind:

von gleichartig abgewandelten Mustern: der unvollendete Bogen *f* (*erwda* = Biegung);

von ungleichartig abgewandelten Mustern: die Düse *g* = *żöp* (Dreieck mit Linie), der Strahl *h* = *nsäm* (Winkel, entstanden aus dem Hakenspeer durch Fortlassen des Stiels, mit oben angesetzter Linie) und der Haken *i* = *köb* (halber Winkel mit Linie).

Die fünf Muster: Stöcke, Düse, Haken, Strahl und Strudel stehen, wie ihre Namen beweisen, in enger Beziehung zur Eisentechnik und zum Feuer. In die Linie hat man den Führungsstock hineingesehen, der bei der Anlage des Schmelzofens die Öffnungen für die Düsen des Gebläses freihält, im Dreieck mit Linie, die in entsprechender Anordnung zufällig aneinandergesetzt waren, die Düse wiedererkannt. Derselbe Vorgang wiederholt sich bei dem Haken *(köb)*, mit dem der bei der Eisenverhüttung gebrauchte Schürhaken *(oköb)* gemeint ist, und beim Strudel *(atök)*, den man beobachtete, wenn man das heiße Metall zum Abkühlen in Wasser tauchte, und dieses zischend aufbrodelte (*a tök* = brodeln) und in Ringen auseinanderfloß, und endlich beim Strahl *(nsäm)*, der die offensichtlichste Lebensäußerung des Feuers wie der Sonne ist, und den man deshalb, weil der Arm das Sinnbild der Lebensäußerung ist, genau wie die alten Ägypter als Arm darstellt (vgl. Abb. 215 Fig. 8 *h* und Adolf Erman: „Die ägyptische Religion", Bild des Sonnengottes S. 78).

Ein mir als Tabakspfeife *(mrö-taa)* bezeichnetes Muster, das sich wohl ebenso wie das Düsenmuster aus Dreieck und Linie entwickelt hat, blieb ein vereinzelter Fall.

Nicht erklärt bekam ich ein Muster, das einen Winkel darstellt *(k)* und in Zusammenhang mit dem Dreieck steht.

Die Ziernarbenmuster kommen selten einzeln vor, in der Weise etwa, daß eins den Oberarm schmückt, ein zweites die Brust u. dgl., sondern meist in umfangreichen Zusammensetzungen, in denen die einzelnen Teile aber stets selbständig gesehen werden und ihren ursprünglichen Namen behalten, nur zweimal begegnete ich einer eigenen Bezeichnung für eine derartige Musterverbindung, aber auch sie schloß sich nicht an den Inhalt des Dargestellten an, sondern an den Ort, an dem das Muster angebracht war; das eine hieß Nabelteilung *(osa-döb)* [1]), war über dem Nabel angebracht (vgl. Abb. 215 Fig. 6) und bestand aus einem Querstock mit oben und unten angesetzten Haken, Dreieckspeeren, Stöcken und Bögen — offenbar hatte es früher tiefer, um den Nabel herum gelegen, so daß der Querstock durch den Nabel ging und ihn

[1]) *a sa* = spalten, teilen; *döb* = Nabel.

Abb. 216. Grundmuster der Tätowierung.

„teilte" —, das andere *(zāṣe abēm)* bestand in der Hauptsache aus Halbmustern (diagonalgeteilten Rechtecken) und trug seinen Namen nur deshalb, weil es für die Scheiden der Schwerter und zweischneidigen Messer bevorzugt wird (Abb. 215 Fig. 9).

Die Ziernarben bedeuten dem Fang einen vornehmen Schmuck, und können in der Tat, selbst mit den Augen eines Europäers betrachtet, schön und würdig genannt werden, besonders wenn sie in so außerordentlicher Regelmäßigkeit angeordnet sind, wie in Abb. 215 Fig. 5.

b) Tätowierung.

Die Entwicklung der Ornamentik ist in der Tätowierung weitergediehen, insofern die Grundmuster seltener, die abgewandelten häufiger und mannigfaltiger werden.

An Grundmustern (Abb. 216) kehren wieder Raute (hier als Einzelraute, *bendō be bą* = Raute aus Rotholz, vgl. Abb. 218, *c*, genannt), Varan *(nkook)*, gerade Parallellinien (hier ebenfalls *melōn* = Palmbänder oder *mekōn* = Stöcke,

Abb. 25. Entwicklungsreihen der styro-radialen Muster der Tikuarbauen.

auch *mekón akoo* = Speerstiele oder *mekón e mosó* = Stöcke der Ziernarben genannt), *a*, Bogen (hier *ekólupo-ekputs* = Fallenbogen der Vogelfalle), *b*, und Gräte (*akoo e kjo* = Fischgeräte), hier zum Teil mit bogenförmigem Verlauf der Ästelungen, *c*; von gleichartig abgewandelten Mustern das Kistenmuster *(efima)*, das Pfeilblattmuster *(eníjele ndu)*, *d*, das Spitzenmuster *(mosió)*, *e*, das Korbeckenmuster *(mebége me nkón* = Korbecken oder *mekó* = Palm-

bänder), mit Rückbildung bis zum Winkel, *f*, parallele Bögen (hier ebenfalls *ekɔ̀ŋga nkpaɛ́ɔ* = Fallenbogen oder *melɔ́n* = Palmbänder oder *bemɔ́[k] be nkɔ̀ŋ* genannt), *g*, unvollendete parallele Bögen *(eɛ́ŋda)*, *h*, Halbmonde *(efɔ-ŋpimendin* = vgl. Rindenmuster), *i*, Kreis (hier *ndɔ́ŋge, ŋpimendin* = Vollmond genannt), *k*, und Strudel *(ɔ́ŋk)*, *l*; von ungleichartig abgewandelten Mustern Widerhakenspeer *(ŋpam ekɔ̀n)* und Pfeife *(mɛ́ɔ́ ton)*, *m*.

Neu treten auf (Abb. 217):

Der Vogelschwanz in drei Abarten, dem Milanschwanz *(ŋpɔ̀b-ɔ̀kɔ̀m)*, *a* 1—3, dem Drongoschwanz *(ŋpɔ̀b ɔ̀kɔ̀mɔ̀ke)* [1]), *b* 1. u. 2, und dem Schwalbenschwanz *(ɔ̀kɔ̀no e kàlɛŋmɔ)* [2]), *c*, entstanden aus dem ins Dreieck gesetzten Bogen ohne Basis. Diese Figur haben wir mit der Basis als zusammengesetztes Muster bei der Kerbschnitzerei und mit weggelassener Basis verbunden mit einem Strich als Widerhakenspeer unter den ungleichartig abgewandelten Mustern der Zierarben kennen gelernt.

Tränen einer Schönen *(mɛ́ɔ́ŋe me mbɔ̀n)*, eine einzelne Linie oder Parallellinien mit kursen auf der einen Seite rechtwinklig angesetzten Strichen, mit Vorliebe auf den Wangen angebracht, *d*.

Gabel *(ɔ̀kɔ́ɔ́)*, aus dem vorigen entwickelt durch Ansetzen von ein oder mehreren Stöcken, *e* 1—3.

Skorpion *(kɔ̀ɔ́ŋne)*, gleich dem vorigen mit einer Lücke in der Mitte der „Tränenzeile", *f* 1—3.

Affenschwanz *(ŋɔ̀m ɔ̀ɛ̀m)* [3]), aus Stock, in Verbindung mit Bogen oder Winkel, *g* 1—21. An diesem Beispiel sieht man besonders gut, wie das Auge des Negers von dem Tier gerade das Wesentliche erfaßt, hier den Schwanz und Hinterleib, denn tatsächlich sieht man von den Meerkatzen, wenn sie in der Ruhe sind, nur die von den Ästen herabhängenden Schwänze, was die Pointe folgenden Rätsels abgibt:

ɔ̀ɛ̀mɔ̀ ghɔ̀ɔ́ e bɔ̀le ma mɔ́ɔ́[k] m'ɔ̀ɛ̀ɔ́n.

Gelbbauch-meerkatze [4]), sie sitzt mir in der Verzweigung der Copaifera.

Antwort: *ɔ̀kɔ́-ɔ̀ɔ́* = Tau (Luftwurzeln) des Feigenbaums (Ficus).

Genau so war es bei der Schwalbe, wo der typische gabelförmige Schwanz den Anstoß zum Muster gab, und dasselbe werden wir beim Leoparden sehen, dessen Flecke, beim Nashornvogel, dessen Schnabel dem Muster den Namen gegeben haben.

---

[1]) Dicrurus coerulens Verr.
[2]) Psalidoprocne tessmanni Rchw.
[3]) *ŋɔ̀m* = Cercopithecus lhoesti Pocock, Weißnasenmeerkatze.
[4]) *ɔ̀ɛ̀mɔ̀* = Cercopithecus grayi Fraser.

Leopardenflecken *(zŏ)* F. oder Papageikrallen *(bigi, be kŏs)* Nt., eine Anzahl über- und nebeneinandergestellter Halbmonde, *h* 1—2.

Nashornvogelschnabel *(ngŏŏ* = Nashornvogel, **Ceratogymna atrata** Temm.), eine Biegung (unvollendeter Bogen) mit einem angesetzten Dreieck, *i* 1—4.

Froschbeine *(endm edźŋ)*[1]), eine Reihe nebeneinandergestellter Bogen mit senkrechten Linien zwischen ihnen, *k* 1—7.

Fisch **Barbus guirali** Thomin *(mŋŏ)*, aus Bogen und Dreieck entwickelt, wie Reihe *l* 1—4 zeigt, in der Vollendung aber nur einmal beobachtet.

Spinne *(abŋb)*, entstanden aus den in den Kreis gesetzten Scheitel-dreiecken, die, wie bei dem entsprechenden Schemelmuster, zum Teil längshalbiert sind, *m* 1—4.

An je einmal beobachteten Mustern seien erwähnt:

Eiserne Doppelschelle *(nkŏn)*, aus einem Bogen mit zwei angesetzten Dreiecken (Abb. 219 a), die ich an einem Küstenmwai sah, und die wohl entlehnt ist, da eine Doppelschelle bei den Pangwe nicht vorkommt.

Messer *(okŏŏ)*, das wohl in Anlehnung an das Rechteck (Kistenmuster) entstanden ist, vielleicht in Verbindung mit dem Dreieck, und das möglicherweise absichtlich einem europäischen Messer angeähnelt ist (Abb. 218 b).

Seefisch *(kŏfs a mŏŏ)*, aus Kreis und Linien entstanden, die vermutlich eine Erinnerung an einen Seefisch, Seeschildkröte oder ähnliches ist, und die der Künstler hier in einen aus konzentrischen Kreisen gebildeten Strudel gesetzt hat (Abb. 219 c).

Es erscheint bedeutsam, daß diese drei letzten Vorwürfe Dinge betreffen, die dem Lande bzw. der Kultur der Pangwe fremd sind, und ich glaube, daß sich hier zu dem Spiel mit den bekannten Mustern die bewußte Absicht gesellt hat, ein Erinnerungsbild festzuhalten, also gleichsam ein Übergang vorliegt zum reinen Zeichnen.

Ein ähnlicher Vorgang liegt vielleicht dem „Chamäleon *(dzŋŋbŋŋ)*" zugrunde, das ich zweimal sah, das erstemal war die Entstehung aus dem an einen Halbmond angesetzten Rechteck vollkommen deutlich, so daß sogar die Wölbung des Halbmondes auf der verkehrten Seite saß (Abb. 218 d), das andere Mal war das Tier in Körper und Kopf realistisch gut getroffen (Abb. 218 e).

Die zusammengesetzten Muster, die — wie ich erwähnt habe — in der Tätowierung sich außerordentlich häufen, sind so mannigfaltig, daß sie hier nicht alle erwähnt werden können; wir finden vielfach Halbmond mit Linie und Tränen vereinigt, Dreiecke und Stäcke usw. (Abb. 220).

[1]) *edźŋ* = **Rana senkeri** Ndn.

Abb. 221. Zusammengesetzte Muster der Tätowierkunst.

c) Verzierung von Raphiastengeln usw.

Die Technik, die ich selbst nicht gesehen habe, da es mir nicht gelang, einen ihrer Meister zu treffen, soll mit einem Werkzeug ausgeführt werden, das bohrend oder schabend die Oberschicht der Raphiarinde herausdrückt.

In ihrer Ornamentik kehren Typen aller in den verschiedenen Handfertigkeiten und Kunstzweigen gewonnenen Muster wieder (Abb 221). Es kommen vor:

von Grundmustern: Rechteck (Ziseliermuster), Einzelraute (Beschmieren des Körpers), Varan (Rindenmuster), Fig. 5, Scheiteldreiecke, hier nicht ganz ausgeführt (Rinden- bzw. Kerbschnittmuster), Parallellinien, gerade oder gewellt (Rindenmuster), Bogen (Rinden-, Kerbschnitt- oder Tätowiermuster);

von gleichartig abgewandelten Mustern: Kisten- (Kerbschnittmuster), Pfeilblatt (Kerbschnitt- bzw Tätowiermuster), Schuppentierschwanz, hier nicht vollendet (Kerbschnittmuster), Speerklinge (Rinden- oder Kerbschnittmuster), Mond (Tätowiermuster), Parallelbogen (Tätowiermuster);

von ungleichartig abgewandelten Mustern: Milanschwanz (Tätowiermuster), Widerhakenspeer (Ziernarben- bzw. Tätowiermuster), Sonne (Malen), Chamäleon (Rinden- bzw. Tätowiermuster), Fig. 4 *b*, Fig. 2 *e*;

von zusammengesetzten Mustern: zwei Striche mit Dreiecken (Tätowiermuster), Tränen und Bogen (Tätowiermuster), doppelter Widerhakenspeer (Tätowiermuster), Strich mit zwei Bögen (Ziernarbenmuster), dreifache Parallelbögen (Tätowiermuster).

Neu treten auf eine Zusammensetzung von Quadraten, in die auf jeder Seite ein Bogen hineingesetzt, Fig. 2 *a* (einzelnes Quadrat mit Bögen: Kerbschnitt- bzw. Ziseliermuster), eine S-artige Zeichnung mit eingezeichneten Kreisen (Bänder), Fig. 4 *a*, ferner eine Anzahl Figuren, die wahrscheinlich von der Malerei

Abb. 22. Blasinstrumente.

Fig. 1. Frontansicht. Fig. 1a. Muster auf der abgerollten. Fig. 2 und 2a auf einem Spatelmesser aus dem Gebiet der Bapahin (Kaplinie Imperialgebiet). Fig. 3. Muster auf einem Spatelmesser aus dem Gebiet der Bapahin Bamkum. Fig. 4 und 4. Muster von Bapahin-Pfeifen der Bakwiri einer Vorzeichnungsgebiet.

übernommen sind, nämlich Mann (Viereck, Striche, Bogen), Fig. 2 *b*, Fisch (Dreiecke, Striche), Fig. 2 a, *c*, Gewehr (Dreiecke, Striche), Fig. 3 *a*, Affe (Mond, Kreis, Haken, Strich), Fig. 3 *b*, Katze (Bogen, Kreis, Striche), Fig. 2 a, *d*.

4. Ziseliermuster.

Halsringe, Fußstulpe (seltener Fuß- und Fingerringe), Schwertklingen und Streitäxte werden mit Ziseliermustern verziert.

Von den Halsringen sind nur die dreikantigen verziert, und zwar in der Mitte der vorderen Flächen in je drei quadratischen oder rechteckigen Feldern nebeneinander (Abb. 222a Fig. 1—10). Die beiden Mittelfelder zeigen durchweg je vier den Kanten aufgesetzte Bögen, die zum Teil samt der Fläche zu tiefen Kerben ausgemeißelt sind. Den Außenkanten der Seitenfelder ist je ein ebenso gearbeiteter Bogen aufgesetzt. Die Seitenfelder selbst sind nun verschieden gemustert, und zwar fast nur in „Grundmustern", nämlich dem Rechteck (Fig. 10), der Raute (Fig. 6, Fig. 10), dem von einer Diagonale durchzogenen Rechteck (Fig. 9), den doppelten Parallellinien (Fig. 1), dem Bogen (Fig. 1—10) und der Gräte (Fig. 2); von gleichartig abgewandelten kommt nur der Kreis vor (Fig. 8).

Abb. 222a. Verzierungen auf Messinghalsringen.

Die Ornamente der Fußstulpe verhalten sich zu denen der Halsringe wie die Kerbschnitte zu den Rinden, das will sagen, sie zeigen entwickeltere Formen (Abb. 222 b Fig. 11—13). Auch Grundmuster kommen vor, aber nur in Zusammensetzung, so Bogen (hier *nkõdo* = Biegung genannt) mit dem Dreieck (Fig. 11, 2), Bogen mit Gräte (Fig. 11, 1), Bogen und Parallellinien (Fig. 11, 4 u. 5), Gräte und Gräte (Fig. 11, 3), Spitzen mit Parallellinien (Fig. 13, 2), Dreieck und Rechteck.

Als neues Muster tritt auf der männliche Tausendfuß *(nõm e ngugn)*, Fig. 13, 1, eine von Parallellinien gebildete doppelte Schleife, die sich zu der Fig. 11, 6, Fig. 12, *b* u. *d* weiterentwickelt, aber denselben Namen behält.

Bei den Schwertern (Abb. 223 Fig. 1—12) sind die Muster nur auf dem unteren Ende der Klinge angebracht und bedecken ein mehr oder weniger quadratisches Feld, das unmittelbar an den Griff anschließt. Nach der Anordnung der Muster in diesem Felde unterscheiden die Pangwe zwei Arten, bei der einen ist das Feld gleichmäßig über die ganze Fläche gemustert, bei der

Abb. 222 b. Verzierungen auf Fußstulpen.

Abb. 231. Verzierungen auf Schwertern (Fig. 1—6), und Gewändern (Fig. 11—17).

Abb. 224. Topfmuster der Ntum, Fang und Mwai.

zweiten bleibt ein länglicher Ausschnitt davon frei (Fig. 9 u. 12), und zwar dadurch, daß die gewöhnlich vorhandene schmale Blutrinne nach einer Seite hin verbreitert ist.

Die Muster selbst sind fast nur Grundmuster in allerlei Zusammensetzungen. Eine Auswahl von Mustern auf Streitaxtklingen zeigt Abb. 223 Fig. 13—17.

Anhangsweise ist die Verzierung der Messingscheiden für Schwerter und zweischneidige Messer zu erwähnen, deren Linien sich aus lauter kleinen Punzen zusammensetzen, die mit einem Eisen nach außen herausgetrieben sind (vgl. Abb. 141). Die Musterung besteht fast immer aus aneinandergereihten Halbmustern (in einer Diagonale geteilte Rechtecke), die wir von den Ziernarben her kennen.

Einen Begriff von der Ausbildung der Topfmuster gibt Abb. 224.

B. Zeichnen und Malen.

Die Zeichnungen werden besonders von Kindern oder halbwüchsigen Leuten außen an die Rindenwände der Häuser gekritzelt, seltener auf eigene Rindenstreifen, die an den Innenwänden der Versammlungshäuser angebracht werden.

Ihre Motive sind dem profanen Leben entnommen, und zwar vielfach einer fremden Kultur (Abb. 225). Am häufigsten sind Tabakspfeifen,

Abb. 25. Zeichnungen an Hauswänden (Fig. 1—10) und auf Rindenplatten (Fig. 11—14). Fig. 1, 3, 4 und 8. Mann mit Tabakspfeife. Fig. 2. Tänzer wird in vier Hängematte getragen. Fig. 5 und 11. Mann mit Tabakspfeife zu Pferd. Fig. 6 und 9. Mann zu Pferd. Fig. 7. Mann mit einer Hundepeitsche. Fig. 10. Coitus. Fig. 12. Drei Leute und ein Tier (Kamaeleon?). Fig. 13. Leiter. Fig. 14. Zug zweier Weiber zu Pferde, die von Soldaten begleitet werden.

rauchende Männer und Reiter vertreten. Letztere sind regelmäßig mit beiden Füßen à la Buffalo Bill auf die Pferde gestellt, diese selbst sind durchweg verzeichnet; sie könnten bald ebensogut zur Familie der Eidechsen gehören (Fig. 6), bald als Katze oder Tausendfuß (Fig. 9) bestimmt werden und sind, wenn es hoch kommt, mit einem langen, fischgrätenförmigen Schwanz (Fig. 11 u. 14) ausgerüstet, so daß man sofort auf die Vermutung kommt, der Künstler habe überhaupt noch nie ein Pferd gesehen. Bestärkt wird man darin, wenn man auch in den entlegensten Dörfern, von denen Einwohnern gewiß noch keiner an der Küste gewesen war, Pferdezeichnungen in überwiegender Menge be-

Abb. 228. Zeichnungen eines Dieners des Verfassers. Fig. 1–3 Verfasser, links mit Peitsche, rechts mit Speerstock. Fig. 4 Taschenuhr des Verfassers. Fig. 5 Raphiapalme. Fig. 6 Quastenstachler. Fig. 7 Mann auf einem Zweirad. Fig. 8 Schlüsselbund des Verfassers. Fig. 9 Europäische Kneifzange.

obachtet. Es ist daher wahrscheinlich, daß die Vorfahren der heutigen Zeichner in früheren Zeiten, als die Pangwe noch nicht ihre heutigen Wohnsitze eingenommen hatten, bei den Reitervölkern Adamauas oder anderen afrikanischen Völkern Pferde gesehen und die Kenntnis dieses Tieres durch Bilder, die immer wieder nachgezeichnet wurden, ihren Nachkommen überliefert haben.

In Dörfern, die von der europäischen Kultur beleckt wurden, hauptsächlich in solchen, die an Karawanenstraßen liegen, finden wir häufig Europäer — oft entsprechend ihrer Körperfarbe weiß gemalt — dargestellt, teils allein, teils in einer Hängematte getragen und von Dienern begleitet, teils auf einem Pferde, den Soldaten, die durch rote Kappen hervorgehoben sind, voranreitend. Dabei sind die Beine des Reiters, ähnlich wie auf Zeichnungen unserer Kinder hinter dem Tiere gemalt (Fig. 14).

Sonst sind noch Leute mit Speeren oder Gewehren häufig dargestellt, aber damit sind die künstlerischen Gedanken ziemlich erschöpft; Haustiere oder wilde Tiere sieht man sehr selten, Pflanzen gar nicht, von Geräten nur sehr auffallende (z. B. das große Schmiedeeisen) gezeichnet, und das Meiste ist überhaupt Gekritzel, bei dem sich wohl nur der Urheber, und vielleicht auch der nicht immer, etwas gedacht hat. Obszöne Bilder, wie Fig. 10 Abb. 225, sind eine große

Seltenheit, bei den meisten dargestellten Personen sind sogar die Geschlechtsteile ganz weggelassen. Der Bilderbogen, den mir mein schwarzer Junge zum Abschied überreichte, und den er auch mit meinem Bildnis geschmückt hat (Abb. 226), ist nur für die „moderne Kunstrichtung" und vielleicht noch für die allgemeine Auffassungsgabe der Eingeborenen bezeichnend, hat sonst aber keinen ethnographischen Wert, da eine solche Schöpfung unbeeinflußt nie entstanden wäre.

C. Plastik.

Die Plastik wurzelt noch fast ganz in der Religion und erhält ihre Motive daher aus dem Vorstellungskreise der Ahnenverehrung und der großen Kulte.

Abb. 227. Ende eines Häuptlingsstockes mit menschlicher Figur.

Die Ahnenfiguren sind aus Holz geschnitzte Köpfe oder Vollfiguren im afrikanischen Stil, d. h. mit einer stets wiederkehrenden Ausdruckslosigkeit, die mir bei aller Oberflächlichkeit der Formengebung doch eine gewisse liebenswürdige Naivität und einen stillen Humor widerzuspiegeln scheint. Das kommt in den kalten Museumsschränken freilich kaum zur Geltung, wohl aber in ihrer heimischen Umgebung, zumal wenn die Eingeborenen sie bei den Kultfesten herumtragen und tanzen lassen. Jedenfalls tragen sie nie die verzerrten tierischen Züge, die die papuanische Kunst auszeichnen.

Eine auffallende Ausnahme von den aus einem Stück geschnitzten gewöhnlichen Ahnenfiguren bilden die großen Figuren für Ahnenverehrungsfeste mit angesetzten Armen, die etwas beweglich sind, Beinen und Geschlechtsteilen.

Den Ahnenfiguren schließen sich mit wahrscheinlich ursprünglich religiöser Bedeutung an: menschliche Figuren auf den Enden mancher Häuptlingsstöcke (Abb. 227), dann menschliche Köpfe an dem Mittelpfeiler und an den Ruhebankpfosten der Versammlungshäuser, an den Harfen und am Kastenmirliton, rein profan ist dagegen wohl die Schnitzerei am Gedächtnisspiel, das an einem Ende in einen Kopf ausläuft, ebenso vielleicht die Tierdarstellungen an den Versammlungshauspfosten (z. B. Leopard, der ein Schwein in den Schwanz beißt).

Rein religiöser Bedeutung sind die Masken für den Mondkult und die Lehmfiguren der Kulte, und namentlich in den letzteren erhebt sich die Plastik zu Leistungen bedeutender, man könnte sagen, monumentaler Größe, einer Größe im eigentlichen materiellen Sinne des Wortes (ich sah Figuren von 8 m Länge) sowohl wie in der packenden Wiedergabe des in ihnen symbolisch zum Ausdruck kommenden Gedankens.

Medicine

000

General observations; concept of medicine. -- Medicine men. -- Specialists. -- Remuneration of medicine men. -- Social status of medicine men.

1. Medicines used in sorcery. Sorcery and poisoning. The principal medicine nschu, its composition (white, red, black nschu), preparation, properties, use. -- Frequency of deaths by poison. -- Effects of nschu. -- Preventives and antidotes. -- Sõ-throwing, preventives for sõ-throwing.
2. Medicine to bring luck and ward off misfortune. General observations. -- Medicines for acquiring wealth. -- Mekuk medicines (how obtained, use of the medicines of sorcery, danger, preservation of the skulls, their care, stories of the mekuk). -- Other medicines for wealth. -- Ceremony under the Copaifera, reference to a tale. Homosexual intercourse as a medicine for wealth. -- Medicines for influence. -- Love medicines, great love medicine engongeschok (preparation, elephant tusk medicine, frame; 1) first festive day, dance and purification of the forehead, grove of love, tree of love, fumigation, punishment of the skulls; 2) second festive day, ablution, civet skin dance, final celebration). -- Minor love potions (their explanation), shot medicines, the war medicine angungu, other medicines for good luck, medicines to ward off misfortune.

3. Medicines for cult sicknesses. -- General observations about cult sicknesses. -- Treatment of a Bokung patient, treatment of a Ngi patient.

4. Knowledge of healing. Unrecognized ailments. -- Recognized external ailments, recognized internal ailments, parasites. -- Origin of illness through sorcery, cult powers (invocation of these), and contagion. -- Leprosy, elephantiasis of the testicles, a serious form of diarrhea, frambesia, elephantiasis of the legs, running sores, blood tumors, gonorrhea, swelling of the inguinal gland, eczema, scabies, ringworm, herpes, foot eruptions, epilepsy. -- Medicines for other diseases (backache, heart diseases, etc.), eye inflammations, eye worms, sand fleas. -- Remedies for vomiting and diarrhea, laxatives. -- Poisoning from scorpions, spiny-finned sheatfish, wasps. -- Treatment of external wounds (bullet wounds, stab wounds, burns). -- Sprains and fractures, growths. -- Bandages.

5. Food taboos. Various types. -- List of all animals with indication as to which are never eaten, which are taboo, and which are not taboo. -- A. Mammals. B. Birds. C. Reptiles. D. Amphibians. E. Fish. F. Lower Animals. -- Forbidden plant foods. Reasons for prohibitions are of a religious nature, based on the fear of transference of the food's characteristics to the eater or based on dietary experiences with the particular food. Breaches of the taboos and medicines for them. -- Reasons why certain animals are never eaten or are forbidden to all. -- Reasons for temporary dietary taboos.

129 I am using the concept "medicine" in the sense used by the Pangwe /Ed., the author uses Pangwe [Fang] as the name for a group of tribes in which the Fang are one tribe; the others are the Eton, Mwele [Mvele], Jaunde [Yaunde], Bene [Bane], Bulu, Ntum, Mwai [Mvae], and Mokuk (Oschileba)/, who have a much broader conception of it than we do and unite under the term bika, "medicine," various things which we are accustomed to separate, namely, charms, means for bringing luck and avoiding misfortune, remedies for cult sicknesses, and healing remedies in our sense of the term. In addition, I shall include the food taboos (eki).

The knowledge of medicines is fairly widespread among the 159 Pangwe. Each Pangwe man -- and /144/ even each Pangwe woman -- is familiar with half a dozen or at least a few. However, only a person who is an extraordinarily good observer, who does not stay at home as does the average Pangwe, and who has gained experience and knowledge is designated as a medicine man, ngŋ̄ŋgā̄n I. As was observed in an earlier section /Ed., Vol. I, Section 8/, extreme specialization of all knowledge and skills is found among the Pangwe. This is no less the case with medicines. One man may be familiar with cult medicines, another with ewu medicines; others specialize in the opening of corpses for the detection of ewu, still others specialize in skin diseases, etc. Within these areas specialization goes still farther. Individual medicine men may be specialists for a particular disease (e.g., leprosy) or for a particular method of treating this disease. Such a specialist is called ngŋ̄ŋgā̄n. He is frequently sought from a great distance by patients who do not have a specialist for their case or one of sufficient repute in their own villages.

Medical knowledge is not guarded as a legacy in certain 424 families, but is the property of individuals and is imparted to 159 others by the expert in return for cash payment. This is a business 161 deal of such great importance that a father seldom or never instructs his own son in medical knowledge, as he could not accept much payment from him -- particularly since it is in a sense a matter of his own money -- and he would not do it for nothing

424 759 461 because, in spite of the great love for children, in spite of the intimate relationship between father and son, the Negro is simply not able to endure the effort of working unless the prospect of payment is constantly before his eyes. The price for strangers, [435] to be paid in advance, is 100 spears or a small sheep, in return for which the medicine man will teach his pupil all the cures that he knows.

759 554 754 The medicine men do not have any special social status, authority, or influence. In general, they are regarded only as experienced and skillful persons (akón, i.e., "skillful"). Only those among them who know the medicines of sorcery and give this knowledge to others (including the cult leaders who, by means of a magic medicine, give the cult figures the power to practice sorcery) are feared, and rightly so, because one suspects that with the help of these "medicines" they may practice sorcery, i.e., kill other people, at any time.

1. Medicines for Sorcery

754 [753] We have seen in the previous chapter /Ed., not translated/ that the sources of belief in sorcery are to be sought in the need to assign causes for unrecognized internal ailments, particularly malaria and poisoning. Because of the similarity of their symptoms, these two cannot be distinguished by European outriders,/145/ and even the native inhabitants for the most part find it impossible. At the moment, therefore, it is not possible to obtain a clear picture of these things. It is certain that the Negroes know how to get someone out of the way with poison and that they mix poison with the conscious intention of killing, but it is uncertain to what extent they are conscious of the physiological effects of poison in our sense. As far as I could observe, a generally mystical view of these matters still prevails. All poisoning, just like all internal illness, is sorcery, and all sorcery is the mystical operation of the physical being, detached from the body, that finds its strength in its ewu which has been developed through medicine (see Section 12)/Ed., not translated/. If someone wishes to kill a person

754 or to make him ill, he prepares a medicine which serves to strengthen his ewu and, at the same time to stimulate it anew and in a particular way for the occasion to point out the direction of the victim and to provide the power for the sorcery. In this way also, the cult figures were transformed by a medicine into active magical beings. From the sequence of medicine, ewu, object of the sorcery, the ewu was later omitted, so only the direct effect of the medicine on the object remains. Thus, instead of killing through sorcery, we have direct poisoning. Among the Pangwe these things are as yet still confused. Only among the Jaunde does there appear to be the beginning of a separation between the two, inasmuch as they do not unquestioningly surrender to their fate, but instead attempt to investigate the poisoning and to find and punish the murderer. In so doing, however, barely escaping this Charybdis, they are caught on the Scylla of legal murder; in view of the difficulty of finding the culprit, they proceed in a
[442] very summary manner. If, for example, a chief dies, presumably poisoned by one of his wives, all of them or at least very many of them will be punished by death.

754 The most common sorcerous medicine used for poisoning is
278 nkɔ̃, with which we are already acquainted as a medicine for giving power to the cult figures. It is prepared in three different ways, as white, red and black nkɔ̃. As a rule, all three contain toad poison. In addition, the white one usually contains:

1. fine, sharp-edged splinters of grated cowry shells, mica (ebɔ̃b e dɔ̃ɔ̃b, "scales of heaven"), or glass;

2. skull bones of a man who has been dead for a month and who must have died on the same day that he was taken ill;

[825] 3. toad, Bufo superciliaris Bigr. (mvɔ̃ɔ̃) dried and grated;

4. lizard, Lygosoma fernandi Bart. (ebɔ̃makɔ̃kɔ̃), prepared in the same way (see "Religion" /Ed., not translated/): /146/

5. the poisonous roots of the Dioscorea macroura Harms (dɔ̃ɔ̃k IV), dried over a fire and grated;

6. poisonous hairs of the Leguminosa Mucuna pruriens D.C. (akɔ̃n' ellɔ̃ɔ̃', that is, leaves from the Sea, e.g., leaves of death); at times also

7. scraped and charred rind of the Leguminosa Detarium macrocarpum Harms (emɔ̃k), with whose symbolic significance

[259] [278] we are already familiar.

Another mixture consisted of ground mica, a toad, and ground male fangs.

The red nlɛ̄ usually contains:

1. Lygosoma fernandi Bart. (see above);
2. a red crab from the forest (nkɔ̄ɔ̄lɛ̄ lɛ̄'dɛ̄) (1):

[125]

1. The animal is supposed to make a sound that is reproduced by ɛ̄ɛ̄, ɛ̄ɛ̄.

3. a kind of scorpion (mɛ̄nɛ̄), ground;
4. a chameleon, ground;
5. Mucuna pruriens D.C. (see above).

The black nlɛ̄ contains:

1. ngɔ̄-alɔ'k or ebɔ̄l-alɔ'k, fungus soil dried and ground;
2. alɛ̄n, a fungus growth that lives under water, which is supposed to be very poisonous;

[82] 3. ɛlɔ̄ko ngɔ̄lɛ̄n, a centipede which is greatly feared because of its poison.

The preparation of nlɛ̄ is carried out in the most ingenious manner by expert medicine men. For this purpose, the men sew [287] for themselves a special suit made of the bark of the ondɛ̄m tree [292] (Fig. 50). This suit resembles a long shirt and leaves only the head and hands exposed; these parts of the body are then rubbed [92] with an extract of Heckeria subpeltata (Wild.) Kunth (abɛ̄mɔ̄dɛ̄ɛ̄l), [79] principally in order to protect them against the very poisonous hairs of the Mucuna that fly about. With this preparation, the poison mixers proceed to pound the dried components in a pot and and to mix them by stirring. For this purpose they use a long stick so that they can stay as far away as possible from the poisonous mixture. Indeed, they go even further and call upon old leprous [73] persons to collect and pour the poison into little horns or bags [159] (Fig. 51), since in their case it would not matter if in the process they were to become sick or even die.

754 278 The finished mixture is a bone-dry and extremely fine powder. It is not immediately put to use, but first tried out on dogs. By leaving out certain ingredients, such as the Mucuna hairs, or by means of other combinations, the poison mixers -- so various informants emphatically affirm -- are able to shorten or lengthen the victim's period of suffering at will or to produce only illness without fatal results. /147/

The medicine sold by the medicine men (because of its tendency to decompose rather rapidly, it does not keep very long) is used in the following ways. Either it is mixed with the food or sprinkled on the head of the bed or the floor -- merely inhaling the stuff, it is said, produces severe illness. Otherwise it is buried near the surface where the victim usually sits. The Ntum, furthermore, mix the poison with the pulverized resin of Albizzia [p.4] [711] facrigiata Oliv. (ekiyime) and then place in it for five days the pieces of iron with which they load their rifles.

754 679 Concerning the frequency of secret murder by "sorcery" or murder by poisoning, Europeans certainly have no accurate /Fig. 50 appears here in the original text/ conception, since without further ado we tend to ascribe deaths in the unhealthy regions of tropical Africa to malaria. At the same time, the importance, even for us, of investigating this matter precisely is demonstrated by the following fact. In the small Campo region (disregarding the coastal strip), which has been visited by Whites only in the last few years, no less than six merchants have been poisoned within this short period of time, attempts were made to poison two others.

The effects of the medicine of sorcery, whenever it is a question of poisoning in our /Fig. 51 appears here in the original text/ sense of the term, for instance, poisoning food, depend on its composition. According to descriptions, it produces either terrible pains in the abdomen, as though "fire were penetrating the bowels," or the symptoms are those of blackwater fever, among others, dark urine, or it produces paralysis; thus, there is a great variety of effects so that correct diagnosis is extraordinarily difficult.

278 757 If someone believes he has been poisoned or exposed to poisoning, he employs special antidotes concerning whose value

I am, of course, unable to judge. /148/

In the class of preventives are the leaves of Phyllanthus gracilipes Pax (esǎ̄n elǐ), which are eaten whole or ground. As an antidote for poison in food, the Jaunde use the Corymanthe pachyceras K. Sch. (eyē) and the Sida acuta L. var. carpinifolia K. Schum. (sīxǐm IV), the leaves being ground and eaten. In the Fang region a medicine contisting of the following ingredients is used:

1. Heckeria subpeltata (Wild) Kunth (abǐ'mědzǎ'n), the leaves or stalks ground;
2. ripe bananas (adǐ̄fie) cut in pieces;
3. Sterculia tragacantha Lindl. (edzō'le), bark scraped off;
4. Pachylobus macrophyllus Oliv. (andōlō'm), bark scraped off;
5. Abrus pulchellus Wall. (ozǐ̄zōge III, eloenǐ̄, "herb to counteract nǐ̄"), leaves ground;
6. Desplatsia dewevrei De Wild et Burs. (afǐ̄nōk), bark scraped off.

These six ingredients are placed in water, and then the extract is drunk. As an antidote for poisoned bullets, the first three of the above are mixed together, and the mixture is eaten dry.

A further use of nǐ̄ is called zō̄, from zō, "leopard," because the whiskers of the leopard are used for it. Just as the leopard tracks its victim /Fig. 52 appears here in the original text/ by means of its whiskers and then treacherously pounces on it, the zō̄ thrower wants the same effect. A piece of such a whisker about half a centimeter long is drawn through a fruit of the umbrella tree, Musanga smithii R. Br. (aōǐ), Figure 52, to form a small missile which is dipped in the magic medicine and then hurled at the opponent. If it hits the opponent's skin, he is supposed to get sick and die within three to six days. I myself once had an experiment performed with this "poisoning" -- something I felt justified in doing in view of the natives' conviction concerning its purely mystical effectiveness. Naturally the experiment was unsuccessful. Meanwhile, this did not disconcert my informant; he thought that perhaps the medicine he had been given was not the right one. Aside from being put on whiskers, nǐ̄ is also sprinkled on darts which are shot from ambush when the

754 enemy happens to be dancing with other people at some festivity
679 and in the general excitement does not notice when the missile hits him.

As a preventive against zõ, a medicine is recommended
754 which consists of:
751
278
1. Albizzia fastigiata (E. Mey.) Oliv. (sõ'ne), ground resin;
2. Musanga smithii R. Br., ground involucral leaf (it is slippery): /149/
3. Pouzolzia guineensis Benth, Urticacea (mbõanẽ III), its leaves ground;

Fig. 52. Magic Medicine of a Sõ Thrower, i.e., a Sorcerer or Poisoner.

4. Heckeria subpeltata (Wild) Kunth. (abõmẽdzẽ'u), stalk scraped off;
5. Corynaothe pachyceras K. Sch. (eyõ), its leaves ground;
6. an unidentifiable Euphorbiacea (ayõ), its leaves ground.

This medicine is added to the red wood which is smeared on
[302] the body as a festive decoration.

2. Medicines for Acquiring Luck and Warding Off Misfortune

777
751

I combine these apparently different medicines because there is a number of them that serve both purposes, the acquisition of good fortune and protection against misfortune. Medicines for warfare, for instance, give one unerring aim as well as protection against bullets. The majority, to be sure, are specific means for obtaining luck or warding off misfortune. The Pangwe designate them as bikõ because they are intended to guard against an illness, for he conceives misfortune or the endangering of his good fortune as an illness. We shall do best to take over this conception and to call these devices "medicines." The medicines for good luck are supposed to bring, above all, wealth and good fortune in love, shooting, setting traps, catching fish, and wrestling. The medicines for wealth (bikõ alõ'ma) are based in part on the

777 conceptions developed in connection with the veneration of
751 ancestors, concerning the influence of the ancestors, who live where Nsambe does, on the terrestrial well-being of their
754 descendants. The most important of the medicines for wealth,
777 atum or aseb, that is, the Mekuk medicine, is based on the ideas of sorcery which I discussed in the previous section /Ed., not translated/. The skulls needed for the ancestor cult are not in
[149] this case those from relatives who died a natural death, but from those who were murdered secretly by sorcery (poisoning). Each biA akü'ma, therefore, is a mɔ̄m, a sin. The murder victims,
[826] or rather their souls, are called mekik (1). A person who keeps

1. Etymologically related to nkik, "upper part of the body." Perhaps we have here an intentional circumlocution, because the Pangwe like to avoid the real designation for their mɔ̄m (sin).

the skulls in order to acquire wealth is called e mɔ̄de a bIIE mekik (= e mɔ̄de a n'a mekik), that is, the man who has the Mekuk. I have known a Mekuk man who had no less than ten skulls of his murdered relatives in his house. In addition, the Mekuk man possesses magical devices which he sells on request together with the skulls in exchange for an excessive payment from people who themselves want to become Mekuk men. The latter are of course only sorcerers, that is, people who -- as was said in Section 12 /Ed., not translated/ -- receive the power to practice sorcery in their youth through a medicine, but who perhaps until then had not yet used their power and now want to train themselves in the specialized field of Mekuk medicine. For this purpose, their teacher demands that they murder a close relative, usually a father or mother, and bring him the skull. He himself will give them in exchange an older /150/ skull from his own collection and in addition frequently the back bones. The first
[608] skull of a Mekuk collection is therefore one of a stranger and has already been effective as a medicine. It is not an actual ancestral

754
777
[608]

skull, but may be regarded as such because all the Mekuk people enter into a kind of kinship relation with one another and the skull medicine that has been effective for one will likewise be successful for the others. In this way the new Mekuk man is able to go on murdering and chooses his victims from among his closest relatives, older brothers, sisters, brothers-in-law, uncles, etc., in order to become rich through the mediation of the souls of his victims who do not suspect that the sorcery (or poison) of their dear relative made possible their sudden reunion with Nsambe. Wealth acquired in this way naturally also includes the inheritance which is thereby more speedily obtained. The effect of the magical medicine is described in the following manner. The Mekuk man places the medicine in a cloth and offers this to his brother, for instance. If the brother has "sense," he may say: "Oh, formerly you used to buy many pieces of cloth and gave none of them to me! What's the idea of this piece of cloth now? I don't want it!" Then the Mekuk man himself becomes ill. The Mekuk man may offer his hand to his brother when he returns from a journey, having first sprinkled a medicine into it. Most frequently, however, the medicine is given to a cock which, according to one informant, has its tail feathers plucked out; the cock is then given as a present to a relative home from a journey. If the relative eats the animal, he is supposed to die, but if he refuses it or secretly throws the animal away, the Mekuk man will become ill and die. In still other cases, the medicine is poured into a tobacco pipe, bush salt, or food. Whether any of this has a physiological effect or not must remain undecided, as I have already said on pages 3 and 4.

Even the Mekuk sorcerer believes that a failure of his attempt would result in his death, as we saw in Section 12 /Ed., not translated/ in the case of the wicked sorcerers. It is evidently assumed that if the person attacked notices that he is an intended victim, he himself goes over to the attack and on his part tries to get rid of the enemy. That is to say, according to the Pangwe conception, he sends his sorcery against that of the attacker. It is certain that this belief considerably limits the number of relatives murdered.

757 It is not the bark container known to us from Malan that is
777 used to keep the Mekuk skulls, but rather a chamber dug under the floor of the house (Fig. 53). I saw a bark box used only once, placed on tall props reaching almost to the roof. The chest is divided into two sections by means of a dip in the bottom, and it is carefully leveled and smeared with red wood (hence, the name atum from atóm, "section, /151/ /Fig. 53 appears here in the original text/ room," which refers to the entire medicine). It is covered up by a piece of bark and a thin layer of dirt and thus remains hidden from strangers' eyes. Frequently a chest is placed over it also, or the little underground chamber is located under a bed. On the step-like raised part the medicines (b) are kept inside a circle made of plantain pieces (a). these medicines include nkí, above all, and furthermore bark scraped off the Passifloraceae
[278] Ophiocaulon cissampeloides Hook f. and Adenia lobata (Jacq.) Engl. (undhudóle a ndzik) (1), leaves of evéème or ayóle-beyo,

1. Also used as fish poison (see Vol. I, p. 83).

important because of the nodules in the leaves which make them look perforated like the ewu of a dead magician, and other things. Below the step the skulls (c) are set up in a semicircle so that they face the medicine.

[76-9] The skulls are cared for in a manner similar to the customary manner of treating the Malan skulls. Unlike the latter, they are not served food every day, but nevertheless frequently; sometimes chickens are slaughtered for them, and they are bedbed in chicken blood and have chicken meat set before them.

[80] This medicine, which is unknown in the northern region (Jaunde), is quite widespread among the Fang and is the subject of many tales and stories which make all light men /Ed., men with light skin color?/ break out in a cold sweat. My boys were so excited by the
[82] stories that they maintained they could not sleep if they kept thinking of these hideous Mekuk. Thus it is told, among other things, that the Mekuk walk up and down in their little room at night and make a hullabaloo or even come out of their room and throw

754
777
[164]

(a) Circle made of plantain pieces, (b) magic medicines, (c) skulls of murdered relatives.

the Mekuk man's house companions in their sleep, so that they wake up the next day completely beaten up. They are also supposed to steal money and goods in order to take them to the Mekuk man. In short, the Mekuk stories remind one of the experiences of the man who wanted to learn to be afraid /Ed., in one of Grimm's fairy tales/.

T.7 Other medicines for wealth that utilize the power of the souls are more innocent; they do not require the murder of relatives nor care of the skulls. Instead, their powers are derived from the [§29] habitation of the souls, the Copaifera tessmannii Harms (oyom). The Mekuk skulls must be included only in the event the medicine man already possesses some. The procedure as a rule is as follows. The father of the person concerned goes with a medicine man, /152/ and both clear an area under a large Copaifera. Then a leaf vessel filled with water is set up, and into this some of the bark of the [§30] Copaifera is scraped nine times (three times three); furthermore a stone from the stomach of the crocodile is placed in it if one is available. A peculiar test of the worthiness of the young man is now given. Various objects are placed together in three piles: on the first are placed steamed cassava (women's food) and a basket [§31] [§32] (ebɔ̂ɔ̂) carried only by old women because it has a small capacity; on the second, a rifle, a bundle of vegetables (ngon) with fish, brass ornaments, cowrie shells, and a piece of cloth, all of which are things that delight young people; on the third pile is placed [§33] a fly swatter (implement of the chiefs), a foot ring made of ivory, [§34] and a boiled chicken, in other words, such things as are allotted to chiefs. Now the young man is brought to the piles. "If he has sense," he will go to the last pile and consume the chicken. In this

777 case he has successfully passed the test, is washed with the water from the leaf vessel, and receives the crocodile's stone (Fig. 54) which will help him in the future to become a great chief and very wealthy. If he goes to the pile on which the things for young people are heaped, he will become a philanderer, and as such he will waste his money and come to nought. If he should go to the first pile, he is sure to become insane.

777 Many tales portray the effects of medicines for wealth which
538 Essamniamabōge makes for one of his sons, usually Ekute E., who has sought him out in the land of the spirits. Here, too, a place is always cleared under a Copaifera, and Essamniamabōge then has an entire miniature village [illegible] up, with many huts or other

Fig. 54
Medicine for Wealth (stone from a crocodile's stomach, tied between little sticks so as not to be lost).

things to symbolize the treasures that can be expected. In addition, Essamniamabōge gives his son boxes which contain helpful souls who later will obtain wealth for the person, just like the little men of our fairy tales. Also, as frequently happens in our tales, the conclusion is always that all treasures, especially the houses and wives, disappear at one stroke, usually through the fault of the person concerned, and the man who was wealthy a moment ago is again as poor and miserable as before. Such a tale is reproduced here.

Ekute Essamniamabōge among the Souls

539 Ekute once said to himself, "Oh, I would like to go to the
777 place where my mother was born!" Ekute had only his mother

539
777

and three brothers in the village; otherwise he possessed absolutely nothing, not even a wife, nor did his /153/ brothers have anything. For this reason he set out to visit his relatives on his mother's side, that is, the souls. He soon came to a large forest full of animal trails, and it was not long before he met a porcupine that had hung a bell around his hunting dog's neck so it would track down other porcupines, "for," said the porcupine to Ekute, "the others have eaten my mother's cassava." Thereupon Ekute said, "Why is it that you kill other porcupines; are you not one yourself?" Then the porcupine answered, "That is an affair (1) caused by the souls. Turn around and don't go to them."

1. dzǎm, coastal English, "palaver."

Ekute, however, went on. He soon met a bird that was setting up a trap to catch birds. Then Ekute asked again, "Why do you want to kill other birds; are you not a bird yourself?" The bird answered, "Oh, that is because of the affair with the souls. Turn around and don't go into their land!" Ekute went on, however, and met two pigs that were setting up a pitfall to kill other pigs. In answer to Ekute's question, one pig said that they were doing it because other pigs were in the habit of eating their mother's cassava. Then Ekute asked once more, "Why do you want to kill other pigs when you yourselves belong to the family of pigs?" To this the pigs answered, "That is because of the souls; turn around and go back to the land of men!" Ekute did not want to take their advice, whereupon the pig said, "Ah, Ekute, I thought that by now you had finally developed some sense, but I see that you are just as stupid as before. Go your way to wherever you please!" Then Ekute encountered an antelope that had set up a fixed net. He asked the antelope, "Oh, what are you doing here with the fixed net?" Thereupon the antelope said in reply, "How can you ask such stupid questions, Ekute; I am here to catch the other antelopes." At that Ekute was very surprised, but the antelope asked, "Where do you want to go?" Ekute said, "I want to visit the relatives of my mother." The animal replied, "In that case just go along the path that I have

777
539

taken, and keep going straight until you arrive at a deserted clearing; there you will be close to the village." Then Ekute went on and passed many other animals, elephants, kudu, and so forth, all of which were engaged in a hunting drive. He went on for a long time, for three days, until he finally came to a village where a man was sitting, and the man said, "Now then, where do you want to go?" Ekute answered, "Oh, I want to find the sons of my mother; am I not on the right track here?" To this the man replied, "Yes, indeed, just go into the next village, there you will see them all." So Ekute went on and came to a large village that was full of animals. They were all there, the antelope, the pig, the eagle, the dog, the leopard, the elephant; /154/ oh my! Then said Ekute: "Am I not in the village of my grandfather here?" The animals confirmed this. Then Ekute went into the meeting house and wanted to sit down, whereupon many voices called out about him, "Oh, oh, what do you think you're doing, sitting down on us?" Then he sat down elsewhere, but as he did so a voice said, "Oh, Ekute, look out for my feet; why do you have to sit down just here?" Ekute, however, saw none of the souls, because human beings cannot see souls. Thereupon he said to the invisible beings, "Oh, I just wanted to visit my grandfather and his relatives; if you don't like me, I shall go back again. Whenever I sit down somewhere, I am told, 'Not here,' but I don't see anybody, so what shall I do?" His grandfather finally came shortly thereafter; he took a leaf bag and put medicine into Ekute's ears. The latter immediately fell down dead and awoke as a soul. Then he saw all the people, many, many, and only then did he see properly the large village in which he found himself. All the houses were covered, whereas previously he had seen them with only rafters. Then Ekute spoke, "Oh, Grandfather, I have nothing, no chickens, no sheep, absolutely nothing, and at the same time I have three brothers, who also have nothing, and my old mother. Now I wanted to ask you, if you had a chicken or a sheep, whether you would give it to me (1), for I don't have

1. Of course as marriage money for a wife.

717
539

a wife either." Thereupon the grandfather laughed and said, "Oh, that doesn't matter, it will all turn out all right; first have a proper meal." Thereupon he caught a big pig, killed it, and ate it with his grandson. The next day they slaughtered a sheep, and so they lived happily in great style. After some time, the grandfather said to Ekute, "Come, we shall go into the jungle on that side, and there I shall show you everything; you will become a great chief, and everyone will marvel at you." So they went into the jungle until they came to a large Copaifera (2). There the grandfather said, "Clear everything

2. Copaifera tessmannii Harms.

away carefully around this tree, down to there." The grandfather then went down and asked, "Do you see me?" Ekute said, "No." Then his grandfather said, "Clear that side too!" Ekute did as he was told. "Now you must make little houses, forty on this side and forty on that side!" That, too, Ekute did. Then the grandfather knocked on the Copaifera and behold, it immediately shrank and became so small that they could knock off firewood from its branches. With this they made a large fire on which they boiled the medicine. The grandfather went to a small river and brought with him two bark boxes that could run by themselves. When he called to them, "Come, come," they came by themselves. Now the grandfather spoke, "Dear Ekute, all the things that I am able to give you are here. Take these boxes, they are enchanted boxes, and do not hide them in your village, but underneath /155/ the brook in the vicinity of your village, and in such a way that no one can find them, for if someone should, all is lost. Now when you return, you merely need to utter a wish and it will be fulfilled; the boxes will help you." Thereupon Ekute replied, "Ah, Grandfather, I don't think what you are telling me is quite right." But the grandfather retorted, "Oh yes it is, just go there. Your village will grow and become large, and you will build eighty huts, for you will marry eighty wives, just as you have built eighty houses

717
539

here, and call on the boxes." Ekute did this and called, "Come, come." They did come, and Ekute was very happy and said, "Yes, now I see that you have shown me everything." After the grandfather had once more knocked on the tree to make it regain its original size, the two went back into the village. There, as a pretense in front of the people, the grandfather said that he did not have much to give away and that Ekute was to go home again, but that he would accompany him to the next village. This is what he did, and on the way the grandfather once more instructed him not to display the boxes, but to bury them under the designated brook. Thereupon the grandfather again gave Ekute the medicine that he had dropped in his ears, and Ekute was again a human being and went with his boxes through the forest to his village. When he came to the brook just outside his village, which his grandfather had told him about, he dug another bed for the brook, made a hole in the old bed, and placed the boxes inside it. Then he threw dirt over them and redirected the course of the brook (1). He then went into his village. The

1. This idea is not new and reminds one of the burial of a dead body in a river bed. Thus, Mgr. Le Roy reports on the Okoa, a Pygmy people on the Gabon, in the following manner. "In the middle of the forest the course of a brook is redirected and the corpse, which is wrapped in mats and pieces of bark, is lowered into the pit dug into the bed of the brook. This is done around midnight, and the women and children are kept away. A large stone is placed on the head of the corpse, and it is surrounded completely with loam to prevent the water from getting to it." See also "Das Grab im Bueno /The Grave in the Bueno/." /Ed.., a poem by Von Platen, a German poet of the nineteenth century/.

people there were of course greatly surprised, and one of his

777 brothers said, "Oh, Ekute, we thought that you had died long
599 ago since you were gone for such a long time. What have you been doing?" Ekute answered, "Ah, I have been running around in the forest and was close to starvation, but I saw no one." Then the brother said, "Oh, Ekute, you are stupid; why do you go so far away? In the meantime we were close to dying of starvation." Then Ekute went into the village where his three houses stood, and seeing that everything was grown over, he said, "Oh, I see that my village has been in ruins for a long time." /156/ Thereupon he cleaned up the area near his house so that it was nice and tidy. Overnight, however, as though by magic hands, the entire village was made so clean and the houses so pretty that one seldom sees the like. All the people who passed by marveled and said, "Oh, what a charming little village; we shall rest here a while." People brought him all kinds of trinkets and gave them to him as a present. At this point, he heard that there was a girl in a village to the east, and he decided to go there immediately. But his brother said, "What, you just came back from a journey, and nothing is in order in your house; you have nothing beautiful on your body, and you are not even oiled." Ekute asked his brother to arrange his headgear nicely. He then tied a brass collar around his neck, put brass rings on his feet and arms, and so went into the village where the girl lived. When he came to the girl's father and spoke to him about his daughter, the father said, "Ah, Ekute, you have absolutely nothing for marriage, but if you want to become friends with my daughter, that's all right too." Then Ekute went to the girl, and when he saw that she liked him, he asked her whether she would not like to go with him to his village later. The girl replied, "Oh, Ekute, you're beating about the bush; I'm ready to go with you any time." Then Ekute said, "Let us depart at once." But the girl replied, "Ah, no, at the moment the food is on the fire." When the food was ready, she offered it to Ekute who, however, said, "Please, let's go; I am not hungry at the moment." Then the girl put the food in a bundle and went with Ekute -- it had meanwhile become night -- to his village. The next morning Ekute asked himself in despair where he was to get the money;

177 he now had a wife, but no money to pay for her. Soon, indeed,
539 the girl's father appeared and reproached Ekute for his thoughtlessness, saying, "Give me back the girl since you cannot pay." Then the man turned around, and when Ekute went into his house, lo and behold! -- there stood five large chests full of spear money and a chest with cloth, as well as a great many other things. Thereupon he called his brother, and with him took all the things to his father-in-law's village. The latter was greatly astonished and thought to himself, "How did this Ekute, who just a little while ago didn't have anything, get all these things?" To Ekute himself, however, he said, "My dear son, you are heartily welcome; I see that you have an enormous amount of money and that you will indeed become a great chief." At this Ekute was, of course, very happy, and he said to himself, "Indeed, now I have a wife, but no plantation from which to make a living." Then he remembered his grandfather's words and went into the forest to pick out a place for the plantation. During the night, chop, chop, the invisible souls cleared the site of the plantation by cutting down the trees and burning it over. When Ekute arrived /157/ the next morning, he found the plantation cleared and burned. Then he said, "Now the tree trunks still have to be removed, and we still need boundaries for the plots for two women, that is, for my mother and for my wife." The next day this also had been done, and Ekute said happily to his mother and wife, "Now plant ngon in the ground; it's time for you to get to work." Then his mother asked him, "What, have you prepared everything and put in the boundary lines already?" "Certainly," said Ekute. Then the two women went to the plantation and planted ngon. Also the souls helped him build a house for his wife. Ekute then went to find another wife, and since he always had bride money in the house, it was only a short time before he had seventy-nine wives. All the plantations and all the houses were prepared for him by the souls. Then, one day, he heard that not far away there lived a very beautiful girl by the name of Odengemaking (1). He wanted to ask for her

1. That is, "she who surpasses all in cleverness."

777
539

hand as well, but his brother warned him, "Oh, when you hear that something is called Odangemaldng, it's very bad; you had better not marry this girl." But Ekute answered, "Come now, why shouldn't I marry her?" Indeed, the girl immediately fell in love with him, and he took her back to his village as his wife. In the evening, however, the girl said, "Please sleep with one of your other wives tonight; I don't feel like it!" Accordingly, Ekute did so, and when he had gone to sleep, Odangemaldng made a fire by lighting a piece of wood and then asked, "All these many things that Ekute has, where do they come from? From this direction?" -- The fire kept burning. -- "From that direction?" -- The fire kept burning. -- "From that direction?" And she pointed in the direction of the path leading to the brook, whereupon the fire went out. Then she went along the path, and when she came to the brook, she again made a fire for the medicine and said, "Where is this affair that has produced all these things? Here?" And the fire kept burning. "And here ? and here?" -- and as she asked, she pointed in all directions, but the fire kept burning. Then she pointed down to where the was standing, and the fire immediately went out. She thereupon began to divert the brook's water and dug and dug until she finally found the two little boxes. Then she said, "So that's the affair," and opened the lids, whereupon, whoops, all the helpful souls contained in them escaped from both boxes and returned to the land of the souls. The wife herself went back to the village and very quickly packed all her things. During the night, however, Ekute came out of the house and said, "Ah, I don't know what has got into my head; I can't sleep at all tonight, so I want to sleep with you." But Odangemaldng called out, "Don't come, don't come into my house!" Then Ekute returned to his house and lay down. Odangemaldng took all her things and returned to her father, to whom she said, "When this man sees that all is spoiled and finds me tomorrow, he will /158/ kill me." The next day Ekute woke up and could not believe his eyes, because everything, the entire village, was gone, and only the three old houses remained as they had been at first; all the women, everything

777 was gone. Then his brother said, "You see what I told you?
539 If you had not married this woman, everything would have been as it was yesterday, but as it is you have nothing left." Emam mese mandmabo ava. (Customary conclusion of tales.)

It is noteworthy that homosexual intercourse is included
777 among the medicines for wealth because it is believed that
838 through the intimate contact the medicine of one will be transferred to the other. In a case known to me in Ebakingon, the passive party possessed the medicine and the active party wanted to acquire it. Another case is related in the tale that I reproduce in Section 18. In actual fact it might turn out that the effect of the medicine consists in the mutual support the two "friends" render each other, based chiefly on the consciousness of common guilt and the endeavor not to let this guilt be known. This medicine is not without danger, for in the case just mentioned it was related that one of the men became blind and the other leprous, and in the tale both parties become leprous or suffer from frambesia.

A variant of the medicines for wealth consists of those
777 which especially help one to marry or abduct women (bikâ e bêm); another variant consists of the means to acquire influence and respect (bikâ e bame, bikâ a vîge), such as the great Annonaceae
[illegible] Pachypodanthium confine Pierre, Engl. et D. (ovôm I) and the Melastomaceae Memecylon teuscheri Gilg (ovôm IV) which, in addition, is also regarded as an authentic medicine for wealth.

In addition to the medicines for acquiring wealth, the most
332 important and the most common are the love medicines (bikâ anfumas). No less than about 100 different plants are placed in the service of Venus.

If the inhabitants of a village have the idea that the love affairs of the young people need revitalizing, a general love medicine festival (engôbôbô) is arranged, which is celebrated under the supervision and with the cooperation of the ancestral skulls worshipped in the Melan. Consequently, only the initiates of the Melan may take part. The course of the festivities together with the period of preparation corresponds to that described in the section on cult festivals /Ed., not translated/: two feast

[832] days and the establishment of a sacred place, on which the Fang even set up a female figure of clay. During the seven days of preparation, the necessary medicines are obtained.

[824] These are bark, scraped off the Annacea Monodora tenuifolia Bth. (ŋ̄ŋ IV) and the Olacacea avɔ̄m, and a small elephant's
[825] tooth, into which are put the following /150/ things.

1. The most important is the larynx (engɔ̄ŋ) of a famous
[826] singer, especially of one who was versed in love songs, or the larynx of a woman who before the payment of the bride price allowed herself to be abducted by her lover. The aim is to obtain the power of the singer, who was loved on account of his voice (famous tenors even in other countries are, after all, not only popular but also loved), and to be loved as he was, or one desires to have the woman consent (with her larynx = voice) to follow the call of love as quickly as did the woman whose larynx has been placed inside the elephant's tooth. The name engɔ̄ŋbɔ̄k was chosen because of the desire to pretend that only the throat of an elephant (bɔ̄k) was involved and to avoid naming the real contents, the human throat. As a name for the whole thing, engɔ̄ŋgɔ̄chok is intended to veil the meaning of the feast just as the animal names conceal the purpose of the cults. In other words, whatever you do, don't call a spade a spade.

2. Sex organs of a mother-in-law, the one who has given birth to the daughter and loved one.

3. The bones of an albino (mɔ̄ŋ-mɔ̄ŋ), preferred by women
[827] because of the skin color (1).

[114] 1. Opinions concerning an albino vary a great deal; in other areas an albino is less highly regarded (Jaunde).

4. The bones of twins, because of the desire to be united with the loved one just as twins are united in the mother's womb.

5. Fulgurites (abɔ̄ŋ-aPiki), so the love will be as powerful
[821] as the lightning that throws down the tallest trees.

6. mɔ̄ŋ, so that the sorcerous beings (= evil persons) will not

[or possibly "risk"; see figure 55, page 26.-Analyst]

832 destroy the medicine.

7. The tooth of a chief, to make one capable of talking as well as a chief, who obviously wins his wives by his words.

824 8. Monodora tenuifolia Bth. (fob IV).

832 9. Ocimum basilicum L. (osim), the "forget-me-not of the Pangwe (a siman, "to remember, not to forget"); the woman will not forget her lover.

10. Aeolanthus edlingeri Gürke, labiates (elihgelihge Fang) with which the women like to adorn themselves since they smell pleasant and have a soporific effect.

11. Abutilon indicum Sw., Malvacea (abofu' III), since the plant has a white sheen, and the woman must see the lover as "pure" as the plant. The tooth is closed off with wax, and a parrot feather, which must have been found in the woods, is stuck on it (Fig. 55).

This medicine brings good luck otherwise than just during
832 the festive period; one could say that it performs miracles. Placed under the threshold in the house of the beloved, in such a way that the girl does not see it, it makes her "consent" immediately when the lover wants to abduct her; if before this, she did not love the suitor, she will now prefer him to all others. In short, she will henceforth "only say yes," and all this has been brought about by the engongeschc with its throat (= voice).

Monodora and avom in a leaf bag are placed in a pot of water, and this is suspended from flexible rod in the center of the festive area in front of the meeting house (Fig. 56, a). The /160/ festive area is customarily closed off by a curtain of raffia leaves; within it /Fig. 55 appears here in the original text/ a peculiar frame (Fig. 56 b) is set up, which, the natives say, is meant to represent traps. In addition, a cult place is cleared at the side of the house, where actual traps are set up. I shall return to these in a moment. A civet's skin with two tail pieces, into which is sewn a love medicine, is hung from the frame.

When all this is ready, the festive goat is fetched, and the ancestral skulls are told that everything is in readiness. Now the actual festival, which lasts two days, can begin.

832
[825]
[415]

Fig. 55. Love Medicine, engongeschok (elephant's tusk with love medicine in it).

In the love festival that I witnessed in Ebiangon, the procedure was as follows. On the first day a dance to the accompaniment of drums took place in the festive area. At the dance, the leading singer swung the civet skin around and made a clatter with the inevitable cymbals. The chief and medicine man (they are not always one and the same person) thereupon

[417]

Fig. 56. Love Medicine Festival engongeschok in Ebiangon (Eseng Family).
(a) Pot with love medicine suspended from a rod; (b) frame to deceive the uninitiated as to the purpose of the celebration.

went to the pot, took the bag out, called the participants individually from the circle, asked them to sit down (see Fig. 57), and sprinkled the medicine /Fig. 56 appears here in the original text/ water on their foreheads in such a way that it ran down the bridge of the nose to the tip. If this did not succeed immediately, the procedure was repeated two to three

Fig. 57. Washing the Forehead at the Love Medicine Festival.

times, and in the case of very recalcitrant drops, the medicine was wiped down the bridge of the nose with a bundle of Abutilon leaves. The festive company then moved to the cult place, in this case called a love grove (elik andʒmin). Just as the cult figures are usually set up on the trees (because of the sorcerous beings, trees with spikes are chosen) and just as the medicines for wealth are made up under the soul tree, the Copaifera, in the same way the love tree belongs to the love grove, namely the Leguminosa Amphimas tessmannii Harms (edʒi) (1). In Ebäangon the tree was only a small one, but

1. a dʒi-á, "to love."

often they are huge specimens. In the background a kind of bench of rods was erected, and under it were heaped a great many twigs of various trees regarded as love medicine. Then the ancestral skulls were set up behind the bench, and the twigs ignited. Those persons who needed an improvement in their love affairs, /161/ /Fig. 57 appears here in the original text/ lay down on the bench and allowed themselves to be thoroughly

832 fumigated (Fig. 56), while the skulls with cold severity surveyed the situation, until they themselves had justice done to them, for they were carried in a dance around the love tree. Meanwhile, a member of the participants took red dye and with it drew a line on the bark of the love tree, observing that they themselves would like to look like this in the eyes of their beloved. Another one took black dye in addition to the red and first made a red line, saying, "In the eyes of the girl to which I shall go (he probably was not allowed to pronounce her name) I want to appear like this (red)"; then he drew a black line and added, "On the other hand, the girl shall see all others like this (black line)." We already know that red is the color of life,
[822] of joy, and of light. Black here signifies its opposite, the unpleasant and ugly.

Finally, a small punishment was meted out to the ancestral
832 skulls by sticking them in the above-mentioned draw traps set
769 up around the tree and leaving them there until the next day. Such a punishment of the ancestors is very rare, and it is significant that it does not occur at the Malan but in connection with the love medicine, which is to be regarded as a degenerate form of the Malan. Then around the tree a great variety of other medicines were distributed, such as red dye and a piece from the loincloth of a mother-in-law. Among the Fang the genitals
[826] themselves are supposed to be taken, these having been cut from the deceased mother-in-law. /162/ /Fig. 58 appears here in the original text/

832 On the forenoon of the second day of the festival about 25
763 banana leaf vessels were set up in a row in the festive area and
[845] filled with freshly fetched water. Into the first vessel the medicine man put a whole pile of bark pieces and leaves, all of them love medicines. The other vessels were treated in a more perfunctory fashion: only a few pieces of bark were placed in the second vessel, and in each of the following, only one; the last vessels did not get anything. The medicine man then sat down at the first vessel, blew into it with a pipe, whereupon a thick,
[988] soap-like foam arose, which supposedly comes from the bark of
[824] the Cylicodiscus gabunensis (Taub) Harms (edfim), and then washed his face, first in this vessel and then in all the following

ones as rapidly as possible. The aim is to purify oneself and through the external purification to bring about an inner one so that the beloved girl will see her entire pure, white as the leaves of Abutilon, and then love him. Whether the desired effect is achieved, I must confess I do not know; externally, at any rate, the favorable effect of the water cannot be denied. The foam is intended to cause the girl's heart to "open up" in the same way. This ablution may also be undertaken at times other than at the love festival, for instance, when a person has his eye on a certain girl, but in that case, the nails, head hair, pubic hair, and underarm hair of this girl must also be put in the vessel. /163/

[326]

While the ablution was still going on, two people ran down the village square and threw the civet skin back and forth to each other, crossing each other's paths as they ran. People amused themselves with a similar ball game, whose significance I was unable to discover during the subsequent dance.

832
526

832 I was unable to discover during the subsequent dance.

The concluding celebration took place in the love grove. A man seized the tree with one hand and swayed about, while the others took the skulls from the traps, danced with them in the opposite direction around the tree, and were embraced by him every time they passed him. Then the festive goat was [832] brought and slaughtered, its blood was poured over the skulls and medicines, and a speech of conciliation was addressed to

Fig. 59.

[824] Love Medicine of the Wood of Monodora tenuifolia.

the skulls. This speech culminated with the request that they should not be angry for having lain outside without food; a goat had now been brought to them, and they were from now on expected to make every effort to assist their descendants in matters of the heart. So the festival ended to the satisfaction of both the skulls and the young men.

It would be impossible here to cite by name all the plants 832 used for love medicines; all we can do is to mention the 824 criteria that were paramount in choosing them, as well as a number of examples. In each case, some quality that is to be transferred to the person is involved, for example, the following.

1. Abundance of blossoms, fruit, and shoots, especially when the blossoms or shoots are beautiful; the desire is to appear likewise in the eyes of the beloved. Monodora tenuifolia Bth. (fõb IV), (Fig. 59), because of its luxuriant shoots with magnificent leaves; furthermore, the Simarubacea Desbordesia glaucescens Engl. (aiõ̂b), with its resplendent red to blue shoots.

2. Beauty of the blossoms. Examples: many orchids (ajã̂ - oõb) and Scitaminea, like Aframomum hanburyi K. Sch. obõ[s] -adzõm, blossoms atsõ[k] adzõm) and Canna bidentata Bertol (ekõn e zõk); furthermore, Mussaenda species, which have colorful top leaves.

832
824

3. Beauty of the leaves. Example: Phyllanthus cappillaris Schum. et Thom. (mɛ̃ʼbɛ̃ III), with its delicate leaves, and the cordate Geophila speciosa K. Sch. (ɛsɛ̃k-ɔbɔ̃ɔ).

4. Beauty of the stems. Examples: Distemonanthus benthamianus Baill. (ɛ́ɔ̃n); Triplochiton tessmannii (ɛ́ɔ̃ɔ); and, above all, Amphimas tessmannii Harms (ɛdɛ̃ɔ) already mentioned.

5. The white color of the stems and leaves: Voacanga obtusa K. Schum. (ɛdɛ̃mvɔ̃n a zɛ́n); Polygonum lanigerum R. Br. (ɛlɔ̃ɔmɛ̃ɔ); and Abutilon indicum Sw. (ɛbɔfɔ̃ʼ) already mentioned. /164/

6. The fact that the trees are isolated (certain trees are supposed to keep down smaller ones through the development of their crowns; in the same way, one wants to keep rivals at a distance), such as ɛngɔ̃ɔ̃ɔ́m and Memecylon tessmannii Gilg (mɛ̃ʼmɛ̃ IV).

7. Beautiful fragrance, such as afɔ̃n and Plectranthus (avɔ̃).

8. Tendency of the plants to wind around others; one wants to be united with the woman in just the same way. Examples: the parts of two lianas that have grown together (Fig. 60) and roots which wind around each other, like those of the Dracaena viridiflora Engl. and Kr. (alɔ̃ʼn-ɔgbɔ̃ʼ III); furthermore, the tendency of plants to wind around other growths, in particular the Rubiacea Sabicea calycina Benth. (ɔkɔ̃ʼdɛ̃n) (1), the Asclepiadacea

1. a kɔ̃ʼ-dɛ̃n, "to wind around, to wind around each other."

Secamone myrtifolia Bth. (ɔkɔ̃ʼamalɔ̃ʼn), and others.

9. Formation of burrs; the desire is to stick to the woman like a burr. Examples: Desmodium species (ɔbɔ̃ʼbomzɛ̃n), (burr fruits); the Cyperacea Scleria barteri Bckl. (pfɛ̃ʼfɔʼlɔ̃ III Ntum), whose leaves and stalks are sticky; and especially the grass Streptogyne crinita R. Beauv. (nkɛ̃m I, nkɛ̃mesɔ̃ʼɔ̃ I), whose panicles stick together with extraordinary firmness. /Fig. 60 appears here in the original text. /

10. Popularity among women. Examples: Kolobopetalum auriculatum Engl. (andɛ̃ʼme III), popular among women as a belt;

832 829 Lycodium smithianum Pr. (onǒk), used by women for ornaments.

I was unable to obtain any satisfactory explanation as to why a number of Ficus species, certain Amaryllidaceae, and gall nuts of the Microglossa volubilis (Wall) D.C. (myǒyǒ) are used as love medicines.

832 835 Aside from plant ingredients, which are used in preponderant number for love medicines, antelope horns (Fig. 61) are especially popular. These are worn as forehead or neck ornaments, and when they are supposed to be effective, they are blown like a whistle. Just as an antelope never has a single horn, but always a pair, so a person should not be alone, but with another.

777 824 229 The no less abundant shot medicines make up a third group of medicines for good luck. Of the 109 plants used for these, 67 are rifle medicines (biǎ̱ ngǒ), that is, medicines that guarantee

[832]

Fig. 60. Love Medicine: a piece formed by two lianas so grown together that they appear as one.

a good shot with the rifle; two war medicines (biǎ̱ betǎ), 18 hunting medicines (biǎ̱ tǐ), four crossbow medicines (bia n mbǎn), two medicines for hunting drives (biǎ̱ a ldǎ tǐ), two medicines /165/ for a lucky eye in hunting, and 14 medicines that raise the hunting efficiency of the dogs (biǎ̱ myǒ) (Fig. 62).

The ingredients of the shot medicines are chosen according to various criteria. First the intention is to lure the game. Hence one takes parts of trees "loved" by the animal (that is, the animal likes to visit them, and hence will visit /Fig. 61 appears here in the original text/ the hunter who has them, even in the form of medicine). In other cases, parts that resemble animals are taken from trees, for example, the tendrils of the Oncinotis tessmannii Gilg (nǐm oǒk, "tail of the red-tailed monkey"), which resemble

789

Fig. 62
(Caption on following page.)

777 a monkey's tail. The hunter thus becomes similar to the animal,
224 as it were, and the animal loses its shyness of him. In still other
224 cases, the game is to be made "weak" while the hunter and his hunting dog are to be made "strong," and for this purpose parts are taken from corresponding plants, or they are taken from trees that bear much fruit in order to have similarly rich results. Finally, plants are chosen which are intended to remove the noxious impurity of the body. /Fig. 62. Medicines of the Fang. (a) medi-
789 cine for wealth, the root of a tree (Homalium africanum) decorated with brass wire and a brass ring; (b)-(d) medicine against enemy weapons; (e) medicine against enemy surprise attacks, fruit of the Tiliaceae Duboscia macrocarpa (okak), to make enemies calm, peaceful (Duboscia and Leptonychia = peace linden); (f) medicine for successful travels; (g) medicine for speaking and singing well, contains the tooth of a tree conny (which is continually "singing"); (h) medicine for the Duhama dance; (i) medicine against palpitations and nervousness, the heart-shaped fruit of the Ertela scandens, worn around the neck (makes the heart strong). about 1/4 actual size; (k) war medicine, leopard claw, 1/2 actual size./ /166/ The manner of use varies; sometimes it is
777 internal, the leaves being cut up into small pieces and eaten with
224 the meat of the animal one has most recently sometimes killed;
789 it is external, in the form of injections of a bark infusion, which have the double effect of removing the impurity from the body and imparting to it the essence of the plant; or a piece of wood is charred and then used to draw a line across the forehead, so that one "looks" just like the plant concerned. Most frequently, the impurity is removed by ablutions; either individual parts, face, hands, and frequently also elbows and the knee, as well as the rifle, are washed in medicine water; or the entire body is washed in a stream, on which occasion a little dam blocks off the water which, after the completion of the ablution, is again allowed to run its course so that it will carry the dirt far away downstream (ôlle nkial). In order to guarantee the lasting efficiency of the
777 medicines, people generally wear pieces of wood and bark as
224 pendants on neck chains, hunting pouches, satchels, belts, and so forth.

The veneration of skulls likewise occurs in the case of the
769 hunting medicines. The skull of a man killed by violent means,
224 whose corpse remained on the spot (if the man belongs to the same
824 kindship group), is kept in a bark box and taken care of as in an-
cestor worship. When a huntsman kills a wild animal, for exam-
ple, he takes the first piece that falls to him in the distribution of
the meat to the skull as a thanks offering. This piece consists of
the sex organs and the flesh around them (ekī)ā', see Fig. 92 in
Vol. I). After he has taken it to the skull, he carries it off again
[762] to eat it himself. On the other hand, if there has been no luck
on the hunt, a chicken is killed for the "man" in the box so he
will see to it that a wild animal soon appears in front of his
prodigal's rifle and will be hit as effectively as he was in his time.

In addition, the Fang have a great war medicine, a celebra-
721 tion which is called afgōgu and is a companion festivity to the
789 engongechub. On this occasion, a sacred place is set up, a sub-
terranean corridor similar to that described in the case of the Ngi
/Id., not translated/ is dug, and a dwarf antelope, Cephalophus
[825] melanorheus Gray (ngbwō), which must have been caught alive,
is brought to the place. Then the medicine man stations himself
at one end of the corridor, and all the other men, armed with rifles,
[824] hang a seed of the Sarcodeia rubriflora Engl. (afāna(k)) as medi-
cine around their necks, and crawl -- the first with the antelope
in his arms -- through the corridor. At the exit, the medicine man
gives all of them, including the antelope, a medicine. The
antelope is thereupon released, and it is believed that when a sur-
prise attack is planned and the enemy has got wind of it, the ani-
mal will appear and thereby warn the attackers. By way of medi-
cines to secure the /167/ necessary courage for such an attack, five
different ones are available.

The medicines for trapping and fishing are rarer than the shot
777 medicines, a sign that these occupations are more in the Pangwe's
226 blood than open hunting. I have taken down only eight plants for
229 fish medicines and twelve for trap medicines.

Other medicines for good luck are used for successful buying
777 (two), speaking and singing well (about a dozen), faultless drumming (two), wrestling (29), the Jaunde game of chance (eight), and to make edible plants flourish (nine, see Section 5 /Ed., Vol. I/).

The second class of medicines discussed in this part consists of those used to ward off misfortune. In this category the most important are the medicines against theft (approximately 30), against adultery committed by the women (two), against the shrewishness of wives (one), against rivals among women (three), against forgetfulness and stage fright (three), against rain (only a few, see Section 14), against enemy weapons, against the consequences of cohabiting during the day (seven), of sleeping with pregnant women (for the last two cases there are even prophylactic medicines), and finally, against consequences that occur if one eats unclean animals (seven).

3. Medicines against Cult Maladies

In the description of the cults /Ed., not translated/ it was
764 shown that transgressions of mores resulted in punishments in the form of illness. These cult maladies are real illnesses of the body, but they can be cured only by the power whose anger has caused them. For that reason, they could also have been mentioned in the description of the cults. Every cult power is able to impose a malady, so someone can be Sso sick (Sidong-mba sick), Bokung (Elong sick), Schok sick and Ngi sick; we have already become acquainted with Malan sufferers. Since in the south Ngi is the most common and most feared cult power, the most frequent and most serious cult malady there comes from him.

I saw two cult maladies treated. One case involved a boy who
765 pretended to have Bokung sickness because he did not want to work any more; the second case involved a man who had been shot in the chest during the war and claimed that he had been punished this way by Ngi.

Bokung sickness is supposed to be recognizable by the trembling

755 of the head and hands. In the case in question the good Schona, the name of the boy, feigned these symptoms very well. The Bokung man was summoned, and /168/ drums were set up in front of the sick man's house; the Bokung man disappeared for a moment in the bushes and then reappeared as a chimpanzee (see the Bokung cult, page 65 /Ed., not translated/), amidst the screaming of reed pipes, and performed the ape dance while his assistant prepared the medicines that the sick person was to drink. Then the patient had placed around his neck a raffia pith rope that had been dipped in medicinal red wood (so he would feel as light as raffia pith is light). A line was drawn around about his body with the same color, and the medicine man then uttered the following incantation through the reed pipe:

755 a ŋŏna, a ŋŏna, a ɓŭaŋ a bŭenga
559 O Schona, O Schona, he together (ate) with women

kŭbŭ́ a ke adŭ́n kŭ́ ofŭ́ŋ, a bŭ́ŋ
goat, he goes to step over turtle over, he is possessed

ete, bokŭ́n a bŭ́ŋ nie,
by it, Bokung he has him (made possessed)

nkaku maŋŭ́ a nim ebŭ́
? oil palms?, make straight (like) stick (of the)

dzŭ́ŋ, myŭ́ yŭ, ma nyŭ́ nkŭ́ ŋ,
raffia, dog he dies, I take dorsal vertebra,

a kŭb, a nim, ofŭ́ nkŭ́ ŋ'
take away, make straight, (into the) water down

wŭ, nyŭ́ ɔ́ŋ́n, nyŭ a yŭ́ŋ.
(onomatopoetic) skin unsurpassable, skin it easily.

This song -- like many purification songs -- is evidently very ancient and in part no longer understood. Through its agency the

755 sickness is supposed to be taken away. By way of explaining the
539 verse it may be observed that the initiates of the Bokung and Elong cult are forbidden to eat goats or sheep with women and are forbidden to eat turtles or to step over them. It is assumed that the sick person may have transgressed one of these prohibitions. The phrase "making straight" refers to the sick person, since he is supposed to become as straight as a raffia stick; the dog represents the scapegoat that is killed and whose dorsal vertebra (the stuff causing the sickness is in the spinal marrow) is thrown into the water instead of the patient's in order to indicate that together with its habitation the sickness itself is to be washed away, taken away. Then the sick man will feel light. Of course, the presence of women is strictly prohibited.

755 Of a Ngi sufferer it is said: ngi a bîlê nif, that is, Ngi has
§24 him, has made him possessed. The treatment is carried out by the Ngi man who appears in the sick man's village amidst roaring and clanging of cymbals; with the Ngi bones in his hand he then dances about to the accompaniment of drum music. In the case that I witnessed, /169/ the barks of various plants were then dissolved in water; among them were especially the following: Lasa guineensis Don (afôwelê), Musanga smithii R. Br. (asôlê), Trema guineense (Schum.) Engl., Vernonia conferta Bth., Costus, Emilia, Uapaca, Antidesma, and Hecheria.

755 The actual "cure" was performed as follows. The Ngi man
beat the patient's head alternately with bundles of the Macaranga and Trema; then he washed the bullet wound with the medicine water and gave the patient a drink of the same water. Thereupon he mixed together red wood, bark shavings, and chicken's blood obtained by forcibly pulling the chicken's beak open; with this paste he drew a line around the sick man's chest, smeared his neck, and painted the bed posts. The next day the Ngi representative appeared once more with bones and sacred thorns, performed all kinds of dances, such as I have described in connection with the Ngi cult /Ed., not translated/, and in a singsong made a kind of exorcism speech similar to that of the Bokung man. In case a single attempt to cure is of no avail, it is repeated; in one village I heard the Ngi man roaring night after night in order to free a seriously ill person of his sufferings.

4. Medical Knowledge.

157 All internal afflictions which the Pangwe do not recognize -- 169 especially malaria, as has been mentioned, as well as migraine (eyŋ̄-nlɔ̄, that is, ewu in the head), and sudden, quickly passing cramps (elīfmu) -- are conceived by them as ewu. That is to say, he thinks of them as illnesses caused by sorcery and fights them with all kinds of mystical remedies that for lack of space I cannot discuss in detail here.

The Pangwe have, however, more or less correctly identified and named a large number of illnesses, especially such as have externally visible symptoms. He names them in the order of their ravingness as follows:

1. ɔ̄ŋm IV = leprosy;
2. ɔ̄ŋ̄ = elephantiasis of the scrotum;
3. ɔ̄ŋ IV (1) = serious form of dysentery, distinguished

1. But ɔ̄ŋ IV = meat, animal.

by a swollen belly (nkɔ̄ŋ I);

4. kɔ̄ŋ̄ III kɔ̄ŋ̄ III = syphilis, only among the Jaunde (2);

2. As recently as 1891 Zenker was unable to observe any syphilis.

5. mabā́da I = frambesia (3);

3. The pockmarks are designated by the Pangwe as mbā́da-mɔ̄ŋ̄ (plural).

6. bendɔ̄mejɔ̄n (plural = elephantiasis of the legs;
7. ɔ̄, pfɔ̄ I = festering boils;
8. ekɔ̄, ekɔ̄, mvɔ̄m IV = furuncles;
9. nkɔ̄k I, edɔ̄, okɔ̄n mabɔ̄ŋ̄k = gonorrhea; /170/
10. nkɔ̄la = swelling of the inguinal glands, bubo;

759
759

11. [illegible] I = eczema, Kraken /E4., 7/;
12. [illegible] = scabies;
13. [illegible] = herpes on the head;
14. [illegible] IV = herpes on the skin.

Towards less serious internal ailments, such as intestinal disturbances, stomach pains, toothaches, and so forth, the Pangwe behave with comparative equanimity. Although they have come to realize that some of these are caused by immoderate eating, spoiled food, and so forth, they do not give up their accustomed way of life. Instead of following a sensible diet, they try to cure themselves by medicines.

Of internal illnesses the Pangwe have terms for the following: [illegible], [illegible], [illegible] = epilepsy; [illegible] = back pains (of a nervous origin); [illegible] = heart disease actually, then mental illnesses because it is believed that nervous ailments proceed from the heart; [illegible] = headaches; [illegible] = lung ailments (consumption?); [illegible], [illegible] I = common cold; [illegible] = neck pains; [illegible] I, usually used in the plural = stomach aches, intestinal pains (when shooting pains are felt); [illegible], [illegible] = toothache; [illegible] I = rheumatic and nervous ailments; [illegible] = stomach-aches (when twitching pains are felt); [illegible] = rump pains; [illegible] = arm pains; [illegible] = hemorrhoids; [illegible] = eye diseases; [illegible] I, [illegible] = inflammation of the eye; [illegible] VII = [illegible] in the eye.

The principal parasites are: [illegible] = eye worms; [illegible] = sand fleas; and [illegible] IV = lice.

759
759

As regards the origin of these afflictions, elephantiasis of the scrotum and the legs is attributed to sorcery; all other serious illnesses are attributed to the cult powers which impose them as a penalty for sins committed. At the head of this list is leprosy, whose name [illegible] should therefore be derived from the root [illegible] (see page 13 /E4., not translated/), "to extend one's hands to punish, to punish." After that come frambesia and incurable festering boils. The cult powers cause these afflictions either independently and on their own initiative, or the cult powers are utilized in the performance of certain symbolic ceremonies with objects connected with their cult. If the Ngi is invoked, for

759 example, in the case of the theft of some food, a bit of the remains of the food, such as chewed sugarcane, is put in a rifle and fired off, or the chewed sugarcane is put in the smithy pit in place of iron and belabored with the bellows. In still other cases, this same sugarcane is placed with a pepper twig in the burrow of
[825] a Lygosoma fernandi Bert. (the scincoid lizard), and a fire is lighted under them. In all /171/ these cases the fire is a symbol of the Ngi (fire cult). Another time the Seo is called upon. If, for example, someone has stolen a wild animal from a trap, the hairs still sticking to the trap are placed in a halved Negro banana (the plant sacred to the Seo) or on a halved piece of the
[824] Ancistrophyllum acutiflorum Becco. nkine I (likewise a cult plant, but its significance is unknown to me), and the thief will then contract leprosy. Furthermore, the remnants of the stolen goods merely need to be placed on the path to a frambesia patient's toilet in order to cause the thief to contract frambesia. Such a manner of wishing an illness upon someone is called a pfu'di, from a pfude, "to do, to lay, to do something to someone, to impose (lay) something on someone, to throw upon."

753 As the third cause of illness, the natives are familiar with the simple communication of diseases, infection (substantive, nkŭ̄hŭn I; verb, a kŭ̄hŭn), and the Pangwe know very well that frambesia is more contagious, whereas leprosy is less so.

In the case of less serious illnesses, some people may get the idea that the illness was involved in some way by offended or harmed companions. In general, however, people do not think about causes; the illness simply comes by itself.

Among the Jaunde the a pfŭ̄'ŭi is unknown because the cults
[149] are not so highly developed as they are among the southern Pangwe.
[759] The Jaunde often blame sorcerous beings.

The fee for treatment of disease is variously handled. In the
759 case of leprosy the medicine man receives 110 spears (seven marks) or a small goat, if his art has been of some help -- otherwise he receives nothing. In the case of frambesia and illnesses of the ewu he receives in advance a chicken, as well as the head and heart of the goat that is slaughtered so that the patient may drink the blood. If the cure was successful, he is paid 50 spears. In the case of less

759 serious illness, an advance payment is not customary; only now and then the medicine man receives a small present, especially since he knows an almost inexhaustible number of remedies. If every remedy is of no avail or should the sick man die, the medicine man will not demand a fee simply from a sense of tact and compassion -- "so that the hearts of the relatives will not be afflicted even more." On the other hand, if there is an improvement, he receives five spears if he lives in the same village and ten spears if he has been called in from outside.

I have nothing to report concerning any ceremonies held during the cure.

Leprosy (nǎm). Figure 63

767 The spots of leprosy -- which appear yellow on the black skin
768 of the natives -- are rubbed with the rough leaves of the Ficus exasperata Vahl (ekǒŋ' Fang) or the stalks of the Manniophyton africanum Muell. Arg. (ŋgǒ Ntum) until /172/ /Fig. 63 appears here in the original text/ blood appears. The following medicines are then dried and ground: Microglossa afzelii O. Hoffmann (ojǎ e ndǎk); plantain peel (oyǒna ekǒn); and Diospyros ampullacea Gürke (efifi'ni), leaves or bark. These are rubbed on the body with resin of Xylopia aethiopica A. Rich. (ojǎ) and oil from the seeds of Mimusops djave (mbǒn adǎ). When the cure begins, a tree fungus is added. A second medicine is the following. After the same preparatory treatment, a tree fungus and bark from Pachyelasma tessmannii Harms (makǒ III) and from an undetermined Rubiacea (oyǒ') are burned together to an ash and rubbed on the body with shea butter oil or raffia palm oil or oil from Carapa procera D.C. (ebǒ). A third recipe recommends leaves of Microglossa afzelii and Phaulopsis longifolius Smis. (ǒǒ-eǒk III) to be placed on the leprous spots. The leaves of the last-named plant are also taken as a preventive after being ground and boiled in the food with an egg (bundle form). In some regions the spots are burned out with a glowing iron, and then the ground leaves of the Apocynacea Psychotria coffeosperma K. Sch. (odimaǒ e' III), together with oil, are put on the spots; or the burned spots are washed with a hot extract of the bark of Eurypetalum tessmannii

.757
278
[342]

Fig. 63.- Leper in front of his Hut, Bébai (Esseng Family), South Cameroons.

Harms (andzĭtsĭn), whole leaves of the Phaulopsis or ground leaves of cassava (Manihot utilissima) and Emilia sagittata L. (alōmvū III) are pressed on the spots, and over them is sprinkled a powder made of the dried and charred roots and stems of the Asystasia macrophylla T. And. /173/ (elŏbokūi). Shortly before the complete healing of the spots, the fruit of Solanum aethiopicum L. var. (ndzē̱i-ʒŭ̱m) is pressed on them so they will become as black as the fruit.

For the later stage of the illness, in which the festering boils form, the following prescription is used: leaves of the Bidens bipinnatus L. (aniŏ́ń), leaves of the Brillantaisia vogeliana Bth. ebūgebŏ́ń), and pieces of bark of Ficus exasperata are boiled together in water; the water is then poured into a leaf vessel and left to stand until it is lukewarm; then the leprosy spots are washed with it. Thereupon, whole leaves of the Fleurya aestuans (L) Gandich (ngūkŭ́n IV) are placed on the boils as a compress. After two days, the leaf is taken off, the washing is repeated, and the young, still folded leaves of the Loganiacea Mostuea buchholzii Engl. (ofū̱mū) are ground and put on the wounds.

757 Whether these medicines really are effective will have to be
278 investigated by doctors. The Pangwe themselves, at any rate,
164 assert that they can cure leprosy in its early stages, and I was shown cases with healed areas that had left lighter spots from which all symptoms of inflammation had disappeared. Frequent repetition of the treatment is presupposed. Leprosy is one of the most terrible and common diseases of the southern Pangwe region. At a Sso festival in Akonangi, for example, I counted seven lepers among approximately 30 men present. With the primitive living conditions and the carelessness of the Negroes, the disease is all too readily communicated. It is true that prophylactic methods
[714] are used; indeed, lepers are even segregated, but only in the advanced stages of the disease and then very incompletely since, for example, they are admitted to all the dance festivals. The
[837] women even seek out lepers by preference for extramarital sexual intercourse. In the north leprosy does not occur so severely; according to the statement of one Jaunde, this is because they use medicines as soon as the illness appears.

757 The explanation of the effect of the medicine, if one is given at all, is always a mystical one, although it should by no means be concluded from this that the plants concerned would not be worth scientific investigation. In the case of leprosy, for instance, the blackish color or the blackening property of the plants is usually declared to be the cause of their effectiveness. The skin is supposed to become black, and therefore the medicine is usually made at night when everything is black: hence, the choice of ojǎ̰n e
[824] ndžīk (Microglossa afzelii) and of ojǎ̰h (Xylopia aethiopica), from a jǎ̰n, "to roast, to blacken"; hence, efifi'di (Diospyros), from fi'di, "coal," because the tree is black as coal; hence, ovīna ekōn (black plantains), from a yīn, "to become black"; hence, osṵ̆ŭ elōk (Phaulopsis) from nsūt, "black." /174/

Elephantiasis of the scrotum (ojūn, mbǎ̰n).

Elephantiasis of the scrotum is not too frequent among the Pangwe, but it is greatly feared by them, probably only because

757 in its later stages it makes sexual intercourse impossible. In the Pangwe region I never encountered the gigantic scrotums that one finds in the Northern Cameroons, for instance. The natives be-
[753] lieve that the disease is caused by worms that ordinarily live in the stomach and are the cause of stomach pains. From the stomach they are supposed to migrate into the scrotum and cause it to swell. Allegedly from the example of the Whites (perhaps
[177] from Nkomakak?), people in a few places have hit upon the idea
[152] of opening the scrotum and cutting out the swellings. The original treatment, which is still practiced today, is to use the medicines for stomach worms. Recipes for these medicines are as follows.

757 1. beyūĕ a ndžīk III, scraped bark boiled with raffia palm
278 resin, the water being in part carefully poured off, the rest injected as an enema. At the same time, pieces of bark of Cylicodiscus gabonensis Harms (edūm) and Alstonia congensis Engl. (ekūk) are placed in a leaf vessel with water; then somebody blows into it with a reed until foam rises. The patient must sit down in the vessel. Both plants contain an acrid sap supposed to drive away the "worms."

2. Illigera pentaphylla Welw. (matū,lū mesiń III), ground leaves eaten with salt and pepper.

3. Citrus limonum Risso (alō's), "because it is bitter and evil-smelling, and so drives away the worms," together with Plagiostyles klainei Pierre (ešŭlă', from a šŭlăn, "to loosen" knots), "so that the disease will likewise be loosened," Oncinotis tessmannii Gilg (njĕm osō'k IV), "because the worms fear the hairs (= the itching)," Brillantaisia lamium Bth. (dźibe elō'k III), "because the plant is bitter," and Stenochlaena guineensis (Kuhn) Unt. (nkădena' III), all boiled together in a pot with water and then used as an enema. In addition, pieces of bark of Mesocarpidium lepidotum Engl. et Diels (amvim) slightly boiled and pressed on the stomach.

4. Dioscorea preussii Pax (abă'n), Xylopia zenkeri Engl. et Diels (odžūę), and an herb osă; leaves or pieces of bark ground together, then boiled a little, and the water used as an enema.

When the healing starts, Maesobotrya (mbă'n-afă'n I) dried, ground, and eaten.

751 278 Furthermore, the following are supposed to be able to cure the disease as well: the Meliacea Trichilia prieuriana Juss (eyǒ), the Rubiacea (oyǒ'), the Rhamnacea Maesopsis tessmannii Engl. (nkǎ́ńgǎ' I), and especially the Leguminosa Millettia tessmannii Harms (niḗ'kemakjī' I). /175/

Serious form of dysentery (tīɩ).

Aside from the symptoms of ordinary dysentery, this disease is distinguished by an unsightly swollen belly, and it frequently leads to death.

As a remedy, Trichilia prieuriana Juss (eyǒ) is used. Pieces of bark are placed in a leaf vessel, hot water is poured over them, and the water is then used as an enema. Hot pieces of the bark are also pressed on the body. Furthermore, the bark of the Leguminosa Amphimas tessmannii Harms (edžī) is scraped off, mixed with red wood, heated on a potsherd over a fire, and then pressed to the belly. The following is also recommended: pieces of bark of Leptonychia tessmannii Engl. Stercubiacea (akǎk), boiled and pressed while hot on the stomach; in addition pieces of bark of a species of Parkia (esḗ,ń) and ground leaves of Cassia occidentalis L. (ebḗī-sī) and Solenostemon ocimoides Sch. et Th. (ayǎ, e sī), from which an extract is made in cold water and consumed, these last two plants being used because of their smell. Finally, pieces of the bark Pseudospondias tessmannii Engl. (angǒkǒń) are boiled, and the lukewarm water used as an enema, or extracts are made with cold water from the bark of Anonidium mannii Oliv. (ebǒm) or from the leaves of Dichapetalum patentihirsutum Engl. (étǎ') and used as an enema (1).

1. For syphilis, only Trichilia tessmannii Harms (atǔm) is used. Pieces of the bark are boiled and placed with water in a leaf vessel, and the patient is made to crouch in it for a long time, or ashes of the bark are sprinkled on the area primarily affected.

Frambesia (mabā'da).

757 278 [164] Next to leprosy, frambesia is the most widespread of the dangerous diseases of the Pangwe region. As various infected Europeans assert, the natives' manner of treatment was markedly successful with them.

The most usual medicine is the following. The diseased areas are cleansed with a decoction, as hot as possible, made from the bark of Heisteria parvifolia Smith (žōebê III) and leaves of Claoxylon africanum Muell. Arg., Euphorbiacea (bešobešōo III), Costus littoralis K. Sch. (2) (zĕlănă' mĭĕm), "so the illness will go

2. Or Costus aff. ligulatus Gagnep.

around one like the leaves around the plant," and a species of Aneilema, "because the leaves are cold and supposed to lessen the heat of the pain." Then the contents of the red fruit (esŭn) of the Cardamom are heated on a potsherd and pressed on the areas. If blood spurts forth, it is washed off with the hot water. Then /176/ the dried roots of a species of Dioscorea (minutiflora Engl.?), awū'nūk, are charred, and the affected areas are sprinkled with the ashes. Finally, the principal medicine is sprinkled on the ashes; this is the milky sap of the nyă,mă ndžīk, two Apocynaceae, Olafia multiflora Stpf. and Oncinotis glandulosa Stpf. Instead of the Dioscorea ashes, fine bark scraped off the Apocynaceae mentioned may also be used. The milky sap is often mixed with ground leaves of the Ochnacea Ouratea nigro-violacea Gilg (okū,m-afă'n), and the bark of Ouratea spinuloso-serrata Gilg (abŏnežŏk Ntum) is often added to the water.

Elephantiasis of the legs (bendūmejăń).

[164] This disease is quite frequent in the Pangwe area and is supposed to be prevalent chiefly among women. It is curable only in the initial stages, when only the foot is swollen. If the swelling has spread to the shank, all efforts are in vain. The treatment that the afflicted person must submit to is a regular horse cure.

757 278 First the feet are beaten with the spiked Acanthus montanus T. Andl. (ndū́ī IV) until the blood pours from them; better still, the upper part of the foot is lacerated with a knife. Then both feet are covered with sand that is heated by several fires. If the pains become unendurable, the patient is allowed to cool his feet in cold water to which are added leaves of Alchornea cordifolia Muell. Arg. (abūī Ntum) and bark of Macaranga heudelotii Baill. (asǎs). The Alchornea is supposed to be "cold" and to have a cooling effect; the Macaranga is supposed to remove the sickness (a sǎ[s] okōn, "to shake off a sickness"). Then the feet are again put into the hot sand bath, and this procedure is carried out three times in succession. The treatment is repeated every other day until there is a cure.

Festering boils (fṓ, pfṓ).

The treatment resembles that for frambesia. Frequently the affected spots are washed with hot or at least warm water and afterwards with the milky sap of the Apocynaceae Olafia and Oncinotis. A few other medicines may be mentioned here.

1. Cissus smithiana (Bak.) Pl. (njǎ'mandūmǎnǎ III): the bark is scraped off just above the ground, placed in water, and then applied to the wound.

2. Costus (miēn IV): after removal of the bark, the stalk is ground, then boiled, and pressed on the wound while still hot. After this, ground leaves of Alchornea cordifolia Muell. Arg. are placed on the wound.

3. After the same preparatory treatment with Costus, leaves of the Asclepiadacea Periploca nigrescens Afz. (abǎń e ndzīk) are placed on the wound. /177/

4. Pieces of the bark of Erythrophloeum guineense (elūn) and Eurypetalum tessmannii Harms (andzītsīń) are boiled, and the water is pressed on the spots; then the leaves of Ampelocissus cinnamochroa Pl. (nsī'sā III) are ground and laid on the wounds.

5. Trichoscypha (eńgǒń): a number of pieces of bark are boiled, and the wounds are washed with the hot water. Then pieces

of the bark are charred and sprinkled on the affected areas.

6. Trichoscypha (amvût): just like 5; in the beginning, after the washing, bark of Conopharyngia brachyantha Stapf, Apocynacea (etū,ě), is scraped off and sprinkled on the spots.

7. Dissotis decumbens (P.B.) Tr. (mabǒmogbwā III): leaves are ground, then boiled, and the wounds are washed with the hot water; then leaves of Solenostemon ocimoides Sch. et Th. (avá,e sī) are placed on the wounds.

8. Solenostemon leaves are ground and pressed out over the wound, together with the sap from the tuber of the Aframomum.

Furuncles (ekiě, ekō, mvǐm IV).

A few medicines will be mentioned here.

1. Commelinacea Palisota preussiana K. Sch. (epfūpfū'i): stalks are scraped off after the removal of the outer layer, and the shavings are tied on the boils.

2. Colocasia antiquorum (atū): the tuber is hollowed out by twirling a knife, and the contents are placed on the affected areas with the resin of Pachylobus fraxinifolius Engl. (ašē,ǎ).

3. A whole leaf of the Euphorbiaceae Maesobotrya (mbǎ'ń-afǎ'n I) is placed on the spot with the resin of Pachylobus, "so it will become small," because the Euphorbiaceae mentioned have small leaves in comparison to Tricalysia macrophylla K. Sch. (mbǎ'ń).

4. A whole leaf of Solenostemon ocimoides Sch. et Th. (avǎ,e sī, edǒdǒelǒ), together with resin, is placed on the spot, "because of the odor."

5. Ancistrocarpus densispinosus Oliv. (akǎ[k] a ndžīk): the bark is scraped off and placed on the spots together with red wood; "akǎ[k] a ndžīk is quiet (compare akǎk, "peace linden") and has odor (?).

6. Gall fruit (plural, bebūma, "fruits") of the Microglossa volubilis D.C. (mvūvū' I) are charred and smeared on the wounds together with oil.

7. Cassava roots are scraped and tied to the affected area.

8. Cucurbitacea Lepistemon owariensis (Spreng.) Hallierf.
757 (nkōmbwǒ̰le III): leaves ground together with red wood and some
278 water and smeared on the affected places /178/; "a bwö̰le (buḛ̄le), break open, the fruit breaks open of its own accord, and in the same way the boil is supposed to break open."

9. Ophiocaulon gracile Harms, Passifloracea (ejǒk): the leaves are heated over the fire and then pressed on the affected places. The fruit of Ophiocaulon are hollow and burst easily, making a slight noise. "In the same way the boils are supposed to burst open."

10. Conopharyngia brachyantha Stpf. (etṵ̄ě): the sap of the plant is sprinkled on the boils, "so they run like the milky sap from the Conopharyngia."

11. Desplatsia subericarpa Bocq. (ukū'kūt a mfǒ'hǒk III): the contents of the fruit are smeared on with red wood, so the swelling will become as small as the fruit of the Desplatsia subericarpa in comparison to the Desplatsia dewevrei (mfǒ'hǒk I).

12. Euphorbiacea Tragia cordifolia Benth (otṵ̄m): the leaves are pressed on with resin. The leaves burn, and it is hoped thereby to dispel the swelling.

Finally, attempts are also made to remove the swellings by
[752] means of external treatments. Thus, the boils are beaten, for example, with the sharp-spiked Acanthus montanus until the blood pours out, and then the wound is covered with the leaves of Dioscorea dumetorum (Kunth) Pax (andéă), or the boils may be cut open with a knife.

Gonorrhea (nkǒk I).

Gonorrhea is supposed to be indigenous to the Pangwe region,
[177] but it is quite infrequent in the untouched interior. In Yaoundé /Ed., in German, Jaunde/, on the other hand, and in the vicinity of the coast, under the influence of "civilization," it is very widespread. The cure of gonorrhea is attempted mainly by internal medicines. For instance, a watery solution of the Conopharyngia (etṵ̄ě) is drunk so the gonorrhea will "flow out," or one may drink a bark extract from Heisteria parvifolia Sm., Flacourtiacea

757 (yiŏ́s IV), from Rinorea dentata (P. Beauv.) O. Ktze., Violacea
278 (olŭ́ń), from Mesocarpidium lepidotum Engl. et Diels, Anonacea (amyim), or from Berlinia acuminata Sol., Leguminosa (epfɔ́bǎ). Instead of pure water, they frequently take sugar water, which first has been placed in the sun, with, for example, a root extract of Triumfettia cordifolia Guillet, Sterculiacea (okūń), or with the Araliacea Schefflera tessmannii Harms (abēokū́ī), with Garcinia purulata Oliv. (mekǎ eli), or with Canarium schweinfurthii Engl. (abē Ntum). Furthermore, leaves for example, from Polycephalium poggei Engl. (okǒngūs), are cut up and eaten with spices (salt, pepper, melegueta) (1) in a ngon bundle, often together with the

1. Melegueta pepper always should be taken to mean Aframomum melegueta K. Sch. (andǔń).

flesh of the spiny-finned sheatfish. The sharp or spiked things used are supposed to drive out the illness, hence, okǒngūs, from okǒń, "knife." More rarely, they use /179/ enemas, with preparations such as an extract from the head of a blossom from the Costus (explanation: "So that the 'body sap' -- this is how the discharge is conceived in this case -- will stick together in the body as do the blossoms of the Costus"), from Rinorea, or Maesopsis tessmannii Engl. (nkǎ́ńgǎ́ I). Furthermore, the skin over the pubes, where the seed arises, according to Pangwe opinion, is lacerated, and ashes of Cnestis ferruginea D.C., Connaracea (ntěbe sī I), are rubbed into the wounds, so that the discharge will "sit down" like the herb (a těbě o sī, "to sit down").

Swelling in the groin (nkǎ́ǎ́).

A procedure aimed at removing the malady entails making an incision in one toe on the side of the body affected and rubbing pepper and salt into the wound. Another prescription goes: leaves of Tricalysia macrophylla K. Sch., Rubiacea (mbǎ́ń I) and Selaginella scandens (B.B.) Sprg. (zělǎnǎ́), charred and then

757 placed on the areas together with oil. The affliction is supposed
278 to miss (a sèlǎn) the person just as the leaves of the Selaginella "miss" their counterparts (the leaves, in other words, are alternate); mbǎ'n from a bǎ̀n, "to evade," that is, the disease is supposed to evade the person just as the tree has an evasive quality (meaning unclear). Furthermore, the disease is driven out by blows with the nettle-like inflorescences of the Urticaceae Boehmeria platyphylla D. Don (sǎ'[s] -dǐǎm IV) or Fleurya podocarpa Wedd (sǎ's IV). Finally, they also grind blossoms of Hippocratea myriantha Oliv. (mesī, ndǐk I) and apply them with oil to the swelling.

Eczema, Krokro (ntǐǎn I).

Prescriptions. 1. Hosluntia verticillata Vahl (osaavō', asǒbenkūm): dip the shoots in hot water and rub them on the affected areas; then apply the ground leaves of the Cyathula achyranthoides (Kth.) Mog. (num e kǒlō't III) with oil. 2. Solenostemon ocimoides Sch. et Th. (ayǎ, e sī): wash the areas with a decoction; then apply the ground leaves of the Apocynaceae Doacanga or Rauwolfia with oil.

Furthermore, parts of the following plants are rubbed onto the areas together with oil: Phyllanthus cappillaris Schum. et Thom (elǒametšǎn IV) (ground leaves), Rumex abessinicus Jacq (esǎn) (heated leaves), Fleurya aestuans (ngūkǔ'n IV) (heated leaves), Palisota thyrsiflora Bth., Commelinacea (ekǒkā̀delǎ'n) (charred leaves), Millettia drastica Welw. (onǔmežǒk) (scraped-off bark), Gouania longipetala Hemsley, Rhamnacea (ngǒnǒ' a ndǐk III) (scraped-off bark).

For scabies the natives frequently use raffia palm oil by itself or with the leaves of Hosluntia or of the Vitacea Ampelocissus cavicaulis /180/ (Bak.) Pl. (pfǎ'ǐǎǒk IV) or Aerua lanata (L.) Juss., Amarantacea (angō'ngō'nǒ III). Also, hoops of Cissus or Lepistemon stalks are slung around the foot.

For herpetic eruptions on the head (akǒ), which for the most part, it is true, are ignored and occur with special frequency among children, tobacco leaves are rubbed on the shaved head, on the head

757 is powdered by making the sole of one's foot quite dusty and then
274 pressing it on the head of the patient.

More widespread is a herpetic eruption of the skin (tōn, matōn) with bright spots that must not be confused with leprosy. As remedies the following plants are known to me: Capsicum leaves are ground and placed on the areas affected; the leaves of Brillantaisia lamium Bth. (dźibě elōk III) are heated and placed on the areas, and a leaf extract is used as an enema (the plant is dark, and the skin is supposed to become dark again); Asclepiadacea Marsdenia ladifolia (Bth.) Schltr. (abodeambě III), the leaves ground and put on the areas together with oil (the plants "blacken"); Clerodendron buettneri Gürke (mavūlū elōk III), because of its hairs.

A less important skin disease, a kind of Krokro which especially attacks the feet and is called aśū,lūk, appears chiefly during the rainy season. Heated shoots of Hibiscus sabdariffa L. (esǎń) and Rumex abessynicus Jacq. (ebūdo esǎń), which are pressed on the diseased areas, are used for it, or leaves of Aneilema aequinoctiale Kth. (nnǎt I) are added to a foot bath.

Epilepsy (okū,bū́k).

According to one view, epilepsy is caused by the fact that along with his food a person has accidentally got a cicada (ngǎmtětě'a IV) into his stomach. According to the dominant opinion, however, it is caused by the fact that one has looked too long into the sun. Medicines for it are the Apocynaceae Rauwolfia and Doacanga, whose leaves are ground and boiled, and used as an enema when they have cooled; furthermore, from Cola ricinifolia Engl. et Krause (alǒn), one root is stuck into the hair, another is scraped and steeped in water, the water then being drunk, and the other roots are put under the bed. The Cola is supposed to be "cold." During an attack, ground leaves of Cissus aralioides (Welw.) Pl. (aṅgǒ'ṅengí) are put in water, and this is poured over the afflicted person. The Cissus causes itching and brings the patient back to consciousness.

757 For back aches Erythrophloeum guineense (elǔn) and the
278 Rubiacea Gaertnera paniculata (esǒ̄ mǒ̄ Fang) are used. The bark of the Erythrophloeum is heated and laid on a bed on which the patient lies down. The bark of the Gaertnera is cut up into small pieces and is put into a larger piece of bark of the same plant; the patient must lie down with his back on it. For organic /181/ heart disease (nnǎ nnēm "pains in the heart"), an extract of the
[826] bark of Sterculia tragacantha Lindl. (edžō'le) is drunk; for mental
[828] disorders, which are also supposed to come from the heart (okǒn nnēm), 10 different medicines have been mentioned to me. By acquiring the particular property of the plant, the heart is supposed to be put to sleep and made dark and small. I have further collected: 21 medicines for headache; four for lung disease (sǒ); nine for the cold; 56 for stomach and intestinal disorders; 54 for toothaches; 47 for rheumatic pains (nnǎ and nnǎ-nkūk); 23 for stomach-aches when twitching pains occur (nnǎ-abǔm); and five for hemorrhoids, among them especially the Cucurbitacea Cephalonema polyandrum K. Sch. (ejažǔ'm).

For eye inflammations, ground leaves of the Rubiacea Chasalia macrodiscus K. Sch. (dži a ndžīk III) or bark scraped off the Euphorbiacea Hasskarlia didymostemon Baill. (efüō'le, dži III) are put in a leaf bag, a little water is added, and the extract flowing out at the bottom is dropped into the eye. The same process is carried out with ground leaves of Ampelocissus cinnamochroa (nsī's ǎ III) as a remedy for sties.

To get rid of eye worms (evǎ'), the sap of the following plants is used: Dipteropeltis poranoides Hallier f., Convolvulacea (atū'k e ndžīk); Diodia breviseta Benth, Rubiacea (dēmezǒ III); Gabunia brachypoda Stpf., Apocynacea (etūe' ndžīk); Phaseolus lunatus L. (okǒkūnǒ III).

The Negro's indifference toward sand lice, Sarcopsylla penetrans (ašǒ), is well known; the Pangwe, too, neglect sand lice wounds and do not use medicine until half the toe is festered. Then ground leaves of Phytolacca abyssinica Hoffmann (atǒt e nkǒ), ground leaves of Ocimum gratissimum L. (asō'b) mixed with oil, or bark shavings of the Euphorbiacea Neoboutonia africana Muell. Arg. (okǒ'jōm) mixed with oil are placed on the wounds, and after a few days the

757 resin of Pachylobus fraxinifolius Engl. (ašē, ǎ), which kills the
278 parasites that might have stayed in the flesh, is smeared on them.

The medicines for lice (nǐn) were given in Volume I, page 188.

An effective emetic, which, however, is rarely used, is supplied by Microglossa volubilis D.C. (myūvū' I). The leaves are ground and steeped in water, and the water is then drunk.

An infusion of the bark of the Olacacea Stromboisopsis congolensis de Wildem. (edžīb, from dzīb, "to close") is supposed to have a constipating effect; it is used cold as an enema. An infusion of avǒm is supposed to have the same effect.

As a laxative Cassia occidentalis L. (ebē'ī sī) is used, the leaves being ground and put in cold water, and this is drunk; furthermore, young shoots from the Rubiacea Urophyllum /182/ callicarpoides H. (mbóšō' III) are ground in water, and this liquid is used as an enema; finally the root of Physedra longipes Hook f. (ebŭ'i) is steeped in cold water, and the liquid used as an enema.

One rarely hears anything about snake bites in the Pangwe
752 region. Despite the fairly large number of species of these reptiles,
136 there are only a few whose bite is almost always deadly. These include Bitis nasicornis Shaw (fē'ī' IV Ntum) and Naja melanoleuca Hall. (eyǐndi nyǒ', "black snake"). Those whose bite frequently leads to death include Naja guentheri Blgr. (okŭm), Atheris squamiger Hall. (yiǒt IV), and two Thrasops species, Thrasops flavigularis Hall. (nkō'dō-nšūt III) and Thrasops aethiops Günth. (nkō'dō-fǎm III). All other species, even if some of them are poisonous, are little if at all feared since their poison is not fatal and can be made ineffectual by medicines. The varying effect of snake bites has given rise to the belief that those who die from them had been engaged in sorcery the night before (nwūǎn I, that is, one who must die), whereas the others did not (nniǎn I, that is, one who shall live).

In the treatment of snake bites the principal role is played by a
752 stone concerning which I was unable to discover any further details.
278 In addition, the leaves of the Urticacea Pouzolzia guineensis Benth (mbǒanĕ' III) or of Solenostemon ocimoides Sch. et Th. (avǎ, e sī) are ground in water, and with this the wounds are washed; or the sap of the Guttifera Haronga paniculata (Pers.) Lodd. (atūī') -- which is also used when goats are castrated -- is dripped into the wounds.

751 A preventive device consists of a brass ring worn on the left thumb, the ring having first been given curative powers by the medicine man through certain ceremonies, for instance, by boiling it in medicines.

752 278 If someone is stung by a scorpion, his urine is applied to the spot, something that the Pangwe ordinarily do not do with wounds. Later, they attempt to dispel the morbid matter by evil smells; [826] for instance, a leaf with vaginal slime is placed on the wound. The explanation by the informant ran as follows in the best coastal English (1):

[124]

> 1. In order to avoid misunderstandings it should be emphasized that my Pangwe people gave their reports in their own language, but that their statements were checked with the help of an English-speaking interpreter.

Bumbo	be	bad	ting,		dem	smell,	he
Vagina	is	bad	thing,	(namely,)	the	smell,	it

come de!
comes out.

An injured foot is put in water in which stalks of Palisota preussiana (epfúpfū'ŋ) have been pounded to bits, or heated leaves of the calabash (ndǭk IV), together with oil, are rubbed on the injury, "because the calabash has a bad smell."

The very painful puncture made by the spiny-finned sheatfish (kō'mesǔm IV), for instance, Auchenoglanis balayi (Sauv.) (nsǐn̄ I) pictured on Plate 9 of Volume I, for whose dorsal /183/ spikes the fisherman has great respect, is made harmless by tying a rope tightly around the arm and then holding the spot over the fire.

The Pangwe combat wasp and bee stings with Heckeria subpeltata (Wild) Kunth (abǒ'medzǎ'n).

Bullets, that is, the pieces of iron with which the rifle is loaded and which, due to the aimless firing practiced by the Pangwe

752 find their way into the bodies of fighting companions, are removed
278 by incision. The sap of Landolphia ochracea K. Sch. (avŭ'm) is then trickled over the wounds, and they are rubbed with oil containing leaves of Chasalia afzelii (Hi.) K. Sch., Rubiaceae (dzî a ndzīk III), or they are washed out with water containing ground leaves of Sarcocephalus sambucinus (K. Sch.) C.W. (alū'mă).

[579] In the case of cut wounds, which occur quite often either during the frequent scuffles with bush knives or as a result of carelessness while clearing the jungle, the wound is covered with the leaves of Cissus vogelii Hook f. (mbómōnezăm I) mixed with snake water, or the sap from the twigs of Pterocarpus soyauxii Taub (mvō' IV Fang) is dripped into the wounds, or they are covered with bark scraped from Amphimas tessmannii Harms (edzī) or the rind of the roots of the Menispermacea Jatrorrhiza strigosa Miers (ndzī'kengū,i I, IV). In the treatment of wounds the following are also used: a Sterculiacea (okū,n e zŏ,k) (leaves ground in water); Combretum mucronatum Thom. et Schum. (otūgĕlĕ III) (leaves ground in the same manner); Coinochlamys schweinfurthii Gilg., Loganiacea (otūgĕlĕ-etŏ,k); and Adenia staudtii Harms (edŏdō ndzīk III); furthermore, Phaseolus lunatus L. (okŏ'kŭno III), the ground leaves put in a leaf bag, and the latter pressed out over the wound; finally, Trichoscypha (olĕ'ne amyūt), pieces of whose bark are boiled and then decanted lukewarm onto the wound; likewise Eurypetalum tessmannii Harms (andzītsin).

In the case of burns, ground leaves of Combretum lawsonianum Engl. et D. (tŏńtŏńebŏ III) and Combretum latialatum Engl. (nsŏsŏ'k I) are applied to the wounds with some water.

About a dozen medicines are known for sprains (mbū'ge) and fractures. In the case of the former, the treatment consists of heating a bundle of the medicinal plant over the fire and then pressing it to the painful areas. Fractures are put into splints with
[283] firmly tied raffia leafstalk strips.

For tumors (etūt) the bark of the Euphorbiacea Cyclostemon tessmannianus Pax (betūte elĭ' III) is used. The tree itself has excrescences on its bark; the latter is removed from the tree, dried, and charred. Then incisions are made into the tumor, and the ashes

752 are rubbed into them. In this case it is clear that the view the
278 natives have of powers of healing is not free of contradiction and confusion. The excrescence on the tree is /184/ natural, that on the person unnatural. By incorporating the tree's natural excrescence in the form of ashes, they hope to induce the human growth to return to its natural shape, that is, to become smooth, while in actual fact one would expect the person to get a swelling from this.

752 For bandages the Pangwe usually use strips of dried banana leaf sheaths. In the case of finger and toe injuries, a small halved calabash, fastened with a string around the joint, is slipped on as a cover (Plate 25).

000 Medicines for impotence, sexual stimulants, devices to influence the woman's sexual life (menstruation, pregnancy, birth) will be treated later (Section 18).

5. Food Prohibitions

262 Pangwe life is dominated by a number of rules which they call
784 bekī (from ekī). These, in the main, prescribe that certain actions shall not be performed at certain times and that certain foodstuffs are to be avoided either at all times or only at certain times. The most important rules are the latter, the food prohibitions. The following are distinguished: 1) ekī bebin = taboo for those not initiated into cults, or ekī bonenga = taboo for women, who are uninitiated as regards the men's cults; 2) eki bongus = taboo for the initiated of the cults, in practice usually of the women's cults; 3) ekī-bondŭ'mǎn = taboo for young, vigorous persons, and the forbidden animals are called dūm; 4) ekī abŭm =
262 taboo for the belly, that is, the prohibition of certain animals at
784 the time of pregnancy, or ekī mǒn = taboo because of the child,
843 that is, food taboos for the duration of the pregnancy and nursing the child, a period during which the taboo applies both to the mother and the father, a consequence of the opinion held by the Pangwe that the woman --as it is always put -- has the lover or husband "in her belly," that is, that the developing fruit is actually

[Text continues on page 60]

/Facing 184/ Plate XXV

341
752
291
142

Fang with a "cover" on his Toe.

262 784 [843] nothing else but the man who with the help of the female body is newly formed, nourished, and born; 5) ekī, bongō'n = taboo for young girls.

The following list will show which animals are never eaten, which are subject to an ekī, and which are not forbidden.

A. Mammals

1. Never eaten.

262 [784] Crocidura species (mbāšū,m I); Mus rattus L. (tōlō III); Sciurus pumilio Leconte (mvūk esōn); and the inside of the elephant's tusks (ngō e zōk I), which it is likewise forbidden to step over, "because flaccid and bitter." /185/

2. ekī, bebin or ekī, bonenga.

Sheep and goats (kabād IV) among the Fang; Simia satyrus L. (woā III) among the Fang; Gorilla gorilla L. (ngī IV); Potamochoerus albifrons Du Chaillu (ngūī, Fang) among the Fang; Cephalophus dorsalis Gray (sō' IV); Neotragus batesi Winton (odžūē') among the Fang; the last two are also taboo for the uninitiated of the Sso cult.

3. ekī, bandúman.

Bats (otā,n), which also may not be touched by adults (ekī, a bi,); fruit bats (indē'm) and Scotonycterus zenkeri Matschie (ngōm I); Dendrohyerax tessmannii A. Br. (nīū'k IV); Perodicticus batesi Winton (awū'n); Arctocebus aureus Winton (māsātšīdi I and III); Sciurucheirus gabonensis Gray (emām IV) which also may not be touched; Anomalurus species (ngui IV); Mus species (edū,); Viverra civetta poortmannii Pucher. (zōē IV); Bdeogale and Herpestes species (mvāk); elephant's trunk "because the limb becomes weak"; elephant's limb; Phatages giganteus Illiger (pfīma IV) and Manis species (kā' IV); Sciurus wilsoni (kūē' III).

4. eki-abum or eki-mon.

262
843

Sheep and goats (kăbăd IV), the large male animals because of their heavy breathing, and the child would have the same heavy breathing; Cercopithecus brazziformis Pocock (fũ̱h IV) and Miopithecus talapoin Erxl. (ozö'm), usually not eaten at all by women capable of bearing children; Cercopithecus buccalis Leconte (ošōk); C. laglaizei Pocock (avö'm) and Colebus anthracinus Leconte (mvõn IV), eaten by some when the child is born and by others during pregnancy, but iff that case they prepare a medicine which eliminates the bad effect; Thryonomys swinderenianus Temm. (mvĭ'b IV) until the birth (if eaten during pregnancy, an antidote is necessary since otherwise the child would get festering skin ulcers, pfõ IV, on the leg; Sciurus rufobrachiatus aubryi A.M.E. (ovē'i) and Sciurus eborivorus Du Chaillu, egg-devouring female (nsõm I); Sciurus rubripes Du Chaillu (edũn) until the birth; Sciurus eborivorus Du Chaillu (mvok) until the birth if the animal was caught in a tree hollow (tree hollow = female sex organ; the child would remain stuck in the same manner in the mother's belly," as the squirrel in the hollow) (1); Cricetomys

1. In what follows I have omitted as obvious the fear of the Pangwe that the child might acquire the same characteristics or properties as those possessed by the animal.

dissimilis Rochebrune (kũi IV) until the birth if the animal is sighted near its burrow and killed during its flight; Atherura africana Gray (ngũm IV) if it is killed by means of baskets at its burrow, /186/ only the skin is taboo if the animal was killed in flight; Mus hypoxanthus Pucheran (abŏk), but because of its small size it is eaten only by young and old people; Mus species (ekŏn), eaten only by young and old people because the animal trembles and because of its small size; Mus species (ndũ̱n I) because of its long feet; Myoxus angolensis Winton (osĭm Ntum) because it lives in burrows; Elephas africanus Blumenb., the head taboo until the birth because it is feared that the child would have an equally big head, the feet until

262 the birth because it is feared that the child would have club feet;
843 Potamochoerus albifrons Du Chaillu (ngūī, IV Fang), head and belly until the birth, the head because of its ugly appearance, the belly because of its warts; Bubalus (niǎ't IV), male animals because they make a rattling noise; Hyemoschus aquaticus Gilg (viǒn, plural lǒn) until the birth; Tragelaphus knutsoni Lemberg (nkǒ'k I) and Cephalophus longiceps Gray (mvū IV), male animals; Cephalophus nigrifrons Gray (žūm IV) until the birth; Cephalophus leucogaster Gray (miē IV Fang), the animal is supposed "to die of its own accord."

5. Taboo for young girls.

262 Mus univittatus Pet. (mvǒ'n IV) because of the shamelessness
[825] of the mouse which in the presence of people steals the Kassada /Trans., cassava?/ as it is being washed; the young girls, therefore are afraid, if they eat the mouse, that a man would steal them just as quickly.

6. Not taboo.

Dog (mvū IV); Maimon planirostris Elliot (esōge); Hemigalago demidoffi Fischer (ozǎm), but eaten only by young people because of its small size; Euoticus elegantulus Leconte (nsēi, I); Sciurus lemniscatus Leconte and sharpei Gray (osōn) among the Ntum and Sciurus subviridescens Leconte (sib IV); Cricetomys dissimilis Rochebrune (kūī IV) if it is caught in a spring trap and is carrying fruit in its cheeks, but in this case the fruit must be kept in the dining area (būū) and burned to cinders after the birth of the baby; Cricetomys dissimilis and Atherura africana Gray if caught under circumstances other than those so far described; Mus longipes A.M.E. (kǒm IV); Mus pusillulus Peters (okib), Mus pulchellus Gray (zǒfǒ III), Mus sebastianus Winton (ekū,ī), Mus species (ayūlū ekū,ī), Mus tullbergii Thomas (ndǎ,n IV), but not eaten by adults because the animal is too small and because it lives in the vicinity of houses; Felis leopardus Schreb. (zǒ IV), Felis servalina Puch. (ebǐ'ǒ); Genetta aubryana Puch. (nsī'ń I); Nandinia binotata

262 Reinw. (mvā,i' IV Fang); Poiana poensis Waterh. (ojǎn); Lutra matschieei Cabr. (abǎn) and Herpestes melanurus Gray (nsōm I); Elephas africanus Bl. (zǒk IV); Potamochoerus albifrons /187/ Du Chaillu (nguï IV); Bubalus (niǎ't IV); Tragelaphus knutsoni Lemberg (nkǒ'k I); Cephalophus longiceps Gray; sheep and goats with exception of the above-mentioned animals; Limnotragus gratus Scl. (žīb IV); Cephalophus callipygus Peters (mvǐn IV) and Cephalophus melanorheus Gray (ogbǔ,n).

B. Birds

1. Taboo for the initiated of the Mekang cult (women).

[794] Guttera plumifera (Cass.) (nkǎ'n I) among the Fang.

2. ekī,-bondǔ'mǎn.

Himantornis haematopus (Tem.) Hartl. (nkū'lūngū' I); Milvus aegypticus (Gm.) (esǐ'sǎ'); Strigidae, especially Bubo species (ndžū,k I) and Syrnium nuchale Sharpe (akūn); Centropus monachus Rüpp. (dūgū' III) and Passer griseus (Vieill.) (mvǎekū,m IV).

3. ekī,-abǔm or ekī,-mǒn.

262
843 (a) Because the bird lives in caves or hatches its eggs in secluded nests: Vinago calva (Tem.) (obǒn) and Columba unicincta Cass. (apfǒ'b) until the birth if caught in the next; likewise Calopelia puella (Schl.) (edūgebǒ'm); Capitonidae, for example, Gymnobucco (ovǒ Ntum), Buccanodon (eji'le), and Barbatula species (omvǒk); Indicatoridae (mā' III) and Picidae (ngǔ'megǒ IV); Bucerotidae, for example, Ceratogymna (ngǔn I), Bycanistes (miǒm IV), Lophocerus fasciatus (Shaw) (okogbwai), and Ortholophus species until the birth in case they are caught walled up in their tree hollow; Nicator species (ekǒ') until the birth if found in the nest; Sturnidae, for example, Lamprocolius species (kbǎ'n IV) and Pocoptera (mesōō'lǒn IV) until the birth.

262 §43 (b) Because the bird has ugly or unnatural visible characteristics: Pteronetta cyanoptera (Tem) Hartl. (alǎt Ntum) until the birth because of its ugly feet; Canirallus oculeus (Tem.) Hartl. (mvūlūbengǎ'ś IV) until the birth because of its long legs and also because of its screeching; Ardeidae (esī'sǒ'-osū,ě Ntum) until the birth because of their long feet and long necks; Lophoaetus occipitalis (Daud) (abǎ'jě'k) because of the long neck feathers; Buccanodon duchaillui Cass. (eji'le) because of its fat belly; Bias musicus (Vieill.) (abǎ'jě'[k] etǒ,k) because of its neck feathers; Diaphorophyia castanea (Fras.) (mekō'boga III) because of the flaps of skin below the eye; Motacilla vidua Sund (mangǒpmentě'me III) because of the bobbing tail; Camaroptera griseoviridis (v. Müll.) (dindī' III) because of the long feet.

(c) Because the bird calls or screeches in a startling and ugly manner: Theristicus hagedash (Lath.) (ngǎmō'mō' I); Turtur semitorquatus /188/ (Rüpp.) (žū'm IV) and Chalcopelia afra (L.) (odū') until the birth; Francolinus lathami Cass. (obǒm) until the birth; Psittacus erithacus L. (kūs IV) until the birth; Musophagidae, such as Corythaeola cristata (Vieill) (kū'nūk IV) and Turacus species (mbǎ' III) until the birth; Eurystomus species (kǎ'mǎ'k IV); Smithornis zenkeri Rchw. (nǔmekūpafǎ'n); Sigmodus rufiventris Bp. (angbūū'ngbūǒ) until the birth; Laniarius leucorhynchus (Hartl.) (nžūěbekō,t IV); Lanius mackinnoni Sharpe (avěwě'abǒbe III); Dicrurus coracinus Verr. (obǎ'mǒke III).

(d) For other reasons: Polyboroides typicus A. Sm. (ehgbǎ,n) because of the way it squirts out its excrement and because of its screeching; Gypohierax angolensis (Gm.) until the birth if shot in the nest, since the bird badly befouls its nest; Alcedinidae, for example Halcyon species (akū'i); Ispidina species (okūdebakū'i) until the birth because of the peculiar way the birds duck down when they are on the lookout; many Muscicapidae, for example, Alseonax and Pedilorhynchus species (okǔ,dūgu) because the bird always settles down on the same spot; Ploceus species (ngā'ǎ III) because of the way they vibrate their wings; Spermestes and Estrilda species (edžō'le) because of the way they keep seeds in their crops, "cheek pouches."

4. Not taboo.

262 Domestic hen; Guttera plumifera (Cass.) (nkǎ'ń I) among the Ntum; Francolinus squamatus Cass. (ogbwǎ); Agapornis pullarius (L.) (kǔ' o kiǎ'i IV); Dryotriorchis batesi Sharpe (gbǎwǔǎ III); Urotriorchis, Baza among others; Falconidae (obǎmedžū,i Fang); Ceutmochares and Clamator (nsǒ'mentǔ't I); Cuculus species (owū'a III) and Chrysococcyx (avē̄vē̄'abǒ̄be III); Lophocerus camurus (Cass.) (nkūkū'e I Ntum); Meropidae (otsidambū,i'), and Hirundinidae, such as Hirundo (mvā,i' IV) and Psalidoprocne species (kǔlejē̄'be III), but not eaten because of their small size; Tschitrea species (abǒbǒge III, mekō'dǒgō III); Campephaga (mbūī'jǒm I); Malaconotus gabonensis Shell. (ekō); Dryoscopus senegalensis (Hartl.) (evǔ'gǔ); Oriolus species (mvū,i'n); Malimbus species (ngǎ e nkǎn IV); Spermospiza guttata (Vieill.) (kǔ o sī IV); Quelea erythrops (Hartl.) (sělěkō'ō III Ntum), but not eaten because of their small size; Nigrita species (makūmašū,bo III), likewise; all Pycnonotidae and Nectariniidae (esǐ'sǒ' Ntum); Cisticola (ekūī'ni-otō,k) and Turdus pelios saturatus Cab. (etī'tǒ').

C. Reptiles

1. Never eaten.

Chamaeleon cristatus Stutsch (dźingbwō' Fang); Lygosoma reichenowi Ptrs. (nšūē' III) and Lygosoma fernandi Burt. (ebǒ'makūkūī'); Agama colonorum Daud. (ngǒdǒ III) (1). /189/

[184] 1. Eaten only among the Jaunde by boys.

2. ekī, bondúman.

Varanus niloticus L. (nkǎā'k III); Cinixys erosa Schw. (kǔ IV); Mecistops cataphractus Cuv. (ngǎn IV) and Crocodilus niloticus

262 (Laur.) (nkŭ̱m I); the majority of snakes, with the exception of those species mentioned below.

3. ekī-abŭ̱m or ekī-mŏ̱n.

[843] Phython sebae Gmel. (mvŏ̱'m IV), until the birth (1); Grayia

[794] [184] 1. Among the Jaunde taboo for all those not initiated into the Sso cult.

smythii Leach (nsŏ̱k I), likewise.

4. No taboo.

Tree snakes (ajǎ'ń).

D. Amphibia

1. Never eaten.

Bufo superciliaris Blgr. (mvŭ̱ń IV); Bufo latifrons Blgr. (dzŭ̱n VII); Rana mascareniensis D. and B. (nkŏ'ń I).

2. ekī bonduman.

Rana zenkeri Ndn. (edzŏ̱); Hylambates species (akǎbě III Ntum).

3. Not taboo, but eaten only by women.

Rappia species (obǎ't); Xenopus calcaratus Bchh. and Ptrs. (mīe̱'nezŏ̱k IV).

E. Fish

1. ekī bonenga.

Large specimens of Clarias walkeri Gthr., since the women

262 would otherwise become Ngi sick.

2. ekī, abǔm until the birth.

262
843 Eutropius banguelensis Blgr. (ekī,da Fang) because of its tendency to spoil rapidly; Eutropius banguelensis? (nkǎ'de-ošōb III) because of its large belly; Distichodus hypostomatus Pellegr. (mbǔń I) because the fish "is supposed to die of its own accord"; Distichodus notospilus Gthr. (akǒ'lo III) because of its large gills; Auchenoglanis balayi (Sauv.), var. gravoti Pellegr. (nsǐn I; small specimens, ndǎngō'na III), because of the large head (see Volume I, Plate 11, Drawing a); Clarias walkeri Gthr. (ngǒ' IV), smaller specimens because of their large head; Parauchenoglanis guttatus (Lönnbg.) (ebū') because of the fat belly; Alestes kingsleyae Gthr. (mbǎk I) because of "the snout."

The other fish are not taboo. /190/

F. Lower Animals

1. ekī, bonduman.

262

Larvae of the beetle Angosoma centaurus F. Pl. (akū,m); the snail Pseudachatina downesii (Gray) (nšō'ǎboń I Ntum); Pseudoglessula retifera v. Mart. (tǎń IV) and another snail (ebǔs).

2. ekī, bonenga, for men ekī, abǔm.

Achatina species, especially marginata Sw. (kō,ī' IV) (1).

1. In case of transgression, the offenders become Ngi sick.

262 3. ekī, abǔm, until the birth.

[843] Edible caterpillars (nkŭn I) and larvae of the Rhynchophorus phoenicis Fabr. (fǒs IV) if found in the cocoon; edible termites (sūē me IV Ntum) because of the large belly.

4. Not taboo.

Edible caterpillars and larvae of Rhynchophorus when they are found in the open; dragonfly larvae (esēī,-bāk), although then the child will urinate a lot, like the dragonfly larvae; common crabs and shrimp; the mussel Lanistes libycus var. bernhardianus (morelet) (alǔn).

All other lower animals are inedible.

Of plant foods only the following are taboo (with the exception [794] of those sacred to the cults, such as the Negro banana used at the Sso and Mawungu): the fruit of the atūlǔm plant, which tastes horrible, and young mushrooms. These are eki mon since it is feared that children might develop spots on their skin like those on young mushrooms.

825 If we examine the deeper reasons why certain animals are never 784 eaten or are "taboo," we find that there is a religious element involved, as well as a fear of the animals' way of life and their appearance, perhaps combined with dietary experiences.

784 Animals that are taboo for religious reasons may not as a rule 825 be eaten by women and persons who have not been initiated into 794 the particular cult, but where the cult is absent, there is no taboo. Thus, horned animals, which play a role in the cults of the Evil One with their conceptual connection between moon and horns, are taboo; among the Fang this applies to sheep and goats, and throughout the entire region to Cephalophus dorsalis (sǒ). In the domain of the Ngi cult the gorilla (ngī) is taboo; the same applies, among the Fang, to the chimpanzee (worshipped in the cult of the Evil Ones, Bokung), the pig (an important animal in the Sso cult), and Neotragus batesi (odzūē) which is worshipped in a manner

825 corresponding to Cephalophus dorsalis in the Odschüle cult. The
784 python /191/ (mvǒ'm IV) is also taboo. We have learned of its
794 relation to the phallus in the Sso cult among the Jaunde, who, as is mentioned in Volume II, page 45 /Ed., not translated/ have preserved in purest form the most ancient views concerning the Sso cult. Large specimens of the fish Clarias walkeri (ngǒ' IV) and Achatina snails are taboo since they evidently have some connection with the Ngi cult, although I am unable to explain in what sense. Finally, among the Fang, the meat of the guinea fowl is taboo for the initiated of the women's cult Nkang. This fact is especially noteworthy since in the men's cults it is usually just the other way around: the initiated are allowed to eat the particular cult animal, while the uninitiated are not.

In surveying the cults, the only animal we find omitted in the taboos is the elephant, which is worshipped in the Schok cult. This can only be explained by the fact that, because of the large quantities of meat it supplies, an exception is made, either voluntarily from the outset or, as seems more probable, through necessity, because it was impossible to guard the huge quantities of meat. For this reason, the women doubtless partook of it and soon noticed that its enjoyment involved no evil consequences of any kind.

The taboo against Sciurus wilsoni (kuē' I Ntum) also seems to have a remote connection with the cults. In contrast to other squirrels, it lives in the swamp and on the ground, and its call is therefore interpreted: sǒ' abǔm, bokūn abǔm, sǒ' abǔm, bokūn abǔm, that is to say, Sso in the belly, Bokung in the belly, or, since both are mesǒ'm, "sins," simply: sinner and double sinner.

825 A number of other animals that are taboo are only indirectly
784 connected with the cults; the taboo stems from older religious conceptions. Chameleons and lizards, especially Lygosoma fernandi, are never eaten because they are linked with death (see Vol. II, p. 30 ff. /Ed., not translated/). For young people, furthermore, the flesh of monitor lizards and crocodiles is taboo, in my opinion because both animals formerly played a more significant role in the religion of the Pangwe. The crocodile probably derived its significance from its habitat in the water, and the monitor lizard, its counterpart, from its habitat in trees and above

825 all from its characteristic of devouring crocodile's eggs (see Volume
784 I, page 273). Finally, turtles and poisonous snakes are taboo. We have encountered the turtle repeatedly in our description of the cults (see the Schok cult, Vol. II, p. 77 /Ed., not translated/, and the Bokung cult, Vol. II, p. 72 /Ed., not translated/) without being able to explain its appearance properly (1). The poisonous

[794]

1. In this connection it is particularly noteworthy that the turtle is the only animal which is prohibited for the initiated of a men's cult.

snakes with their sharply defined head (vipers!) have given rise to the comparison, penis = snake (see Vol. II, p. 32 /Ed., not translated/).

For other taboos it seems to be decisive that the animals lead a nocturnal life and that they have attracted the attention of human beings by their powerful, peculiar screech /192/ (see the prefix classes, Vol. I, pp. 27 and 28 /Ed., not translated/, the nocturnal animal, Vol. II, p. 36 /Ed., not translated/). Included in this category are alipeds, certain lemurs, the tree cony, the flying squirrel; among birds, the night rail Himantornis, the owls, and the West African blue-headed coucal.

Still further taboos seem to stem from the fact that the animals live in the house or near human dwellings and therefore belong, as it were, to the family. In this category we find the domestic rat and its sister, the African rat (edu) which is almost extinct in the Pangwe region, the parasite kite, and the sparrow, the agama, and perhaps also domestic lizards (Lygosoma reichenowi). For the rest of the prohibited animals, their repulsive smell or their ugly and peculiar shape enters in as a consideration. In this connection we should mention: the civet cat and the Herpestes species, with the exception of Herpestes melanurus, the shrews, all of them having a repulsive smell, the shrew otter (Potamogale) because of its peculiar appearance (half mammal, half fish), the scaly anteaters because of their armor, Sciurus pumilio, toads, and frogs. There
[831] is a quite remarkable, real fear of the inside of the elephant's tusks,

825 which one is not even allowed to step over since one's penis would
784 become as flaccid as the elephant's gums. The latter do indeed
[831] look rather uninviting with their bluish-red coloration and flabby consistency. It goes without saying that a woman likewise is prohibited from eating the meat since she could transmit a debilitating influence to the man during intercourse.

In the case of temporary food taboos that are enforced for the
843 duration of pregnancy and nursing, the decisive element -- as I have
825 said -- is the fear that the animals' characteristics might be trans-
784 mitted to the child. For example, there is a taboo against the
262 hawk-eagle, Lophoaetus occipitalis (abǎ'jɛ̄'k), an animal which the Pangwe themselves greatly admire for its beauty, and whose crown the boys try to imitate by sticking long feathers in their hair or behind their ears. In the case of pregnant women, however, the situation is different. They reason as follows: if the child, by acquiring the bird's characteristics with its food, were also to develop an excrescence, how unnatural and ugly that would be! For the rest, the natives fear above all large heads and fat bellies -- two characteristics which frequently strike us unpleasantly in Negro boys -- as well as long legs. In this connection, one readily perceives the accuracy of the Negroes' powers of observation and the precision with which they recognize the slightest differences among various species of a genus. Birds with an ugly screech are completely taboo, since the child might screech in just the same way, something which would be extremely disagreeable, as any father of a family would understand. Of further significance is the exclusion of trembling or wobbling animals, through which the child might even become epileptic. /193/

The most terrible danger threatening pregnant women, however, is from animals which live in any kind of hollow (holes in the ground, in trees) or are caught there. One can speak of a downright horror vacui. If such an animal were to be eaten, the child might also wish to stay in its hollow, "in the belly," and a difficult birth could be expected. Similarly, during this time the parents may not remove any bird nests built in holes in trees, and one of my employees who had made a woman pregnant resolutely refused to make a model of a cassava loaf for me, because it was supposed to be hollow inside.

843
262 supposed to be hollow inside. I knew a Jaunde man who refused to
784 eat anything when two pots were set next to each other on his
[845] hearth fire. He was afraid this would cause his wife to have twins
(mvé, "pot," and mvŏ, "vagina").

In view of the many hairsplitting distinctions among the food
262 taboos, it is hardly surprising that they are frequently violated by accident. They are also transgressed knowingly, however, if the desire for meat is greater than the fear of the evil consequences of its enjoyment. In these cases, it is again medicines (biǎ,ñ ekī) which help and which are often even taken beforehand or simul-
[177] taneously by way of prophylaxis. It is probably scarcely necessary for me to mention that food taboos are the first to be relinquished under the influence of a foreign civilization, not all at once, but nonetheless gradually and totally. The religious taboos are clung to most tenaciously of all. Nor need I emphasize that the Pangwe, even at the age of 20, still like to count themselves among the boys if there is a delectable piece of meat to be had. Accordingly, I saw my "boys," who were from ten to 20 years old, consuming without pangs of conscience the parasite kites I had shot. /194/

Section 14

Soothsaying and Science

000

1. Soothsaying. Extent and area of practice. -- The soothsayer's tool. -- Master and pupil. -- Fee. -- Distrust of soothsayers. -- Soothsaying in times of war.
2. Meteorology. Rain, lightning, and thunder. -- Appearance and effect of lightning. -- Rain medicines at the time of drying ngon, at cult festivals, at the time of harvest, and on journeys; their evaluation. -- Rainbows: their origin, tale concerning their origin. -- Storms: their origin, counter-medicines.
3. Astronomy. General observations. -- View of the earth as a heavenly body. -- The vault of heaven:

000 its height, clouds. -- Moon and sun and their course. -- The moon as "presider" over fertility and the seasons. -- First day of the new moon as Sunday. -- Significance of the days around the full moon; taboos and means of circumventing them. -- Stars and their nature. -- Comets. -- Size of the heavenly bodies and their color.

4. Time reckoning. Contempt for time. -- Half years of the Pangwe. -- The seasons and explanation of their names. -- Division of the month. -- Day and night.

1. Soothsaying

791 Today the soothsayer is to be found only in the heart of the Pangwe region, in the Uelle area, and even here he is in the process of becoming extinct. The reason for this is that his art relates mainly to events and accidents of wartime, and as the result of European influence wars are becoming more and more infrequent. In times of peace the soothsayer deals only with the apprehension of a thief and with the questions as to whether a woman is fertile or infertile and whether the physical malformation of a child is to be explained by the fact that another person gave the child the medicine for sorcery, in other words, for an ewu.

The medicines for soothsaying, like all those cited earlier, are in the possession of certain persons, but for a price (a sheep) they can at any time be acquired by anyone. The principal medicine is enclosed in a horn of the white-rumped duikerbok, Cephalophus longiceps Gray (mvŭ IV). The soothsayer takes the horn in his hand and shakes it (a pfōge) -- hence the name mpfōge-mvŭ, "one who shakes the antelope horn," for soothsayer. The contents of the horn are acquired in the following manner. The soothsayer's novice with his master must participate in a war and find the body of a person slain in battle, cut off the head, take out the teeth and one eye, and finally slit open the belly, into which is placed, for one day, the antelope's horn intended for the novice.

791 The teeth, the eye, and a piece of an evū'-besī (see Vol. II, p. 128 /Ed., not translated/) are placed in the /195/ horn, which is sealed with monitor lizard skin. Once the principal medicine has been secretly acquired in this gruesome manner, the ordination of the novice into the office of soothsayer takes place in public on the village square. The medicine man boils a chicken together with leaves of various medicine plants, especially of the [824] "medicine tree," Distemonanthus benthamianus Baill. (elī'bengǎń, ejěn), and he gives the novice some of this concoction to eat ten times (1). Then the old man leaps about the village square shaking

[801] 1. Ten is the number of wisdom, seven the lucky number, and three or nine the sacred number of the Pangwe.

the soothsayer's horn, chars a piece of the most gigantic liana of [824] the Pangwe region, Entada scandens Benth., Leguminosa (ntū' I), after he has touched it several times with his foot as he was leaping about, makes an incision in one of the novice's toes, and rubs the ashes into the wound. As he does so, he says: "If you go to war and you knock your toe against the ground so that the wound opens, the prospects for your side will be bad; otherwise they will be good" (for the liana strives upwards). The ashes of the liana, therefore, are supposed to communicate to the toe the plant's property of striving upwards and thereby help the soothsayer to rise above his fellow human beings just as the liana in its striving for light rises above the other trees. This concludes the initiation, and the novice is now a full-fledged soothsayer.

As a fee for divination, usually from one to five spears (seven to 35 pfennigs) are paid, but in times of war, when excitement, tension, and fear fill everyone with uncertainty, considerably more is paid. At such times the distrust towards soothsayers, which today is already almost universal, gives way to a willing credulity. During peaceful times the situation is pretty much as it is with us; very stupid and superstitious people, for the most part women, go to the wise man, but the great majority no longer believe in his hocus-pocus. "There are a lot of lies in it," I was told, "but once

791 in a while there is some truth to it." Or, like our countrymen who in other respects consider themselves enlightened, they will adopt the standpoint: "After all, you never can tell . . ."

791 The unsuccessful soothsayer does not have to look far for ridi-
558 cule. In Bebai I heard a poem ridiculing a man from the Ntum region who had been deliberately taken in. One man hid his chopping knife in his house in the presence of witnesses and then went to the soothsayer to ask him quite innocently to tell him where the knife was that he had lost. After all kinds of mystification and tomfoolery the soothsayer answered that the knife had been stolen in the field during the clearing of the farm. Amidst the hilarity of all those present, the "victim of the theft" produced the knife from where it was hidden, and the soothsayer departed, shamed.

721 In times of war, however, the soothsayer's reputation is re-
787 established. Before setting out against the enemy village, the entire company of young men stand around him in a circle, the soothsayer leaps about with the horn in his hand, shaking it according to all the rules of his art, and then suddenly points it /196/ to one of those standing around him, saying: "You will be killed, or (pointing to another) you will be wounded if you go into battle." Or the wise man says: "You can go confidently into battle for nothing will happen to you," but he will say this -- if we may trust his shrewdness -- only to those who in any case tend to stay in the rear. The person who has received a bad "prognosis" stays safely at home, and in this way the soothsayer is seldom found out.

787 In Volume II, page 108 ("Religion") /Ed., not translated/ we saw that the Pangwe believes he can read the future from dreams through appropriating the power of the soul by holding his head in the resin fire kindled on the grave: In so doing he learns to distinguish true dreams from false ones, and consequently comes to recognize what the future will bring.

I am not acquainted with animal oracles in the south, but among the Jaunde there is a spider oracle. Zenker (1) writes about

1. G. Zenker, "Yaunde," in Milleilungen von Forschungsreisenden und Gelehrten aus

787 den deutschen Schutzgebieten /Reports by Explorers and Scholars from the German Protectorates/, edited by Dr. Baron Von Danckelmann.

this spider oracle: "In each hamlet or along the way one finds a quadrangle surrounded by the trunks of plantain trees, in the center of which there is a hole with little bamboo sticks (2) set around

2. This should read: raffia!

it. In this hole lives the field spider. Now, if the owner of the hamlet or one of his relatives wishes to undertake a journey, the hole is covered with plantain leaves during the night. If the little sticks remain undisturbed, everything will go well; on the other hand, if a little stick has been moved out of place, a misfortune threatens, and the people concerned stay at home."

2. Meteorology

821 The rain is up in the sky in a large vessel which holds the rain just as a piece of fruit holds its juice. When it is completely full, the vessel bursts, and the water gradually flows off and falls to earth. When the vessel is completely empty, the people say: "The rainy season is over." During the subsequent dry season, the vessel gradually fills up again, with perhaps some water seeping through once in a while, but the greater part stays in. Then the vessel bursts again when the new rainy season begins.

When the vessel bursts and the water streams out, there is a tumult and a roar as of a waterfall or the surf. It can be heard in the distant rumble of thunder during a storm, which in the tropics coincides with rain more frequently than among us. Hence the Pangwe call this rumbling of the thunder ndʉ̃ae̋ mmvǒ̋n I, "the rushing (noise) of the rain" (3). Rain is a creation of the primeval

3. mvǒ̋n a dʉ̃m means: it is thundering,

821 there is a thunderstorm; actually,
"the rain is roaring."

mother, and, as a sign of a certain season, it is dependent upon the moon which, like all other celestial bodies, was assigned its course by the same primeval force. /197/

As we saw in the creation stories /Ed., not translated/,
821 lightning also existed from the beginning (in the egg!). Later,
775 however, the souls subdued lightning, and they now use it for two different purposes. The first is to warn their descendants on earth of a threatening storm, that is, sheet lightning and atmospheric lightning (yǒ'yǒs IV Fang or fǒ'leyǒs IV Ntum). "There is lightning" is then expressed by fǒ'leyǒs a yǒ's or fǒ'leyǒs a lǔd, "the atmospheric lightning lights up," or "it passes by"; the root yǒs means "to open suddenly with a bang, to light up, to appear suddenly and disappear again." Secondly, the souls use lightning to strike down large trees that bar their view of the earth and the activities of human beings -- that is, lightning that strikes, zǎ'n IV Ntum, zǎ'lǎn IV Fang, or zē'yǎn IV. The fǒlevǒs is thought of as like the igniting of powder when it lights up briefly and suddenly; the zǎ'n is like the firing of a rifle, and just as in the case of the latter, one says: ngǎ a kǒbo, "the rifle is talking," so in the case of the former, one says: zē'yǎn a kǒbo, "the lightning rifle is speaking," that is, "it is thundering" (the cracking thunder accompanying lightning, in contrast to the distant rolling thunder of which we spoke above).

[195] Lightning that strikes is conceived as a black bullet that strikes the trees and splinters them. The "turd of the lightning" (abī'
[278] zē'yǎn) -- this presumably refers to molten and conglomerated masses of resin -- is believed by the natives to have curative powers, as does the bark of trees struck by lightning.

Although the "lightning cartridge" is intended solely for purposes of blasting, it can also be dangerous for human beings if they happen to be in the neighborhood of the trees affected, and it is believed that death is caused by the tremendous roar. Hence it is advisable to withdraw into the house during thunder storms, because, by strict command of the souls, lightning is not allowed

821 to penetrate into houses. To be sure, this lightning is a disobedi-
775 ent fellow who has already caused his primeval mother Alonkok a great many difficulties, and he does not always heed the command of the souls. If it should happen at any time that in his willfulness he strikes the houses -- incidentally, I never heard of such a thing happening -- the natives do not assume that there was malice on the part of the souls. Possibly, as is only human, they aimed wrong. For this reason the Pangwe, who like all primitive people are quite apprehensive in other respects, are not afraid of thunder
[152] storms. A momentary fright, however, caused by the brightness of the lightning and the violence of the thunder, can very often be observed in the case of nervous temperaments.

There is only one more question: "Why is it that the souls make use of their 'lightning rifles' only when it rains; they could surely strike down the trees just as well without it?" To this my Pangwe has a ready answer: "It doesn't work so well, because rain and storms make a passage through the air for the lightning bolt, and then the souls have an easier time of it." /198/

Rain medicines are infrequent in the Pangwe region; rain does
789 not need to be summoned for there is enough of it -- God knows --
821 in tropical West Africa. They would sooner fend it off, for instance, during the drying of ngon, at cult festivals, sometimes during the harvest, and on journeys. For this reason, unnecessary beating of drums is avoided because it invites rain, in accordance with the view, which, incidentally, also prevails outside the Pangwe region, that (rumbling) thunder is produced by rain.

During the drying of ngon, women sometimes place an inverted pot covered with leaves on the village square. Next to it they plant a little stick with a plantain dyed red speared on it,
[824] and they perhaps plant a twig of Petersia minor Niedenzu (abiń) near it. The pot is supposed to represent the vessel in the sky in which the rain is enclosed (mvé, "pot," mvǒ-ṅ, "rain"). Covering the pot indicates that they wish to have the heavenly pot closed in the same manner. The plantain is a plant of the moon which determines the seasons and thus also the rain, and the red coloration is, as it were, a courtesy paid to the moon. I was unable to discover the relationship of the Petersia to rain, but in the

789 opinion of one Fang, the word a biňǎn, which is contained in the
821 name abiň, has the sense of "moving about and rumbling," and they want the stormy weather just to move about and rumble.

The help of the ancestors is employed in another method of
769 combatting Jupiter Pluvius, one that is used chiefly for cult festivi-
789 ties. The ancestral figures, festively smeared with oil and red
821 wood, are placed in front of the house where they would be drenched "to the skin" if they did not see to it that no rain fell on this particular day. At the same time the ancestral skulls are frequently painted with a salve made of red wood and ground bark of
[824] Pentaclethra macrophylla, whose pods, when they are ripe, burst open with a pop and fling the fruit a great distance; in this way the natives indicate that the rain should be flung to one side in the same fashion.

789 When women are in the fields harvesting -- especially at the harvest of ngon -- and rain threatens, they put a little water and a
821 stone in a leaf bundle and hang this up in the field. In the same manner the rain is supposed to remain suspended in the sky, be as heavy as the stone, and stay in its place just like a Negro whose "heart is heavy" and who shows no inclination for any kind of undertaking.

Medicines with a similar effect are used on journeys. A leaf
484 of Trachyphrynium violaceum Radl. (tsědĕkiǎ̄i, IV Fang) is twisted
789 into a bag, filled with a little water, and then fastened to one
824 finger. By doing this, the rain is held fast. Another medicine consists of hanging up old pieces of wood saturated with water, so that the rain will likewise be absorbed up in the sky. Furthermore, a person will take a Petersia twig or a fern leaf dipped in water in his hand, /199/ so that the rain will be broken up into as many little parts as the small pinnules of the fern. Finally, there is the familiar Selaginella, the herb of "missing" (zĕlǎnǎ̄, from á sĕlǎn, "to miss"), that is to say, the rain is supposed to miss man.

789 It should be emphasized that the Pangwe no longer regard
178 these medicines seriously and even ridicule them as "superstitition"; they have long since noticed that none of them helps. Hence, medicines against rain are no longer used today, except as a joke. A possible exception may be the cooking pot medicine of the women,

789 but even that seems to be dying out for its meaning is frequently
178 no longer understood. Thus I once (on an earlier occasion) found an open cooking pot set up as rain medicine; I simply could not understand this until I saw the authentic medicine and was informed that in the first case a mistake had been made.

821 According to one conception, the rainbow is the handiwork of a great sorcerer who wanted to show the others what he was capable of performing. Other natives think the rainbow is water vapor or smoke, and when it appears in the east, late in the afternoon, people say jokingly that one end is standing in the Campo and the other end in the Uelle. A third notion concerning the rainbow -- and this one is probably based on its iridescent colors -- is that it represents a water snake. The word for rainbow is, accordingly, nyū,-ñ III, from nyŏ', "water snake." In addition, there is ntūtǎ'm I, derived from the onomatopoetic expression tŭmetŭmetŭm, a designation for a flickering in front of the eyes.

The Tale concerning the Origin of the Rainbow

821 Once upon a time the grandmother of Ekute Essamniāmabōge
539 said to her grandson: "Go and show me the place where your mother
773 always catches fish." Thereupon Ekute went along with her and showed her a good place along the river, but his grandmother said: "No, this was not the place." Then her grandson showed her another place, but here, too, the grandmother said: "This is not the place where I am going to fish." They went together this way to four other places, but at none did the grandmother want to fish. Finally, the grandson said: "There are no more places for fishing; after this there is only the large river left." The grandmother replied: "All right, that is where we shall go." But her grandson said: "Oh, the places where everybody fishes are here, but in the big river the fishing is poor." However, the grandmother answered: "But I want to take a look at the place; come along, we shall leave right away." Thereupon the grandson went along with her, and when they came to the spot where the river widened, the grandmother said: "Here is where I want to fish." The grandson

821 again advised her against this, but the grandmother refused to give
773 in, went into the water, and tried to drive the water away (1),
539
[226]

1. In smaller watercourses the water is removed by splashing it away; in larger rivers this is, of course impossible.

but in doing so she got in deeper and /200/ deeper until she was up to her neck in the water. Then she said to Ekute: "Bring me two sticks and lay them in the water so that I can stand on them." This Ekute did, and the grandmother removed the water and fished, and lo and behold, she soon had ten baskets full of fish. Then her grandson said: "Come, we have enough now, let's go home." But the grandmother said: "No, first I want to get all the fish out of the water; then I will surpass all people in fishing." Thus, she went on fishing, but then, all of a sudden, the water rose up to her neck and over her mouth, and finally she disappeared under the water. At that moment there arose out of the water a great snake (1), and when Ekute saw it, he seized his

1. In other words, the grandmother was a sorceress.

spear to kill it. Then the snake said: "Wait! I have something to say to you." Ekute, however, ran away into the village and called all the people, above all his father whom he already met on the way; the latter took spears and went with him to the river. When he saw the snake, he wanted to kill it with his spear. But the snake said: "Wait a moment, I have something to say." Then the snake commanded the people to make a basket and to carry it /the snake/ into the village. This was done, and when the snake had been brought into the village and had been assigned a house to sleep in, it said: "No, I want to sleep in the first house next to the meeting house." The people complied with this wish. Soon the rumor spread everywhere that a great snake was to be seen in the village, and many, many people came to see it. Everybody had to pay a lot of money for this, about as much as ten marks.

821 Thus Essamniamaböge became very wealthy, and from this money
773 alone he was able to purchase two wives.
539 Now it happened that he and all the people were gone one day, and only his son, Ekute, stayed behind. Then several people from a distant village appeared, but they had brought with them only two choppers (2), and in exchange for these they demanded

2. Bush knives valued at two marks.

to see the snake. Ekute, however, did not want to show it to them. The people argued with him and threatened, and they demanded to see the snake. Then Ekute, who was very imprudent, angrily took a chopper and knocked in the top of the house wall instead of carefully opening the door somewhat and letting the people look in. Thereupon the snake came out, went to the village square, and cried "See, now I am leaving." But the people and Ekute had run off. Thereupon the snake raised its head and body and swung itself into the air. At this very moment Ekute's father came back and was just able to cut off the lower end of the snake; the other part of the snake was already high up in the air and still stands in the sky today as the rainbow. The tail, however, turned into the python, and from the eggs there crept forth all the other little snakes. /201/,

821 The storm is likewise represented as the handiwork of an evil
789 sorcerer. Whenever a great sorcerer is dying, he unleashes a storm,
[754] lays low the plantain fields of those people toward whom he feels ill will, destroys their houses, and indeed, he goes so far as to knock down their children in order to injure them. Anyone who has experienced a tropical tornado will understand the notion of the Pangwe that sorcerous beings are at work. The natives also have medicines against storms; the storm is gradually weakened if
[824] one places young macabo leaves (these are weak to begin with) on the fire (whereby they become still weaker) and then grinds them to a powder on the ground in front of the house (this makes them weakest of all). Conversely, the storm is "made heavy" and thereby held back in the sky by placing a stone on Paspalum grass (obūt), which, because of its toughness and strength, is supposed

789 to represent the storm. Thus the storm is pressed onto the ground,
821 as it were. If the storm is already approaching, they beat a plantain stalk to tatters on the ground of the village square, and as they do so, they exclaim:

[539] okǔ[s] a lǔde ma a lǔd: Okǎ[k] nkǐa
Storm, it pass by me, by (pass), (to) Okak in the west.

3. Astronomy

821 Even for a primitive people the astronomical knowledge of
772 the Pangwe is very limited. This fact can be excused only in part by the unfavorable conditions of their country (rainy forest region).

The Pangwe have the same conception of the earth as that of the "ancients," that is to say, they think of it as flat like a plate and surrounded on all sides by the ocean. Over the earth and the ocean arches the sky which, as is stated in the creation story, originated as a part of the earth that was blasted off and raised up on high. In other words, the sky is thought of as firm and finitely bounded, just as is the earth. One should, accordingly, imagine a large bell jar placed over a gigantic plate in the center of which the earth floats in water, and this gives one the conception held by the Pangwe. As regards the earth, they naturally think only of Africa, that is, they conceive of it as one single continuous land mass.

The sky is infinitely high; the tallest mountains known to the Pangwe do not extend into it. One would have to set about 200 or more silk-cotton trees (Ceiba, on the average 70 meters tall) end on end in order to touch the sky.

821 The material of the sky is similar to that of the earth, and,
[823] like it, it is harder and firmer on the inside and softer, more fluid on the outside -- a train of thought engendered by the swamps and the softened loam soil. Just as the crust of the earth forms clods, so the outer surface of the sky forms "scales" (ebǔ[s] e dzǒb "scales of the sky," that is to say, clouds). The clouds, however, are

821 subject to constant alteration, and this is explained /202/ in the following way. The masses of the sky's crust move against each other in a manner similar to iron or brass that has been liquified in forging and moves more or less viscously as it cools down, so that in the case of the first metal that flows out, its more rapid cooling impedes the movement, while the subsequent metal, flowing over the first, moves more quickly the nearer to the surface it is. This is why the clouds move at different speeds and in various layers relative to each other.

The moon and the sun pass across the vault of the sky exactly as the primeval force has ordained in eternal laws. During the day the sun moves under the vault from east to west, and during the night it moves back the same way over the vault where it is, of course, invisible. At night, the moon follows the course of the sun under the vault, and during the day it returns over the vault, but closer to the ceiling, so that during the day one can frequently see it shimmering through. The Pangwe very easily account for the phases of the moon. They assume that in its various phases the moon moves in one of the inner layers whose clods have already become more rigid and that it remains covered by one of these clods.

In our account of the religion of the Pangwe /Ed., not trans-
821 lated/, we have already discussed the significance of the moon
805 in the cults. Here we need to consider only the practical side of its relation to human activities. The moon is the lord of fertility and of the seasons; the days and months are reckoned by it. The first day (according to other informants, the first two days) when the new moon appears is called avǒ̄ ngō̄n, that is, cold moon. From this day on all impulses toward propagation are "put in cold storage" for seven days, all development and all fertility are interrupted, the women have their menstrual flow, and the men abstain from sexual intercourse. For this reason, nothing else is undertaken, not because a taboo exists, but because one would not have any luck. The man does not go out to clear his farm because he would cut his finger; the woman does not go out to plant because the plants would not flourish. Even hunting and fishing are not attempted. It is important to note that this day is by no means designated as "bad," but as a day of rest which might correspond to

821 our Sunday, as if all nature had to take a rest.

805 By way of contrast, the days around the full moon are no good for hunting, probably because the moon when it is full is especially "evil" and hateful to all those who are sinless -- as are animals, for instance. Even the festivals of the moon cult (Sso) are never celebrated at the full moon, but always towards the time of the new moon in order not to display evil in its most glaring form. The natives count nine "days of the full moon," the sacred number which we have already encountered in the cults /203/, and during this time the Pangwe speaks of the ndžībe ngōn, that is, the closed (full) moon, or ndžīge ngōn or abŭm e ngōn, that is, the used moon. On these days the people do work, but fishing, trapping, and hunting drives are not practiced. Among the Fang, a direct taboo (ekī) exists for these three activities, though it is true that they like to circumvent this taboo -- like many others -- with the help of medicines.

Rules are made to be circumvented, the Ntum in Bebai thought, [789] and during the days of the full moon they very gaily held great hunting drives. They also made a medicine by cutting a circle -- the full moon -- into the bark of a tree and within the circle removing half of the bark. In this way it became a half moon (Fig. 64). This medicine is delightfully naïve and beautifully indicates how the Negro knows how to help himself in all situations.

821 Concerning the nature of the stars the "Pangwe scholars" are not yet quite agreed. Some believe the stars are simply holes in the vault of the sky through which the sun can be seen at night as it moves over the arch. Others say that they are little fires which during the day are simply outshone by the brightness of the sun. Still others -- and these are probably in the majority -- assume that the stars are little celestial bodies like the sun and the moon, but that they are afraid of the sun, so during the day they withdraw into the interior of the vault, and during the night, fleeing from the sun as it moves across the top of the arch, they come out and then become visible, hence their name o-tǐ'-tē-ī, from the root a tē = to move from one's place (1). If one of the stars has ventured too

1. oa tē odĕn = when did you leave (travel from) home?

82] far from its hole, it naturally falls down. We call that a shooting star; the Negro says: "otǐ'tēi, a ke a bǒm (the star goes forth to get a bride)."

It is a cause for some surprise that many, even older people have not yet noticed that the stars apparently move from east to west. When I made such a statement, it was steadfastly contested, and when I offered proof, the phenomenon was new and striking to all.

Constellations or names of stars, it seems, are totally unknown to the Pangwe; if there have been reports about these from the [181] Jaunde, they are borrowed plumage with which the easygoing little Jaunde people have once more adorned themselves. The Pangwe calls comets botū,le from tū,lo III, and he sees monitor lizards in them. A quite subordinate group of stars in the vicinity of Orion was pointed out to me several times and designated as tū,lo, but I consider this a mistake, since in 1902 a comet disappeared in the vicinity of this area.

Extremely eager students may like to know the Pangwe's idea of the size of the heavenly bodies. Well, I hope their expectations are not too great! -- "Sun and moon," said my Pangwe, whom I /204/ /Fig. 64 appears here in the original text/ asked in the presence of his comrades, "are of the same size, and about -- let us say -- as large as one of the large tin plates sold on the coast." At this answer by the aspiring scholar, there was, however, a general shaking of heads, and in reply to my objection that even people in the distance look as small as ants and that the sky is so infinitely much farther away, the native questioned had to admit that he had underestimated. They finally agreed that the sun is as large as the area in front of my station (about ten meters wide). With that I had to content myself. In the case of the stars they obliged me from the outset, after this experience, by stating that they are as large as the space enclosed by the extended thumbs and index fingers of both hands, but the narrator evidently felt the need to justify his exaggeration to himself, and went on to remark: "They seem smaller, because they are far away!" /205/

As regards the color of the stars, the sun according to my Pangwe is red and hot like fire, the moon and the stars are white

821
[789]
[224]

Fig. 64. Medicine on trees, so that a hunting drive may be undertaken during the full moon, something which is actually prohibited. Bébai (Esseng Family), South Cameroons.

and cold. "If the moon is cold and has no light of its own, how is it that you can see it? After all, you cannot see people dressed in white either when everything is dark!" This objection the Pangwe counter with the reply: "On earth it is dark, but in the sky it is bright, that is, nothing obscures the view there!"

4. Time Reckoning

805 The Negro is happy-go-lucky and does not bother about "time." Time plays no role at all in Africa; indeed, the Negro regards it almost as an insult when a White hurries him because "he has no time." After all, there is lots of time. It is due to this contempt, also, that the Negroes never know how old they are, or rather, that they never find it necessary to remember. The same fact serves to explain their inability to combine numbers into conceptions and logical conclusions, even though they have a good [802] grasp of numbers up to 10,000, and beyond that with some difficulty.

The Pangwe possess no designation for the time segment corresponding to our solar year. Instead, they reckon according to membū. Each mbū (which should be translated roughly as a half year) comprises two of the four seasons that are established for the Pangwe region (see Section 1, p. 2 /Ed., this section of Vol. I is not translated/). To one of our years, therefore, there are two Pangwe "years," or, as the natives who have come in contact with Europeans express it, membū mensūte mebōt, "years of the Blacks."

One mbū includes the great dry season and the brief rainy season and is called esěb, from a zěb (okōṅ), "to sharpen (a knife)," because knives are sharpened at this time to clear the farms; in other words, it might be called the farming season or sowing season. The second mbū includes the short dry season and the great rainy season and is called ojǔn, from a jǔn, "to mourn, to wail," in other words, the fasting season; it corresponds very well to our winter, which is likewise a time during which nature sleeps and people starve. The Pangwe explain the name by saying that at the beginning of the rainy season all "food" is planted, and therefore food becomes scarce, but perhaps the expression arose in former habitations when the rainy season brought with it special misfortune, such as floods.

The correspondence of the seasons of the year among the Pangwe to the divisions of our solar year is, accordingly, as follows.

First half year (mbū́)

805 esěb = farming season (summer), from December to May, consisting of:

1. vūē'n esěb = great dry season (December to February);
2. šōgō, esěb = short rainy season (March to May). /206/

Second half year (mbū́)

ojǔn = rainy season (winter) from June to November, consisting of:

1. vūē'n ojǔn = short dry season (June to August);
2. šōgō, ojǔn = great rainy season (September to November).

A division of the half years into months is unknown to the Pangwe; he only knows the time span of the individual month (ngō'n, "moon"), and he has great difficulty in understanding that about six to seven of his months correspond to the Whites' half year and about 12 to 13 of his months correspond to the Whites' year.

To divide the month into weeks is something that the Pangwe [177] has learned from the Whites and has wholeheartedly adopted on account of the four Sundays (sǒ'nǒ III). He himself has marked off the first one to two days after the new moon as days of leisure, as has already been mentioned. He also observes the first seven [841] days of the month as something special, since the menstrual flow of the women supposedly lasts for seven days, but these days do not constitute a special segment of the month designated by a name of its own (1). Nor is there any such time segment in the rest of

[539] 1. It is merely said, for instance:
avǒi' ngō'n a sǒ malū' malǎ or zǎngbǎ'
Cold moon, it came days three or seven.

the month.

We have the same picture with the day as we do with the month. Here, too, only the beginning is sharply defined, while

805 the remainder follows as a matter of course. A day of 24 hours is called alū' mbok (Ntum), "day one," and it falls into day = mŏ's IV, and night = alū'. The day begins with the morning, kī'dī IV or kī'kī'dī, lasting from six o'clock (sunrise) until seven o'clock, in other words, one hour, and it continues until ngū̃ɛ IV, ngūngū̃ɛ IV, "evening," that is, until the time around sundown (six o'clock). In between, the Pangwe have as the designation of an hour only "time when the first women come from the plantations," that is, at 11 o'clock. The night is not divided up into definite segments. If they want to specify an hour of the night, for instance, for marching upon an enemy village, they make shift with the expression: "with the first call of the coucal," Centropus monachus Rüpp. (dūgū' III), that is, at 11 o'clock,
[825] just as we might say, "with the first cock crow." This same time is also called zǎ'ɩ alū', "midnight." In case of a departure before sunrise, the natives may speak of a "time when the first ogbwǎ' (Francolinus squamatus Cass.) calls," that is, around five o'clock in the morning. Time designations by indicating the position of the sun with the hand -- which in regions where the sun rises and sets at approximately the same time throughout the entire year would be both easy and convenient -- are not known, and indeed, they are not even understood. /Plate 26 faces p. 206./

Chief of Nschúggebot (Ojek Family), Spanish Guinea.

The chief weapon of the Pangwe today is the flintlock musket.
411 Until the middle of the previous century it was found in our region
439 only in quite isolated instances. Imported since the 1860's and 1870's in ever-increasing numbers by the many newly-founded coastal trading posts, the flintlock musket was a marketable and profitable commercial commodity which since then has so flooded the land that for each Pangwe, at least for each Ntum and Fang, one can reckon three, four, or even five rifles, of which, however, a fraction is unusable. Since 1906 the German government and since 1909 also the French and Spanish governments have prohibited the import of powder, and as a result there has been a noticeable scarcity, especially in the north. Among other things, it has had the effect of putting an end to the great amount of superfluous shooting during festivities, etc., in the Cameroons and adjoining Spanish territory. The small amount of powder which still finds its way from south to north by way of barter is kept in hiding for later occasions.

The charge of the rifle consists of small pieces of iron which --
411 like the powder -- are usually carried around in small containers
[482] fastened to the belt or the shoulder bag (mfǒk) (Fig. 78). Frequently, the latter itself serves to hold the ammunition, that is, the pieces of iron which the Pangwe calls by the same name as the
[415] spears, akǒń. The containers (Fig. 77) are little pouches made of hide (a), flasks (only for ammunition) attractively decorated with brass (b) and (c), little flasks covered with monitor lizard skin (d-g), calabashes (h), the round fruit of a tree (ašo, ašun) (i, k), raffia fruit (l), a cacao fruit (m), or other fruit (n-p).

With the importation of powder cut off, the rifles are useless, and it may be that in this way the throwing spear, which formerly was the true long-range weapon of the Pangwe, /Fig. 77 appears on p. 244/ /245/ will again occupy a place of honor, especially since it has never been entirely out of use. To be sure, the spears manufactured today are not as large as those of olden times. They
[481] are used more as walking sticks of superior quality or as an ornamental weapon taken along on a journey -- usually people carry two or three with them -- and the natives scarcely know how to use them for actual battle. Only the Jaunde through continued

practice have maintained some skill in spear throwing. On the whole, the Jaunde did not go over so exclusively to the use of firearms as did the Fang, for instance, who are quite unable to part from their flintlocks. They even give them human names and love to let them "speak."

The spears (Fig. 79) consist of a shaft and tip. The former is made of wood and is artfully grooved lengthwise, as has been described in the section on woodworking /Ed., Vol. I/. The tip is attached with a socket and forged from iron; in very recent times one could frequently see Ntum chiefs carrying ornamental spears with carefully worked brass tips. The cutting edge has the shape of a more or less oblong leaf, and this distinguishes the different types of spears. The older types among the Fang are gbŭn-akŏn (akŏn = spear) (a), akŏn-okăk (okăk = Okak, Fang people) (a), tō mō-akŏn (e), and mbă[s]-akŏn (b); of more recent origin, supposedly is the barbed spear, ngā'm[k]-akŏn (c), and etŏ'hŏk.

The crossbow is only a hunting weapon; the bow and arrow, as well as the slingshot, occur only as children's toys.

The weapons for short-range fighting are the sword and the battle-ax.

The sword (pfă IV Ntum, fă IV Fang) (Fig. 80) has two cutting edges which sometimes end in barbed hooks at the base

411 and a wooden handle well-shaped for the hand. The handle is partly bound with an iron band or brass wire. The sword is placed inside a wooden sheath, consisting of two halves and frequently covered with monitor lizard skin, or in a brass sheath which has two brass eyelets for the hide strip worn over the shoulder from which the weapon hangs /246/ /Fig. 79 appears here in the original text/ (see Fig. 80). After the appearance of the chopping knives or choppers imported from Europe, the latter displaced the sword for a while and were then carried about in sheaths (Fig. 81); however, these are no longer in use today.

The battle-ax, called ovunebokui, "axe of the Pygmies" [184] (Fig. 82), is of lesser importance and is to be found only among the Fang, especially the southern ones, but even among them only in small numbers. It can be used only for short-range fighting. Its wedge-shaped blade with a convex cutting edge and /247/ corners curved inward, is fitted into the handle, the short lower half of which is round while the upper half is flattened out.

As a protective weapon, three kinds of shields are in use: the wooden shield, the shield made of buffalo hide (Fig. 83), and the shield made of an elephant's ear. The latter two are supposed to protect an individual man. They have lost their importance since the appearance of the firearm, and today they have /Fig. 80 appears here in the original text/ become quite rare. The wooden shield (stationary shield, Fig. 84), on the other hand, protects the entire troop of warriors and is, as it were, a portable rampart carried ahead by one man, while the others hide behind it. When the enemies clash, they shoot from behind the wooden guard, and in case it becomes necessary to flee, the shield is simply abandoned. It is made from a slab of wood from the umbrella tree and is approximately 145 centimeters long and 37 centi- [531] meters wide. The outer surface is covered with patterns carved in relief, such as we have seen in Section 9 /Ed., Vol. I/.

726 The battles of the Pangwe are usually only to settle hostilities between neighboring villages and hence are limited to small-scale warfare, that is, to a series of surprise attacks in which the attacker naturally has the advantage and thus "wins." Such encounters, however, give the tribe their warlike reputation; the

[Text continues on page 97]

411

411

Fig. 80. Swords and Sheath made of Brass. One-fifth actual size.

726 Fang especially are extremely warlike and quarrelsome and not at all disinclined to military expeditions that promise to yield booty. At the same time, they know how to take full advantage of their forested land. They surprise the enemy at impassable [184] places, lie in ambush in the dense bush, and sometimes carry out night raids when the occasion is favorable, whereas generally the Pangwe is loath to undertake nocturnal expeditions. Furthermore, they impede the advance of the enemy through "chevaux-de-frise," that is, pointed sticks made of the bark of raffia leafstalks and planted in the ground, as well as through pitfalls which are well covered like the traps for game, but wider and [725] deeper, and similarly spiked on the floor. In hand-to-hand combat they throw the spiked stems of Macaranga ledermanniana Pax [824] (as?) between the legs of their enemies. /248/

/Figs. 81 and 82 appear here in the original text. /

In unsettled times, women, children, and -- insofar as this 722 is possible -- movable property are taken to safety, that is, to 712 hiding places in the forest or to friendly villages. Fortifications

411

Figs. 81 and 82. Fang Chopper Sheath and Battle-ax.

712 exist, but only to a limited extent. As has already been mentioned
722 in the account of house construction /Ed., Vol. I/, the walls of the meeting house are built of halved trunks of the umbrella tree placed in layers over each other for the purpose of fortification. In addition, the village entrances are blocked off when danger threatens by means of fences or barricades made of sticks. The southern Fang especially can easily do this since they design their villages more compactly so that the meeting houses themselves almost block off the road. Only once did I see an entire village surrounded with a protective fence, a fairly strong paling consisting of vertical posts and laths connecting them. In front of the fence the terrain had been cleared by cutting down the bush, so that the approach of enemies could be easily discovered and prevented.

The following example will give a good idea of how feuds arise
579 and take their course.

On both sides of the Lo, a small tributary of the Campo, there
[361] are two communities of the Esseng kin group about 12 minutes apart, namely, Bebai and Ebäangon. The inhabitants of the three Bebai villages closest to Ebäangon are related to the Ebäangon people; the others of Bebai did not move into the territory until later and are unrelated to the inhabitants of Ebäangon. The most influential chief of the Bebai people, who are outsiders, is called Makina. For a long time he had been "talking impudently" to Schüe, chief of Ebäangon. One day, on the occasion of a festival for the souls which

411
281

Fig. 83. Shield of Buffalo Hide.

579 Schüe gave for one of his deceased wives, strife broke out. In the course of the festival Schüe wanted to start counting up the people who had done some injury to the deceased. And since -- as /249/ usual -- there was a great deal of shooting at the festival, he ordered that there be quiet in front of the meeting house, saying that whoever wanted to shoot had better go into the next village. Thereupon Bekongo, the son of Makina, stood up and said, "I don't care, I'm not going to listen to that stupid talk," and fired off his rifle near the meeting house. Naturally, the Ebäangon people would not stand for this, and Schüe's sons said to Bekongo, "Hey! our father just forbade anyone to shoot here; do you think that Schüe is a slave here in his village?" In this way a verbal battle developed between the two parties, and soon the brawl with bush knives was in full swing with blood flowing on both sides. The Bebai people related to the Ebäangon people tried to bring about a reconciliation or they sided with Schüe. Finally the Bebai people moved off, pursued by the Ebäangon people armed with choppers, who called after them, "Wait, we'll get even with you yet!" The last of the Bebai people was Ejamatua, a man from Makina's village. He was either annoyed by the shout or he was particularly harassed by the pursuers; in short, for whatever

579 reason, he suddenly took his rifle and shot down the foremost of these. As soon as the Ebäangon people saw that one of their men, a son of their chief to boot, was killed, they quickly ran back to get their rifles. The Bebai people who sided with them waited for them,and all together they moved against the hostile Bebai villages, where they had a shooting bout with Makina's men, without, however, any blood being spilled. The Ebäangon people spent the night in the houses of the friendly Bebai people. The next day they resumed the fighting, and again nobody was killed; however, the Ebäangon people succeeded in burning down Makina's village. Thereupon the "victors" returned to Ebäangon. After two days they renewed their attack, but achieved nothing.

579 628 At this point Makina wanted to have the whole affair over and done with, so he sent two women as payment to Schüe. The latter kept the women, but was by no means inclined to make peace. On the contrary, his people again raided Makina's villages. Then Makina's patience came to an end. He went to the chief of Messelle, a large village on the right side of the Campo, and requested him to settle the argument. When Schüe heard this, he sent the two women back to Makina's village and dispatched four of his sons as representatives to the negotiations at /250/ Messelle. The decision ran thus: Makina was in the wrong because "it was he who in the first place talked insolently against Schüe, it was his son, Bekongo, who started the entire fight at the festival for the souls, and he is therefore responsible for the death of Schüe's son." Thereupon the chief of Messelle immediately seized Makina and demanded his court fee -- five sheep -- from Schüe's party, at the same time promising Schüe in exchange the extradition of Makina. After the payment was made and Makina had been extradited, Schüe's sons demanded that Makina summon his guilty son. Makina declared himself unable to do so and was beaten down with cudgels -- on the Mburru -- and his corpse was thrown in the river. /Fig. 84 appears here in the original text./ At the news of these events, brought to Ebäangon by Schüe's sons, Makina's people seized their rifles and in turn moved against Ebäangon, burning half of Schüe's village to the ground. With this, the need for revenge of both parties

579 had been satis- fied, because on either side
628 the loss was exactly the same: each had
a village burned and a man killed.
[411] The matter would have gone on, because
the Bebai people were still dissatis-
[531] fied since they regarded their loss as
greater; their casualty had been a great
chief, while the other had been only a
young man. However, by this time the
influence of the Whites had penetrated
to Bebai and thus an end was put to the
fighting.

From this example it can be seen that
628 the Pangwe act according to the princi-
682 ple of an eye for an eye, a tooth for a
tooth, and that blood revenge can cease
only when the losses on both sides are
equal. In a "war" between Schumu and
Esseng people, eight Schumu peo-
ple had been killed, and peace could not
be concluded until eight Esseng men had

Fig. 84. Wooden Shield.

likewise been killed. Furthermore, it can be seen that village feuds fraught with consequences often arise from quite trivial causes.

Prisoners are usually killed and then often eaten, as has been
72 mentioned earlier. Only children are raised as "slaves" in the
[266] village. Captured women are usually taken by the victors as
[567] wives, but sometimes they are also killed in order to even out the number of killed on both sides and thus to make peace possible. /251/

Section 18

Sexual Life

000 1. Sexual life until maturity. Three stages of development of the person (child, man, old man). -- Children as good people (bebin), as "innocents." -- Sexual advances in play. -- Homosexual intercourse between boys.

2. Sexual life between maturity and marriage. Young men and girls. -- Free love. -- Virginity. -- Desirability of the women (dance songs). -- Girls who are available to anybody, nžila. -- The young man's tact in his social relations with the girl and her family. -- The sense of shame toward the girl's parents. -- Relations with the girl. -- Lasting love unions. -- Love tests (narrative). -- Illegitimate children.

3. Marriage. Prohibition against sexual intercourse with related kin groups; sexual intercourse within one's own kin group, incest. -- Abduction of the girl, suing for the girl's hand with the father. -- Price of the wife and manner of payment (example). -- Relations of the future bridegroom with his parents-in-law, mother-in-law and their veneration, extreme shame. -- Wedding (festivities). -- Honeymoon. -- Polygyny. -- Number of wives of chiefs. -- Marital fidelity. -- Lending wives. -- Secret lovers. -- Return of wives, reasons for doing so. -- Repayment of the bride price.

4. Medicines, influence of sexual intercourse. Origin of the seed. -- Cause of menstruation

000 (staunching of the blood). -- Medicines for strengthening virility. -- Impotence among men; origin, medicines for impotence. -- Venereal diseases; payment in case of contagion. -- Influence of sexual intercourse. -- Women who bring good luck and those who bring misfortune. -- Imitation of castration (miāk): motive and purpose, distribution, course of the initiation ceremony, abstinence of the initiated, desecration.

5. Deviant forms of sexual intercourse. Twirling of the members to relieve itching. -- Masturbation among men and among women. -- Homosexual intercourse among men. -- Homosexual intercourse a medicine for wealth; tale. -- Punishment of homosexuals by cult spirits.

6. Pregnancy, birth. Establishing the beginning of pregnancy. -- Cessation of sexual intercourse. -- Abortion: reasons for it, medicines. -- Place of delivery. -- Midwives. -- Delivery. -- Treatment of the child; squeezing off the umbilical cord. -- Treatment of the afterbirth. -- Medicine for the mother. -- Announcement of the birth. -- Feeding of the child by the mother, absence of milk. -- Later conduct of the mother, prohibition against sexual intercourse, period of nursing the infant.

1. Sexual Life before Maturity

561 Like Europeans, the Pangwe divide the individual's life into
856 three sections, the period of childhood, that of adulthood, and that of old age. The last period, however, concerns the Negro much less than the first two periods of life, because on the average death occurs at an early age. Sexual maturity represents the boundary line between childhood and adulthood, and the Pangwe emphasizes it very much because sexuality is at the center of his religious conceptions and /252/ finds external expression through the initiation into the cults. This initiation corresponds to our confirmation. The Pangwe acts as though a person before sexual maturity -- for the sake of brevity I shall call this person a child (mǭŋgo III) -- represents a stage antecedent to actual manhood, mot III, just as, say, the caterpillar is the stage prior to the butterfly.

If we think back on what was said concerning the soul in the
774 discussion of religion /Ed., not translated/, we remember that
836 the Pangwe distinguish two kinds of people according to the kind
864 of soul they possess: bebǐn (uninitiated, good), and bongǔs
882 (initiated, evil). Children (bǭŋgo) are bebǐn, uninitiated, good, because they do not know sexual intercourse and, if they have become acquainted with it prematurely, do not know that they are committing a sin; indeed, they could not know since, after all, they are not initiated into the profound connections between sexual intercourse, life, and death.

In reality the situation is such that the Pangwe young people
882 are perfectly well informed, but officially each one must empha-
884 size that he is a child, mǭŋgo, that is, good, unknowing, uninitiated as to sexual intercourse, even when he has long outgrown not only the actually innocent childhood (in the narrower sense), but also the period of sexual maturity. This point can be tested on any Negro between the age of ten and 20 years by asking him whether he already practices sexual intercourse. The answer will always be the same, be he a Fang from the bush or a Jaunde long since glossed over by a bit of civilization: "ma ne mǭŋgo (I am
[672] a child, that is, innocent, I know nothing about sexual intercourse)."

882
864 By this answer, he secures for himself the mild judgment with
[672] which we dispose of "silly boys' pranks."

For children, bǭŋgo, therefore, quite a different yardstick is applied; what they do, especially in respect to sexual matters, is not taken seriously.

bǭŋgo bǎ bǭlě oson = children have no sense of shame, and
834 the other way around, adults do not display much towards chil-
155 dren (see homosexual life, Vol. II, page 131), since, after all,
864 children simply do not know what evil (sǒ) is or what shame (o-so-n) means. If the otherwise, at least externally, very modest Negroes say this themselves, we should not hope to find many of the characteristics of a true, innocent ebīn among the children. As a matter of fact their first playful imitations of
836 sexual intercourse as they observe older people performing it
838 begin at five or six years of age; between the age of eight and nine "playing parents" is nothing but perfectly conscious sexual intercourse, though it is generally regarded as a game and was cited to me in the category of "children's games" under the name ebōbǎne-bǭŋgo (Ntum) or ebǎnebǎne bǭŋgo (Fang). It is usually done in the forenoon /253/ in the dwellings when the parents are in the fields or absent elsewhere. The partners are not only boys and girls, but also boys among each other. Later, at the age of eight to 10 years and frequently somewhat beyond, many boys manifest a similar inclination towards members of their own sex, along with a sexual urge for girls of the same age. In view of the emphasis on maintaining, as long as possible, the outward appearance of modesty, the Pangwe boys make use of a device whereby they come to an understanding "metaphorically." A boy
[201] rakes some earth and sweepings onto a leaf, ties this hastily together like a food bundle, and gives it to the other. If the latter is ready to respond to the proffered affection, he will open the bundle and pretend to eat of it, saying finally, "ma mane a dzǐ," that is, "I have eaten." If he is not inclined to respond, he will throw away the bundle, of whose contents he has full knowledge.

Concerning masturbation, see below, page 130.

2. Sexual Life between Maturity and Marriage

After reaching maturity, the girl is called ngōn III, and the
836 young man nkǒ̄ I; for both there is also the term bandǔ̄man,
[884] plural of ndǔ̄man = young man or girl at the age of being in love.
Thus the name itself shows under what sign the subsequent period of life is lived. Free love in the boldest sense of the word prevails. The girl may give away her favors without inhibition to whom and whenever she desires to do so, and she need only ob-
[833] serve the religious rule that prohibits sexual intercourse during the
[885] day and the social rule that prohibits intercourse between blood relatives. Otherwise there is no barrier; members of the same age group come together and make thorough use of their freedom. In the initial period after maturity, to be sure, sexual desire is dampened by the moral admonitions of the cults with their proclamation of the sinfulness of sexual intercourse. This sinfulness, combined with physical satiety and psychic revulsion, produces a "moral hangover"; however, such considerations and feelings are soon overcome. As in eating, so in their love life, the Pangwe know no moderation. They empty the cup of joy to the lees. Later on, especially when the Pangwe has acquired several wives, he tends to develop a more business-like attitude towards sexual love, in place of the youthful amours which alternate unsteadily between ungoverned passion and its aftereffects, psychic unease.

In view of this extensive free love, it goes without saying
[585] that the virginity of his future wife plays no role in the man's choice. Indeed, the presence of a hymen (ajādebǎ) is usually scarcely noticed and /254/ to some is totally unknown. Around the age of 15 years it is supposed to be destroyed by boys of the same age.

As for their libidinal drive, the girls are generally not in-
833 ferior to the boys. However, we may say that for the girls potency
936 alone is as a rule the deciding factor in the choice of a friend.
[572] This fact is well expressed in the various dance songs at the Mbale (which, incidentally, were brought to the Fang and Ntum by the
[181] sexually loose Jaunde) as, for example, in the following complaint.

Leader of the chorus:

539 Mīhǐnga ya mot ebō'n, edǒ a va
133 (A) woman and (a) man love affair (1), thereupon he had
836

1. ebō'n, "public region," hence, by extension, "love affair, relationship."

kě, a kě a bǔmo ba mī'nǐnga
gone (to her), he goes to sleep with (the) woman (on)

enǒn, a sā a nie kaa ngū edǒ
bed, he cohabits with her, no virility, thereupon (a)

mót a va ke, a nga jiē'
man (that is, another) he had gone, he lived to sing (the)

dżá: mīhǐnga niěne: o kīnī
song (2): (The) woman she (speaks) thus (to me): you go

2. Poetic license, because the manner of recital is song; ordinarily it would be: Thereupon a man said the following.

a kāda nā: kaa bědě a sǒ', kaa
to say this (to the lover): Not again (to) come, not

bede a ǔū, a sǎ dżā mebǔ'n, aīū'
again (to) come, one not complete sex act, night

a ngěn ojǎ'b --ma nga tame
it was still long (lasting) (3) -- I live must (to)

3. That is, the lover would have had enough time to cohabit several times.

539 tǒbǒ nale, adzǒ a n'abě
833 remain thus, affair it is bad.
836 Chorus:

A ta ma vū or a na ma
Oh, my father, I am dying, Oh, my mother, I

vū.
am dying (4).

[195] 4. The Negro dies on every occasion when something unpleasant happens to him; the chorus thus speaks from the point of view of the woman who is in such despair concerning this "bad affair" that she would almost like to die.

836 Although there are no actual prostitutes, a number of the
548 women enjoy the free life of a girl and up to the age of 30 or 35 years remain ngǒ'n, "girls." This kind of "girl," to whom every man, boy or adult, whatever his name, whether he is handsome or not, is equally /255/ welcome, is called a ñzīla. The fact that people have no better opinion of her than we have of a loose woman is shown by a song sung at a festival for the
[533] souls. In its own way this song represents a delightful satire and, for the Pangwe, an extraordinarily witty, poetic achievement. I have reproduced it in Section 20 ("Music") /Ed., not translated/.

In spite of the great sensuality, relations between the sexes
831 do have finer traits; tactful behavior, precise observation of prescribed forms, and profound spiritual sensibility are not absent. The ingenuous conduct of the young man toward the girl's parents and the naturalness with which the young people enjoy their love, without obligations, without social prejudices, have something almost ideal about them.

584 If the young man has noticed a girl or has already come to an understanding with her, he goes to her parents, introduces himself first to the father, who usually shows his most amiable side and recommends the young man to his daughter. Even though the lover did not obtain the girl's agreement beforehand -- something which can be accomplished with a few words in a brief encounter -- he will nonetheless find little opposition. The relations with the "father-in-law" and above all with the "mother-in-law" are as cordial and tender as can be. The young man brings his "mother-in-law" a little present, European salt or other things that women [431] love, and he also endears himself to the father through little attentions or presents, while the parents or the girl herself entertain the guest to the best of their ability. A natural tact causes the Pangwe to avoid mentioning anything that touches upon his relations to the girl in his contact with her family. Indeed, his delicacy with respect to the "parents-in-law" grows into a false sense of shame:

wō'-oson a vū mabā'de
[539] (The) feeling -- shame, it dies (from) frambesia

menkiē'.
(of the) parents-in-law (relatives by marriage).

The sense of shame has caused a person to die from frambesia transmitted by the parents-in-law, that is, a suitor was afraid, from a sense of shame, to turn down the food offered him by the girl's father who was suffering from frambesia. He ate with the man from one bowl, caught the disease, and died.

To the girl herself the lover usually brings half a piece of 584 material -- valued at one mark -- (among the Jaunde he brings 836 a whole piece). In his courtship, the lover does not usually arrive at the desired goal right away, for it is customary for the girl, even if she grants the young man her affection and /256/ sleeps in the same bed with him, to refuse sexual intercourse with him during the first night. (See the tale on p. 132).

The reason for this custom lies in oson, the feeling of shame toward the talk of other people. The two parties know each other perfectly well as regards their lechery, but they pretend to be quite

584 innocent and anxiously avoid anything that might give rise to
836 gossip. Thus, if we speak with the Pangwe about sexual matters, we constantly hear the word oson, "shame," oson this and oson that. Admittedly, wherever European influence is spreading, the
[177] use of oson decreases, for together with this influence the religious conceptions upon which shame is based are disappearing (as we saw in the case of sin, nsöm); at the same time, moral sensibilities are becoming laxer, and there are no longer any self-imposed restraints.

With free love universally prevalent, it naturally happens
836 also that several lovers find their way to the same girl in one night, especially when she is no longer a beginner, and she takes "pity" -- as the Pangwe themselves say mockingly -- on them all (1). With such nžila, especially the older ones, the

[802]
[211]

1. Even to keep track of their number is too difficult a task for her memory; for that reason the Jaunde girls count the number of their friends on little sticks of raffia (see Zenker).

men also permit themselves the use of offensive expressions and crude jokes, such as would be unheard of and strictly prohibited with a young girl -- especially the future wife. As an example,
[831] phalli are sometimes made of wood and then displayed wrapped in a leaf.

As has already been indicated, liaisons of the heart based on
831 genuine love are by no means uncommon. Nobody, on the other hand, will be surprised to learn that for the most part they are of limited duration and are incapable of bearing the burden which we expect of them. Thus I did not learn of a single case of a person
[762] committing suicide because of unrequited love or a spurned courtship, even though women hang themselves because somebody stole a few of their miserable hens, and men shoot themselves because their father sold a daughter in order to buy a wife, instead of leaving her to the son, the girl's brother. Generally speaking, the power of Negro love is not as great as that of the love of the Whites.

831 If the latter resembles a rushing stream which tears away everything in its path, the love of the Blacks is like a still, deep lake, and it is certain that even in Africa the magic power of love often intimately joins two hearts and that there is genuine love which in every respect is comparable to the European conception. This point is well demonstrated by the "love tests" which the men sometimes apply in order to convince themselves of the love of a future wife, quite according to the pattern: "Drum prüfe, wer sich ewig bindet, ob sich das Herz zum Herzen findet" /Trans., "Therefore assay, before you bind yourself never to part, whether there's harmony 'twixt heart and heart," from Schiller, "Das Lied von der Glocke"/.

539 514 836 An example is presented by the following tale.

One day a young man went to see the girl that he loved and wanted to marry. At night, while he was sleeping in her house, he had /257/ to urinate, but since he did not know where the toilet was and since there was no man there whom he could ask, he said to himself: "Oh, what shall I do in my need? -- -- But let me see whether the girl really loves me!" He took a small cooking pot (obə̌bə̄') and used it so that it was filled to the brim (lǫ̌'dǒtǫ̌); then he covered it with leaves and placed it behind a bed. The next morning he set out on the way home, and the girl accompanied him until they were outside the village. On the way he said: "I am going now to my village, and I shall see

ng(e) oa dzǐn ma: obə̌́bə̄', ng(e) oa bə̌'ne
if you love me: (the) little pot, if you hate (do not

ma: obə̌́bə̄'."
love) me: (the) little pot,

that is, the little pot will show whether you love me or not! The girl did not understand what he meant by this and asked him to explain. But he simply answered:

ǒ', kaa dzǎm mfə̌,
Oh, no matter other (than that):

ng(e) oa dzǐ'n ma: obə̌́bə̄', ng(e) oa bə̌ne ma, obə̌́bə̄'.

539 514 836 When the girl went home she thought to herself: "I wonder what that means: ng(e) oa dzǐn ma: oběbe, ng(e) oa bə̌ne ma: oběbe!?" When she was in the house, she was still thinking about it; then she suddenly smelled the odor and found the little pot behind the bed. She took it, poured its contents into the plantain grove behind the house, and cleaned it thoroughly with water. Meanwhile her lover had secretly come back to the village and observed from a hiding place how the affair was developing, whether the girl would call other people and publicly expose him (1). But nothing /258/ of the kind happened. He then saw

539 514 836 558

1. In that case the lover would not have been able to hide from the mockery of his companions and would have become completely unacceptable in the village of his beloved. It should not be forgotten how terribly disgraceful a Negro finds such an occurrence, indeed, the very thought of a natural need to relieve himself. A person who has had, as we would say, an accident, as in the above case, will be socially unacceptable for a long time if the incident becomes known, while we "barbarians" with our trifling amount of oson look upon such an occurrence as a painful accident for the moment, but do not carry it any further and, moreover, regard the physiological evacuation of the body as something "natural." Unfortunate uncivilized civilized people! The savages are better people after all! They have a countless number of circumlocutions for the terrible deed: ma ke a npə̌[n̄] biǎn, "I am going to fetch a medicine"; a bə̌be ekūidi, "to inspect the spring trap"; a bə̌be ebə̄i, "to inspect the pitfall"; a tsǎ ndzǎǎ,

514 539

539 514 "to look for firewood"; ma ke ofe̱ī, "I am going into the bush," and so forth. Even today I have to smile when I think of an incident that happened at the beginning of my stay in Alén. One of my Fang boys, who accompanied me on the hunt and was near a thick, half-rotted tree stump, suddenly said, "ma ke tsǎ ndžā,ǎ (I am going to get some firewood)." Under the impression that he really wanted to cut off some firewood from the tree stump, I countered this, to me unintelligible, notion, half amazed, half mockingly, with the words, "ye oa bě̱le ovǔ̄n (but do you have an axe)?" It was only after a while that I understood why I was struck by such an annihilating look of moral disapproval. After this faux pas, I became more cautious and was soon sufficiently polished to be a highly civilized person in the Pangwe sense, who in strange villages no longer spoke of the eduk (toilet), but instead, as a well brought-up "Pange," merely asked:

114 514

nge ba tší'dǎn ma, ma yā̱'le
If one drives (urges) me, I duck (hide)
[539] vě'?
where?
or: zě'n e medžā e ne vě'?
Where is the way to the host (actually: head of the village)?

539 757 514 Further demonstrations of the Pangwe's feeling of shame with respect to natural requirements are the use of an enema syringe (which is directly connected with

514 [757] 539

the feces or anus) as a deterrent medicine for thefts from the field and the significant tale of the turtle and the woman. A turtle wants to force a girl against her will to become his wife, and after all kinds of vain attempts finally succeeds only by smearing the girl's bed and clothes one night with his own feces. Having done so, he lies down to sleep, and the next morning when the girl sees the mess, he threatens to tell in the village and all the world that she had befouled her bed. The turtle thus put the girl completely in his power and forced her to agree to the marriage.

539 836 514 the girl going into her mother's house, quickly stole after her through the plantain grove, and listened behind the house to what the girl might say; not by a single word did she mention the incident. He then went back with a joyful heart, and said to himself: "This girl truly loves me." After two days he returned, asked for her hand in marriage, and took her back to his village as his wife.

This tale gave rise to the popular saying: ng(e) oa dži̱n ma, oběbē', ng(e) oa bǭne ma: oběbē'.

832 The great number of love medicines (bia̱n andu'man), which very graphically symbolize the fusion and embracing of the sexes (in a spiritual as well as a physical sense), has already been discussed in Volume II, page 30 .

848 836 Illegitimate children are quite rare. The child's father -- even when he is known -- has no claim upon the child, just as the girl has no claim upon the father. The child belongs to the girl's father and is regarded as a not altogether unwelcome addition, since when the girl marries, it considerably raises her purchase price. As long as the mother remains unmarried, her child stays in the house of her parents. When she marries, the child becomes /259/ a part of the marriage bargain, as it were, and is considered

836 entirely as the husband's own. If the mother runs away with a
848 man -- which sometimes happens -- without taking the child along, it is fed by the grandmother whose name it also usually bears if it is a girl. It is by no means a disgrace for the girl if her sexual relations with young men have consequences.

3. Marriage

We have already seen that sexual intercourse within blood
835 relationship is taboo (ekī).
184 Such relationship includes:

1. one's own familial group;
2. the mother's familial group;
3. the familial group of the father's mother.

Formerly this taboo was observed by all Pangwe with uniform strictness, but today it is frequently circumvented. The Jaunde do not always observe it, and the Fang -- of all people, the Fang with their constantly emphasized oson -- have dropped it for the own familial group, but retain it for the other familial groups. To the Ntum and all the other Pangwe this shocking occurrence has been a great irritant, and they never let an opportunity pass of making fun of the immorality of the Fang who "cohabit with their own sisters" or of speaking indignantly about it, without failing at the same time to stress their own great respect for morality and decency. This is done despite the fact that the Ntum themselves have at least in part been corrupted by the bad example of the Fang, and in other respects, too, transgressions against the taboo are not infrequent. The custom of having sexual relations with women of one's own kin group (sisters in the Pangwe sense) is called zǎmadulu III or simply zǎma III, the verb being a dulu zǎma. As can be seen by the prefix class, the name has been derived entirely unchanged from the name for God (zǎma) and signifies "to act like Sama," because, as can be seen from the creation story (Vol. II, p. 16 ff. /Ed., not translated/), Sama (Nsambe) had sexual intercourse with his own sister.

835 Where zǎmadulu is still taboo, a payment must be made to
684 the girl's father in case of a violation. The payment varies depending upon the gravity of the offense: a number of goats

835 (formerly it was commonly five goats), as well as a dog which
684 serves as scapegoat, that is, the dog is supposed to take upon itself the disease with which the sinner is threatened by the cult spirit. If disease nonetheless occurs, medicines which are connected with the cults are prepared (see medicines for cult sicknesses, Vol. II, p. 36).

The modern, freer conception or -- among the Fang -- the
855 denial of the taboo against intercourse with blood relatives (in
582 the Pangwe sense) disappears as soon as there is a question of marriage. Then the taboo is in force everywhere and without qualifications. /260/

Free intercourse between the young man and the girl is, in
836 many cases, only a shorter or longer testing period which, if the
583 result of the "test" -- in this case a physical one, as contrasted to the spiritual one of which we spoke above -- is favorable, leads to marriage. If the girl is very much in love with her friend, to use a Pangwe expression, he can readily persuade her to follow him immediately to his village. Such an "abduction" is considered -- partly, at least -- to be sanctified by custom, even if the bride's family is usually not overjoyed at the practice. In such a case, the girl's father will set out the next day to demand the purchase price from his son-in-law. If the latter is able to pay him a part, say, half of this price, the matter is settled, and the balance is usually put on a buy-now-pay-later basis. If it turns out, however, that the "abducter" is a poor beggar or that his father does not want to produce the money, the bride is mercilessly taken away from him again even if she pours out streams of tears. You simply cannot get something for nothing. In the majority of cases, however, the girl will not agree to run away with her lover; instead she will demand that her suitor ask her father for her hand in marriage and first make a payment.

Every woman, young or old, has the same value. Nonethe-
583 less, the amount of the purchase price fluctuates greatly in accordance with general economic conditions. A woman is cheapest among the Jaunde and she is most expensive in the heart of Pangwe country. The price fluctuates between 200 and 750 marks in our money. On the average, one can assume a price of

583 between 500 and 600 marks in the south. Devaluation of the money, which has also taken place in Africa, has considerably raised the price in comparison to what it was formerly.

The purchase price cannot be paid in money (spear money)
583 alone, in cattle alone, or in any specific type of goods alone;
426 instead, all the objects of exchange which are in circulation
435 must be represented. Thus, in 1906, for instance, the following things were paid for a woman in the Fang region:

6,000 spears	420. -- marks
12 rifles	120. -- marks
2 vats of powder . . .	4. -- marks
70 choppers	70. -- marks
2 sheep	50. -- marks
2 iron pots	8. -- marks
10 pieces of cloth . . .	40. -- marks
5 hats	10. -- marks
13 kettles of salt @ 2. -- marks	26. -- marks
2 knives	2. -- marks
2 packages of beads . .	2. -- marks
2 tobacco pipes . . .	---. 50 mark
2 packages of flints . .	--. 50 mark
1 hatful of buttons . .	--. 50 mark
	753. 50 marks /261/

Any existing illegitimate children go along with the marriage
[848] bargain. In fact, the bridegroom has to pay 500 spears for a boy and 1,000 spears for a girl; incidentally, he is only too glad to do so, because each child means an addition to his wealth.

I shall not go into a discussion of the endless number of quar-
578 rels that arise on the occasion of a marriage, especially when
583 the entire purchase price is not paid at once. Nor shall I speak of the fact that the girl's father likes to steer his daughter, even if she is in love with another, into the hands of the man who can pay the most or the most readily. All this would lead too far afield.

606 If the girl stays in her parents house and if the payment of
583 the purchase price extends over weeks and months, the suitor has
584

583 sufficient time to get to know his future wife and her family.
584 He treats them with the greatest consideration, and for the mother-
606 in-law (nie-ngon III, that is, the girl's mother) especially he has an enormous amount of respect. He is courtesy itself, bringing her presents, large and small, and from time to time killing a chicken or a sheep for her. In short, one could in all seriousness speak of a mother-in-law cult (see the love feast, Vol. II, p. 24). And above all: oson, oson, oson: shame, shame, and more shame. The son-in-law is unspeakably ashamed before the mother-in-law, and vice versa, she before him. This is especially true after the wedding when the good mother-in-law extends her modesty also to the members of the son-in-law's kin group. Like a thief she steals behind the dwellings into her daughter's house in order not to be seen, and -- who knows? -- perhaps in order not to give rise to mother-in-law jokes.

Riddle:

[539] nzǎ'n e bönsüe, e ne kaangǎ
[524] Way of the lizards, it is (in the) reeds (Cyperus)

Solution:

nzǎ'n e bonǐ́ěngō'n, e n' a
Way of the mother-in-law, it is on (the) stretch

fā́
behind the houses.

585 On the day when a man takes his young wife home, the village
535 celebrates with a sizable dance, for which all adorn themselves to
[302] the best of their ability and which the young wife, red from red wood dye, attends as guest of honor seated on a stool. On this occasion, the popping of blunderbusses may not be omitted, because it belongs to the festive music like our flourish of trumpets. The dancing and shooting last several days when a wealthy chief has acquired a new wife or if it is the first wife of a fellow villager. There is nothing strikingly special about any of this; the festivity simply involves a series of different /262/ dances (among which the dschama is particularly popular which are also customary on other occasions.

585 After the wedding, the young bride is allowed a certain period
595 of rest (up to one month), during which she does not need to work. Every day, newly painted with red wood, she struts around the village. After this honeymoon she then proceeds to the diurnal work in the field, while the man may possibly already be on the lookout for a second wife. Incidentally, there are not many who can afford the luxury of several wives; usually these are only the chief, his brothers, and a number of other people. The great majority must content themselves with a single wife. In former
[589] times there were even people who, for lack of money, were condemned to permanent bachelorhood because the opportunities for earning money were not as favorable as they are today with European commerce. In the account of the belief in souls (Vol. II, p. 102 /Ed., not translated/), we mentioned how a loving father procures a wife for his son by transforming himself into a leopard.

The number of wives that the individual chief calls his own
622 decreases from north to south, precisely in the same proportion
595 as his power as a ruler decreases towards the south. The most
184 respected and greatest chiefs of the Mwele and Jaunde sometimes possess up to 100 wives; similarly, Bulu chiefs with 50 wives are not a rarity. Among the Fang, on the other hand, the chiefs have only from 16 to 20 wives, at most 30, while in smaller villages they may have as few as five or even fewer, since, as we have seen /Ed., not translated/, anybody can become a chief (nkūkūma) by founding a new village because in this village he will be the "wealthiest."

The statement sounds harsh, but it must be made: the
837 woman's sexual life is basically a continuation of that of the girl, perhaps in even more artful forms, in other words, a higher form of prostitution. Marital fidelity is a great rarity, even though my Blacks steadfastly maintained that this is not so. I myself was only once shown a woman, as a "curiosity," who did not permit herself to be seduced by other men, and this was not even in the Pangwe region, but on my travels in Bassá country. I do not wish to deny that even among the Pangwe there are women who remain faithful to their husbands without being compelled

837 to do so, but, as I said -- white crows! Actually, it would be asking rather a lot to expect this as the order of the day, in view of the prevailing polygyny. All jealousy and all supervision are of no avail; the women simply acquire behind the man's back what he cannot or will not grant them.

[622] Generally, the chief keeps only a small number of his wives, [595] perhaps from three to five, for himself. The others he divides among his /263/ adherents and friends or hires them out to acquaintances for one or more nights in exchange for cash payment. In addition, as is apparent from the reckonings at the feast for the souls, the women keep a whole series of admirers who -- if there is no other way -- satisfy them during the day in the fields, in spite of Ngi and all the cult spirits. Even lepers and cripples are not spurned if they are capable sexually. If the [684] husband learns the name of a wife's lover, the latter must pay him about 300 spears. The price fluctuates somewhat, and in case the parties do not come to an agreement, it is determined by legal proceedings. If the husband catches a rival in flagrante delicto, he sometimes has no scruples about shooting him down on the spot.

587 If a woman dies soon after marriage, the widower obtains the sister of the deceased as a wife, either for nothing or for a small additional payment, because it is believed that the woman carried an ewu inside her, in other words, that she was a sorceress and was therefore responsible for her own death, thus wronging her husband.

If for some reason or other a man does not like his wife, he 586 can give her back without great difficulty, since, after all, she retains her value and finally always "gets her man." In the case of young people, who frequently marry the first person that happens to be available and only later realize what they have actually acquired, wives may be taken back purely if they have a poor appearance, diseased teeth, an evil smell, and so forth, in other words, if they are generally "unpleasant."

Otherwise, the chief grounds for divorce are: 1) spitefulness and disobedience towards the spouse; 2) malicious, extended desertion of the husband (but not simple running away) and

586 insurmountable aversion to him; 3) repeated theft; 4) sorcery by which the woman kills (poisons) the children of other women, and the man is afraid that sooner or later he will likewise become her victim; 5) the slow development of the woman who was a child when married, in other words, the man had overestimated her age (this case is as characteristic of the Negroes as the reason given for it: "So that his money will not be spent for nothing"); 6) such diseases as leprosy, elephantiasis of the feet, and a form of dysentery (tiɣ), if they appear soon after marriage.

In certain cases it may also happen that continued adultery and sterility of the wife lead to divorce.

If the reason for the return of the wife is well founded, which in most cases it doubtless is because a Negro will not give away his wife for nothing, the purchase price is returned, or in case the father-in-law has more daughters, a sister of the ex-wife is given in exchange for the unsuitable one. /264/

[691] Naturally, quarrels arise in great abundance on such occasions, and legal proceedings stemming from the refusal to return the purchase price of a wife constitute, next to cases of adultery, the majority of all litigations.

4. Medicines, Influence of Sexual Intercourse

842 In the opinion of the Pangwe, the seed is formed in the
827 nipple. This idea was probably arrived at through the fact that at the time of sexual maturity the breasts swell and at times even attain the size of the breasts of girls of the same age. From the nipple the seed flows into the pubic region to the mons pubis (edǎ'k) and is deposited there to flow out during coitus (see medicine for gonorrhea, Vol. II, p. 50). There would be too much [302] if the pubic hairs were shaved off. Hence they are merely cut short as a hygienic measure dictated by the hot climate, the secretion of sweat, and itching skin rashes. Concerning the significance of the testicles, the Pangwe are in complete ignorance; they believe that they merely serve to erect the penis.

841 Menstruation is the sign of the ability to bear children and is looked upon as an effect of the moon (ngō'n = girl and moon).

841 Hence, according to rule, menstruation should start in the first few days after the new moon, but unfortunately the white-haired old fellow seems to take his task rather lightly and is rarely dependable. In order to hasten the appearance of menstruation and thereby to make the girl capable of bearing children or, better yet, to make her accessible to men, a medicine is used. Sexual intercourse during menstruation is not exactly prohibited, but it [834] is nonetheless regarded as unaesthetic and is usually avoided. In [824] order to staunch the blood (a dzib makji), the women stuff dry plantain tow into the vagina, a process which they repeat from time to time. They also have medicines designed to hasten the end of the flow of blood.

In view of the lack of moderation with which the Pangwe from 832 early youth indulge their sexual desires, the young man at an early 824 age feels the need to fortify his sexual powers. For this reason, they take medicines, bläʌ nkŭn, medicines for the penis, whose effects are thought of as a transference of characteristics, in accordance with the conceptions described earlier concerning the power of organization /Ed., not translated/. I shall mention the following.

1. Hardwoods, to transfer their hardness to the penis: Albizzia brownei Oliv., Leguminosae (angŏk); Baccaurea bipindensis Pax., Euphorbiacea (mbǎ'n-afǎ'n I), leaves ground in ngon and eaten; Carpolabia alba Don., Polygalaceae (onŏn, tōmo[k] IV Fang, tŭē'me Ntum), a remedy frequently used, /265/ /Fig. 85 appears here in the original text/ the leaves eaten with an egg and a piece of the stem is tied around the body so that it lies over the seat (Fig. 85, a); Cyclostemon gilgianus Pax., Euphorbiacea (onŏn nsǎk, t.-nsǎk), root scraped into an egg, stem piece worn as in the previous case; Tricalysia tessmannii Krause, Rubiaceae (tŭē'me-afǎ'n IV Ntum), likewise; Cola pachycarpa R. Schum., Sterculiaceae (ekŏ'm), fruit kernels eaten; Clerodendron bipindense Gürke, Verbenaceae (ndžike fǎm = men's liana), leaves ground with true Cola and eaten.

2. Thorns whose stiffness is supposed to be transferred to the penis: Lonchocarpus barteri Benth., Leguminosae (ejō' a fǎm a

892
824
[825]

Fig. 85. Medicines to reinforce virility, worn at the belt, usually over the seat.
(a) Wood of Carpolabia alba, (b) tibia bone of a cock, (c) caudal vertebrae of the leopard.

nsŏsɔ̄'k I), and perhaps also Combretum tessmannii Gilb. (anduń a ndžik). In the case of the first two, the thorns are boiled in a bundle together with various spices and the leaves of other fortifying plants (so that the strength of the thorn goes into the food and thus enters the body); then the thorn is taken out and worn on the forehead or over the seat. The leaves of Combretum tessmannii are cut up and eaten with an egg. Also Macaranga ledermanniana Pax., Euphorbiacea (kɔ̄ǐa III, asǎs), is used; pieces of the bark (with the thorns) are boiled and strained, and the liquid is drunk hot.

3. Sharp leaves and stalks: Scleria barteri Bckl., Cyperaceae (pfǎfɔ̄'lɔ̄ III Ntum, from pfǎ = sword, bushknife, and -- perhaps -- afɔ́lɔ̄, afǒlǔń = hat, because the climbing reeds threaten to cut up the hat? It is called "bushknife" in coastal English. The young leaves are eaten.

4. Bitter and sharp substances: salt; black pepper (Capsicum); melegueta pepper, that is, seeds of Aframomum melegueta (Rool) K. Sch. (andǔń = seed; ndǔń) (1); Andropogon schoenanthus

1. Root tu, ndu = warm, hot; compare nduǎn = fire; o-tu = bush hair, torch; o-tu-m = Urticacea Tragia cordifolia

832 824 Pax, burns; a-ndu-ń a ndźik = Combretum tessmannii Gilg (see above).

L. (designation questionable) (ołźm e ntǎńgǎn), root eaten; Cola acuminata (P. Beauv.), Sterculiacea (abǒ).

5. Substances that cause itching: Tragia cordifolia Pax (otńm), leaves ground and eaten with an egg; likewise Urera dinklagei Engl., Urticaceae (sǎ[s] ndźik).

6. Heating substances (designation of the natives): Derris glabrata Welw. (eǒn e ndźik), root and leaves ground, boiled with spices, strained, and the liquid drunk. /266/

7. Explanation unknown: Uapaca guineensis Muell. Arg., Euphorbiacea (asǒm) (perhaps because of strong wood?); Coinochlamys schweinfurthii Gilg., Loganiaceae (oli fǒm = men's little tree), little pieces of the stem stuck in the hair (hardwood?); Geophila herbacea L., Rubiaceae (eiǒ[k] a tǒn), leaves ground with Cola and chewed (leaves are durable, "strong," perhaps for that reason?).

832 825 Of animals, the meat of the spiny-finned sheatfish, which is very fat, is considered a stimulant of the first rank; furthermore, the tibia bone of a cock (Fig. 85, b) is worn on the body because of the spur, as are caudal vertebrae of the leopard (Fig. 85, c) because of the strength of the tail.

833 278 The medicines for impotence (biǎń a ǒ or biǎń e ǒ) should be distinguished from the stimulants (aphrodisiacs). There are thought to be two forms of impotence: one dating from earliest youth, and one acquired later in life. The former, it is said, came about because the persons concerned had urinated in their food as very small children while they were being fed pap by their mothers. Another version is lined with the belief in magic: a boy is thought capable of giving away his sexual power (see belief in magic, Vol. II, p. 134 /Ed., not translated/) in exchange for the power of sorcery, that is, power over other people. Perhaps this conception stems from the fear that impotent persons try to avenge themselves on their fellow human beings for their misfortune. The medicines for impotence are not numerous, but they actually seem

833 to be, in part at least, effective. Thus, the most common of
278 these, derived from the Rubiacea Corynanthe yohimbe K. Sch.,
[824] has recently been incorporated in our medications under the name "yohimbin." -The natives produce an extract from the bark and wood of the tree and drink this. They conceive the manner of its effect as similar to the one mentioned above, and they reason as follows: the wood of the tree is especially hard in relation to that of other trees, say, like the penis of a pig in relation to that of
[825] other animals (something which one notices if one boils it and tries to eat it), and I shall acquire this characteristic of the wood if I partake of some of the wood. Hence the tree also bears the name nkŭn e ngŭi, "pig's penis."

Aside from the Corynanthe yohimbe, we should mention here
824 two other trees which possibly also give physiological effects:
833 Leguminosa Baphia buettneri Harms (mfǎ I, mfǎn I), and the
278 Flaccourtiacea Homalium africanum Bth. (ejŭm, supposedly from a jŭme nkŭn, "to erect the penis," an expression that I never again encountered. In my opinion, the root contained in ejŭm is the same as in nnŭm, plural bojŭm = masculine gender; thus, the tree would be called ejŭm for (e) the man; majŭm, plural = seed). /267/ The leaves of the Baphia buettneri are gathered, ground on stones, and placed in the sun in sugar wine. The mixture is drunk while it is warm. From the Homalium, on the other hand, the bark is scraped off and ground; then it is boiled with spices and the liquid drunk while it is hot.

Finally, three more plants were mentioned to me as belonging in the category of bǐǎn eē, among these, the Solanum duplosinuatum U.D. (etŭi'n) because of its spikes.

Venereal diseases (see Section 13) are prevalent only in those
164 areas where European influence has existed for some time, especially
684 in Yaoundé and Gabon, from where syphilis has been spread. The
[177] Negroes seem to consider frambesia a kind of sexual disease, for the man who has communicated this disease to a girl or a wife must pay her or her father the same penalty (500 to 1,000 spears) he would pay if he had infected her with syphilis. If, on the other hand, the lover becomes infected through the woman, he can claim no damages.

In the case of gonorrhea, the infected woman can demand
164 damages only if she notices the misfortune before she has been
684 paid for the favor rendered. The damages amount to 400 spears if the disease came from a person of the same kin group, and 1000 spears if it came from a person of another kin group. With the payment the "temporary marriage contract" is terminated, and thereby any claim for damages is nullified. In other words, it is always a good idea to pay one's debts as soon as possible:

[539] a bɛ̌le, a bɛ̌le, a kɔ̌n abɛ̌ mayɔ̌k.
Keeping, keeping, it strikes (a) poor bargain.

The person who always keeps his money to himself runs into an unfavorable price situation.

Their unrestrained sexual intercourse has a highly deleterious
831 effect upon the Negroes; it weakens and stupefies them. Smaller
461 boys are often quite useful as servants, but once they reach sexual maturity and become acquainted with women, they can simply no longer be used. The Pangwe recognize this bad influence, and intelligent ones among them did not hesitate to confess frankly to me that their sexual practices corrupted them and made them incapable of strenuous physical or intellectual work. We do not need the testimony of individuals, however -- popular customs demonstrate this insight sufficiently. I believe that, aside from
[834] being based upon the original religious conception concerning the sinfulness of sexual intercourse and its incarnation in the woman, the abstinence rules for war and hunting expeditions and for iron smelting are based on the experience that sexual intercourse weakens the man's physical and intellectual capacities. Naturally, the man is inclined to heap the blame on women /268/
[196] and bebɔ̌n, "vaginas," as he contemptuously calls them (1).

171 1. "Terms which originally only signified 'vulva' or 'cunnus' but were then generalized into the concept 'wenches,'" exist everywhere in Europe, too; see Anthropophyteia, Jahrbücher für folkloristische Erhebungen und Forschungen zur Entwicklungsgeschichte der geschlechtlichen

171 Moral /Anthropophyteia, Yearbooks for Folkloristic Inquiries and Explorations into the Historical Development of Sexual Morality/, edited by Dr. Friedrich S. Krauss (1912), Vol. 9, p. 31.

833 Over against the great mass of women, the bebŏbăñ, who
777 through sexual intercourse bring the man misfortune, there is the exceptional phenomenon of the woman who among the Ntum is called ayūē' III and among the Fang ayā̆. Union with her brings both parties, the woman as well as the man, good fortune. At the same time her influence is more important for the man, for instance, during military and hunting expeditions. If, for instance, the man goes hunting on the day after having had intercourse with such a woman, he is bound to see a wild animal soon and to kill it. If he goes to war, "his rifle will hit its mark," whereas the enemy's will not. For this eventuality, moreover, he has the woman give him a medicine, namely red wood that she has ground in a certain way (bā-ayā̆, mfumu-bā). The woman, too, is lucky on this day if she goes "hunting" for fish, that is, if she goes on a fish drive (a lŭk), or works on the farm (see Vol. I, p. 56).

But -- as was said -- such women who bring good fortune are a rarity; the majority of women bring misfortune. If a man goes hunting on the day after coition, all the animals evade him in a wide arc (a bă̆ñ), hence the name ebŏbăñ.

[833] In the peculiar custom of the miāk consecration I see proof of
785 the fact that the Pangwe know the harmful effect of excessive sexual
554 intercourse. The word miāk actually means the castrated animal,
831 in particular the buck goat (see Vol. I, p. 76), and here it is applied symbolically to a person who through a public and solemn declaration is for a time excluded from sexual intercourse. After a successfully concluded war, more rarely upon some other occasion, somebody (usually the chief) decides to consecrate his son or his daughter to purity. Naturally, neither of the latter may as yet be acquainted with sexual matters, in other words, they will only be

785 from four to six years old. They are thus consecrated so that
554 one day they will surpass all others in insight and understanding;
831 then, through their spiritual superiority, they will acquire influence, power (knowledge is power!), and especially wealth. In the case of the son, this will be to his own advantage; in the case of the daughter, it will benefit the father who can get a higher purchase price for her than for a girl with the usual loose way of life. In other words, the "savages" know well the value of moral purity. /269/

831 The custom of mǐǎk consecration was formerly practiced
785 throughout the Pangwe region. Nowadays, however, since warlike
[184] times have ceased, it is to be encountered only among the Fang of the central Uelle region. I should like to compare the custom
[171] to the practice found among us during the Middle Ages, whereby the heads of important families (especially princes), after some lucky success (for instance, in war), destined one child for the clergy and consecrated it to the pure life dedicated to God, frequently not without calculating the advantages that could accrue to them from such an action.

785 The procedure of the consecration feast is as follows. The
789 child, clothed in a small loincloth, is led to the medicine man
556 and is washed by him with a medicine water. The medicines used
831 for this are barks of various trees that bear ample fruit, such as
[824] the Pseudospondias microcarpa (Rich.) Engl. (ofǒs), so that the child's understanding may bear fruit as abundantly as these trees or, in other words, so that wealth may fall to its lot in the same abundance as the fruit of these trees falls to the ground beneath them. The various barks are placed in a container made of banana leaves, and hot water is poured over them. After the ablution, the child must swallow the principal medicine, a bundle of ngon
[824] with the chopped leaves of certain "weak" plants, such as Hibiscus moschatus (Roxb.) (tège III, from a tĕk, "weak," because the fruit is cooked in a short time), in order to make the child
[833] equally weak, that is, sexually incapable. Furthermore, the ngon
[825] is mixed with chicken meat -- the chicken is the bird of day, of the good and the pure, and at the same time it is supposed to point symbolically to the wealth that is desired for the child (the chief, the "Very Rich One," is regarded as the privileged son of the

831
785 sun) -- or with elephant's meat, in which case the child is sup-
556 posed to become spiritually great and important, just as the ele-
[825] phant surpasses the other animals physically, or, finally, with the meat of the hedgehog -- the child is to get as many things as the hedgehog has quills (1).

[539] 1. A well-known proverb, to be intelligible, would have to be translated into Pangwe something like this: He is as full of stupidities as the hedgehog is full of quills.

Thus, the child becomes miǎk. Its loincloth is taken off
785 and from now on -- be it male or female -- it must go about
831 completely naked. Here is another significant fact regarding
[834] the moral-religious view of the Pangwe: clothing, that is, the
[291] covering of the sex organs, arose because the sense of shame (o-so-n) which started with the first sin (n-sö-m, root so), that is, sexual intercourse, demanded it. If the innocent state (ignorance of sexual matters) is artificially restored, clothing becomes unnecessary.

The miǎk are generally respected. People are careful not to speak to them about sexual matters or to seduce the girls, especially since /270/ the protection which they are accorded by cus-
[684] tom is effectively strengthened through the right of the father or the relatives to shoot down the seducer without further ado wherever they find him. Nowadays, however, the old customs have been somewhat relaxed; the miǎk are not always what they ought to be.

Annulment of the chastity obligation takes place in the same solemn manner when the consecrated person is fully grown, in other words, not before the age of 20 years. In the case of the man, it is required that he prove himself the bravest in war or at least that he has shot an enemy (1). In the case of the girl, it is

[177] 1. Today, in the regions influenced by the Whites, this decree has had to be moderated.

[583] required of the suitor that, contrary to the usual custom, he pay

785 the already higher marriage price in advance, down to the last
85 little string of beads.
[583]

The ceremony itself proceeds as follows. A goat is killed, and its blood is mixed with medicines by the medicine man and rubbed onto the body of the miǎk. The medicines are made from shavings of bark from various trees and are supposed to cause sexual incapacity to be "stripped off"; the goat is chosen because, [825] in contrast to the chicken, it is the animal of evil, of the sexual drive. Finally, the medicine man solemnly declares that the person concerned has ceased to be a miǎk and is thus relieved of the obligation to abstain. Henceforth the erstwhile miǎk again wears a loincloth.

5. Deviant Forms of Sexual Intercourse

The Negro's strong sweat secretions, but chiefly a skin 839 disease -- Krokro /Ed., ?/ (metšǎn) -- appearing on the sex organs and between the buttocks, cause an itching irritation which among the Pangwe has led to the bad habit of constantly scratching the penis whenever time and opportunity are favorable, even when there is no itching as well as to relieving an itch. They do this by twirling the penis in a manner similar to that used in making fire with sticks. This is a sport practiced by boys and adults alike and is called a kīk e metšǎn or a wōʼo (= wōk) metšǎn, which simply means "to relieve the itching by scratching" (metšǎn means itching of any kind, Krokro being simply the most unpleasant form of itch). On this occasion, erection naturally takes place as a rule, although no orgasm follows, just as there was no intention of relieving sexual desire. Indirectly, on the other hand, this action passes into a form of real masturbation, likewise through twirling the penis (a sīk nkǔn) from which, however, orgasm does not always follow either. In certain regions among the Okak this nsīɛ n-nkǔn (the noun) is prohibited (ekī); it is said that otherwise the person concerned will no longer be able to cohabit with women successfully. /271/

839 In the case of members of the female sex, masturbation by
[824] means of a plantain fruit is widespread, something which is to be foreseen in view of the bad situations arising from polygyny. A proverb states:

[539] o kūe ma zā (sā[k]) ebôn onū,
you find me satisfying vagina (with the) finger (1)

1. Probably a circumlocution since one did not want to mention the real object. Moreover, in coastal English the clusters of fruit growing alternately in a "plantain bunch," are called a
[196] "plantain hand," and the individual fruits making up the hand are called "fingers."

oa bĕle nkŭn,
you have (the) penis,

and this is used whenever someone does not part with something of which he has a superabundance, even when he sees that another person is short of it and makes shift with a poor substitute.

We have spoken above of homosexual relations among "chil-
838 dren." In adults such conduct is regarded as something immoral and unnatural, simply as unheard of. In reality, however, it is frequently "heard of" that young people carry on homosexual relations with each other and even of older people who take boys -- who, as is well known, "have neither understanding nor shame" -- and readily console them by saying: "bia bŏ pfiăⁿga (we are having fun, playing a game, joking)." The children are excused with the well-known assertion, which in its deeper sense can rarely be defended: bŏ ne bŏⁿgo = they are ignorant, that is, they know not what they do. Adults are excused with the corresponding assertion: a bĕle nnēm e bŏⁿgo = he has (the) heart (that is, the aspirations) of boys, which is, of course, by no means flattering to them.

Publicly, of course, homosexuals are treated with the greatest contempt, and they were therefore forced, as a matter of course,

838 to cast about for a protective covering to shield themselves from the attacks of those who are different, just as the hedgehog is protected by its covering of quills -- a covering on which the attackers would cut their mouths and their caustic tongues. Such a covering was supplied by medicine -- it is said that homosexual intercourse is a "wealth medicine" (biǎ,n nkū'ma); see Volume II, page 23. This is the name applied to it in the following tale which was told to me.

There once was a man called bongo-be-ntuu-dumo (= boys -- 838 which?) who had a daughter called akukebedanga who was very 539 beautiful (the name allegedly came from akúk = Achatina marginata [551] Sw. var. nigrofasciata Thiele, which is very beautiful, and from [825] adǎn = to surpass, because she was as unsurpassably beautiful as the Achatina snail; thus, if I understand it correctly, the name means "Achatina snail of unsurpassable beauty"). /272/

Now it happened one day that four young people met on the way to the village of Bongo (I shall thus abbreviate his name). They were all on their way to see the girl. They asked each other: "Whom are you going to see?" and each of them said: "Akukebedanga!" Then they conferred and agreed that they would go into the village together and wait to see whom the girl would love the most. The young people, who came from various families, were called (I place the abbreviation first):

Schok I, or by his full name he was called ǯ[k] bǒ ǯūa (explanation?);

Schok II, called ǯ [k] bǒ ngōne makę̌ makǒ,(ekę̌kǒ), that is, Schok, bōngōne (unknown) I am going away to come back later (= I shall be gone for some time);

Schok III, z [k], bǒ kǎ ję̌m bǒdǯǒ melǎn (1),
Schok -- of not knowing speeches bad,

1. Instead of: belǎn.

that is, the Schok who speaks no evil, and

Schok IV, ǯ [k] bǒ nǔ'm e kūb b'ogbwā'le ba
Schok of: cock and francolin they
jǒm e ki'ḍi ma lę̌ne.
know the mornings they begin.

838
539 The four suitors, then, came into the village where they introduced themselves to the girl's father, Bongo. The latter said: "Oh, why is it that four men are coming all at once -- there is after all only one girl! But let's see what we can do!" Then he led them into the house where they found the girl's mother. The latter likewise said: "Oh, -- four men! I know that hitherto this or that suitor has come, and if the girl loved him she slept with him, and if she did not love him he went back home! But now -- four men all at once!?" Thereupon the young men said: "Let us see whom the girl loves." Now the girl loved Schok IV, but the mother loved Schok III, while the girl's brother loved Schok II, and the father loved Schok I. When night fell, the strangers were led into the girl's house. She slept with Schok IV, and the others slept on the other beds. Now when Schok IV wanted to embrace the girl, one of the others shouted: "Oh, how lecherous this girl is; the very first night she gives herself to her lover!" Then the girl said to Schok IV: "Oh, how this person talks, desist, let's wait for another night!" When the others were sleeping, Schok IV asked the girl very softly: "Don't you want to marry me?" The girl consented to marry him, and they decided that they would both flee the next day (that is, in Pangwe, that the lover was to "kidnap" the girl); if someone /273/ were to see them, they would say they were going to bathe. Thus the next day Schok IV pretended to go bathing, and the girl followed him unnoticed. Both then went to the village of Schok IV.

When on the afternoon of the same day, both of them had not returned and it was evident that Schok IV had kidnapped the girl, Schok III went to the mother, who, as we saw, was fond of him, and reproached her most violently for the fact that the girl had fled. The mother replied: "Well, why am I to blame; I'm not in the girl's skin." Thereupon Schok III became furious, took a bush knife, struck at the woman, and killed her on the spot. Then he went home.

Schok I, who loved the father, turned to the latter, likewise reproached him strongly, and asked him how the girl had come to run away. In answer to this, the father said: "Oh, how am I to blame; if I were the girl I would not have acted so (Bongo's

838 feminine role seems to be hinted at with these words), but I am
539 not in the girl's skin either, after all!" However, Schok I was not satisfied with this explanation. Thereupon the father went to the village of Schok IV, who had abducted his daughter, and demanded bride price from him. Schok IV accordingly paid this price. Bongo went back home with it and said to Schok I: "Here is all the money for the girl; I am paying you with it!" But Schok I said to him: "No, I don't want the money!" Thereupon the father took one of his wives and the money and wanted to offer all this to Schok I as compensation. But still Schok would have none of it. He said: "No, I don't want it -- rather (and this will be the compensation) we shall both always be together; when you urinate, I shall also urinate; when you defecate, I shall also defecate, when you sleep, I shall also sleep with you on the same bed (1)!"

1. The great declaration of love of the Pangwe corresponding to our: "Wherever you go, there I will go too!"

So, in fact, it turned out, and the two slept together. Finally, however, both contracted frambesia and died of it.

The last Schok, Schok II, who loved the brother, did the same thing with the latter as Schok I did with Bongo. As a substitute for the girl, he stayed with the brother, and the two slept together. But they, too, became sick, of leprosy, and died.

In this tale it is particularly striking that the sexually normal and abnormal have different fates. The normal Schok III gets away unpunished, even though he kills the wife of his host, who was to become his mother-in-law. The homosexuals Schok I and II receive a terrible punishment in the form of leprosy and frambesia for their intercourse.

838 As we already know and as we have seen again here, the
[684] punishment for homosexual intercourse is usually leprosy, meted out by Ngi (or /274/ other cult spirits) as the guardian of purity. This is also the punishment for other immoral crimes, such as sexual intercourse during the day, and so forth.

838 Concerning homosexual intercourse among women, I was unable to discover any facts.

839 So far as I know, bestiality does not occur.

6. Pregnancy, Birth

843 The Pangwe recognize the beginning of a pregnancy by the nonappearance of menstruation; they are also familiar with the fact that a slight indisposition and headaches about a month after cohabitation may cause one to suspect pregnancy. Once pregnancy [833] is established, the man continues to have intercourse with a woman for about two more months, but then relations with her must be broken off, since it is feared that the fetus would be destroyed or at least harmed by the seed that it must "drink," It must also be emphasized that this prohibition is not always observed; indeed, [755] there is a medicine, sand in water, which a woman is supposed to drink if the man has intercourse with her shortly before the confinement. The sand is supposed to scour the seed from the body of the fetus.

[843] Usually the beginning of a pregnancy is greeted by the woman as a joyous event. There are also cases, however, when it is not 847 welcomed, for instance, when prohibited intercourse with men of 278 related kin groups has consequences, when a woman is pregnant by an "unloved man," or generally if she does not want to assume the burden of rearing the child or wants to evade the command of sexual abstinence. In such cases -- and they are by no means rare -- the fetus is aborted (a gbwē abǔm, a kū'e abǔm, "to drop the belly (fruit)"). The medicines, for the greater part poisonous substances with which we have already become acquainted as fish poisons, are: 1) Piptadenia africana Hook. f., Leguminosa (tǔm IV), bark loosened in pieces, pared and boiled, and the extract, when cooled, used as an enema; 2) Cylicodiscus gabunensis Harms, Leguminosa (edūm), used in the same way; 3) kernel of the fruit of Mimusops djave (Lan.) Engl. (tree = adźą̌b, kernel = ngǫ̈n-ebǒn IV), ground in water; 4) Rubiacea

847 oyǒ', fruit chopped up, and Cognauxia, Cucurbitacea
278 (mbǔmyɛ̄i I), roots ground, both boiled together, strained, and after cooling, used as an enema; 5) Maesopsis tessmannii Engl. Rhamnaceae (nkǎngǎ' I), bark boiled, strained, and used cold as an enema. In this last case, its inclusion among abortives was probably determined by the fact that the wood of the tree is stronger in the upper part of the trunk, while below it is weaker.

When the confinement is near, the woman usually goes to her
844 parents if her native village is not too far away and if conditions permit her to do so. /275/ Otherwise, she stays at home as do all older women who have borne three or four children.

Before the confinement the woman stays quietly in the house from two to three days, more rarely four days. Cases are not infrequent, however, when the birth pangs take the woman by surprise during her work in the fields, and she has to bring the child into the world without help, although when this happens she will try to attract the attention of passers-by or women in the vicinity by screaming and shouting, and the latter will assist her and take her and the child into the village.

It is strictly prohibited for male relatives or strange men to witness the birth (osōn, "shame"; some even said nsǒ'n, "crime"). Even the woman's own husband is present (osōn applies to him also) only when there are no female helpers, on which occasion he must take their place. This is, however, a rare and exceptional case; ordinarily there are helpful and experienced women aplenty, who flock to the woman in childbed to encourage her and to assist at the birth by clasping her body from behind and thus supporting it.

Without medicine, of course, a birth cannot take place. The
[278] sap of Cephalonema polyandrum K. Sch., Cucurbitaceae (ejǎzǔ'm), and Fleurya aestuans (L.) Gandich, Urticaceae (ngūkū'n IV), is allowed to trickle into the vagina. The sap is slippery, "smooth," and will thus effect a smooth birth.

The actual birth takes place without any kind of assistance if the child has what the Pangwe also regard as the normal head
845 position. In case of the feet-first position or other irregularities, the child is forcibly pulled out and is then -- so it was said -- always dead. Difficult births seem to be quite rare since my various

845 informants had never heard of such a thing. Similarly, it very rarely happens that women die immediately after delivery from the consequences (bleeding, a weak heart) -- death by puerperal
[164] fever, on the other hand, is more frequent. In cases of such a death, the Pangwe speak of a kiɛ̃'ɛ̃, which is as much as to say that a strange woman brought about the death through sorcery.

Once the child (in the case of a normal birth) has passed out
844 of the birth canal, it is received by one of the women assisting and the umbilical cord (ngǒ'b IV, not to be confused with ngõb IV, "caul, sheath") is squeezed off with a raffia splinter at a distance of from eight to ten centimeters from the little one's body. The rest of the umbilical cord drops off of its own accord after five to six days and is then casually thrown away; by then the navel (dǒb, plural mǒb) is healed. In other cases, the umbilical cord is cut off one centimeter from the belly, thereby causing an umbilical rupture (edǒdǒb = navel par excellence) which is regarded as particularly beautiful. Now the child is washed and placed on a layer of leaves on the bed next to the mother. /276/

The afterbirth (akǒ'nan) soon follows of its own accord. It is usually placed in a leaf bundle and hidden in the refuse pile or buried in a pit in the plantain grove behind the house. If this precautionary measure is not observed, the child will die or the mother will no longer be able to bear children.

Finally a medicine is made for the mother: the herb Ocimum
[278] gratissimum L. (asǒ'b) is dipped in hot water and pressed on the genitals.

During the delivery, the husband waits in the meeting house.
851 Once the child is born, he is told the news by one of the women assisting. Formerly, shots were fired as an expression of joy, but now the custom is no longer practiced, especially in the north, for lack of powder.

On the very first day, the mother gives her breast to the child.
853 If no milk flows, it is assumed that the mother has had lovers who are still in her "belly" and exercise an impeding influence. Therefore, out with them! Argument is of no avail; one after another, all the lovers must be named before those present, in
000 other words, the women, if the milk is to flow. On the second

On the second
846 day after the delivery the mother may go outside to relieve herself, but otherwise she stays in the house for eight or ten days. Then she rubs herself and the child daily with red wood, for a month if she is in the village of her parents or for two months if she is in her husband's house. Only after this period has elapsed does she again take up her customary work.

The woman has to observe a special diet before and after
834 the confinement only with respect to the food taboos discussed
846 previously. On the other hand, she must abstain from sexual intercourse until the child can walk (two years), for if she does not, the worst, even death, is to be feared for the little one. Of course, especially towards the end of this period, a great many infringements of this taboo occur; in such a case one speaks of a tsǎbe bǒ'ngo (literally: to cast the children away, to thrust them away from oneself).

The child is nursed for a like period since the milk is sup-
853 posed to diminish and dry up only after resumption of regular sexual
862 intercourse. However, the flow of milk resumes in case of renewed pregnancy, so in that case the child can again be nursed. Even later, often until the seventh year, the sturdy urchin now and then still enjoys the sweet draught. If the mother is tired of giving the breast, she simply rubs her nipples with pepper (Capsicum).

/277/ Section 19

Childhood and Games

000 1. Names and name-giving. Time at which the name is given, announcement of the name. -- Names given by the mother. -- Variation of names among the subtribes. -- Classification of names. -- Names with explanation: A. Boys' names and their classification; B. Girls' names. -- Nicknames, jocular verse with nicknames. -- Full name (father's name, kin group, name of the mother's kin group), example. -- Series of

000

ancestors, jocular verse. -- It is an insult to ask the name of the ancestors.

2. Rearing the child. Means of rearing: influencing the sense of honor. -- Means of frightening small children (scare sticks, wooden whizzer). -- Rearing by teaching; precepts (examples). -- Rearing supervised by the father. -- Obstinacy of the son. -- Curse: reason, proclamation, effect, removal (formula, symbolic action). -- Cursing of the man by the chief wife. -- Cursing the souls. -- Secret curses. -- The curse of Nsambe.
3. Children's games. Classification. -- Gymnastic games and walking on stilts. -- Spear throwing. -- War and hunting games (play weapons and instruments of warfare, nooses to catch human beings, hunting rifle, crossbow, bow and arrow). -- Imitation of fishing and trapping. -- Other kinds of imitative games (exploding powder, cult games, imitation of family life). -- Toy games (slingshot, etc., tops). - Group games (game with palm nuts, skittles with tops, bowling, memory game with leaf and vegetables). -- Skilled games (technical feats, rope games, patience games, magic tricks).
4. Games of adults. Memory game of the dwarf antelope. -- Memory game of Momendöge. -- Stone game: origin and distribution, playing board and names, rules, outcome; master players, jocular songs and their explanation. -- Game of chance: origin and distribution, playing disks and counters, rules of the game, procedure and outcome, stakes, medicines.
5. Wrestling. General observations, procedure, technical terms.

2: Tessmann--140 E-5 (1904-1909) 1913 FH9 Fang FH9

1. Names and Name-giving

553 Immediately following the birth, but not before the detach-
851 ment of the afterbirth, the child receives its name from the father who has already thought it up before the delivery but has kept it secret until then. The name is publicly announced, accepted without objection or formalities, and is considered to be the permanent principal name. The child receives a second name from his mother; many Pangwe designated this name as "big," that is, important -- probably because they had heard it exclusively from their mother in early childhood. Later, however, in giving their names, they usually mention the name given by the father, unless that name sounds unpleasant to the person concerned or if he wants to hide his identity with the intention of deceiving -- especially the Whites. In that case he prefers to use the name given by his mother. /278/

It is in any case a fact that the name given by the mother is close to its bearer's heart, and for this reason friends often use it as a pet name.

I shall herewith give a number of names that I learned, to-
551 gether with their explanations. As can be seen from the abbreviations of subtribes or tribal groups (N = northern Pangwe, S = southern Pangwe) placed after them, only a small number of the names is distributed over the entire Pangwe region; the majority do not extend beyond a few subtribes, so that a thoroughly experienced investigator can frequently tell by the name alone what a given native's place of origin is.

According to their basic significance, we can divide the names into the following groups:

I. Names of religious origin (only in the case of boys' names);
II. Names that allude to an attractive skin color;
III. Names that designate the desirable characteristics which one wishes for the child;
IV. Names that are supposed to bring good luck;
V. Names intended to indicate that the man will become the terror of his enemies;
VI. Names that express a bad characteristic, with the idea of thereby causing the bearer, on the contrary, to develop good characteristics;

551 VII. Names that report an event before or during the time of the child's birth.

A. Boys' names

I. Names of religious origin.

1. nsǒm, from nsǒ́m = cult, sacred act, Ntum (Fang);
[825] 2. ngī = gorilla, as the animal of purity, symbol of the Ngi cult; the name Ngi, freely translated, means "the pure one" (S.);
3. esū́n = fruit of the Cardamom, chief food of the lemurs, used in the Ngi cult in like manner (1). /279/

192 551 824 1. At least that is what I suspect, even though it is not quite certain, because it may be that Cardamom fruit is chosen because of its shiny red appearance, and in that case it would belong in the next section. On the whole I do not believe that in the case of names an immediate origin from religious institutions or conceptions is to be assumed. In this instance I simply followed the natives who told me that nsǒm came from nsǒ́m, "cult." Now it is true that the Pangwe themselves are frequently mistaken in their explanation of words, but in the second place the name (nsǒm) was given to me with a mediate high pitch, with the name for cult I hear a high pitch, while ichneumon (nsǒm) has a mediate low pitch. But since the mediants are readily substituted (see Vol. I, p. 16 /Ed., not translated/), I assume that here the ichneumon and not the cult served as the root from which the name was derived. This assumption fits perfectly with the fact that the ichneumon,

192 551 825

192
551
825

Herpestes melanurus Gray, which is called nsǒm, has a gray color which may well have given rise to the designation of a person by the name nsǒm. The name ngī, "gorilla," may also be meant as a symbol of strength, or, perhaps like esǔ'n, it may have been chosen because of the red color.

551 II. Names which allude to an attractive skin color and are for the most part derived from fauna or flora that the Pangwe finds especially beautiful.

According to the color, the following were mentioned to me.

(a) Red.

4. mbǎ' = Turacus, actually the shiny red one;
[292] 5. ndūno, from andūn = dancing cap made of touraco feathers (S.);
6. mvē' = redwood tree, Pterocarpus soyauxii Taub., because it is red.

(b) White.

7. mfūmū, from mfūm = white (S.);
8. asǒn = umbrella tree, Musanga smithii R. Br., because of its white trunk (S.);
9. akǒ'm = bracelet made of ivory (Fang).

(c) Gray.

10. edǔ = African rat (in the Pangwe region displaced by the domestic rat) (S.);
11. tǔlo = domestic rat, Mus rattus L.;

551 12. ndǎ'ńga = domestic rat, Mus rattus L.;
13. okū,du, from okǔ,dūgu = flycatcher, mainly Alseonax and Pedilorhynchus species because of their attractive mouse-gray color;
14. ngǒ[ń] mvǎk = Bdeogale nigripes Pucheran.

(d) Black.

15. myǒno, from mvǒn IV - Satan's monkey, Colobus anthracinus Leconte.

(e) Light and dark, variegated.

16. zǒ = leopard, light and dark spots (S.);
17. žǒé = civet cat, Viverra civetta, likewise (S.);
18. mangǒ, from mangǒmentě'me = pied wagtail, colored black and white (S.);
19. ndū,tǔmo, from ndū,tǔm = rainbow, variegated (S.).

III. Names that indicate the good qualities desired for the child.

20. ayǒń, from ayǒń = kinship group, familial group; he is to become an able representative of his kin group and show himself worthy of the good name which the kin group has in the tribe (S.);
21. mayǒń, plural same (Ntum); /280/
22. ejǎ,ǎma, from a jǎ,[k] mǎm = to pay in case of controversies - thus, he is good-natured (S.);
23. owǔno = groundnut that tastes good; the bearer of the name is, therefore, just as "enjoyable" (Fang, Jaunde);
24. olō'(g)o, from alǒk = air-tuber yams, Dioscorea sativa L., the same explanation as for the preceding (S.);

551

25. ogbwɛ̃, from a gbwɛ̃ madzõ = to repeat things, something like chatterbox, by which the man makes himself popular because people like to hear it;

26. ekõ = Lannea longifoliolata Engl., Anacardiacea, so he will be just as popular, as the tree is to the touraco which settle in its crown and eat its fruit (S.).

IV. Names that are supposed to bring luck.

551
777

27. obũ'du, from obũ't = the grass Paspalum, so he will get things in great quantities, just as the grass exists in great quantities (S.);

28. ekõ'mo, from a kõ'mo bĭm = to acquire things, that is, he will acquire things himself since he has no sisters, etc., through whom he gets money, in other words, he is a self-made man (Jaunde);

29. atɛ̃'nã, from a tɛ̃'na kũ'm = to become suddenly rich, to come up in the world, a parvenu in the good sense (S.);

30. atãndãnã', likewise (Jaunde);

31. esĭ or besĭ, from evũ' besĭ = the capacity to acquire things, that is, he will acquire something for himself (S.);

32. olũ, from a lũ' bĭm = to forge things, that is, he will earn money through working as a smith (the only handicraft in our sense).

551 V. Names intended to indicate that the man will be the terror of his enemies.

33. obã'm = bird of prey, chicken thief, a name which could also be included in the previous section if it is intended that the bearer will receive the things (onomatopoetic, bãb; hence o-bãm),

551

otherwise it is terrifying since it designates robbery (S.);

34. olǎ'me, from olǎm = draw trap, that is, he will be to his enemies as the trap is for animals (S., Mwal);
35. oyǔ'no, from oyǔ'n = ax, that is, he will be to his enemies as the axe is to trees (S.);
36. ewǔ'dǔ, from a wǔ'ǔ, a wǔ'dǔ = to murder, the murderer of men (Fang, Ntum);
37. avǒdo, from a vǒk = to be tired, the people will become tired of molesting him since he is a very angry man and destroys his opponents;
38. mvǒ, from a bǒ mvǒ'la = to urge, to admonish, his father sends him out to admonish his debtors, perhaps the father is old so that the son will now collect the debts;
39. zǒk = elephant, he will be feared as much as an elephant;
40. nkizǒ = elephants' spoor, he will make his way through people like the elephant through the jungle, in other words, he will destroy everything that stands in his way. /281/

VI. Names that express a bad characteristic, with the idea of thereby causing the bearer, on the contrary, to develop good characteristics.

41. nǽ'ma, from nǽ'm = tail, as the essence of animal characteristics (S.);
42. ntǔk = spoiled (S.);
43. nkǒabǔ'nu, from nkǒk = tree trunk that has fallen down, bǒnu = a thorny tree whose scientific name I am unable to give; also occurs as a nickname and is supposed to mean worthless and bad (Ntum);
44. mapfǒ = I am a talebearer, likewise used as a nickname (Jaunde, Fang, Ntum);
45. bekǒnǒ, from a kǒ'n = to snore, a jocular name (Ntum).

551 VII. Names that report an event before or at the time of the child's birth.

46. bokǎ = sisters, he has only sisters and hence is the only son (S.);

47. epfū'man, from a pfū'man = to miss, when the bearer of the name was born his father had already sold all his sisters, so the son "missed" the advantages that the sale of the sisters would have brought him;

48. engūno, from engū'na mbūn = dried cassava rolls for the period of famine, supposed to indicate that his mother bore him during a famine;

49. maʒʷbe = I am yearning for something, that is, the father had yearned for a son (S.);

50. mabǎ' = neck pieces of game, the father loved these pieces (Fang);

51. abō'sō, from a bō sō = he was the spirit of contradiction, that is to say, the father; to judge by the past tense, he seems to be tame at present, however;

52. mesǎ'ǎ, masǎ'ǎ, from a sǎ'na ayǔk = to settle an imbroglio; the father is supposed to have done this, but it might possibly refer to the son himself, and in that case it would belong to Division III;

53. nkǔ,lǔ, from a wū,lū a kǔ,lū kǔ,lū (onomatopoetic) = to go softly, thus the father went to the wife;

54. abū'du, from a bū'du mōt = to cover someone, to protect, thus the mother protected her child from her brother;

55. ʒō,gō, from aʒō,k = a familial group of the Fang; the mother was born an Aschok; today this is a generalized name.

551

VIII. Explanation unknown.

56. engūńa, from engūń = Deinbollia reticulata Gilg, Sapindinaceae; interpretation unknown;
57. osǎ'le = a tree unknown to me;
58. nsō' = the fish, Sarcodaces odoe (Bl.), perhaps because of its dangerousness to other fish (like our pike), in which case it would be a name designed to inspire terror; perhaps because of its silver-gray color. /282/

B. Girls' names

I. Names which refer to a beautiful skin color and are for the most part taken from fauna and flora that the Pangwe finds particularly beautiful.

According to the color, the following were mentioned to me.

(a) Red.

1. ndžǎ̄o, from ndžǎk = dancing cap made of touraco feathers;
2. ngūi = pig, evidently because the pig has a reddish color;
3. ngūi dǎńa, from ngūi = pig, and adǎń = to surpass, hence a female who surpasses a pig.

(b) White.

4. mfūmū = the white one, also a man's name;
5. nsōfūmū = nsō = smooth, shiny, the shimmering white one;
6. mbǎ̄ń = ivory;
7. mbǎ'žǎo, from mbǎ̄ń = ivory, žǎk = elephant;
8. mfūmezǎk = the white (the tusk) of the elephant;
9. mǎnembǎ̄ń = little ivory;

551 10. akī'ngǎna = akī, = egg, ngǎn = crocodile, crocodile's egg because of its whiteness.

(c) Gray.

11. abǒǒ, from abǒ'k = Mus hypoxanthus Puch. (this may also belong to (e).

(d) Black.

12. nǎū,ǒū, from nǎūt = black, the black one;
13. mesī[s] me ǒk = tail hairs of the elephant, which are shiny black.

(e) Light and dark, variegated.

14. ojǎ'ne, from ojǎn = Poiana poensis Waterh., civet;
15. ezǒ'na, probably Tragelaphus albovirgatus;
16. myǒdo, from myǒt = brass, with brilliant variegated colors; perhaps also because of the yellow (red) coloration, in which case it belongs with (a).

II. Names that designate good qualities desired for the bearer.

17. mǎ'ǒ from a ǎ'ǒ = admire, because everybody admires the girl's beauty;
18. nkǒ'ne, from nkǒn = stalk, because the girl is as slender as a stalk;
19. nkǒ'ngǒ'no = nkǒn = stalk, ngǒn = girl, same as above;
20. kǒmabǒ'ne, from kaa mabǒ'n = not vain;
21. ayǒ'mǒ, from ayǒm = Landolphia ochracea K. Sch., because of its delicious fruit, that is, the girl will be just as delicious;

551 22. akūlabǎ́ń, from akū l] = paws, claws, abǎ́ń = otter, i.e., the girl steals about as softly as an otter;

23. mōdē-abǎ́ń = single otter, as above;

24. mōneabǎ́ń = small otter;

25. abǎ́ne-mǔ́ń, from abǎ́ń = otter, mǔ́gebǔ́ = to adorn oneself, to go about adorned. /283/

III. Names that are supposed to bring luck.

551
777

26. aję̄kǎ́be, from a ję̄ = difficult, a kǎ́be = to buy, to exchange; may also be included in the previous group since the girl has such good qualities that the price cannot readily be realized;

27. majī́ę́, from a jī́ę́ = to wake up quickly, the girl is supposed to wake up quickly so that she will soon bear fruit (that is, bring in the purchase price); see divorce (Vol. II, pages 120 and 121);

28. angṓho or angṓnemǎ́ne, from ngṓn = girl, a mǎ́ne = to be ready, that is, the stage of girlhood is supposed to be over soon;

29. ajǎ́ńekǔs, from ajǎ́ń-nkǔs = Liliacea, purchasable medicine (nkǔs); the girl is supposed to bring in as much as she would if her father had this medicine;

30. medzǎ́, a dzǎ́ a tǒbǔ́ a dǎ́ = she has fulfilled the time for staying in (her) village, that is, she will marry at the proper time;

31. metǔ́, from a tǒbǔ́ = to sit, I am sitting, that is, she should not be forced to work too much (by her future husband, of course), but instead she should remain seated in the village.

551 IV. Names intended to frighten away, in this case presumptuous suitors or secret lovers.

32. atsǎ́ma, from a tsǎ́ma = to break down (a village), "because the father would destroy the village out of grief

551 and anger if the girl were to be abducted; in case the lover hears that such have been the consequences, he may bring the girl back again";

33. aŝŭbanneme, a ŝŭb = to be enraged, a nnĕm = at heart, perhaps in reference to the father, perhaps to the husband (so it was asserted, anyway) who will become very angry in case of adultery.

V. Names that report an event before or at the time of birth.

34. ajĩ'ngõ'n, from a jĩ = to wish for, ngõ'n = girl, because the mother had only boys and now wished for a girl;
35. menkõ̃ = young men, since the mother already has many boys;
36. asãngõ'no, from a sa a ngõ'n = he (or she) has no girl, that is, had no girl hitherto, and this one is the first;
37. adã', from a dã'n = to surpass, to be very many, because the mother has borne many children, and this is the last one; thus it was explained to me, although doubtless other explanations are possible;
38. ntõ'ngõ'no, from ntõ' = eldest, ngõ'n = girl;
39. mapfũmana, from a pfũmãn = to miss, since she saw neither father nor mother;
40. bejẽ, from a ntõ bejẽ a nnĕm = he is already sad at heart, referring to the father because "he does not know whether his daughter will stay alive";
41. okõ'mo, from okõ'm = Micania rusticana Klatt., Compositae, popular among the women, especially the mother. /284/

VI. Explanation unknown.

42. belõ̃, from belõ'k = herb;
43. abõ'(g)e, from abõ'k = Gynura repidioides Bth., eaten by women.

551 There are very few names that are used for boys as well as for girls. I am acquainted only with Mfumu and Mangöö, both of which, incidentally, were used more often for girls than for boys.

Nicknames are common. The Negroes, who are always in-
[522] clined to jokes and teasing, delight in making fun of the weaknesses of their fellows and constantly heckling them. A peculiar characteristic or a comical incident produces the nickname, and the latter is retained without anyone later ever knowing its original meaning. "Famous" people frequently have a whole
551 series of nicknames, like the chief's son Amwön-Ekang, whose
539 names are immortalized in the following jocular song:

amvǒn-ekǎn -- anduman ekǎn ana -- sösǒ'
Amwön-Ekang -- son (of) Ekang now -- sapsucker (on)

nkū̱m --ewǎ̱s nǔm e kǔ̱n -- a kike
tree stump -- file -- man (in) salt water -- chop off

melǒ'' me zǒn -- ažǒ'n a wū̱mūk, ndzǒm a
(the) heads of the fern -- Solanum (1) it forms, pluck he

1. Solanum esculentum Don.

tělěk -- mekū(n) medžǎ, nnī̱ē a mbě't
stands (ready) -- caterpillars to eat, mother has climbers

asǒn kǎ bekǎ̱l, abǒ'm kǎ medǎ̱l,
-- Musanga no guy ropes, Macrolobium (2) no buttress roots

2. Macrolobium straussianum Harms.

-- mone ngǒ'n eja (bondǎnga madžǎ).
-- son (of a) girl of Eja (Bondanga Madscha = chief of the Eja).

Amwön-Ekang, the son of Ekang, as everybody knows, --
(the following are jocular names) sapsucker on a tree stump

551 (something small, delicate on something gigantic, strong) -- file
539 (something that destroys something else) -- man in salt water (unclear, perhaps corresponding to our "cart that is stuck in the mud"). -- One chops off the young leaf tips of the fern (since this is the food of women, it is unsuitable for a man). -- The Solanum puts forth fruit, and the harvester stands ready (sense clear). -- The caterpillars that sit on the trees are ripe for eating, and the mother has a climber who gets them down (this refers to Amwön himself). -- The Musanga has no guy ropes (lianas, and so forth), the Macrolobium no buttress roots. -- Son of one born an Eja.

As one can see, the jocular names, like the drum names
551 (chiefly in the south), are largely taken from a kind of proverbial speech /285/ that alludes to a peculiarity of the bearer; the peculiarity was no longer known in the foregoing case.

Of course, the Whites also have their nicknames; indeed, they are known almost exclusively by these since the natives usually do not know the European names or cannot pronounce them.

To the name given by the father, the father's own name is added. If, for instance, the father is called Essun and the son is called Boka, the complete name of Boka is Boka-Essun, that is, Boka, son of Essun, or -- with a genitive particle -- Boka Bossun(e); if Boka's son is called Ayong, his complete name is Ayong-Boka, etc. (1).

[113]

1. Von Stein (Mitteilungen aus den Schutzgebieten /Reports from the German Protectorates/, Vol. 12, p. 137) says of the Bane (= Bene): "Almost all names are double names, and in sharp contrast to the custom of the Bakoko /Koko/ (should probably read: Bassá), the name occupying the second place almost always signifies the mother's name. Only in very exceptional cases does the Bane, if he has an especially famous father, add the baptismal name, if I may use the term, of his father's name. Balingekorre thus

means: Balinge, son of Ekore."

551 [113] The custom of the Bane of adding the mother's name to one's own, as reported here, is found also among the Jaunde according to Zenker (Mitteilungen aus den deutschen Schutzgebieten, Vol. 8, p. 50).

Family names in our sense are unknown to the Pangwe. Towards strangers they use the name of the kin group, which is after all to be understood as a "family" in the Pangwe sense; to this, at the same time, is added the name of the mother's familial group. My faithful factotum, Ayong, who has already been presented to the reader in the picture on Plate 3 /Ed., Vol. I/, would, for instance, introduce himself as follows:

[539] ma ne ayǒn-bokǎ, mǒne esǎwǒ'n,
I am Ajong-Boka, child (of the family) Essauong,

mone ngǒ'n esatǒp.
child (of a) girl (of the) Essatop.

551 867 To learn this complete name by heart is the child's first task. Once the child can recite it without a mistake, the father, proud of the cleverness of his offspring, proceeds to the further task of acquainting the little one with the names of his grandfather and great-grandfather (naturally on the father's side). Let us again take an example.

The child is called Ndungo, his father Essun, from the Abai family, in other words: ndŭ̃ngo-esū'n, mǒne abai, etc., Ndungo of Essun from the Abai family. -- "But from whom am I, Essun, descended?" asks the father. "esū'n-nzěma, that is, Essun from Nsema," is the answer. "And from whom is Nsema descended = nzěma nza?" "nzěma-ngěě." -- The child learns it all very [181] quickly, because as regards its ability to grasp things /286/, the Negro child is far superior to white children. -- The Pangwe, however, does not stop with the grandfather. Each of these black gentlemen has all his ancestors in his head, just like our feudal lords. To be sure, none of them knows more about them than

551 their names. Our Ndungo was able to enumerate eleven ancestors,
867 his father Essun, then Nsema, Ngää, Massoo, Obute, Akiege, Asangui, Awodo, Tulo, Nssim, Okudu.

Generally speaking, the Pangwe probably know on the average eight or ten ancestors by name; not infrequently one even hears 10, or 12, and 14 represented the maximum.

Frequently a lengthy cognomen is added to the last ancestor, which gives the whole a magnificent final effect, somewhat in the way that among us the descendants of a famous man trace their genealogical tree back to him: "I am descended from that person, and his father was called so-and-so, and his father in turn was so-and-so, the famous general who in such-and-such a war won such-and-such a victory." Thus the ancestral table of an Esseng man by the name of Aböschoo went as follows: Ogbue, Ngumbaschoo, Edu, Ngumu, Bokoo, Motoo, Ossele, Akuschoo Bebe -- ayěm esěb ya andǔm = the Akuschoo Bebe, who knew when the dry season comes and when it rains (explanation of the latter part uncertain).

551 A jocular poem in which a boy poses questions while another
539 answers enumerates no fewer than 21 ancestors:
211

"o mbe lǔk e vě?" -- "a jǒkm." "oa
You were driving fish where? -- In the Sannaga. You

vüi dzě?" -- "nwǒs."
killed what? -- (A) shrimp.

"za a dzǐ?"
Who it eat? (Who will eat it?) -- "Abele."

"Abele sa?" (= from whom is Abele descended). "Abele-Boka" (Abele is the son of Boka). "Boka bo sa?" "Boka bo Ssissi." "Ssissi sa?" "Ssissi Mening." "Mening sa?" "Mening me Koebe." "Koebe sa?" "Koebe Kum." "Kum sa?" "Kum Otsaa." "Otsaa sa?" "Otsaa Maniodo." "Maniodo sa?" "Maniodo Ssamwinne." "Ssamwinne sa?" "Ssamwinne a Ssongo." "Ssongo sa?" "Ssongo Abui." "Abui sa?" "Abui

551 Nkumu." "Nkumu sa?" Nkumu Bawu." Bawu sa?" "Bawu Otoo."
539 "Otoo sa?" "Otoo Kuboo." "Kuboo sa?" "Kuboo Emwi."
211 "Emwi sa?" "Emwi Abungo." "Abungo sa?" "Abungo a Schiele."
"Schiele sa?" "Schiele Maa." "Maa sa?" "Maa Makama."
"Makama sa?" Makama

me	nga	būge	nana	abō:
who	lived	to break (of the)	mother	the leg,

tsǎ,s
tsass (onomatopoetic).

A remnant of the old aversion of all primitive peoples to
551 mention names, because thereby some kind of mischief might re-
578 sult, can still be observed among the Pangwe. /287/ They do not like to utter their names before strangers, and they find a question about their full names (in other words, including that of the father) tactless, indeed, almost insulting, as I frequently noticed among the Fang who had not had any contact with outsiders. It is also an insult in every respect to remind someone of his ancestors. This need not even be done by name -- since, after all, they do not always know the names -- but can be done with just the words: I shall "show" you your ancestors. This is taken as a threat of sorcery, that is, secret murder, and as though one were telling his enemy in advance that he would kill him and transport him to his ancestors. Such an insult is often avenged with the sword.

2. Child Rearing

The child is reared by means of precept and example, rarely
861 by threats, and almost never -- at least only in case of major of-
fenses against morality, such as theft, for instance -- by means of corporal punishment. The result must be termed an extremely good one; Pangwe children behave more tactfully and better than our children of the same age.

We are informed by some "experts on the Negro's soul" that
867 the Blacks have no sense of honor. A glance at their family life,
861 however, teaches us the opposite. In rearing the child, the

867 development of a sense of honor -- in the Pangwe sense, of
861 course -- may be called one of the primary rules. The child must learn to fear being shamed as much as our boys fear the rod.

The threats for smaller children up to six or seven years old
861 are limited to simple devices for frightening them known by the
534 name kŏkŏ'-bŏ'ngo III (Jaunde) or bim a si,ze bŏ'ngo (southern Pangwe) "things to scare children." The procedure is as follows. In the evening or at night a relative makes some kind of noise in front of the house. The child that is naughty or crying is then warned of the bad man outside. The simplest implement for making a noise is a small tree trunk that is placed on the floor and then alternately and rhythmically stamped and beaten with a mallet. In addition, the person may murmur in a deep voice: "kŏkŏ' nie a žū nie (the bad man (kŏkŏ'), he has come)." The implement itself is called -- onomatopoetically -- kăkăkū,mo III (kă kă = the beating of the mallet, kū,m = the stamping of the stick on the ground, and at the same time, ekū,m = tree stump, upright piece of trunk). An even more effective means of scaring children is the uncanny sound of the wooden whizzer (edžibŏ'ngo, "child eater," Fig. 86), often used by men and older boys to frighten the younger ones. Aside from contrivances for making noise, there are /288/ various other means of frightening them, such as the belŏnežŏk or wandering elephant, which, however, I cannot describe in greater detail at this point.

A much more important means of education is oral instruc-
861 tion and teaching, imparted in ample measure to the little fellow
867 by both father and mother. The mother tells stories /Fig. 86 appears here in the original text/ of which a number, like the story of the Edschibongo (child eater), are designed to keep the child in fear and at the same time to teach. In the next section I shall devote some attention to these stories; at this point I want to discuss in greater detail the purely educational precepts that are for the most part imparted by the father. These precepts or, as we might say, principles are called malĕbega. They are affirmed daily on every suitable occasion and constantly repeated, so that they become firmly implanted in a boy's head. A number of such principles, which unfold before our mind's eye an unfalsified image

861

[534]

Fig. 86. Whizzers.
(a) With stick; (b) without stick, a string being slung around the wood.

861 of the naives' family life and reveal to us the view of the Pangwe
867 with respect to what he calls morality and order, will be reproduced hee in the actual order in which the boys told them to me.

My father told me:

1. When I go on a journey, look after the chickens, dogs, and women for me, so that everything will be in good order when I return; then my heart will rejoice.

2. You should not tell others all the things that were confided to you, otherwise the man who has said them to you will be angry.

3. You shall listen to your father's words, because when you later marry a girl, your father will pay for her.

4. When I have visitors in my house and tell you to bring firewood, do it quickly; when I tell you to bring food for the guests, do it, or else your father will say of you, "You are like a chicken, a goat, or a dog -- I did not beget you!"

5. When you go to wrestle, you should muster your strength so that you will be the victor, for if others throw you, I shall be sad and will have to be ashamed.

6. If you have a sweetheart and she brings you food (Author's note: When the young man visits her), you must not eat up

861 everything right away, but /289/ modestly take two or three
867 spoonfuls, for otherwise the girl will think that you are a real pig, and she will no longer love you.

7. If your father has many wives, industriously help him to clear large areas of the forest and prepare them for planting. Afterwards, the wives will then be able to plant a lot of food (bedzi). When my fathers-in-law and mothers-in-law (!) come for a visit, they must have ample food to eat. If they go to bed hungry, they will have a poor idea of our village and call it a miserable nest.

8. When strangers (guests) come and do not find me at home, entertain them just as if I were there and be in every way helpful; otherwise they will say that you have no breeding (plural, o seke mɔ́ɪ = you are no person = man).

9. If you are able to forge and if one of my brothers (that is, members of the kin group) comes and wants to have something made, make everything for him just as he desires it, and if a man from another family comes, do likewise, because you can never tell whether some day you might not marry a girl from that particular family. If you have done as I have advised you and you desire the daughter of the man or of one of his kin group for a wife, he will immediately and gladly have you since you have done him a good turn.

10. If you have seduced the wife of another man and the husband comes into my village and brings with him the medicine over which you must step (as a proof of truthfulness, see legal concepts), you will die. My son, this is a very bad matter! Remember that! It is better to admit the affair right away; I myself shall pay for you, that is nothing to you! I am not saying that you should seduce the wives of others, and so forth.

11. You must not be greedy for food (plural, akũɪ = avaricious with respect to food). If you are, everybody will laugh at you, and if you go to another place, you yourself will not get anything to eat.

12. If I have many daughters, you must learn to make their coiffures (ornamental coiffures), so that the girls will not go elsewhere to find a man who dresses hair, because girls as a rule do not like to go great distances.

861 13. Treat your (real) sister well! If she scolds you, leave
867 her alone (that is, do not scold her in return); it is nothing to you! Do not beat her, either, because, after all, for the money that is paid for the marriage of your sister, you will in turn buy a wife for yourself. If you beat your sister, she may possibly die through sorcery (this means that in her anger over the maltreat-
[762] ment she might take her life, something which does indeed happen), and you will have no money and no wife, and people will not respect you, and so forth. /290/

14. If you are the older of two brothers and you are married and have a daughter, then do not marry another woman with the marriage portion that you get for the daughter; instead, leave the daughter (or the money) to your younger brother. If, as the eldest, you have acted in such a way, you will enjoy the same honor and respect among your brothers as your father does.

15. Your father tells you all these good /Fig. 87 appears here in the original text/ principles and bits of advice not in order to make you, his son, bad (that is, through lack of trust or lack of respect for him), nor does he do so in order to limit your freedom, but because he desires that you will not bring any unpleasantness (quarrels) into the house, which will harm him and you. For when I have paid two or three times, I will be tired of (disgusted with) these things, and it may not be long before I have no wife left in the village (that is, he would be a poor man, because wives mean money, and he would have spent all his money *for the fines of his son*).

861 The attentive reader, in looking through the earlier sections
593 of this book, will not have failed to note the strict patriarchal tendency of the Pangwe. It is clear, therefore, that the father supervises the education of the child and especially of the adolescent boy. He does this in an ideal manner -- even among us it would be regarded as ideal -- by becoming his son's best friend and by supporting and advising him in all the important problems of life.

Of course, the mother is dear to the Negroes and cherished by them as she is everywhere else in the world, but natural respect and shame in her presence prohibit the son from telling her

[857]
[854]
[291]
[142]

861 everything that is on his mind. Also, any kind of influence in
593 the family unit is wielded only by the chief wife and /291/ even by her only to a limited extent. In all problems of life the father, as head of the family, remains the real friend and counselor of his son, as does the mother for her daughter.

861 In this way the love of the parents gently leads the child
593 through the realm of youth. However, once the boy has matured
578 into a young man, the obstinacy with which nature has to a spe-
626 cial degree endowed the Pangwe, sometimes asserts itself even in the face /Fig. 88 appears here in the original text/ of paternal authority. In such a case, it is sometimes only the most effective and most feared means of education that helps to lead the

Woman from Alen (Esauong Family) with a Child.

861 593 578 626 rebellious son back to gentler modes of behavior, namely, the public curse. The curse (ebǔn[o]; verb, a bǔno) may be pronounced by the father or the mother upon the son, as well as by the eldest son as the father's representative, especially after the father's death, upon a younger brother. In the majority of cases, however, it is the father who pronounces the curse upon his son. The cause for such a pronouncement is continual disobedience, for instance, if the son, despite repeated warnings, takes advantage of the father's wives. The father then stands in the middle of the village square in order to be heard by the people, usually in the morning when they are all at home, or he summons them all to the meeting house and speaks to them somewhat as follows: "This person, my son, continually acts counter to my commands, etc.; therefore from this time on he shall be successful in nothing, he shall acquire no more things (through purchase and trade of gifts), he shall have no success in hunting; when he goes to a girl she shall 'look upon him as dirt' and grant him no love. For he shall be cursed." A definite formula is not prescribed in most regions; only in the north of the Pangwe region they say: "ma yǒk(e) oa" (Jaunde), that is, "I curse you." /292/

In most cases, the curse actually is followed by the consequences threatened by the father, at least insofar as they concern the son's social position. News of the curse spreads everywhere, and nobody wants to have anything more to do with the cursed one; wherever he goes he is looked at askance or even heaped with abuse and ridicule. In his father's village he will be completely unacceptable. As a result, the son is soon tired of this unbearable state of affairs and now tries to induce his father to remove the curse. He requests him through friends or relatives to remove the curse from him, or he approaches his father through his mother, but then by way of her brother, since "she is afraid of her husband."

If, in response to these requests and the son's promise that he will improve, the father is prepared to nullify the curse, the son must first of all -- if he is an adult -- pay him a goat or -- if he is not an adult -- a chicken. Contrary to the usual custom of adding every piece of livestock to the marriage portion for more wives, the animal paid as compensation by the son is consumed by

861 the parents and relatives. Thereafter, the son is summoned to
593 appear in the village the next day. The father again assembles
626 all the people in the meeting house and makes a long speech in
578 which he rehearses the entire affair from his point of view down to the smallest details. Finally, at the conclusion of his speech, he touches upon the actual purpose of the gathering and proceeds to remove the curse. The formula with which he does so is approximately as follows:

ma tɛ̃'i matɛ'iₚ ma kǎbe ma,
[539] I have imposed curse (1) (?), I disengage myself (from

1. matɛ̃'iₚ = the imposed curse, a va matɛ̃'i = to remove the (imposed) curse; the root a tɛ̃'i = to tear oneself away from, to depart from home, otitɛ̃i = star (see Vol. II, pages 85 and 86).

ma nīme ma, -- ɔ̃ũₚ
it), I make straight myself -- (into the) water

nkũ̃ₚi; Chorus: mãn.
down. Chorus: Ready, past.

The texts of the formulas, which are frequently extended through the introduction of comparisons and which do not, of course, correspond word for word, are evidently all very old since they are very hard to understand and sometimes not intelligible at all.

At the same time the father spits into his son's hand to indi-
[201] cate that what he took away from him by means of his words (symbolized by the spittle) he is putting back in his power (hand), or the father bites off -- this is the procedure among the Jaunde --
[324] a piece of the stalk of a Costus (Zingiberaceae) and spits it out. In so doing he casts out all the bitterness from his heart (Costus stalk is bitter).

Furthermore, a curse may be pronounced by the first wife
519 against her husband, in case he treats her badly and always
595 neglects her in favor of others. The curse is either pronounced

578 publicly, as in the case of the paternal curse, or in the field
595 when the women are among themselves. /293/

A droll effect is created when the souls are cursed by their
769 descendants. The curse is pronounced at the ancestral feast if it
578 is believed that the souls of the ancestors no longer care about the living, and the curse is also revoked on the same occasion. Although, as ancestors, the souls were more elevated persons who actually cannot be cursed, here is another instance where might comes before right, for after death the souls are powerless on earth, as we know.

Finally, there is a belief in secret curses, and thus, if people
578 are constantly unlucky in life, they are sometimes afraid that they are being cursed by this or that person.

The most terrible curse is that which was pronounced by Nsambe (God) upon human beings when they committed the first major offense against his paternal will. As described in Volume II, page 59 /Ed., not translated/, the curse is symbolically erased during the cult celebration.

3. Children's Games (1)

524
[113]

1. See G. Tessmann, "Die Kinderspiele der Pangwe" /The Children's Games of the Pangwe/, in the Baessler-Archiv, Vol. 2, No. 5-6, p. 250. The children's games are discussed there in detail.

I divide children's games into two major classes: the generally imitative games, and the independent games. Of the former I distinguish three groups: first, gymnastic games which imitate the movements of adults (running, sport, and dancing); second, war and hunting games which imitate the main occupations, not to say professions, of adults; and third, all the rest of the imitative games. The independent games, which are on a higher level, I divide again into three groups: first, toy games, that is, games that are played with objects and do not imitate any

524 adult activity, second, group games, and third, games of skill. The last group includes the games that have reached the highest stage of development since they are no longer amusements in which all those present participate, but rather are performances by talented individuals. In the performance of magical tricks, the games of skill and acting generally attain their highest degree of perfection. Thus they touch upon the area of the representational arts and might be regarded as a pre-stage of the latter.

So much for the classification of games. I hardly need to point out that the various groups cannot always be sharply separated since the boundary lines between them are blurred by a great deal of overlapping.

I shall mention here only the names of the most common
526 gymnastic games: the foot race, mbi'; a combination of our
957 hopscotch and catch, called ngá-ngûl; furthermore, rope pulling, edudan, played only by bigger boys and corresponding to our tug of war; chain pulling, ogbûn; "treading," played among the Jaunde especially by almost fully grown /294/ /Fig. 89 appears here in the original text/ boys and called eŋ̄ma koŋ (Fang, etŋ' (Jaunde), in which two players, facing each other, tread rapidly on one spot and at the end must try to set down the opposite foot simultaneously; and, finally, the dancing game, ekûkû.

[958] Walking on stilts (Fig. 89) may probably also be designated as
[959] a sport. The stilts are carved out of the umbrella tree, Musanga smithii.

The transition from gymnastic to war games is represented by throwing spears at a disk, a game that is widespread and popular throughout the Pangwe region. It is called ngok, after the fre-
[960] quently mentioned Desplatsia dewevrei Burret (angok), from whose large fruit the disk is cut. The shoots or little trunks of young trees are used for spears.

War and hunting games are probably the most popular and the most frequently played of all the games. In the small-scale war of the older boys (eight to 15 years of age) -- which sometimes /295/ /Figs. 90-93 appear here in the original text/ degenerates into bad fights -- the weapon is, as in the case of adults, the rifle, copied in various forms with leafstalks (Fig. 90), raffia pith, or

526 other materials. Even the "shining sword," made of raffia pith,
857 is not lacking (Fig. 91); it has the advantage, without being too dangerous, /296/ /Figs. 94-97 appear here in the original text/ of making a fairly loud clattering noise when struck on the enemy's body, and it causes a momentary, violent pain.

It is really unpleasant to be pelted with corn cobs which have previously been placed in a basket in the river and have become saturated with water /297/; still more disagreeable is a hollow piece of wood from the umbrella tree, which is filled with earth, closed off by means of a bung made of leaves, and then emptied at the enemy at the closest possible range.

A very dangerous "game" is man-catching. For this a number of boys take a piece of a strip of Oncocalamus (bush rope) and tie it into a noose. They hide the latter along the way leading out of the village, concealing it carefully among the grass and leaves, while the free end is tied to a tree stump. The naughty boys then hide behind trees and shrubs and with mischievous looks await the outcome. If a passerby gets a foot in the noose, he naturally comes crashing down, while the boys run away as fast as they can. They are wise to do so, because if the victim succeeds in catching one of the offenders, the latter must be prepared for a good thrashing or a complaint lodged with his father.

In the lower form of hunting, for soft-bellied insects, spiders,
526 etc., they use a rifle made of wood, into which they put some
857 powder (Fig. 92). The delicate hexapods or octopods are stupi-
868 fied by the smoke and fall to the ground helpless. A crossbow
524 made of raffia pith is likewise successfully used for hunting spiders (Fig. 93). For the "higher form of hunting," that is, for killing lizards and mice, a bow and arrows (Fig. 94) are employed. A method of hunting used by adults, namely, the encirclement of a wild animal, is imitated by having a little boy hide somewhere. The fish weirs find their counterpart in small imitations of them. They are set in the channels stirred up by the rain and block the way of little pieces of wood and leaves that are washed along. Even very clever miniature draw traps are made by skillful boys for the purpose of catching the annoying horseflies, which can be outwitted while they suck blood (Fig. 96).

Otherwise, children imitate in play almost everything that
968 is strikingly done or made by adults. For instance, they make
857 useful objects, such as knives and boxes of raffia pith and ex-
924 tremely charming little hide drums of wood or banana pith (Fig. 96). For the latter, a piece of rat's skin serves as the hide. The little Fang boy augments the popular banging noise at festivities with a device made of raffia pith for detonating powder (Fig. 97). Above all, we may not leave unmentioned the fact
857 that even children imitate a cult and, significantly enough, the
924 cult of ancestor worship which we mentioned above as being of
857 special importance. The ancestral figure is carved out of plantain pith by the children, and it wears a cap made of canna blossoms that are strung on little sticks. Only once did I see a figure made of wood. The ancestral skulls are replaced by -- monkeys' skulls. What a delightful spectacle such an innocent children's game would provide for the /298/ "initiated" European if he could observe it unseen.

We have already spoken in Volume II, page 105, of the imitation of family life in which small girls participate. In the main, the game corresponds to our "playing house." The boys endeavor by means of much screaming and activity to imitate the domineering father and try to drag the already quite rebellious "wives" around everywhere, to bow and bully them to their heart's content. The "child," a doll (mǒn-ekǒ'n = child made of plantain), Figure 98, the most important thing for the smaller girls, and it is always dragged along by the anxious mother and guarded and fed with great love. The doll is a simple roll of plantain pith set in a carrying band made of dry leaf sheaths of the plantain.

The slingshot, among other things, belongs to the fourth
857 group, the games with toys (nǒ'go ye dǒ'me), Figure 99. It
924 consists of a stick to which a raffia pith rope is tied. At its free end the easily torn rope forms a noose in which a nut of the oil palm is placed. The slingshot is never used with hostile intent, say, in war games, but belongs solely to the group of games with toys, that is, they amuse themselves with this toy because of its peculiar effect. In using it, the stick is taken in hand, and the rock

257 is flung forward. The pull of the rock tears the delicate rope
524 without too greatly diminishing the force of the throw. I also include in this category the rattle stick, the spinning top, the puppet game (Fig. 100), and the device for communicating over a distance (Fig. 101). For spinning tops, snail shells (Fig. 102) [124] are used or a fruit of Sarcophrynium velutinum (Bak.) K. Sch. [125] (see Vol. I, Plate 11) which, like the top itself, is called mbôb. A little stick of raffia bark is put through it (Fig. 103), and the top is ready; it is made to dance by twirling the little stick, while the Achatina top is made to spin with the fingers in the manner familiar to us.

Even among the group games of the Pangwe, many correspond precisely to ours. There is, for instance, the hiding of an object among the players, while another player, who had previously gone outside, has to find the object. The palm nut game and the game of skittles with spinning tops are very popular.

The palm nut game is called nigh. The player takes a handful of a large number of nuts lying on the ground, tosses them into the air and then catches them on the back of his hand. The nuts that remain on the back of the hand (between one and five, rarely more) are throwing stones, that is, the player is allowed to throw each of these stones up in the air by itself. While it is in the air, he must pick up with the /299/ /Fig. 98. Doll of Plantain Pith. Fig. 99. Children's Slingshot. Fig. 100. Puppet Game, (a) and (b) Puppets enlarged. Fig. 101. Device for Communicating at a Distance, Children's Game, (b) Cross-section of the Signal Drum. Fig. 102. Tops made of Snail Shells, (a) of Pseudachatina Durnesii, (b) of Achatina. Fig. 103. Tops made of the Fruit of Sarcophrynium velutinum. / /300/ same hand (the throwing hand) as many as possible of the other nuts lying on the ground, and with the same hand again catch the nut thrown into the air. However, the player is allowed to arrange the nuts on the ground beforehand, for instance, three next to each other. If the thrower catches the stone thrown into the air, all the stones in his hand are his property; if not, they are again common property. Then he goes on to try it with the other throwing stones. Once these are played, it is the next player's turn. At the conclusion of the game, that is,

[Text continues on page 179]

524
857

Fig. 98-103.
(Caption on p. 172.)

524 857 when all the nuts are in the possession of players, those boys who have caught some stones place together in the center the same minimum number of their nuts. The boy who then has the greatest number of nuts wins. The nuts which have been won are jocularly called "wives" by the boys.

The best known and most popular game of the Pangwe is the game of skittles with spinning tops of snail shells (a lō ndōʼho). Spinning-top skittles, as we may perhaps call it, is played chiefly by boys five to seven years old and sometimes also by older ones. They usually play it late in the afternoon or towards evening when the sun no longer scorches the village square. Our Figure 104 shows the arrangement of the two teams and of the skittles, which are set up near the team to which they belong (in Fig. 104, the team on the left). One of the players on the opposing team (the attacking team) has a throwing top which is played in between the skittles, and as it spins, it touches one or a number of them. The skittles that have been touched (nkǎ̄ǎn-ndōʼho) and the throwing top (nwōʼan-ndōʼho) are returned to the attacking team. The latter then throws the top again. If a throwing top does not make contact (a ke ōlī nkiai = it goes down the water, westward), it belongs to the defending team which keeps it as a prisoner. If none of the throwing tops has made contact -- something which occurs very rarely since the tops are thrown with great skill -- the attacking team sets up the skittles that previously belonged to the opposing team on its own side, and the team formerly defending now becomes the attacker. The team that throws out the tops, once it has a number of them, plays with them until all the skittles of the opposing team have been hit and now belong to the attacking team, so that the next time around the roles are reversed.

The southern Pangwe know no winner or loser in the game; they "enjoy the game for its own sake," as they say. On the other hand, unlike the Jaunde, they practice giving advances to a considerable degree, a custom which, like the system of advances in the caoutchouc trade of the adults, must lead to an unhealthy state of affairs; indeed, it opens the door to cheating. /301 /Fig. 104 appears here in the original text/ In case the throwing team has lost a considerable number of tops, the defending team, in

524
857
[5.6]
[361]

Fig. 104. Skittles with Spinning Tops made of Snail Shell.

order to prolong the game, may lend it a number of tops, but only from those that were lost by the opposing team, in other words, those that were "captured," and not more than eight. For example: the throwing team has lost six tops and has only one top left; in that case the defending team can lend these six, as well as two more lost later in the course of the game. If all eight of the borrowed tops should again be lost, the teams change roles, but the team now attacking (previously defending) does not begin with one throwing top as usual, but with all of the tops taken from the opposing team, in other words, at least eight; moreover, in the course of the game the previously borrowed eight tops must be returned to the opposing team from the eight tops played out. So the game goes on and may be broken off whenever a team so desires. Frequently, however, the boys first get into a quarrel over the loaned tops, and a general brawl is the conclusion of the game which appears so peaceful. On other occasions, too, the little ones try to "rabble" at spinning-top skittles. Thus, a player of the defending team may snatch a top before it has danced its curving path to an end, even though there might still have been a chance that it would touch a skittle.

524 857 The stone game of the children is a simpler form of the same game played by adults. It is called sɔ́ho and consists of a halved raffia leafstalk whose pith is hollowed out into 12 compartments, arranged in two rows. To the right and left of the ends there is a compartment, twice as big as the others, for captured stones. /302/

The procedure of the game corresponds precisely to that of the adults and is differentiated from the latter only by the fact that in each compartment there are four canna seeds as playing stones, instead of five palm nuts or other large fruit seeds.

524 857 159 (174) The bowling game, mbɛ̂h (mbɛ̂h = bowling ball), in which the extraordinarily well-developed observational powers of the Negroes are triumphantly displayed, is quite noteworthy. The average European would probably cut a poor figure in this "child's play"; I at least declined to engage in it. For the bowling game one must have about 30 of the pill-shaped Canna indica seeds. The game leader, A, takes these seeds in his hand; previously, he has already agreed upon a number, let us say 18, with a fellow player, B. This number must now be discovered by the players, or, as the Negro says, it must be "shown." A throws the balls out rapidly and gives each of them, by way of a name, as it were, the numbers from one to 30 as he throws them. Once all thirty balls are at rest -- having of course rolled every which way, in no particular order -- A points to the aforesaid eighteenth ball while B shuts his eyes as he does so, in order to point to the ball himself afterwards. Thereby A is prevented from cheating or -- as happens more frequently -- from making a mistake. In other words, it is a counter-test. In the subsequent throws, in which the same number counts, the players must indicate the aforesaid ball. This often happens with the second or third throw. The one who recognizes the ball first becomes the leader in the next game, in which another number is chosen.

As the final group game, we shall mention a memory game which is popular with boys six to seven years old. It is called bolɛ̂mo, a name which is also applied to the main player and memory artist who must go to one side or outside the door and then answer. The questioner, seated in the circle of players, has ten

524 peppers, likewise called bolɔ̃mo (from olɔ̃mo = vegetable), in
857 front of him and a banana leaf (okiɛ̃ɛ) is inserted between each
153 fruit. The questioning each time comes to an end at one of the bolɔ̃mo which is then taken away, and the questioning begins all over again, until all the bolɔ̃mo have been removed by this process of question and answer. The questions are as follows:

(a) a bolɔ̃mo? = Oh Bolomo? (b) ɛ̃ or assimilated ã = Yes! (c) ifiɛ a dɔ̃ o yɛ̃? = Your father, he said something to you? (d) ta(d)a (a) dɔ̃ ma na: kaa ɔ̃, ndɔ̃ngo (or dɔ̃am) = My father, he said to me thus: not to fail in skittles (or affairs), that is, you are not to have any failures (in play or in seriousness). (e) dzidzi? = What is that? (f) bolɔ̃mo = vegetable.

Now the questioner takes away the bolomo (the vegetable) and again asks: (a)-(d), then (e) dzidzi? (f) (o)kiɛ̃ɛ = Leaf! (g) dzidzi? (h) bolɔ̃mo. In the next round of questions the answers are: Leaf, leaf, vegetable, then leaf, leaf, leaf, vegetable, and so forth. /203/

All ten questions are uttered in very rapid tempo, usually to the accompaniment of rhythmical handclapping by the fellow players, in order to confuse the one answering as much as possible.

524 The simplest games of skill consist of fashioning droll figures
857 out of a leaf (bɔ̃ɔ). Figure 105; braiding together strips of stalk of the Sarcophrynium in a special form (ɔɔ̃ɔ). Figure 106; and carving birds and other figures from raffia pith (ɔɔɔn-ɔɔɔɔ). Figure 107.

Another group of skilled games includes the universally known rope games, which undoubtedly had their origin in the making of rope. Altogether, I am familiar with no less than 40 different figures among the Fang, of which different ones are developed from each other in series.

The highly developed, ingenious "patience games" probably had their origin in the rope games. The aim here is either to separate two objects that are joined (or to put together two separate objects), or to take apart apparently indivisibly conjoined parts.

A widespread game illustrated in Figure 108 is included in the first group. It could be called the two-string bow patience game (ɔɔɔɔ ɔbɔ). It consists of a stick of the bark of a raffia stalk with

[Text continues on page 179]

857
524

/Between 302 and 303/

Plate XXVIII

Children Playing Skittles with Spinning Tops, Ntum Region.

524 a hole drilled in the middle. A string is fastened at both ends
857 and drawn in a double loop (Fig. 109, a) through the hole in the middle. In this way we get two strands, as it were, and on one of these are strung two beads, pieces of a corncob, or the like, although the hole in the middle must always be smaller than the objects used. One bead, if I may choose this object as an example, must now be brought over onto the other strand. The solution of this task will be most clearly seen from Figure 109, Drawings b-f.

Two different patience games belong to the second group. The first (Fig. 110) consists chiefly of a piece of monitor lizard
[825] skin cut into the shape of a fish (ɛ́ɛ́ɛ́ ekob e tit), into which a hole is cut at the thick end (head), while in the narrow part (body) parallel longitudinal slits are made. The second part of the device is a string, to each of whose ends a piece of the kernel of an oil palm nut is tied. The pieces of kernel, however, are larger than the hole. The middle part of the string is looped (seen from the front) over the strip between the slits and thence runs from behind out through the hole (see Fig. 110). In order to separate the two parts from each other, the strip must be bent through the hole and the string taken out.

The second game of this group consists of two seeds of the
[826] Pentaclethra /304/ /Figs. 105-109 appear first in the original text/ macrophylla Benth. (ɛ́ɛ́ɛ́ ebɔ̄ɔ̄), each of which is provided with three holes. A double string is put through the holes in the manner indicated in Figure 111, and this is looped around the seed. A second kernel is attached in the same fashion at the other end of the double string, and a knot is made at its center. How the problem is to be solved, namely, to remove the seeds from /305/ /Figs. 110 & 112 appear here in the original text / the string, I do not know myself. Perhaps a patient reader will try his hand at it.

The final group of skilled games consists of the performance of magic tricks (makɔ́ɔ́ me bɔ̄ɔ̄ = dexterity of children) whose effect is based upon the fact that the spectator is influenced by the performer and is mistaken in his observation of the basic causes of the phenomena produced, thus permitting himself to be deceived. He does so all the more readily since he is not given any time for quiet reflection on account of the rapidity of execution.

Fig. 110. Patience Game with a Monitor Lizard Skin and a String with Oil Palm Nuts, (a) Solution of the Problem.
Fig. 111. Patience Game using Pentaclethra Seed.

The trick of making a ball appear in the hand of a spectator (efŭ', from the root fa = confined, enclosed, transitive and intransitive) is a simple one. It is reminiscent of our trick of counting three coins while picking them up and putting them down. For the efŭ' game an arbitrary number, but not too small, of balls (for instance, canna seeds) or short raffia sticks are laid in a row in pairs. The number of pairs must always be uneven. In addition, an extra ball, called efŭ', that is, the enclosed one, is put down by itself to finish off the row. Now the chief player, A, and one of the spectators, B, take one ball each from the pairs, and B gets the extra one. In order to influence his fellow player, A, shaking his head back and forth, calls out after the extra ball "enclosed" by B: "efŭ', efŭ', efŭ', efŭ', efŭ', efŭ', nafŭ, efŭ' nafŭ, efŭ' nafŭ, efŭ' nafŭ, efŭ', efŭ', efŭ', efŭ' = enclosed one, enclosed one, come, enclosed one!" Now B is asked to place two balls together. Then A places two together, then B again, and so forth, until all the balls are lying in pairs. To the amusement /306/ of those poor at figuring, A actually places the "enclosed one" as the last one at the end of the row. Thus efŭ' really did come to A.

Conjuring away the middle one of three leaves lying on top of each other is really astonishing. For this purpose, three leaves of [324] —

Panicum sulcatum Aubl. (ekɔ̄ɔ̄) are placed on top of each other; the apex half of two of the leaves, the upper and lower, is removed. Then the little magician places the leaves with their underside on the ground and starts to roll them together from the lower end to the tip. A conjuring verse which the artist now sings induces the leaf to wander off: "kɔ̄ɔ̄ ekɔ̄ɔ̄, kɔ̄ɔ̄ a ɛ̄ɔ̄, o ke o mvɔ̄ - remove yourself, grass (1), remove yourself from

1. Collective term; specifically, Eleusine indica (L.) Gärtn.

the middle and go to the back!" Finally he hands the leaves over to a spectator to unroll, and it now turns out that the two shorter leaves are lying on top of each other and that the large leaf is at the bottom. This little conjuring trick, by the way, can also be performed with paper strips, one of which is a little longer than the others.

The ne plus ultra of what skilled Pangwe boys are able to offer consists of conjuring tricks in which speed constitutes the magic. I shall give a few samples of these tricks.

For example, a boy has a streak of ashes put on his forehead and his hands tied behind his back. One of the tricks is to run behind the house and to reappear with his hands tied behind his back but without the streak of ashes on his forehead. Of course the dexterous boy has put his tied hands through his legs from behind, wiped off the streak, and placed his hands behind his back again. The main thing in this case is the speed, which is indeed astonishing.

A second little trick is that of tying the hands together. The boy has somebody give him a rope, runs with it behind the house, and returns immediately -- with his hands tied behind his back. He had made two loops at the ends, stuck a hand in each, and then by skillfully turning both hands in opposite directions had twisted the rope in such a way as to make one believe that he had really been tied up by somebody else.

A favorite act of our conjurers has its counterpart among the Pangwe in their trick of spiriting away a ring from a hollowed

524 plantain leafstalk whose hollow, in addition, was plugged with
857 "medicine," that is, pulverized leaves. The stalk with the ring lies on the ground, and the conjurer binds across his hand a piece of plantain leaf in which he has previously placed an identical leafstalk plugged with leaves, but without a ring. He then playfully strikes the ground with the leaf-covered hand and in so doing exchanges with lightning speed the two plantain leafstalks /307/. Then he invites the spectators to convince themselves that the ring has now been conjured out of it. While the spectators comply with this suggestion, the artist quickly puts the ring on his finger and also removes the plantain stalk.

4. Games of Adults

The Memory Game of the Dwarf Antelope

524 To my knowledge, this game occurs only in the southern
153 Pangwe region. Like the memory game of the children, it con-
[184] sists of reciting sentences which in this case, however, are not elicited by questions but are uttered by a single player. The sentences are particularly difficult, because they contain many words with guttural sounds whose pitch varies extraordinarily so that even the Pangwe easily makes a slip of the tongue.

To aid their memory, my boys made use of a long raffia stick
[211] on which were strung a whole series of little transverse sticks carved out of raffia pith in such a way that first three pieces, each singly, then two, three, four transverse pieces, and so on, were ranged in groups, in a manner similar to balls on an abacus (Fig. 112).

In reciting each sentence -- there are 12 in all -- the previous sentences must be repeated backwards, and together they form a group which in each instance is introduced by the following verse:

ndʼ gbwɛ̄ . mvɔ̄ʌ̄ kīʌ̄ = Sao antelope's horn: "gbuā" (onomatopoetic, in German, tū); rain: "king" (that is, distant thunder, onomatopoetic, in German, bum). The horn of the Sao antelope whistles: "tū," and behold, the rain answers with thunder: "bum."

As we know, the Sso antelope is the animal of the moon, while the moon is mistress of the seasons and thus of rain; if one blows on the horn, the rain, which according to the Pangwe produces thunder, will answer.

Once the twelfth group of sentences is finished, all previously recited groups of sentences must be recited backwards.

Sentence 1: [illegible] okbṍã́ a ke a
Man of the dwarf antelope, he goes to

dĩ̃ã́gan a akõ̃ã́ kj etõ̃
fall in love in the lying trunk inside,

b(a) asõ̃ãgõ̃h-ogbwõ̃ã.
with Asangon-Ogbwo.

The dwarf antelope man goes inside the prone tree trunk (which is hollow, so that the little antelope can use it as a hiding place) to fall in love with Asangon-Ogbuo, literally, the eldest daughter of the magician.

Sentence 2:

ngbõ̃ã̃ne ogbõ̃ã́ a ke a
Offspring of dwarf antelope, it goes to

bõ̃ã̃ [illegible] okbõ̃ã́.
follow man antelope. /308/

Sentence 3:

ngõ̃-ogbõ̃ã́ a ke a
Wife of dwarf antelope, she goes to

be ngbõ̃ã̃ne ogbõ̃ã́.
follow (the) little antelope.

Sentence 4: agbõ̃ã́ abai (two antelopes) d'a ke a be nga agbõ̃ã́.

Sentence 5: agbõ̃ã́ ala (three antelopes) d'a ke a bõ̃ã̃ agbõ̃ã́ abai (two).

Sentence 6: agbõ̃ã́ ani (four antelopes) d'a ke a bõ̃ã̃ agbõ̃ã́ ala (three).

Sentence 7: agbõ̃ã́ atan (five antelopes) d'a ke a bõ̃ã̃ agbõ̃ã́ ani (four).

Sentence 8: agbõ̃ã́ asõ̃ãman (six antelopes) d'a ke a bõ̃ã̃ agbõ̃ã́ atan (five).

524
153
539

Sentence 9: agbɛ́ʌ́ ɔ̄ŋgbwɔ̄' (seven antelopes) d'a ke a bɛ̄ agbɛ́ʌ́ asɔ̄'ɔ̄ŋ (six).

Sentence 10: agbɛ́ʌ́ mɔ́ɔ́m (eight antelopes) d'a ke a bɛ̄ agbɛ́ʌ́ ɔ̄ŋgbwɔ̄' (seven).

Sentence 11. agbɛ́ʌ́ ebɔ̄ (nine antelopes) d'a ke a bɛ̄ agbɛ́ʌ́ mɔ́ɔ́m (eight).

Sentence 12. agbɛ́ʌ́ avɔ́m (ten antelopes) d'a ke a bɛ̄ agbɛ́ʌ́ ebɔ̄ (nine).

[832]

Young lovers like to play the game with their girls, as may be surmised from the somewhat romantic text. Jokingly, the girl says that she will give herself only to the one who can go through the entire game without making a mistake.

The Memory Game (ndɔ́ʌ́ ondɔ̄ʌ́ or endɔ̄ʌ́)

153
524
211

This game is known only among the Fang and a number of adjoining Ntum kin groups, and it is supposedly indigenous. A flat staff with short, paired transverse extensions and vertically inserted knobs is used in the game. The end of the staff usually has a head carved on it (Fig. 113). Each pair of transverse extensions, along with the knob and the adjacent lower part of the staff, forms a segment on which eleven different points are designated for the answers (see Fig. 114).

The game may have developed from an older, simpler one in which the individual parts of the human body were enumerated. This notion is suggested by the designation of the staff as the body, of the carved end -- even when it is not a regular head -- as neck and head, by the tripartite arrangement of the transverse extensions -- absent in Figure 113 -- (corresponding to the upper arm, the

Fig. 114
Two Sections of the Memory Game nkuk-ondile.

lower arm, and the hand), and finally by the upright knob, called ukigenWége (the red one; red as the color of reproduction, of life), by which originally the male sex organ was doubtless understood. The implement is thus unquestionably supposed to represent a human body whose members are multiplied. [822] [831]

The game is played by two people, one questioning, the other answering. The former, seated in the circle of listeners, holds the implement in his hand and indicates the various points that /309/ must be answered. At each one he calls out: "af af? a-What is that?" (phonetically assimilated and corrupted from dak dak). The principal player sits farther away and answers the questions in rhythmic song while the others stamp their feet or clap their hands in time. He is, of course, not allowed to make any marks to aid his memory, such as dividing a little stick into the corresponding number of sections. This is brainwork. 524 153 [833]

The 11 questions, which are the same for each segment, go as follows: 153

1, 2, 3. (see the corresponding numbers in Fig. 114) 524
nkuk ondile wîle. 539
Body (of the) ondile here. That is the body of the ondile.

153
524
539

4. tsingetsinge nie a tele ni(i) i, a mõmendõge.
Red one, he, he stands here, o Momendõge!
There stands the red one, oh Momendõge (inventor of the game)!

5. mekie me nim e nieli.
Breaking of the twig, it (is) here

6. mejidan me nim e nieli.
Sawing off of the twig, it (is) here.

7. bi a ke a buman (or a sigen) a
We, we go to meet each other at the
mbuman a nazin, a tade mõmendõge.
meeting point of the road, oh father Momendõge
(that is, perhaps, joint of the femur).

8. kizi a bima.
Go away to Buma (supposedly an Esamongun village).

9. ye ma ke a bima.
(Interrogative:) I go to Buma? = Am I going to Buma by any chance?

10. = 7.
11. = 4.

When all the segments -- usually from eight to 10 -- have been answered from bottom to top, the questioner points to the neck piece:

zi zi = What is that? /310/

Answer: kiti ondile e nieli
Neck (of the) ondile it here,

and then he points to the head piece:

zi zi = What is that?
Answer: mi ondile a wile.
Head (of the) ondile it here.

The main thing for the player, therefore, is always to remember how many segments he has answered, so that at the end he does not make a mistake and, instead of answering the two questions concerning neck and head, begins a new segment.

The Stone Game

524 Of all adult games, the most popular is the stone game which
[171] is spread over almost the entire world. It involves placing stones in a number of adjoining concavities, and then distributing these stones among the concavities according to definite rules.

In more recent times, according to informants, the stone game has come to the Jaunde and Bulu from the Bene (who in turn became acquainted with it through eastern tribes), and from the
[177] former it was introduced into the Ntum and Fang region around the years 1895-98. These statements appear to be confirmed by the fact that the most skillfully fashioned playing boards, provided with legs (as in Fig. 115), are to be found among the Jaunde and Bene. They have one of these in each meeting house and eagerly and frequently play with it. It is played more rarely by the Ntum
[164] and only very rarely by the Fang, who in any case have too many other, less harmless things in their heads to be able to devote themselves to the game with any kind of passion.

The playing board (Fig. 115) consists of two halved raffia leaf-stalks tied to each other. By cutting out the pith, each of the leaf-stalks is divided into seven compartments (ndɨ = house; plural, mandɨ). Only in the southern part of the Fang region (and among the
[184] Basɨ) did I see such a board made of wood, which then, in most cases, had one additional compartment for the "prisoners" (Fig. 116) at each end. The playing stones (ngɔ̃k IV) are put into the compartments, five in each one. Originally, and sometimes even today, actual pebbles were used, from which the game was named sɔ̃ngo (alleged: small pebble). This name, however, is current only among the Jaunde and Bene; in the south it designates the corresponding children's game, while that of the adults is called akɨ̃n because of the large black beads (akɨ̃n) that were at one time used as playing stones but today have gone completely out of fashion.
[824] Instead of these beads, the natives like to take the kernels of the
[194] oil palm or of Rhicinodendron /311/ africanum; in the north and in various other places they like to take the pebble-like kernels of a species of tree unknown to me and, more rarely, stones.

524 The procedure in the game itself is the same throughout the entire Pangwe region. Deviations from the ordinary playing rules are to be found only in quite isolated instances.

In playing, the two players (A and B) sit across from each other and place the board between them. Compartments 1-7 belong to A, and those from I VII belong to B. Now each player by turns takes the stones out of one of his compartments and, proceeding clockwise, places a stone into each succeeding compartment, be it his own or that of his opponent. If, therefore, in the beginning player A, for example, takes the five stones out of compartment 5, he must distribute them in compartments 6, 7, I, II, and III; and if his opponent B then picks up the six stones that are now in compartment III, /Fig. 115 appears here in the original text/ he must place them in compartments IV, V, VI, VII, 1, and 2, and so forth. Now, if there are so many stones in one compartment, let us assume it is A's, that in distributing them they go beyond the opponent's row, they are again placed back in A's own compartments, starting with 1, but only up to the compartment from which they were taken, no more being put in the latter. Instead, if there are 14 or more stones, A must place the fourteenth in compartment I of his opponent and then, if there are more stones, continue to the right, up to compartment VII. If by then A still has stones to divide, in other words, if he took up 21 or more, he may not put them back into his own compartments but has to place the twenty-first in compartment I and proceed to distribute them after that in the usual manner.

The goal of each player is to draw out as many prisoners as possible from his opponent's compartments, and the player who has taken the most /Fig. 116 appears here in the original text/ /312/ prisoners has won. The decision comes when a player has no more stones lying in his compartments. In this case the player who still has stones in his compartments adds these to the prisoners, and the highest number of stones determines the victory.

The player can take prisoner all the stones in an enemy compartment if the number of stones does not exceed three: To this end, he must proceed in such a way that the last of his stones to be distributed strikes a compartment in which it is the second, third, or

2: Tessmann--190 E-5 (1904-1909) 1913 F169 Fang F169

fourth stone. These two, three, or four stones then count as prisoners. Since, therefore, only "houses" with a few stones or, as the Negro says, "people," fall victim to the enemy, we shall call such a compartment a weak compartment while every other compartment, that is, a compartment in which there is no stone or in which there are four or more stones, shall be called a strong compartment.

Now a player, if his last stone strikes a weak compartment, may plunder not only this but also all immediately preceding weak compartments. An example will clarify this. Suppose on B's side there are -- something which he should, of course, have prevented -- one stone in compartment I, four in compartment II,

[322]

Fig. 115. Stone Game, made of Raffia Stalks and Wooden Legs, Jaunde. One-sixth actual size.

two in compartment III, three in compartment IV, two in compartment V, nine in compartment VI, and five in compartment VII; further, suppose A has seven stones in compartment 5. In that case A will place these stones in compartments 6, 7, I, II, III, IV, and V, and he will take prisoner the two stones lying in compartment V, as well as his own stone that he has added to them; in addition, he will take prisoner the three lying in compartment IV with his striking stone, and the two lying in compartment III with his striking stone, so that altogether he will have ten prisoners.

[322]

Fig. 116. Stone Game, made of Wood, Southern Pangwe Region. One-fifth actual size.

524 Thus, each player must take care that his opponent does not get into a weak compartment with his last stone or, in cases not to be avoided, that the preceding compartment is strong.

On the average, the Pangwe do not play the stone game per-
524 ticularly well, but there are individuals -- even women -- who
539 have developed their playing skill to a veritable mastery. In par-
578 ticular, a number of Bulu are famous as eminent adepts in this field in the Ntum territory, and a number of jocular stories that are as widespread as their fame have been coined about them. The majority of these stories are attributed to the "champion" of the Pangwe players, Bekona a Mpfa, the son of Mpfa Mangôô. Sometimes these stories are recited during the game by the more skilled player in an extraordinarily rapid, even tone, perhaps with the intention of distracting and confusing the less assured opponent. As regards their content, these stories pour the most vitriolic scorn upon less skilled players.

Satiric Song of the Ntum

ma	ma	nga kǒ	bekǒ'na,	bekǒ'na	a	mpfǒ,	nǒ̄man

dwarf antelope on hunting drive yesterday, father he

tame dʒ̃ ngʒ̃ʒ̃.
must eat dwarf antelope.

Freely translated: I was once playing the stone game with Bekʒ̃ɔa, the well-known Bekʒ̃ɔa-Mpfa who is the son of Mpfa-Mangɔ̃. He said: "You really resemble an old man who has no teeth and wants to eat elephant's hide (1), or a woman who has no

[242]

1. The notoriously thick and tough elephant's hide is actually eaten by some people (with teeth!), after being well boiled.

backside and sits down on the hard wooden stool, and thirdly you resemble the stupid noodle who on the hunting drive lets a Sao antelope (2) pass by and knows his father to be sick at home, infirm

[825]

2. The black-rumped duikerbok, Cephalophus dorsalis Gray.

from the disease that came from Bekʒ̃ɔa-Mpfa, the son of Mpfa-Mangɔ̃." Well, in that case one simply says: "Come now, you people, you're talking altogether too much poppycock! Even if

529 my father is suffering from the Bekōna disease, does he absolutely
539 have to eat Seo antelope meat? After all, yesterday on the hunting
578 drive I shot a dwarf antelope for my father; let my father first eat the dwarf antelope!"

Satiric song of the Fang (beginning as above)

...mī'nīnga kaa maikā'n, niene: ma bōde
...Woman no backside, she says: I wear

azōō ukūkute dīnum, oa lige isōa akōe e
raffia apron; crazy thing, you leave your father sick with

bekō; wōna: oa ie a wōa ngō' akōō.
boils; you say: you go to place stones in the game.

...You resemble a woman who has no backside and wants to wear a raffia apron (the large horsetail-like raffia apron is not suitable for /314/ such a woman). And in addition, you stupid fool, your father is lying at home sick with boils!" In that case one would say (1): "Just place your stones, we shall see!"

1. The translation of wōna by "one" is justified because wōna is in a sense directed at the listener.

Satiric Song of the Ntum

o lō za? o lō fē za?
You play (with) whom? You play more (with) whom?

bō lō, bō lō! ngē nzō'la: mī'nīnga
People play, people play! Madame Nōla (said): Woman

kaa mebī'n niene: o vō ma mvōk anē
without calves, she says: you put me brass wire (about) as

bo nga vō ntsāma-obiāń.
they put (about) Ntsama-Obiang.

Freely translated: With whom are you playing? With whom are you actually playing now? -- Yes, indeed, people are not equal; some play well, others badly, and Madame Nsöla says: "This is queer, a woman who has no calves and wants to have brass rings put around (her calves), just like the beautiful Ntsama-Obiang! (who of course has calves)."

The first story requires some explanation, since it is, as one of my people expressed very nicely in pidgin English, dear for saby (expensive to know, understand) = hard to understand. First of all, we must observe that the master player Beköne is what is known as eki, akiɛ, that is (according to the standards set by abstinence rules, beki). It is not good for the ordinary mortal to play with Beköna, since in case of defeat, a kin beköna = one becomes Beköna-sick, just as in the case of an offense against the cult laws, one contracts a cult sickness.

The beginning is readily intelligible. A good average player (who can perhaps defeat moderately good players, but not Beköna) comes to the master who compares him with the old man without teeth and the woman without a backside, both of whom want to undertake something of which they are not capable, just like the player who wants to compete with Beköna. But finally Beköna compares him with an imprudent hunter who lets a Sso antelope (which is of medium size) pass by in the hope of killing something better (that is, a larger wild animal), even though his father is lying sick (of Beköna) at home and therefore would like something to eat, special namely, meat.

Applied to the player, this means: You want to compete with me, Beköna, and do not let players not as good, whom you could defeat, play with you (in the comparison, the Sso antelope which the hunter lets pass by) in the vain hope of defeating me, Beköna (in the comparison, the larger game), even though your father has already been defeated by me -- for only in this way can /315/ he become Beköna-sick -- and would gladly see his son avenge him by defeating another player.

The other one replies: Even if my father has been defeated by the master player (= is Beköna-sick), must he therefore see that I

524 defeat an average player (in the comparison, the Sao antelope)?
539 After all, just yesterday I defeated a totally inferior player (in the
578 comparison, the dwarf antelope)! That has given my father sufficient revenge for the time being (in the comparison, enough to eat).

We see a cornucopia of ridicule poured forth here. Magnificent comparisons! Pithy expressions! Negro poetry with an elemental force!

Game of Chance (abĩa, Jaunde, Bulu)

525 Like the stone game, the game of chance was not an indigenous
177 cultural possession of the Pangwe. From the Maka (Makie in
184 Jaunde) in the east through the mediation of the Mwogeniangа kin group (probably Bene) on the upper Nyong it came to the core of the Bene, who transmitted it to the Jaunde and Bulu. In only the most recent times, the Ntum have become acquainted with it through Jaunde and Bene traders who came to them in the service of the Whites. Nonetheless, I myself have seen people engaged in this game only once, in 1907 in the vicinity of the northern Ntum region. Among the Fang the game is unknown.

The game of chance is played with small circular playing
525 disks (sĩ; plural, besĩ, derived from esĩ "goods," because, according to the Pangwe, they decide whether the players are winning or losing and hence, as it were, bring in the money in the form of goods, trade items) which are simply cut out of calabash rinds (Fig. 117, a). Furthermore, the game requires counters (mvi ɔ̃ I), [531] of which each player must bring his own. They are produced from [824] the hard rinds of the fruit from a tree called abĩm by the Jaunde, and on their smooth upper surface (outerside of the fruit) they bear attractive patterns of various kinds, animal forms, or human figures, which, like the edge, are carved in relief (Fig. 117, b-d). /Fig. 117 appears here in the original text. / /316/

The number of players that can participate is unlimited, but there must be at least four.

To play (a dɔ̃ abĩa), a basketry plate is also needed, into which are placed once and for all seven playing disks (seven again as a

2: Tessmann--196 E-5 (1904-1909) 1913 P169 Fang P169

525 lucky number). At the start of the game each of the players puts his counter in the basket with the disks. The leader of the game, who does not play himself, tosses the counters and disks into the air with the plate, catches them again, quickly turns the plate over and covers them up. If counters fall to the side, these must simply be pushed toward the edge of the basket -- they are valid. On the other hand, the throw does not count in case a counter is standing on edge, squeezed between others, when the basket is raised.

The question now is whether the counters are lying face up (carved side) or face down.

Then depending on whether the playing disks are lying face up (with the shiny side up) or face down, either face up or face down counters win.

The decision concerning winning or losing can be seen from the following combinations.

If all the counters are lying face up or all of them face down, the throw does not count and must be repeated. On the other hand, if all the counters do not have the same side up, then the winner or winners are:

with four players

if all the disks are lying face down or up to three disks inclusive are lying face up and

1 counter lies face up, the one counter lying face up,
2 counters lie face up, the two counters lying face up,
3 counters lie face up, the one counter lying face down;

if 4-7 disks lie face up and

1 counter lies face up, the one counter lying face up,
2 counters lie face up, the 2 counters lying face down,

[531]

Fig. 117. (a) Playing Disk. (b)-(c) Counters for the Game of Chance. Jaunde. Actual size.

3 counters lie face up, the one counter lying face down;

525

with five players

if all the disks lie face down or up to three disks inclusive lie face up and

1 counter lies face up, the one counter lying face up,
2 counters lie face up, the two counters lying face up,
3 counters lie face up, the three counters lying face up,
4 counters lie face up, the one counter lying face down; /317/

if four to seven disks lie face up and

1 counter lies face up, the one counter lying face up,
2 counters lie face up, the three counters lying face down,
3 counters lie face up, the two counters lying face down,
4 counters lie face up, the one counter lying face down.

Put in words, the matter may be expressed as follows.

1. In case all the disks are lying face down or up to three disks inclusive are lying face up, the team on the right loses only if the counters of all players less one (total minus one) are lying face up.

2. In case four to seven disks are lying face up, the team to the right always loses if more than one chip is lying face up.

Now it may also happen that four players cannot be assembled. In that case, three players help themselves out by putting down a blind counter for the missing fourth. If this counter alone comes out the winner, the throw naturally does not count; on the other hand, if it is the second winner, the share of the dummy falls to the co-winner.

The stakes must be fixed before the basketry place is raised. Each player must place a certain fairly high value (for instance, 2, 5, or 10 marks), usually in the form of goods, on a pile, which the winners share equally. If there is only one winner, he gets the whole pile. The losses suffered by a Negro in the game are considerable. If he has no more money with him, he has his luckier [426] friends give him an advance in the hope of winning at a later throw and paying back the loan. In this process some of them go so deeply [516] in debt that in the end they must leave their wives with the creditor, and sometimes they come to blows, even to homicide; blood revenge

525 and wars have frequently been the consequences of the gambling
528 mania. Ahough in more recent times the game of chance has been prohibited in the area controlled by the German government, nontheless considerable homage is paid the gambling demon in secret.

In order to insure luck at the game, a whole series of medi-
525 cines is made, which, according to the view already familiar
111 to us, transfer the properties of plants to the counters; for instance, plants which make them burning hot (Boehmeria, Urticaceae) sharp, peppery (Spilanthes, Compositae), and strong (Carolabia, Polygalaceae). Others are intended to preserve for the owner the objects that he has put down as his stake in the game. In this category we find burs (Desmodium)
524 and winding Araceae. /318/ /Fig. 118 appears here in the original text./

5. Wrestling

526 Wrestling matches are very frequent, especially in the southern Fang region, both to settle personal quarrels -- in this case the defeated wrestler was formerly sometimes squeezed half to death and cases of death have even occurred -- as well as a sport. In the latter case one might actually speak of a sports festival to which the drum summons young and old, man and woman, from afar. I shall dispense with a detailed description however,

In wrestling, certain rules of the game are observed, for instance, that both wrestlers must be as nearly matched as possible, and this determines whether they turn down the challenge (a kə̄ nsū̄ʒ) or take it up (a mə̄m nsū̄ʒ).

Our picture (Fig. 118) represents a snapshot of such wrestlers (mə̄n I, from a sīn = to wrestle). To the left one can see a group of young men waiting (a jīʌ̄n) to be challenged (a lōʒ = to challenge). Before the match the wrestler rubs dust onto the palms of his hands and his arms (a dūk mbū lūk enīm = to rub dust [on the] arm) to make them less slippery.

526
[291]

Fig. 118. Fang People at a Wrestling Match in Aldn (Essuong Family). Left, before the selection; right, wrestling.

To the right one can see two combatants wrestling. Each grip, even hooking one's foot behind that of the opponent, and every feint designed to bring down the opponent by any possible method of surprise is considered wholly admissible. /319/

The victory is determined when one of the opponents touches the ground with both shoulders. If he merely falls on one side and the other combatant does not immediately succeed in pressing his shoulders to the ground, the round is regarded as undecided (verb, a kánán). In doubtful cases the judges, who, armed with sticks, circle around the pair during the match, determine the victor.

The victor (ngbō, III, from a gbō, = to throw) is hoisted onto the [#82] shoulders of members of his kin group (a bō(g)e mastétá) and carried off amidst singing and hooting. Usually members of different kin groups or at least of different villages fight one another, doubtless a relic from former times when wrestling was a more serious means of combat.

2: Tessmann--200 E-5 (1904-1909) 1913 F119 Fang F119

526
113

In Mitteilungen aus den deutschen Schutzgebieten /Reports from the German Protectorates/, Berlin, 1895, Zenker mentions wrestling matches between Jaunde women and girls. I myself have never heard of these.

Abschnitt X.

Grundlagen der Weltanschauung.

Allgemeine Bemerkungen: Bisherige Fehler von Grundlagen für die Weltanschauung der Neger. — Auffassung der Neger vielfach nicht richtig erkannt. — Unentbehrlichkeit des Ursprünglichen, auch bei den Pangwe. — Mensch besseel; alles andere unbeseelt. — Unorganisierte Welt: Umwelt, Grundstoffe. — Organisierte Welt: Organisationskraft; Beispiele, ihre Übertragung; Verhältnis der Pangwe zu ihr; praktische Anwendung und Beispiele davon. — Mensch: Körper und Körperteile; dessen Äußerung (relative guter und schlechter Körperteile); Beispiele. — Körperteile bei Tieren. — Seele mit drei Dimensionen; Seelenteile. — Seele im Jenseits.

Die Völkerkunde begnügt sich bekanntlich nicht mehr mit dem Einsammeln und Untersuchen der materiellen Erzeugnisse fremder Völker, sondern hat längst erkannt, wie wichtig es ist, das Innenleben der mit ungeheurer Schnelligkeit aussterbenden oder sich unter dem Drucke europäischer Kultur verändernden Naturvölker zu erforschen. Daher ist es die vornehmste Aufgabe jedes Forschers, so tief wie möglich in die Weltanschauung des Volkes, mit dem er sich beschäftigt, einzudringen. Den Schleier, der über diesen Geheimnissen gebreitet ist, hat man in Afrika nur an wenigen Stellen etwas zu lüften vermocht, was begreiflich erscheint, da die Völkerkunde eine verhältnismäßig junge Wissenschaft ist und jeder Versuch, in ihr dunkelstes Gebiet, die Weltanschauung des Negers, zu dringen, auf viele und große Schwierigkeiten stößt, zumal wenn — wie bisher — fast alle Forschungsreisenden nur kürzere Zeit in ihrem Forschungsgebiete bleiben und deshalb die Eingeborenensprachen nicht beherrschen, während doch die Kenntnis der Sprache eine Vorbedingung für das völlige Verständnis der Vorstellungen des Negers ist. Eine Folge davon ist die, daß wir für die Erforschung primitiver Weltanschauungen noch kaum eine sichere wissenschaftliche Grundlage haben. Am ehesten haben die Missionare Gelegenheit, uns in der Kenntnis der Eingeborenen in dieser Richtung weiterzubringen, indessen können sie sich von einer gewissen, vielleicht unbewußten Befangenheit selten freimachen; der tatsächlich oft vorhandene Mangel an Vorurteilslosigkeit und rein wissenschaftlicher, nicht tendenziös gefärbter Darstellungsweise beeinträchtigt den Wert ihrer Arbeiten und gibt den Kritikern vorzügliche Angriffspunkte. Wenn man nun noch obendrein in Betracht zieht, wie außerordentlich empfindlich und anderseits wie anpassungsfähig der Neger in diesem Punkte ist, wie sehr er es sich angelegen sein läßt,

den Missionaren als Lehrern der neuen Religion und Sittenlehre eine möglichst beschönigte bzw. eine je nach ihrem Bekenntnis anders gefärbte Darstellung seines eigenen Glaubens zu geben, wird man gegenüber den Berichten der Missionare, wenn sie sich auf Mitteilungen von Eingeborenen stützen, stets einige Zurückhaltung für angebracht halten. Was sonst von Forschern über die Religion der Afrikaner, zumal der Bantu, geschrieben wurde, ist verhältnismäßig wenig und meist so voller Mißverständnisse, daß man daran verzweifeln muß, Klarheit zu erlangen.

So gibt es denn heute leider noch keine systematische Grundlage der Religionsforschung in Afrika, es fehlen richtige Bezeichnungen für die verschiedenartigen Erscheinungen auf geistigem Gebiet oder vielmehr es fehlen die richtigen Begriffe und leider,

wo Begriffe fehlen,
da stellt ein Wort zur rechten Zeit sich ein.

Von allen Bantu-Forschern ist der Missionar Gutmann [1]) meines Wissens derjenige, welcher zum erstenmal nachdrücklich darauf hingewiesen hat, daß die Vorstellungen von Zauberei und deren Trägern, die ich Zauberwesen nenne, gar nichts mit dem Seelenglauben zu tun haben, während bisher jedermann die zeitweise unsichtbaren Zauberwesen Seelen nannte, wodurch eine heillose Verwirrung und vor allem die fälschliche Meinung hervorgerufen wurde, daß die Seelen der Abgeschiedenen die Plagegeister der Menschheit wären. In Wirklichkeit sind bei fast allen Bantu die Seelen, selbst wenn sie einmal Schaden anrichten, niemals von der ungeheuren Bedeutung, die den bösen Zauberwesen beigemessen wird [2]). Sogar Pechuël-Loesche [3]), der sich allerdings des Unterschiedes dieser beiden Begriffe bewußt ist, hat den irreführenden und unpassenden Ausdruck „Seelen" für Zauberwesen beibehalten. Ich halte dafür, daß man den Zauberglauben, wie in der neueren Literatur schon mehrfach geschieht, überhaupt von der Religion abtrennen muß, da er nichts mit ihr zu schaffen hat, ja im ausgesprochenen Gegensatz zu ihr steht und geradezu von ihr bekämpft wird. Noch heute finden sich seine Überreste in allen Kulturländern. Vor allem ist festzuhalten, daß das Zauberwesen ein Teil des Körpers ist und mit dem Tode zugrunde geht [4]), daß also der Körper des Menschen aus zwei Teilen besteht.

---

[1]) Gutmann, Dichten und Denken der Dschagganeger.

[2]) Vgl. Bd. II, Abschn. XII.

[3]) Pechuël-Loesche, Volkskunde von Loango.

[4]) Der Begriff des Zauberwesens entspricht — wie mir scheint — dem von Wundt in seiner „Völkerpsychologie" Bd. II, Teil 2, S. 167 aufgestellten Begriff der Körperseele; s. u. S. 7 ff.

Undeutlich erkannt ist auch die wohl bei den meisten Religionen, sogar noch bei der katholischen Auffassung der christlichen Religion, vorhandene Dreiteilung des Daseins — in Diesseits, Zwischenaufenthalt (= Fegefeuer der katholischen Lehre) und Jenseits —, ferner hat man nicht genügend beachtet, daß dem Begräbnis, als Abschluß des diesseitigen Lebens, eine religiöse Handlung bzw. Feier als Abschluß des Zwischenaufenthalts entspricht, und daß selbst das Jenseits noch einen Abschluß in der völligen Auflösung des Menschen findet.

Was aber überhaupt noch gar nicht in seiner Bedeutung gewürdigt worden ist, das ist die Tatsache, daß der dualistischen Auffassung des körperlichen Teils des Menschen, aus der der erwähnte Zauberglauben hervorgegangen ist, eine Zweiheit des geistigen Teils, der Seele, entspricht, eine Anschauung, auf der überhaupt erst die bei fast allen Naturvölkern vorhandenen Kulte fußen. Schurtz und Frobenius, die beide nicht den tiefen Sinn dieser eigentümlichen religiösen Einrichtungen erkannt haben, sehen in allem nur einen Geheimbund, während ein solcher in Wirklichkeit nur eine Entartung des Kultwesens darstellt, bei ihrem Zerfall entsteht und keineswegs eine religiöse, sondern — was schon im Namen liegt — eine soziale Einrichtung ist, wenn er sich auch religiöse Anschauungen dienstbar macht.

Bei genauerer systematischer Erforschung der Weltanschauungen der Naturvölker wird man wohl allgemein zu der Ansicht gelangen, daß bei ihnen der Monotheismus und nichts anderes an der Schwelle der gesamten Weltanschauung steht, denn nach dem Glauben der Eingeborenen wäre ohne den Schöpfergeist Gottes weder Mensch, noch Tier, noch Pflanze da, sondern ein Chaos, wie es im Anfang bestand. Bei den Pangwe ist Gott zwar als Persönlichkeit nicht von Anfang an dagewesen, er hat auch nicht Erde, Sonne und Mond gemacht, wohl aber die unorganisierte Materie organisiert, d. h. Lebewesen erschaffen und so das Weltall ausgebaut, eine Tat, nach der er selbst sich in den Himmel zurückgezogen hat.

Der „Herr auf Erden" ist natürlich der Mensch, er ist die Hauptfigur, zu der alles andere eigentlich nur die Staffage bildet. Er unterscheidet sich von allen Lebewesen durch den Besitz einer Seele, d. h. er besteht aus zwei Teilen, einem sichtbaren vergänglichen Teil und einem unsichtbaren, den Tod überdauernden Teil, den man allein Seele nennen kann. Eine Seele hat, wie nochmals betont werden mag, nur der Mensch. Dinge, Pflanzen und Tiere haben keine Seele, geschweige denn ist die Natur beseelt, wie man es oft hinzustellen pflegt.

Aus dem Besitz einer Seele ergeben sich für den Menschen dreierlei Daseinsformen: erstens der lebende Mensch, zweitens die Seele im Zwischenreich, drittens die reine Seele im Jenseits.

Der Pangwe unterscheidet — wie wir — eine organische und eine anorganische Welt oder, wie es besser heißen sollte, eine organisierte und eine unorganisierte Welt [1]). Im Anfang gab es nur einen unorganisierten Stoff, den Urstoff (vgl. Schöpfungssage S. 15 ff.), aus dem nach Pangweglauben alles entstanden ist und zu dem einstmals alles wieder werden wird. Später hat sich dieser Urstoff in drei verschiedenen Richtungen entwickelt: zur Erde, mit den Grundstoffen Erde (Lehm) und Wasser — eine Mischung von beiden ist Sumpf *(zam)* —, zweitens zum Monde, dessen Grundstoff dem der Erde ähnlich zu sein scheint, und drittens zur Sonne mit dem Grundstoff Feuer, das später vom Himmel zu uns herabgekommen ist. Die ursprüngliche Zusammengehörigkeit dieser drei Gestirne zeigt sich auch in der Ähnlichkeit der drei Wortstämme: *sa, si, so*; *sa* = Sonne, *si* = Erde, *so* = Mond. Freilich ist *sa*, später auch *so*. durch andere Stämme ersetzt worden, aber es ist heute noch nachweisbar, daß sie die älteren sind.

Obgleich nun diese verschiedenen Formen der unorganisierten Materie, nämlich Erde (in weiterem Sinne jedes Gestein), Wasser, Mond, Sonne und Feuer tot, ohne organisches Leben sind, so geht doch von ihnen eine fühl- und sichtbare Wirkung aus, so von der Sonne die Strahlen (= Wärme), vom Monde der Schein, vom Feuer die Flamme, vom Zusammenwirken von Wasser (Regen) und Erde die Fruchtbarkeit, d. h. die Fähigkeit, Pflanzen zu ernähren. Wie ist das möglich? Nur dadurch, sagt der Pangwe, daß in ihnen eine Kraft steckt, die von Gott ausgeht, der sich in ihnen täglich und jeden Augenblick von neuem äußert. So kommt es, daß der Pangwe, da nach seinem Glauben Gott in Person menschlichen Bitten und Wünschen unerreichbar ist, ihn dafür in diesen Elementen, nämlich Erde, Sonne, Mond, Wasser, Feuer, verehrt.

Alles übrige in der Welt, Pflanzen, Tiere und Mensch — hier spreche ich nur von seinem körperlichen Teil — ist organisiert, d. h. der ursprünglichen Materie wurde vom Schöpfer im Anfang eine besondere Kraft gegeben, die jeder einzelnen Pflanzen- oder Tierart eigentümliche Form und die ihr eigentümlichen Eigenschaften genau so auf alle ihre Nachkommen, sei es direkt oder durch Vermittlung besonderer abgespaltener Teile (Samen der Pflanzen, Eier der Vögel) oder auf dem Umwege über selbständige Zwischenstufen (Entwicklungsstufen der Insekten) zu übertragen, so daß Gott nicht jedesmal einzugreifen braucht. Diese mit der Materie verbundene Kraft ist die Organisationskraft. Daß z. B. eine Erdnußpflanze immer vierteilige Blätter hervorbringt, daß auch aus den Nüssen wieder genau dieselben Pflanzen mit vierteiligen Blättern entstehen, also — wie wir sagen — die Artenkonstanz erklärt sich daraus, daß der Materie, die zur ersten Erdnuß werden sollte, vom Schöpfer gesagt ist: Du sollst die Vorliebe für vierteilige Blätter haben und sollst diese Vorliebe weiter fortpflanzen.

---

[1]) Vgl. Erich Wasmann S. J., Die moderne Biologie und die Entwicklungstheorie (Freiburg im Breisgau 1906) S. 198.

Diesen uns geläufigen naturwissenschaftlichen Begriff der Organisationskraft haben die Pangwe etwas erweitert insofern, als sie die Kraft auch bei ausschließlich geschlechtlich sich vermehrenden Lebewesen nicht beschränken auf die Keimzlelen, aus denen der neue Organismus herauswächst, sondern nach dem Muster der ungeschlechtlichen Fortpflanzung von Pflanzen und niederen Tieren auf alle Teile eines jeden Lebewesens ausdehnen. Sie beobachteten, daß ein einziger Erdnußsame, der doch nur ein kleiner Teil der Erdnußpflanze ist, wieder ein ganzes Erdnußpflänzchen mit vierteiligen Blättern hervorbringt, oder daß aus irgendeinem kleinen Stück des Kassavestammes eine neue Kassavepflanze, die genau der alten gleicht, hervorschießt, daß ferner das Ei, das doch nur ein Teil des Vogels ist, wiederum einen ganzen Vogel von derselben Form und Größe ergibt, und schlossen so, daß mehr oder weniger in jedem Teil der Materie des Lebewesens die Organisationskraft in mehr oder weniger starkem Maße steckt, und zweitens, daß sie auch dann noch darin steckt, wenn sich dieser vom mütterlichen Organismus abgelöst hat. Das will heißen: die Organisationskraft ist an die organisierte Materie, nicht an das betreffende Lebewesen gebunden und bleibt infolgedessen erhalten, solange als die Organisation der Materie besteht. Sie überdauert daher den Tod des Individuums, aber nur solange, als dessen einzelne Teile die ihnen von der Organisationskraft mitgeteilte Form bewahren. Sie steckt also im toten Leoparden, sogar in Teilen des toten Leoparden, in der menschlichen Leiche. Am längsten hält sie sich in den widerstandsfähigen Knochen. Sind aber auch die verwest, d. h. haben sie ihre Form eingebüßt, so ist damit auch die Kraft dahin, die Materie wird zur unorganisierten Erde.

Die Organisationskraft wird nun für so gewaltig gehalten, daß sie, ähnlich wie das Radium, auf ihre nächste Umgebung ausstrahlen, sie also organisieren kann, ohne selbst merklich an Eigenkraft zu verlieren. Sie ist imstande, wie ich es ausdrücken möchte, auf ihre Umgebung abzufärben. Diese Wirkung kommt zustande entweder durch mehr oder weniger direkte Berührung oder durch völlige Einverleibung der sie enthaltenden Materie.

Hiernach richten sich die Pangwe, indem sie da, wo die Kraft schädlich werden könnte, sie zu vermeiden suchen, da, wo sie Nutzen schaffen könnte, sie sich aneignen. Ersterem Zwecke dienen die Enthaltsamkeitsvorschriften *(ekɪ,)*, die in der Hauptsache Speiseverbote sind, dem zweiten die unzähligen Medizinen *(bläʌ)*. Endlich benutzt man die schädliche Eigenschaft, um sie auf andere Menschen zu übertragen und diese dadurch zu treffen. Überhaupt richtet sich die praktische Anwendung dieser Krafttheorie ganz nach den jeweiligen Bedürfnissen, und man glaubt, imstande zu sein, ihr die Richtung zu bestimmen, so wie man es wünscht, sei es in feindlicher Absicht gegen Fremde,

[p. 5]

sei es zu eigenem Nutzen für sich. Z. B. wendet man einmal verschlungene Lianen als Liebesmedizin an, in der Absicht, die Liebesgemeinschaft so eng zu gestalten, wie die Lianen sich umschlingen, ein andermal in feindlicher Absicht, damit die Gedärme des Feindes sich zu einem Knoten verschlingen wie die Liane und den Menschen natürlich dadurch krank machen oder töten.

Einige Beispiele für die drei Fälle mögen hier aufgeführt werden.

Der Schopfadler, **Lophoaetus occipitalis** Daud. *(abajek)*, darf von Frauen, wenn sie schwanger sind oder nähren, sowie vom Erzeuger des Kindes — der nicht der offizielle Familienvater zu sein braucht — während derselben Zeit nicht gegessen werden, da der Schopfadler die Kraft hat, den „Schopf" zu organisieren, und man fürchtet, daß beim Genuß des Fleisches mit der Materie auch die Organisationskraft in den Körper der Frau und von da in den des Kindes übergehen und bei ihm dahin wirken könnte, daß es auch einen Schopf oder einen Auswuchs am Hinterkopf bekommt.

Die Schwalbe *(kulejeme)* ist eine Medizin gegen den feindlichen Schuß. Sie hat nämlich die Organisationskraft des Ausweichens vor ihren Feinden, so daß ihr z. B. Raubvögel nicht beikommen können. Tötet man eine Schwalbe und bewahrt sie, in ein Bündel gewickelt, am Körper auf, so kann die Organisationskraft, die in der Materie enthalten ist, auf den Menschen „abfärben" und diesen befähigen, ebenso wie die Schwalbe feindlichen Schüssen auszuweichen.

Die Tiliacee **Duboscia macrocarpa** Bocq *(akak-enen)* ist eine Medizin, die friedfertig macht. Dieses Lindengewächs hat die Organisationskraft eines Blätterdaches, das seinerseits kühlend, beruhigend und lindernd wirkt. Trinkt man nun einen Auszug aus den Blättern, so nimmt man dadurch die Organisationskraft des Gewächses in sich auf und wird selbst ruhig und friedfertig.

Menschenknochen und -schädel sind Medizinen für Kultfiguren. Der Mensch hat die Organisationskraft, seine Feinde zu verfolgen und zu vernichten. Diese menschliche Organisationskraft wird nun durch die Knochen, in denen die Kraft steckt, auf die tote Lehmfigur abfärben und dadurch bewirken, daß diese selbst einem lebenden Menschen gleich wird und Menschen verfolgen und vernichten kann.

Auch kann die Organisationskraft des lebenden Menschen auf andere Materie, auf unorganisierte (z. B. Steine) und sogar auf organisierte (z. B. Holz), übergehen, solange er diese Dinge zu einem bestimmten Zwecke benutzt, also als Werkzeug gebraucht. Daher unterscheidet sich die Werkzeugklasse, die V. Vorsilbenklasse, von der Menschenklasse (vgl. Abschnitt II, S. 26) nur dadurch, daß ihr Wesen, ihre Eigenschaft zeitweise, die der Menschenklasse dagegen dauernd ist. Beispiel: *kŏb IV* = der natür-

liche Haken, von *a kǭb* = anhaken; *e-kǭb* = der natürliche Haken, auf den die Organisationskraft des menschlichen Fingers, etwas festzuhalten, vor dem Herunterfallen zu bewahren, zeitweilig übertragen ist, d. h. solange der Mensch es wünscht. Späterhin wurde aus dem zeitweilig vermenschlichten „natürlichen" Haken, ein dauernd menschlicher Haken, ein Kleiderhaken.

Von der übrigen organisierten Materie unterscheidet sich der Mensch — ich spreche immer noch von seiner körperlichen Hälfte —, ausnahmsweise auch einige Tiere (worüber später), dadurch, daß er außer dem Körper (der Materie) und seiner mit ihm verbundenen Organisationskraft noch eine eigene Kraft besitzt; diese ist aber im Gegensatz zu jener nicht an den Körper (die Materie) gebunden, kann sich von ihm entfernen, also selbständig handeln, und wird daher persönlich gedacht. Sie geht mit dem Tode des Menschen zugrunde. Ich nenne diese von Wundt [1]) „Körperseele" genannte Kraft „Körperwesen", weil es sich dabei nicht um einen Teil der nach dem Tode weiterlebenden Hälfte, die man allein „Seele" nennen kann, handelt, sondern um einen Teil der sterblichen Hälfte (Körper), also um eine Kraft, auf die nicht die Bezeichnung „Seele" angewandt werden darf. Das Wort „Wesen" habe ich deshalb gewählt, weil der Pangwe sich unter dieser Kraft die Summe aller Eigenschaften, Fähigkeiten und Triebe des Menschen, soweit diese sich aus dem Verhältnis zu anderen Menschen ergeben, vorstellt, und weil es deshalb ungefähr dem entspricht, was wir „Wesen" nennen: der und der hat ein gutes oder ein schlechtes Wesen.

Das Körperwesen ist bei jedem Menschen vorhanden, nur äußert es sich bei manchem nicht und zählt dann sozusagen nicht mit (gute Körperwesen). Äußert es sich aber, so gilt es immer als mehr oder weniger schlecht, da sich der einzelne durch den Erfolg anderer geschädigt fühlt, auch wenn gar keine böse Absicht gegen ihn vorgelegen hatte, und andererseits die eigenen Mißerfolge auf böswillige Einflüsse anderer schiebt.

Wie der Pangwe sich die Äußerung des Körperwesens denkt, möge hier nur an ein paar Beispielen erläutert werden. Erstens: Ein todwunder Elefant ist, wie man hört, einem Jäger verloren gegangen und muß irgendwo im Walde bei einem bestimmten Dorfe verendet sein. Zwei Leute aus diesem Dorfe machen sich den andern Morgen auf die Suche, um den „Finderlohn", einen Elefantenzahn und die Hälfte des Fleisches, einzuheimsen. Der eine geht den Weg *a*, der andere den parallelen Weg *b*. Letzterer findet den toten Elefanten. Wie kommt das? — Bei uns würde man sagen: Zufall, Glück oder auch eine Fügung Gottes. — Der Pangwe kennt einen Zufall nicht, alles hat seinen Grund; eine Fügung Gottes läßt er auch nicht gelten, da Gott weit, weit entfernt im Himmel thront und viel zu hoch steht, als daß er sich um menschliche Kleinig-

---

[1]) Wundt, Völkerpsychologie Bd. II, Teil 2, S. 167.

keiten kümmern sollte. Nein, sagt der Pangwe, es muß so sein, daß der glückliche Finder selbst gewußt hat, wo der Elefant lag. Da er aber in Person tagsüber im Dorfe war und auch nachts dort geschlafen hat, so kann man nur so vermuten: Nachts, während sein Körper anscheinend ruhig schlief, hat sich sein Körperwesen, das — wie gesagt — als eigene, dem Körper innewohnende Persönlichkeit gedacht wird, vom Körper getrennt, hat auf irgendeine übernatürliche Weise — das ist durch Zauber — den Elefanten ausgekundschaftet und hat sich in derselben Nacht noch wieder mit dem Körper vereinigt. Daher wußte der Mann, daß der Elefant gerade auf dem Wege *b* zu finden war.

Zweitens: Mehrere junge kräftige Männer gehen auf Jagd, werden hin und wieder durstig, trinken aus Bächen und Flüssen, der eine hier, der andere da. Einer, ein Häuptling, hatte infiziertes Wasser getrunken, die anderen nicht — natürlich alle, ohne es zu wissen. Am anderen Tage kehren sie zurück, der Häuptling wird krank und stirbt. — Wie kommt das? — Einige von uns würden sagen: Zufall, unglücklicher Zufall! Der Pangwe sagt: Nein, das gibt es nicht, alles hat seinen Grund. Andere von uns würden sagen: Gott hat ihn abberufen. Der Pangwe sagt wieder: Nein, das ist unmöglich; Gott hat zwar bestimmt, daß alle Menschen sterben sollen, aber zu ihrer Zeit, d. h. wenn sie alt geworden sind, sonst aber greift er nicht in so furchtbarer Weise ins Menschenleben ein; wie würde er — der Gute — wohl einen blühenden Jüngling vernichten wollen? Nein, vielmehr hat hier irgendein anderer Mensch, ein Feind oder Neider, den Mann „verdorben". Freilich hat niemand gesehen, daß der Häuptling getötet worden ist, aber nachts hat sich das Körperwesen irgendeines überlegenen Feindes vom Körper getrennt und den Häuptling — wieder durch Zauber — ermordet. Wie das alles im einzelnen Falle vor sich geht, weiß man nicht, man weiß nur, daß der feindselige Mensch eine übernatürliche, zauberische Fähigkeit besessen hatte.

Der Begriff des zauberischen Körperwesens dient also — um ein Schlagwort zu geben — zur Erklärung von Glück und Unglück.

Wie schon angedeutet, statten die Pangwe nicht nur den Menschen, sondern auch gewisse höhere Tiere, besonders Haustiere, z. B. Hunde und Schafe, aber auch Elefanten, Antilopen und andere, mit einem Körperwesen aus. Der Eingeborene hält es z. B. für möglich, daß der plötzliche, unerklärbare Tod von Schafen durch zauberische Körperwesen anderer übelwollender Artgenossen zu erklären ist [1]).

Genaueres über das Körperwesen und den mit ihm verbundenen Zauberglauben in Abschnitt XII.

Zu dieser körperlichen, vergänglichen Hälfte des Menschen kommt nun eine nach dem Tode weiterlebende seelische Hälfte. Die Seele ist in drei Daseins-

---

[1]) Das ist ein neuer Beweis dafür, daß das Körperwesen nichts mit der Seele zu tun hat und nicht etwa die Äußerung der Seele im Körper ist, denn Tiere haben keine Seele.

formen vorhanden; erstens im lebenden Menschen als Körperseele — dieser Ausdruck darf nicht im Wundt'schen Sinne verstanden werden als eine Eigenschaft des Körpers, die mit ihm vergeht, sondern will zeitlich verstanden sein: als Seele während der Zeit ihres Aufenthalts im menschlichen Körper —, zweitens als Schattenseele, d. h. während eines längere oder kürzere Zeit dauernden Aufenthaltes in der Nähe des Wohnortes nach dem Tode, im „Zwischenreich", drittens als verklärte Seele im Jenseits.

Genau wie der Körper besteht die Seele aus zwei Teilen, der Materie und einer besonderen Kraft als Summe ihrer Eigenschaften, die sich im Willen äußern, dem Seelenwesen. Um uns in diese schwierigen Verhältnisse leichter hineindenken zu können, dürfen wir die Seele nicht rein geistig fassen, wie wir es gewohnt sind, sondern sie uns als eine unabhängige menschliche Person vorstellen. Der Pangwe sieht also in einem Individuum zwei Personen gleichsam in Personalunion vereinigt, die eine besteht aus dem Körper und einer eigenen Persönlichkeit, dem Körperwesen, die zweite aus der Seele und einer ihr innewohnenden Persönlichkeit, dem Seelenwesen. Wie das Körperwesen sich vom Körper vorübergehend trennen kann (behufs Zauberei und natürlich nur im Diesseits), so kann sich auch das Seelenwesen von der Seele trennen, aber nur nach dem Tode und nur in der als Zwischenreich bezeichneten Zeit.

Beim Abschluß dieses Zwischenaufenthalts geht das Seelenwesen zugrunde, und es bleibt die Seelenmaterie nach, genau wie beim leiblichen Tode als dem Abschluß der ersten Daseinsform, des lebenden Menschen, das Körperwesen zugrunde ging und die mit Organisationskraft ausgestattete Materie nachblieb.

Während das Wesen des Körpers das Verhältnis des einzelnen Menschen zu seinen Nebenmenschen und umgekehrt erklärt, hat die Lehre vom Wesen der Seele das Verhältnis zwischen dem einzelnen Menschen oder der Gesamtheit der Menschen zu Gott bzw. den von ihm geschaffenen Gesetzen zum Gegenstand, sie soll also — um wieder ein Schlagwort zu geben — Schuld (Sünde) und Unschuld erklären. Das Seelenwesen ist, da auch der Pangwe das Gefühl hat, daß alle Menschen Sünder sind, im Grunde schlecht; allerdings gibt es Menschen, die nicht mit Absicht Böses tun, weil sie nicht wissen, was Böse ist, ihr Seelenwesen äußert sich nicht und zählt deshalb sozusagen nicht mit (gute Seelenwesen), alle übrigen aber, bei denen es sich äußert, sind bewußte Sünder und sündigen auch tatsächlich zumeist, mögen sie auch mitunter Gutes vollbringen (böse Seelenwesen).

Von dem Wesen der Seele handelt der größte Teil der Religion, und es ist die Quelle aller Kulte geworden.

Ich werde daher, nachdem im ersten Teil des nächsten Abschnittes die Sagen von der Entstehung der Welt, von Gott und seiner Schöpfertätigkeit

behandelt sind, schildern, wie das Seelenwesen entstanden und beschaffen ist (Teil 2 und 3), wie es sich äußert (Teil 4), zu welchen praktischen Anwendungen es führt (Teil 5), zuletzt wie es, mit dem Tode des Menschen freigeworden, selbständig auftritt und vergeht, wenn die Seele ins Jenseits eingeht (Teil 6).

Im Jenseits, das ist bei Gott, lebt dann die verklärte Seele noch weiter fort, sie hat aber kein Seelenwesen mehr, denn sie ist jenseits von Gut und Böse oder besser, von Schuld und Unschuld. Diese Daseinsform ist die längste und schönste von allen dreien, aber ewig ist sie nicht, denn eine Ewigkeit des Daseins, eine absolute Unsterblichkeit vermag sich der Naturmensch nicht zu denken, ebensowenig wie wir den Begriff der Unendlichkeit fassen können. Die Vermutung, daß auch die Seele nach dem langen, unendlich langen Leben im Jenseits „altern" muß, hat die Pangwe zu dem Schluß geführt, daß die Seelen schließlich wieder vom Himmel herunterfallen und zu Erde werden müssen, wie auch der Körper zu Erde geworden ist.

Wir hätten also als Grundlage der Lehre vom Sein des Menschen:

	Diesseits	Zwischenreich	Jenseits
Vergänglicher, sichtbarer Teil . . .	Körper Körperwesen		
Fortlebender, unsichtbarer Teil . .	Seele . . . . Seelenwesen .	Seele . . . . . Seelenwesen	Seele

Abschnitt XI.

Religion.

1. Entstehung der Welt, Gott und sein Wirken. Gott: Dreiheit Gottes. — Name und seine Erklärung. — Gott im heutigen Glauben der Pangwe. — Sagen über die Entstehung der Welt; Entwicklungsgedanke; Schöpfungsgedanke. — Beginnende Spaltung zwischen den Menschen und Gott; Sagen darüber.
2. Trennung von Gott durch die Sünde. Entstehung des Weibes. — Die ersten Menschen. — Auftreten des Willen beim Menschen. — Geschlechtsverkehr; Die erste Sünde, Sagen über den Sündenfall. — Strafe für die Sünde; Eidechsen und Chamäleon als Boten. — Umschreibung des Geschlechtsverkehrs durch Bilder: Penis = Schlange, weibliches Organ = Frucht. — Grund einer abweichenden Darstellung.
3. Das Seelenwesen. Arten der Sünde. — Sitz des Seelenwesens. — Verkörperung im Schatten und in Schattentieren, im Spiegelbild und in Wassertieren. — Beschaffenheit des Seelenwesens bei den Menschen: Gute und Böse. — Kulte als Sünde. — Etwas über die Lüge. — Entwicklung der Religionsformen.
4. Kulte. Allgemeines: Geschlechtergegensatz in den Kulten, Männer- und Weiberkulte. — Zweck der Kulte: Einspruch gegen den Tod. — Einweihung der Neulinge, Leidenszeit Lehre. — Kultplätze; Leitung der Kulte; Trommelsignale; Vorbereitungszeit; Kultmarken. — Besonderes: Schlechte und gute Grundstoffe in der Natur: Mond und Sonne, Wasser und Feuer; ihre Kulte. — Anzahl der Kulte. — Umschreibung der Kulte durch Tierbilder. — Ältester Kult der Mondkult Seo; Stämme *so* und *si*; Verbreitung des Mondkultes.
   I. Der Ssokult. Allgemeines. a) Sso der Jaunde. Zeit der Feier — Markung —, Phallustanz, — Prüfungen der Neulinge: Ekelhafte Speise, Herumstoßen, Ameisenplage. — Ziegenzerreißen. — „Sterben" der Neulinge; Aufenthalt im Buschhaus, Aufzug bei Festen; Wiedereintritt ins Leben. b) Sso und Ndong-mba der Ntum. Unterschied des Sso der Ntum von dem der Jaunde. — Vorfeier: Geschlechtlicher Tanz, Beschimpfen der Weiber, Schattendarsteller und Maskenmänner (= Issisleute). Herausführen und Erschrecken der Neulinge. — 1. Tag: Ndong-mba: Verrückter. Zeigen der aufgehenden Sonne, Darstellung des Tagewerkes. — Verhüllung des Gerüstes. — 2. Tag: Sso: Phallustanz (Reinigungsgesang). — 3. Tag: Sso: Heiliger Hain mit Figuren, Schweineherde, Ssotanz, Einweihung der Neulinge im Schmutz, Belegen mit Pflanzen. — Erklärung dieser Handlungen. — Andere Ssofeiern.
   II. Bokung und Elong. Bedeutung. — Erklärung der Namen. — Vorfeier. — 1. Tag: Schimpansentanz, Eulenrufe. Elong- (Sonnen-)tanz, Bündnis zwischen Gut und Böse, erneuter Schimpansentanz. — 2. Tag: Heiliger Hain mit Kultfiguren. — Grundmedizinen und Ausstattung der Figuren, Bedeutung der Medizinen. — Einweihung der Neulinge: Töten des Bösen (Bokung); Einweihung ins Böse, Berücherung auf der Elongfigur. — Erklärung der Vorgänge. — Bezahlung des Medizinmannes.
   III. Schok. Bedeutung. — Veranlassung zum Kult. — Heiliger Hain. — 1. Tag: Figuren und Grundmedizin, Lieder, Issisleute, Treiben des Medizinmannes. — 2. Tag: Einweihung, Medizinen, Ziegenschlachten. — Eigenschaft der Schokfigur.
   IV. Ngi. Verbreitung. — Bedeutung des Namens: Gorilla (Eigenschaften des Tieres). — Ngifeier. — Vorbereitung. — 1. Tag: Heiliger Platz, Messertanz des Ngi, Grundsteinlegung der Figur, Medizinen. — 2. Tag: Errichtung der Figur, Knochengreifen der Neulinge. — 3. Tag: Einweihung der Figur, symbolischer Tanz, weitere Medizinen, Knochentanz. — Andere Ngifiguren: Anbringung von Hörnern am Kopfe des Ngi. — Schutzdächer, Tempelanlagen. — Feuer als wirksame Kraft. — Person und Aufgabe des Ngi: Bestrafung der Sünder (Sünde = unerlaubter Geschlechtsverkehr, Diebstahl und Ehebruch, Zauberei). — Ansehen der Ngiperson. — Angriffe von Zauberwesen, ihre Abwehr. — Geständnisse von Sterbenden. — Auffrischung des Ngi. — Krankheiten, die der Ngi als Strafe verhängt.
   V. Schlußbemerkungen über Männerkulte. Odschöe. — Honorar für die Medizinmänner.

Lp 117

VI. Weiberkulte. Schwierigkeiten der Erforschung von Kulten im allgemeinen, von Weiberkulten im besonderen. — Anzahl und Namen. — Mawungu: Feueranzünden, Einführung der Neulinge, Beschimpfen der Männer, Umzug. — Mawungumedizin der Jaunde. — Nkang: Perlhuhndarstellung, Erschrecken der Männer. — Endaluma. — Eindringen der Männer in die Frauenkulte.

VII. Allgemeine Schlußbemerkungen.

5. Praktische Anwendung der Anschauung über die Sünde. Bekleidung der Scham und Beschneidung (Operation, Schmerzensäußerungen, Behandlung der Wunde).

6. Zwischenreich, Seelenfest, Jenseits. Verwandlung der Seele (schlechte und gute Gründe), Seele im Leopard. — Schattenseelen. — Abholen der Sterbenden. — Lila als Farbe der Seelen, lila Blumen, lila Schatten. — Aufenthalt der Seele in Baumstämmen usw. — Eigenschaften der Schattenseelen: Gutartigkeit. — Versorgung der Seelen. — Hunger, Felddiebstahl (Medizinen dagegen). — Träume, Traumdeutung. — Seelenfest: Verbreitung, Zeit der Feier, Trommelsignale, Einladung der Gäste, Aushängen und Verteilen der Sachen, Hauptfesttag (Seelentanz, Fortscheuchen der Seele, öffentliche Feststellung, Palmwedeltanz, andere Tänze, Festessen, Scherzmedizin). — Seele im Jenseits, Vorstellung vom Jenseits. — Trennung der Guten und Schlechten. — Altern der Seele, Entfernung aus dem Himmel. — Termitenhaufen als letzter Rest. — Das große Rätsel der Menschheit.

7. Ahnenverehrung. Zweck. — Pflege der Schädel. — Erklärung des Namens Malan. — Schädeltonnen. — Holzfiguren und ihre Bedeutung (Köpfe, halbe Figuren, ganze Figuren, Niamodo). — Heilige Hütten. — Eindringen der Weiber. — Speisung der Schädel. — Malanfeier: Vorpflege, Einführung der Neulinge. Heiliger Hain. — Ahnenfest. 1. Tag: Tanz der Holzfiguren, Aufstellung der Schädel, Schädeltanz, Einweihung der Neulinge, Frauen, Erscheinen des Niamodo, Medizinen, Schmaus, Umzug. — 2. Tag: Bittgesuch und Geschenke an die Schädel, Schlachten der Ziege. — Nächtlicher Besuch der Neulinge im Hain.

---

1. Entstehung der Welt, Gott und sein Wirken.

Soweit meine Kenntnis von den Pygmäen reicht, fassen sie die menschliche Person auf als eine Zusammensetzung von drei Kräften: Körper, Körperwesen und Seele. Die Pangwe haben — wie wir gesehen — statt dieser Dreiteilung eine Vierteilung, insofern sie der Seele ein Seelenwesen zuteilen. Früher dürften sie auf derselben Stufe der Weltanschauung gestanden haben wie die Pygmäen, denn die eine göttliche Person oder Kraft, welche am Anfang alles Lebens steht, wird bei ihnen aus drei Kräften bestehend gedacht: aus der Materie *(nzämba, nzämbe, nzäme, nzäma, zäma)*[1]), aus dem Körperwesen oder der Lebensäußerung *(nkwä*, in Zusammensetzungen *nya)* und aus der Seele, dem Geist, der ältesten der Drei *(maböge, mebege)*. So heißt denn Gott mit vollständigem Namen: *ɛ-säm(a)-nyá-maböge*, entstanden aus der Zusammensetzung jener drei Stämme. Der Betonung *esäm-nyámaböge* ist schon die Tatsache zu entnehmen, daß in diesem Falle zwischen *zäma* und *maböge* ein neuer Stamm eingeschoben ist, nämlich *nya*, sonst müßte es heißen, und das tut es nebenher auch: *zá'ma-maböge*, oder wenigstens *zá'ma ya maböge* (Sama und Maböge); auf letzteren Fall komme ich noch zurück[2]). Außer-

---

[1]) Stamm *sa*; *s* verändert sich oft in *z* (vgl. I S. 14).

[2]) Den vollständigen Namen *esäme-nya-mebege* führt auch George L. Bates in seinem Handbook of Bulu, London 1904, an. Er weiß aber nicht, daß *nya* ein besonderer Stamm ist, sondern meint nur, daß „nya is a connective unused elsewhere" (!).

dem aber führt Trilles[1]) die Mitteilung eines Fang auf, der sagt: „Dieu était, il était Un et il était Trois. Comment cela peut-il se faire? Je n'en sais rien, mon père ne me l'a pas appris, il l'avait entendu dire ainsi. Ce Dieu Un, nous l'appelons Nzame, et les Trois qui sont Nzame et ne font qu'un seul Nzame, nous les appelons Nzame, Mébère et Nkwa[2]). Diese Dreiteilung entspricht genau der Teilung einer Person in Materie — Kraft (= Lebensäußerung) — Seele, ist also ein uralter Gedanke, der einen Vergleich mit unserer Lehre vom Gott-Vater (Materie), Jesus (Lebensäußerung „Wille" Gottes) und heiligen Geist (Seele) aufdrängen muß.

Betrachten wir den Pangwenamen für Gott genauer, so erkennen wir, daß das Wort *nzä-mbä* = *nzä-mbë* aus zwei Teilen zusammengesetzt ist, aus *nza* und *mba (mbe)*. Der erste Teil *sä* ist ein uralter Stamm, auf den wir verschiedentlich schon hingewiesen haben und der die Sonne bezeichnet[3]). *sä-m* heißt Sonnenstrahl, es ist ja das Wesen der Sonne zu strahlen, und zwar ein dauerndes und aktives (vgl. Nachsilben *[m]*). Das will eben heißen, daß die Strahlen durch eine Person (nämlich Gott) von der Sonne jedesmal zu bestimmten Zwecke (nämlich das Leben zu erhalten) ausgeschickt werden. Daher auch derselbe Stamm (*sa*) und dieselbe Nachsilbe (*m*) in Sumpf (*zäm*). Vergleiche hier die Ansicht über die unorganisierte Materie (Bd. II S. 4). *a sä-m* heißt die Hände ausstrecken und ausstrahlen lassen. Da die Hände nun zu zweierlei Zwecken ausgestreckt werden, erstens um abzuwehren und fortzustoßen, zweitens aber um heranzuholen und zu schützen, so könnte man ebensogut der strafende wie der gute, segnende, barmherzige Gott übersetzen[4]), wenn nicht letzteres die größere Berechtigung hätte, da die Strahlen der Sonne vorwiegend lebenspendend, also wohltätig wirken. Man vergleiche hierzu das Bild des Sonnengottes bei Erman[5]). Der Gott ist dort in Gestalt der Sonne, deren Strahlen in Hände auslaufen, dargestellt.

---

[1]) P. H. Trilles, Proverbes Légendes et Contes Fang im Bulletin de la Société Neuchateloise de Géographie. Tome XVI. Neuchatel 1905.

[2]) Auch A. L. Bennett führt als „Götter" auf: Nzame, Mabeka (Maböge) und Nkwa, außerdem noch Sekôme und Ube, letztere sind aber die ersten Menschen.

[3]) Schon bei den alten Babyloniern hieß der Sonnengott schamasch (sam-as).

[4]) Vgl. V. Largeau, Encyclopédie Pahouine S. 213. Die französische Übersetzung lautet dort (Nsama fragt Mebere): „Père, quel est mon nom? Quel est le tien? — On t'appellera Dieu l'Ordonnateur de toutes choses; moi-même on m'appellera le Miséricordieux avec Dieu." Allerdings ist mir der Sinn des letzten unverständlich, es muß da irgendwo ein Mißverständnis in der Antwort des Negers oder in der Übersetzung vorgekommen sein.

[5]) Adolf Erman, Die Ägyptische Religion. Berlin 1909, S. 78.

Der zweite Teil in Nsambe, *mbā* oder *mbe*, deutet gleichfalls auf die Sonne hin, denn *ba, be (ra, re)*[1]) bedeutet etwas Rotes, Rotglänzendes, *m* ist die Menschenvorsilbe, daher *m̄bā* III. Klasse, eigentlich roter Mann, für den Turako mit seinen rotschimmernden Flügeln, *bą̄ III* = rote Farbe, *mre IV* = Rotholzbaum, **Pterocarpus**, *mré IV* = roter Hahn, *e-ré-le* = rot. Ich glaube sogar, daß früher mit *mbā* die untergehende Sonne bezeichnet wurde, mit *sā* dagegen das aufgehende Tagesgestirn, denn man sagt noch heute für die untergehende Sonne im Fang: *ndźób a rū-be (a rūō-be)*, d. h. die Sonne (Himmel) rötet sich beim Untergang, für das Abendrot: *a-rūō-ngūrge*, für das Morgenrot dagegen: *n-są-o-dźób*. Daß *mbā* wirklich mit der Sonne in Zusammenhang steht, geht auch daraus hervor, daß der Sonnenkult *ndoṅ-mbā*, d. h. etwa „Kult des roten Gestirns", genannt wird, wobei ich bemerke, daß *ndoṅ* selbst ursprünglich die Sonne und allgemein die Gestirne, weiterhin etwas Heiliges, insonderheit Kult bedeutete, z. B. *ndoṅ-źok, ndoṅ-bokuṅ* (nur in altertümlichen Liedern, s. u.).

Nkwa und Maböge sind sprachlich nicht zu erklären, auch die französischen Schriftsteller bringen nichts Sicheres darüber. Jedenfalls ist Maböge älter als Nsambe, und man stellt sich ihn als die erste einigermaßen menschlich gedachte Kraft und als Vater Nsambes vor. Daß in ihm die Seele, der Geist der Schöpferkraft personifiziert wird, ist offenbar (vgl. 1. Buch Mose, 1 Vers 2: „und der Geist Gottes schwebete auf dem Wasser").

Aus den angeführten Wortstämmen entnehme ich, daß der Name Nsambe zu der Sonne in Beziehung steht, die Pangwe selbst freilich zerbrechen sich über Gott und seine Tätigkeit nicht den Kopf. Nsambe ist ihnen zu einer mythologischen Persönlichkeit geworden, die in Sagen und Märchen zwar eine große Rolle als Held spielt, von der jeder weiß, daß sie einmal alle Lebewesen geschaffen hat, die aber als Person dem Volke jetzt fern steht. Freilich hat er das nicht immer getan, wie uns die Schöpfungssagen mitteilen, vielmehr haben sich die Pangwe selbst mit ihm überworfen und glauben nun, daß sie nicht mehr wie einst seine Lieblinge seien. Daher der Drang nach Westen, von dem gleich im Anfang gesprochen wurde, nach dem dort gelegenen Sonnenheim, dem verlorengegangenen Paradiese, das dort wohl vermutet wurde [2]). Solange dieser Gott aber nicht wiedergefunden ist, solange meint man bei den Seelen der Ahnen mehr Gehör für seine Wünsche zu finden und widmet ihnen eine Verehrung, die sie bestimmen soll, in Vertretung Nsambes für das Wohl der Allgemeinheit zu sorgen. Nsambe ist unterdessen ganz in den Hinter-

[1]) *b* wird oft in *r* verwandelt (vgl. *o-be-be* = Töpfchen, *m-ve* = Topf).

[2]) Vgl. II S. 28: ... und wenn du mich vergeblich suchst, so wisse: ich bin über das Meer gegangen (also nach Westen) und auch dort suche mich nicht, denn ... usw.

grund getreten, man läßt ihn wirklich — wie die landläufige Redensart bei uns sagt — einen guten Mann sein. Am treffendsten finde ich immer den Vergleich mit dem „Chef" eines großen Handelshauses, der die persönliche Mitarbeit wegen seines Alters und wegen Verärgerung aufgegeben hat und seinen Vertretern, mit denen das „Publikum" zu tun hat, und denen es seine Wünsche vortragen muß, freie Hand läßt, während sein Name aber noch auf dem Firmenschild steht und sein Geist noch über dem durch ihn geschaffenen Geschäftsbetrieb schwebt.

Wollen wir uns des näheren über ihn unterrichten, so müssen wir auf die Schöpfungssagen zurückgreifen, die dadurch besonders interessant sind, daß sie manche Anklänge an das Alte Testament zeigen.

Nsambe (Gott) hat also alle Lebewesen geschaffen, aber er hat nicht die Welt geschaffen, er steht nicht am Anfang aller Dinge, sondern ist selbst erst das Ergebnis einer Entwicklung. Darüber erhielt ich von meinen Berichterstattern verschiedene Auskünfte.

Nach der einen Lesart ist die ganze Erde mit allem, was darauf und darüber, aus einem großen Baumpilz *(alö[k] a nkǫ́k)* [1]), gleichwie aus einem Ei *(„ane makjɐ ma káb"* = wie Eier vom Huhn), entsprungen, der also die eigentliche Welturmutter ist. Wie eine Eischale oder Fruchtschale bei der Reife platzt, indem die obere Hälfte in die Höhe gehoben wird, ebenso platzte der Baumpilz, und Himmel und Erde, die ursprünglich eine zusammenhängende „Eischale" bildeten, trennten sich voneinander. Die Vorstellung, daß der Himmel etwas der Erde Verwandtes, ihr Gleichartiges ist, spiegelt das Rätsel wider:

Was ist das: *bengabagaba be kiai bebai*
Große Flächen von Blättern, zwei.

Antwort: *sɪ, ya dɛ́ɔ́b*
Erde und Himmel.

Der Inhalt des „Eies", auf das vergleichsweise immer wieder hingewiesen wird, bestand aus allen uns sichtbaren Dingen, die also gleichzeitig geboren sind, aus Sonne und Gestirnen, Bäumen, Bergen, Flüssen, Tieren und der Urmutter Alonkok [2]). Von Tieren sind indessen nur die wilden Tiere gemeint, Haustiere hat es bei der Geburt der Erde noch nicht gegeben. Wichtig ist in diesem Berichte die Erzählung vom Ursprung des Blitzes. Der Blitz ist nämlich auch in dem Ei gewesen, nur in einem besonderen kleineren, das in dem großen Ei eingeschlossen war. Von ihm hat Alonkok das Feuer, das sie dann auf ihre Nachkommen übertrug, und das Nsambe erst den Menschen gegeben hat.

---

[1]) *nkǫ́k* = niederliegender Baumstamm.
[2]) Die vorher doch das Ei selbst sein sollte.

Als nun aber der Blitz sich eines guten Tages seiner Fesseln entledigte und Alonkok gefährlich wurde, verbot sie ihm den Aufenthalt auf der Erde und verwies ihn an den Himmel, was ihr weiter keinen Kummer machte, da sie ja nun die Hauptsache, das Feuer, hatte und des Blitzes nicht mehr bedurfte. Vom Himmel aus fährt er nun heute noch manchmal herunter, die Menschen verstecken sich dann nach dem Befehle der Allmutter in ihren Häusern, wohin er nicht kommt; wenn sie sich aber ins Freie wagen und in die Nähe von Bäumen, dann kehren seine alten Untugenden zuweilen wieder, und er tötet die Menschen. Auch Sonne und Mond haben ihren Lauf von der Urmutter vorgeschrieben bekommen, als alles noch im Ei vereinigt war, nachher hatte Alonkok freilich nicht mehr die Macht, den Gestirnen Vorschriften zu machen. Die Sonne ist dazu gesetzt, damit sie den Menschen zu ihrem Tageswerk leuchte; wenn sie erlischt, müssen alle Menschen sterben. Aber auch untergehen muß die Sonne, damit sich die Menschen während der Nacht ausruhen und schlafen, denn Tag und Nacht sollen sich abwechseln nach ewigem Gesetz. Der Mond ist ein Zeichen für die Frauen, da sie bei seiner Geburt (Neumond) Blutfluß bekommen; eher können sie nämlich nicht gebären. So bewirkt der Mond Befruchtung, Geburt, Wachstum und Werden in der Natur, schafft Regen- und Trockenzeit, also den für die Fruchtbarkeit wichtigen Wechsel der Jahreszeiten.

Alonkok gebar nun Zwillinge (von wem, wird nicht gesagt), den Nkombodo und die Odangemekó [1]). Beide scheinen aber noch nicht menschlich gestaltet gewesen zu sein. Diese beiden gebaren wieder Zwillinge verschiedenen Geschlechts, Maböge und eine ungenannte Schwester, beide zeugten den Nsambe und eine Tochter, deren Namen ebenfalls nicht verraten wird. Diese beiden sind die Erzeuger des Menschengeschlechts.

Alonkok hatte alle Nahrungspflanzen, wie Erdnuß usw., in einem Körbchen dem Nkombodo überliefert, der sie auch aß; einen Namen hatten sie aber noch nicht, man nannte sie einfach *bidzi* = Essen; auch kannte Nkombodo noch nicht die Verwertung der Tiere des Waldes, die alle ebenfalls ohne Namen waren. Durch Nkombodo ist dann alles auf Maböge und Nsambe gekommen, und letzterer hat allen Tieren Namen gegeben. Die Tiere, die vorher beisammen waren wie in einem großen Gefäß, zerstreuten sich und liefen unter Nsambes Regierung in den Busch, und Nsambe mühte sich vergeblich ab, sie wieder einzufangen. Nur zwei bekam er wieder, Ziege und Schaf. Bei seiner Jagd

[1]) Nkombodo zusammengesetzt aus *nkó* = Hügel, *mbodo(k)* = Morast, als Personen aufgefaßt (Nko vom Vater Mbodo) ist *mbodo(k)* = der Ältere, *nkō* = Hügel, der jüngere; Odangemeko von *odóń* = übertreffen, *mekō* = Hügel, etwas, was die Hügel übertrifft, also große Berge.

auf die Tiere beobachtete er, daß ein Tier ihm stets folgte und ihm schließlich ins Dorf und ins Versammlungshaus nachkam; selbst, wenn er es schlug, kam es wieder. Da sagte er: „O, du gehst nicht wieder in den Busch, du bist der Hund!" Es wird angenommen, daß die Haustiere vor dem Einfangen anders aussahen und Wildtieren verwandter Gattungen glichen, so das Huhn dem Frankolin, **Francolinus squamatus** Cass. *(ogbwä')* [1]). Dieses kam eines Tages ins Haus, stieß den Teller mit Ngonkernen um und wollte den Ngon fressen, und wenn die Frau Nsambes es zu verscheuchen suchte, kam es doch wieder. Da nannten sie es Huhn, und seit dieser Zeit ging das Huhn nicht mehr in den Busch und bekam ein anderes Aussehen, gerade so wie es jetzt ist.

Derselbe Entwicklungsgedanke findet sich in einer anderen Sage, deren Anfang ich hier mitteile:

„Ekoko-akok (das ist Pilzerde) gebar Kada (Taschenkrebs), Kada gebar Madschib (Wasser), Madschib gebar Nko (Hügel), Nko gebar Nschúm-ngo-bewine (Name unerklärlich) und dieser gebar Esamanyamaböge."

Das soll heißen: Im Anfang war die Pilzerde, d. h. die organische Erde da, die Masse, welche die am niedrigsten organisierten Pflanzen enthält, mit anderen Worten: In der Erde lag der Keim zu der Entwicklung. Nun wurde zuerst Morast, ausgedrückt durch das Bild des Taschenkrebses *(kada)*, ein Tier, das bekanntlich im Wasser und auf der Erde zugleich lebt. Dann schied sich Wasser *(madźib)* vom festen Lande *(nkö)*. Die erste Lesart (S. 15) sagt dasselbe, wenn auch mit anderen Worten und nicht so deutlich: Zuerst war der Urstoff (Ei), in ihm der Keim (Baumpilz) [2]), aus dem Morast und festes Land (Nkombodo), dazu die Gebirge (Odangemeko), zuletzt, mehr menschlich gedacht, Maböge und Nsambe entstanden, von denen anfangs gesagt wurde, daß Maböge der Ältere (Geist), Nsambe der Jüngere, schon vollkommen menschlich gedachte (Gott) sei, die hier in der zweiten Lesart zu einer einzigen Person — Essamnyamaböge — verschmolzen wird.

Jedenfalls geht aus diesen Sagen hervor, daß Nsambe, wenn auch nicht der Schöpfer der Urmaterie, so doch der Sammler, Entwickler und Erhalter alles dessen ist, was er übernahm. Und seine Erbschaft war ja nur, von dem Widerspruch in der ersten Lesart abgesehen, Erde, Morast und Wasser, vielleicht noch die Anfänge der Entwicklung. Wenn Nsambe also weiter entwickelt und Menschen und Tiere (hauptsächlich sind die höheren und höchsten genannt) „gebiert", so ist er doch im Grunde der Schöpfer aller Dinge, wie wir

[1]) Diese Frankolinart sieht dem Haushuhn tatsächlich recht ähnlich.

[2]) Daher auch zuerst die Angabe, Nkombodo sei das Ei (Urstoff) selbst, später: sie sei in dem Ei.

sie heute sehen, der Beherrscher des Himmels und der Erden. Von seiner Frau ist selten die Rede [1]). Wie wir aus der ersten Sage gesehen haben, soll von der Urmutter her stets ein Sohn und eine Tochter geboren sein, die dann die Nachfolgenden zeugten. Die — als Inzucht — verbotene geschlechtliche Vereinigung von Bruder und Schwester — im Pangwesinne gilt das auch von Sippengenossen — heißt einfach *zāma III* = Nsambe (Gott) oder *zāmadə̄ḷə̄ III*, *a bō zāma* = machen wie Gott, und hört erst mit dem Menschen auf, dem Nsambe eine Frau gibt. In allen von mir gesammelten Sagen gebiert Nsambe den Menschen, der deshalb *mode-zāma* (Mensch = *mōt* von Gott, d. h. Mensch [Sohn] Gottes) heißt, und danach alles andere, vor allem die Pygmäen und andere Negervölker, Menschenaffen, den Gorilla *(ngɟ-zama)*, den Schimpansen *(woá-zama)*, den Elefant *(ɛ́ó[k] a zama)*, die Schlange und wie sie alle heißen mögen.

Largeau führt neben dieser Zeugung des Menschen noch eine Schöpfung an. Es heißt bei ihm (S. 211): Dieu créa l'homme avec de l'argile; il prit de l'argile et créa l'homme avec. — Ce fut l'origine de l'homme; il le commença sous la forme d'un lézard. Ce lézard, il le mit, au bout de cinq jours, dans un bassin d'eau. — Les cinq jours passés, il le porta dans l'eau du bassin, et l'y laissa; il y resta sept jours. Le huitième jour, il l'alla voir, et lui cria: — Sors! Il sortit, il était homme!...

Noch merkwürdiger ist eine Schöpfungssage, die Trilles in der bereits genannten Arbeit [2]) wiedergibt. Nachdem der dreieinige Gott aus dem Nichts Erde und Himmel, Tiere und Pflanzen durch seinen Hauch geschaffen, ruft Nsambe seine beiden Kräfte „Mébère" und „Nkwa":

„et leur montra son œuvre.
— Ce que j'ai fait, est-il bien, leur demanda-t-il?
— Oui, tu as bien fait, telle fut leur réponse.
— Reste-t-il encore quelque autre chose à faire.

Et Mébère et Nkwa lui répondirent:

‚Nous voyons beaucoup d'animaux, mais nous ne voyons pas leur chef; nous voyons beaucoup de plantes, mais nous ne voyons pas leur maître?'

Et pour donner un maître à toutes choses, parmi les créatures, il désignèrent l'éléphant, car il avait la sagesse, le tigre, car il avait la force et la ruse, le singe, car il avait la malice et la souplesse.

---

[1]) Largeau führt als ihren Namen Oyem-Mame an, was auf deutsch heißt: die Erfahrung: *a yem mām* = alle Sachen wissen.

[2]) Bulletin de la Société Neuchateloise de Géographie, Tom XVI 1905, S. 130 ff.

Mais Nzame voulut faire mieux encore, et à eux trois, ils firent une créature presque semblable à eux: l'un lui donna la force, l'autre la puissance, le troisième la beauté.

Puis, eux trois:

‚Prends la terre, lui dirent ils, tu es désormais le maître de tout ce qui existe. Comme nous, tu as la vie, toutes choses te sont soumises, tu es le maître.'

Nzame, Mébère et Nkwa remontèrent en haut dans leur demeure, la nouvelle créature resta seule ici-bas et tout lui obéissit."

Und weiter: „Nzame, Mébère et Nkwa avaient nommé le premier homme Fam, ce qui veut dire la force [1])."

In derselben Sage wird dann weiter berichtet, daß der so geschaffene Fam übermütig wird, Nsambe daraufhin den Blitz ruft und mit ihm die Erde anzündet und verbrennt. Fam, den Nsambe seinem Versprechen gemäß nicht hatte sterben lassen, ist seitdem verschollen. Bei der späteren Neuschöpfung wird alles aus einem Baum entwickelt, dessen Blätter, zur Erde gefallen, ein Säugetier, ins Wasser gefallen, einen Fisch ergeben usw. Dann wird ein neuer Mensch geschaffen, namens „Sékoumé", der sich dann auf Anraten Nsambes eine Frau macht.

Schon bald nach dem Auftreten des Menschen setzt eine Entfremdung zwischen Nsambe und seinen Söhnen ein, indem er sie plötzlich verläßt und „ein Stück weiter" fortzieht, aus Gründen, die niemals näher bezeichnet sind, so daß dieser Schritt fast wie ein Akt reiner Willkür von seiten Nsambes erscheint. So plötzlich und heimlich geschieht dieser Fortzug, daß sich eines schönen Tages seine Söhne ganz verlassen und ohne irgendwelche Nahrungsmittel sehen, so daß der Mensch seine Brüder als Abgesandte zu Nsambe schicken muß, die die fehlenden Dinge, vor allem Essen und Feuer, holen sollen. Anderswo hören wir, daß Nsambe mit den übrigen Söhnen (Tieren) und allen seinen Sachen fortgezogen sei und, als er sich an seine Vater- und Ernährerpflichten erinnert, diese Söhne beauftragt, dem Menschen Nachricht von ihm zu geben und das Feuer usw. zurückzubringen. Beide Fälle kommen insofern auf dasselbe hinaus, als sie die Quelle mehrfachen Ungehorsams und zahlreicher Mißhelligkeiten sind, von denen die schlimmste den völligen Bruch mit Gott herbeiführt.

Doch hören wir den Erzähler, einen Mann aus der Familie Ngbue vom mittleren Woddo, selbst:

„Essamniamaböge hatte nun sieben Söhne, der erste hieß Mode a Sama (*mət* = Mensch), der zweite Küi a Sama (*küi* = Pygmäe), der dritte Ngi Sama (*ngɨ* = Gorilla), der vierte Oaa Sama (*wɔá* = Schimpanse), der fünfte Scho a

[1]) Fam heißt hier natürlich nichts weiter als „Mann" (*fàm*).

Sama (*fǫ̀k* = Elefant), der sechste Ekute oder Akute Sama (*akû!* = dumm) und der siebente Ngomwénio (Name nicht zu erklären) [1]).

Eines Nachts ging Nsambe heimlich an einen anderen Platz und ließ alle seine Söhne ohne irgendwelche Mittel zurück, sie hatten weder Feuer noch Essen, noch Kleidung. Am anderen Morgen herrschte große Trauer, und die Söhne sagten: ‚O, was sollen wir tun, so ganz ohne Feuer, ohne Essen, ohne irgend etwas?' Da sagte Mode a Sama zu Oaa Sama: ‚Folge du unserem Vater und bringe uns sobald als möglich Nachricht!' Da ging Oaa fort, aber kaum war er in den Wald gekommen, da sagte er zu sich: ‚Ach, ich bin so hungrig!', und als er die Kardamomfrüchte [2]) sah, aß er sie auf. Aber bald ging er weiter und weiter, und als von seinem Vater noch immer keine Spur zu sehen war, da wurde er des Gehens müde, er bog seitlich vom Wege ab, kletterte auf einen Schirmbaum, errichtete sich dort ein Lager aus Zweigen und vergaß Vater und Brüder. Am anderen Tage, als der Oaa nicht wiederkam, sagte Mode zum Ngi: „Folge du dem Vater und Oaa, gehe schnell und bringe uns Nachricht!" Ngi machte es aber ebenso, kaum sah er die Kardamomfrüchte, da sagte er: ‚Was, zwei Tage bin ich ohne Essen und *ngbàb*!'" (lautnachahmend), er riß die Frucht ab und verzehrte sie. Als er auf seinem Weitermarsche an ein Wasser kam und auch da seinen Vater nicht sah, ging er in den Busch unter die Zweige und ließ Sama und Brüder Sama und Brüder sein. Den andern Morgen sagte Mode: ‚O, Oaa und Ngi sind fortgegangen und nicht wiedergekommen, Schok, gehe du und folge ihnen!' Da machte Schok sich auf den Weg. Er war aber noch nicht weit über die Stellen, wo Oaa und Ngi den Weg verlassen, hinausgekommen, als ihm die roten Früchte der Ölpalme ins Auge fielen. Natürlich hatte er nichts Eiligeres zu tun, als diese zu pflücken und aufzuessen. Etwas weiter kam er an eine lichte Stelle, wo es viele Cissusranken (*pfoafǫ̀k*) gab, er aß die Blätter und, da sie ihm schmeckten, verließ er den Weg, der zu Nsambe führte, und schlug sich in die Büsche. Am nächsten Tage sagte Mode zum Kûi: ‚O, Schok kommt auch nicht wieder; ich weiß nicht, was das zu bedeuten hat. Ob er den Weg verloren hat oder bloß seinem eigenen Triebe gefolgt ist, ich weiß es nicht! Nun gehe du und rufe Schok und die Brüder zurück mitsamt unserem Vater Nsambe!' Da nahm Kûi Flitzbogen und Gewehr und machte sich auf den Weg. Im Walde sah er die Fährte eines Quastenstachlers — sofort machte er eine Falle und ging dann weiter. Gleich darauf sah er ein Rotbaucheichhörnchen [3]) — *ngbwòm* (lautnachahmend), der Pfeil schwirrte

---

[1]) Akute und Ngomwenio sind wahrscheinlich Stammväter anderer Negervölker (vielleicht der Küstenvölker usw.).

[2]) Früchte des **Aframomum** (Fr.: *esàn*), Hauptnahrung der Menschenaffen.

[3]) **Sciurus rufobrachiatus** Aubryi *ongi*.

von der Armbrust, und das Eichhörnchen stürzte herunter. Dann ging er weiter. Da sah er eine rotschwänzige Meerkatze *(ołók)* und schoß sie. Hocherfreut kehrte er nun mit seiner Beute zu Mode zurück und sagte: ‚Ich habe schon viele schöne Tiere geschossen!' Mode aber erwiderte ärgerlich: ‚O, bist du denn nicht gescheit, du folgst den Tieren und nicht unserem Vater; was soll ich denn mit all den Tieren? Morgen gehst du nochmal und bekümmerst dich nicht um das Wild, sondern suchst den Vater zu finden!' Am anderen Tage brach denn auch Kûi mit den besten Vorsätzen auf, aber nicht lange, so lief eine Antilope über den Weg, die er doch schießen mußte, und dann gab es so viele Eichhörnchen, Meerkatzen und Vögel im Busch, und zuletzt sah er ein großes Schwein. Alles erlegte Kûi. Erst spät in der Nacht kehrte er, unter seiner schweren Beute keuchend, nach Hause zurück. ‚Wie,' fragte ihn Mode, ‚hast du unseren Vater gesehen?' — ‚Nein,' meinte Kûi, ‚aber ich schoß viele Tiere unterwegs, die ich dir hier mitgebracht habe.' Da sagte Mode: ‚O, du bist ganz verlassen, warum bist du nicht weiter gegangen? Dich kann man keinen Mann mehr nennen, du heißt mit Recht Kûi (Stamm *ku* = bedeckt, *akut* = dumm, verrückt; *ekû,r wpó* = alleinstehende (verrückte) Schimpansen). Am anderen Tage sagte Mode zu Ngomwenio: ‚Gehe du meinen Vater suchen, mache es aber nicht so wie Kûi und die anderen, sondern folge nur deinem Vater!' Ngomwenio ging denn mit seinem Gewehr los, aber auch er machte es ebenso wie Kûi, sah er Eichhörnchen, schoß er sie, sah er Meerkatzen, verfolgte er sie und schoß sie, auch die Antilopen jagte er. Dann ging er mit seiner Beute nach Hause zurück und sagte seinem Bruder: ‚O, ich sah so viele Tiere im Busch, es war unmöglich, unter diesen Umständen vorüberzugehen.' Da rief Mode a Sama: ‚Du dummer Mensch, du bleibst nun auch hier, du bist ebenso wenig wert wie dein Bruder!' Darum heißt du nun auch Ngomwenio' — denn Ngomwenio hatte früher den Namen Bebange be Sama und Kûi den Namen Mba a Sama, und nur ihre Torheit hat ihnen die jetzigen Namen verschafft. — Schließlich machte Mode einen letzten Versuch mit Ekute und sagte ihm: ‚Ekute, gehe du nun; wirst du es aber auch nicht ebenso machen wie die anderen?' Ekute versicherte ihm, genau nach Modes Weisung zu handeln und brach auf. Bald kam er denn an das Wasser, da lief er schleunigst hinein und badete sich ordentlich, dann legte er sich an die Sonne, ließ sich von ihr trocknen und sagte: ‚Ach, wie schön ist es hier an der Sonne!', denn er verspürte wenig Lust, ins Ungewisse weiterzugehen. Doch schließlich raffte er sich auf, schritt vorwärts und kam an einen Fruchtbaum, **Trichoscypha** *(andółgm)*. Sofort kletterte er hinauf und aß und aß, bis er nicht mehr konnte. Dann baute er sich schnell Körbe aus Sarcophrynium-Stengelstreifen *(ndenán)* und füllte die Körbe bis an den Rand mit der erfrischenden Speise und packte

sich auf, soviel er eben tragen konnte, sogar Zweige mit Früchten nahm er in die Hand und kam so beladen wieder bei Mode an. Aber nun war Modes Geduld zu Ende, er nahm einen Prügel, verhaute Ekute jämmerlich und sagte: ‚So, morgen gehst du nun nochmals!' Da ging Ekute wieder und kam ziemlich weit, bis er an eine Plantenfarm gelangte. Natürlich hatte er nichts anderes zu tun, als die bereits reifen Planten abzuschlagen, zehn große Fruchttrauben lagen in einer Reihe vor ihm. Die nahm er auf den Rücken, ging zu Mode zurück und sagte: ‚Das Essen, nach dem du mich ausgeschickt hast, es ist hier!' Da rief Mode entrüstet: ‚O, nicht auf Essen schickte ich dich aus, sondern um unseren Vater zu suchen, wir haben hier ja kein Feuer und nichts! Was sollen wir mit dem Essen so anfangen? Sahst du denn den Vater nicht?' Ekute antwortete: ‚Nein, aber morgen werde ich wieder gehen! Vielleicht sehe ich ihn dann!' Am nächsten Morgen brach also Ekute zum dritten Male auf, und Mode sagte ihm noch einmal: ‚Sieh, lieber Bruder, wir sind nun schon acht Tage in so jämmerlicher Lage und heute ist der neunte! Nun mußt du auch rasch zugehen, dich nicht aufhalten und unterwegs nichts anderes treiben.' Ekute versprach auch alles und ging. Er war schon eine tüchtige Strecke gegangen, als ihn ein Baum mit noch viel prächtigeren Früchten als die Trichoscypha vom vorigen Tage ins Auge fiel; es war **Trichoscypha** spec, eine andere Art. Da sagte Ekute: ‚Ja, ihr seid die Richtigen!' Schon ist er oben und pflückt und ißt. Andere Früchte packt er sich auf den Rücken und geht weiter. Da kam er an ein zweites größeres Flüßchen, worin viele, viele Welse schwammen. Sofort sperrte er das Wasser durch ein Wehr ab und scheuchte die Fische in Körbe, die er darin angebracht hatte. Das machte ihm großes Vergnügen, und er fing so eine ganze Menge Fische, aber immer mehr wollte er haben, bis er schließlich merkte, daß die Sonne schon längst gesunken war und die Nacht hereinbrach. Da meinte er: ‚O, was soll ich so in der Nacht noch weitergehen, ich werde umkehren, morgen ist ja auch noch ein Tag!' So nahm er Früchte und Fische und kehrte nach Hause zurück. ‚Bist du geradeaus gegangen, um den Vater zu finden?' fragte ihn Mode. Darauf Ekute: ‚Mein Bruder, so schöne Trichoscypha-Früchte habe ich unterwegs gefunden, man konnte doch unmöglich vorübergehen, und dann im Wasser! Diese Unmenge Fische! Wenn da einige Weiber zum Fischen gehen würden, ich glaube, sie könnten zehn Körbe voll fangen!' Mode aber sagte: ‚Wirklich, es nimmt mich nicht wunder, daß dich dein Vater Ekute genannt hat *(akół* = dumm), dreimal sandte ich dich aus, und immer bist du zurückgekommen ohne unseren Vater! Bleib hier, morgen werde ich selbst gehen.' Am frühen Morgen schon stand Mode auf und sagte zu seinen drei Brüdern: ‚Ihr bleibt hier zu Hause und wartet auf mich!' Dann nahm er selbst Messer und Speer und schritt eilig

voran. Am ersten Wasser trank er nur und ging sofort weiter, am zweiten Wasser nahm er Fischkörbe und fing vier Welse, die er auf ein Tau reihte. Dann ging er weiter. Nach langem Wandern kam er an eine Zuckerrohrfarm, wo er ein Stück Rohr abschlug und aß, dann kam er an Maisfarmen vorbei und nahm sich zwei Maiskolben mit. Nicht viel weiter, da hörte Mode auch schon menschliche Stimmen, und gleich darauf tat sich ihm ein großes, großes Dorf auf, wo er zu seiner Freude im Versammlungshause seinen Vater fand. Nsambe rief erstaunt aus: ‚Wie kommst du denn hierher?' Da erwiderte Mode: ‚Ja, ich habe alle meine Brüder der Reihe nach zu dir ausgeschickt, aber keiner ist hier gewesen. Alle waren zu dumm, und Oaa, Ngi und Schok sind überhaupt nicht wiedergekommen!' Hierauf lobte ihn sein Vater und sprach: ‚Ich merke, daß du der beste meiner Söhne bist, und ich sehe dich groß [1]), weil du meinen Platz gefunden hast!' Da nahm er dem Sohne den Mais ab und gab ihn den Leuten in seinem Dorfe, daß sie ihn für Mode auf dem Feuer rösteten. Der sagte: ‚Sieh, welch ein schönes Essen! Mein Vater, wir zu Hause haben gar nichts, kein Feuer, nichts, gib uns doch Feuer!' Nsambe sagte: ‚Ich werde dir alles geben und dir zeigen, wie du tun sollst.' Da nahm er zuerst das Feuer und gab es Mode, dann rief er ihn in das Haus, wo er seine Vorräte aufbewahrte. Hier nahm er zwei Korbteller, tat Ngon in den einen und Erdnüsse in den anderen."

Und so gibt Nsambe dem Mode alle Nutzpflanzen: Plante, Banane, Kassave, Pfeffer usw. und belehrt ihn über deren Anpflanzung, ferner zeigt Nsambe, wie man die Früchte des Waldes, insbesondere die **Irvingia**, genießt, „Wenn sie auch zuerst verdorben sind, weil ihr sie nicht kanntet, so wisse jetzt, daß du die Schale aufbrechen und den Kern essen mußt." Des weiteren gibt er Mode alle Handwerkszeuge, unterweist ihn in den Handwerken, im Spiel und Ringkampf. Vom Schwert sagt Nsambe: „So ein Schwert, wie ich dir gebe, mußt du dir schmieden, und wenn du zu dem Mädchen gehst, das du liebst, und einer beschimpft dich, so schlage ihn damit. Und wenn ein anderer Mann dir dein Mädchen stiehlt, um es selbst zu heiraten, so folge ihm und töte ihn, es macht nichts, denn du bist im Recht. Das Schwert (d. h. der Streit und Kampf) wird ewig dauern."

Aber nicht alle Gaben Nsambes waren dem Menschen angenehm und nützlich, es gab darunter auch solche von recht zweifelhaftem Wert, Sachen, die man lieber nicht schenken sollte. Von solchen Danaergeschenken war die Laus noch gar nicht einmal das schlimmste. — „Diese Sorte wird nicht alle werden," bemerkte Nsambe ebenso treffend wie humorvoll dabei. Aber was soll man dazu sagen, wenn er Lepra und Framboesie und alle anderen Krankheiten seinem Sohne mitgibt und Unfruchtbarkeit für die Weiber?!

Am Schlusse sagt Nsambe: „Und nun geh! Ngi aber und Oaa und Schok, wenn du sie siehst, kannst du töten, denn sie sind nicht mehr deine Brüder,

[1]) Das heißt: ich sehe, daß du ein großer Mann bist.

sondern fortan vogelfrei. Nkûi, Ekute und Ngomwenio — für die paß du auf, denn wenn sie auch verrückt und keine ordentlichen Männer sind, so sind sie doch Menschen, und du mußt dein Geschlecht in ihnen achten und sie nicht töten. Aber ich rechne sie nicht zu den Meinen; du und sie, ihr seid verschiedener Art; du aber mußt dich vermehren und Kinder zeugen, die von gleichem Verstande sind wie du!"

Ist diese Sage auch voll von vielen feinen Zügen und Gedanken, so stört doch der eine Punkt: Wie kommt Nsambe dazu, seine Kinder ohne Grund zu verlassen und nachher aus Dank für die Anhänglichkeit Modes, die freilich aus der Not heraus geboren ist, ihn mit Krankheiten und Elend zu beladen. Anstatt diese Sachen ruhig hinzunehmen, hätte doch Mode seinem Vater das geflügelte Wort entgegenschleudern können:

y oa bo ma tıl e ŝbe„ avŷn avá, enûm evá
(Fragepart). du machst mich Fleisch d. Zibethkatze, Fett hier, Geruch hier.

Machst du mich wie das Fleisch der Zibethkatze, das zugleich schön fett ist und dabei häßlich riecht?

Die einzige begreifliche Erklärung scheint mir nur die zu sein, daß diese unangenehmen Dinge als Strafe für Zuwiderhandlungen gegen Nsambes Gebot ausgeteilt sind. Die erste Zuwiderhandlung gegen das Gebot Nsambes war die erste Sünde. Von der Sünde und der Strafe für sie wird der nächste Teil handeln.

2. Trennung von Gott durch die Sünde.

Die aufgeführten Sagen sprechen bei der Zeugung oder Schöpfung des Menschen nur vom Manne, nicht von der Frau. Über deren Erschaffung gibt es verschiedene Lesarten. Wie bereits mitgeteilt ist, macht sich nach der von Trilles mitgeteilten Sage der Mensch selbst auf Nsambes Anraten eine Frau — ein recht bequemes Verfahren! Äußerst naiv ist auch die Darstellung — wie ich sie hörte —, daß der Mensch einfach seine Brüder ausschickt, ähnlich wie sie auch Feuer und Essen und alle anderen Dinge bringen sollten, um eine Frau, diesen wichtigsten „Gegenstand", von Nsambe zu „holen". Natürlich geht es auch hier nicht ohne Schwierigkeiten und Unfälle ab. Die Erzählung lautet:

„. . . Darauf begab es sich, daß Nsambe fortzog und Ajenne (von *a jèn* = sehen) [1]) seine Sachen übergab. Später schickte Ajenne dem Nsambe die Brüder nach, damit sie ihm eine Frau holten, die Nsambe zu machen oder dazulassen vergessen hatte. Zuerst ging Awûe-Sama *(a vûe* = lachen, also: der immer lachte), dem gab Nsambe in einer Rindenschachtel *(nsôk)* ein Mädchen mit der Weisung, die Schachtel unterwegs nicht zu öffnen. Awûe hörte indessen nicht, machte auf dem Rückweg die Schachtel auf, und das Mädchen entwischte

[1]) Gemeint ist damit nur der Mensch im allgemeinen, weil er „sehend", d. h. in übertragenem Sinne „verständig" ist (Homo sapiens!).

und lief zu Nsambe zurück. Ebenso machten es die anderen beiden Brüder, die Ajenne dann schickte. Als vierter kam Aböbe *(a böbe* = zusehen). Dem gab Nsambe gleich vier Schachteln auf einmal; in eine tat er ein männliches Schaf, dazu ein weibliches und sagte: ‚Diese haben weder Mutter, noch Brüder, noch Schwestern; sie müssen sich bloß begatten, dann werden sie mehr gebären.' So nahm er auch noch den Hund, 'das Huhn, alle Säugetiere und Vögel und alles Getier — von jedem ein männliches und ein weibliches Stück — und tat sie in die drei Schachteln [1]), in die letzte aber steckte er das Mädchen und sagte: ‚Dieses Mädchen dürft ihr nicht heiraten, sondern an einen anderen Mann geben und gegen Geld eintauschen, für das ihr euch ein fremdes Mädchen kauft [2]).' So ging Aböbe mit den Schachteln zu Ajenne zurück; der tat, wie ihm Nsambe befohlen, und tauschte das Mädchen gegen ein anderes um."

Genaueres über die Art der Schöpfung des Weibes gibt uns wieder Largeau in der Encyclopédie Pahouine [3]). Der Gedanke, der hier entwickelt wird, erinnert stark ans Alte Testament.

„Le père (Maböge) lui (Nsambe) demanda: — Te plaît-il de rester là? Il répondit: — Oui; mais je suis toujours seul. Le Père lui dit: — Attends que le jour soit levé. Puis, le jour étant venu, le Père l'appela et lui demanda: — Que préfères-tu? un homme ou une femme? Il répondit: — Ce qu'il te plaira de me donner. Le Père lui commanda: — Couche-toi. Il lui mit le sommeil dans les yeux; il lui arracha le gros orteil; il le tira, il l'arracha. Ensuite il le réveilla: — Enfant! enfant! enfant! trois fois. L'enfant s'etant éveillé, il lui demanda: — Qu'as-tu vu? Il répondit: — Père, je n'ai rien vu. Le Père lui dit: — Viens ici. Il prit une marmite en terre, prit l'orteil et le mit dedans; il ajouta de l'eau, et dit: — Viens voir. Le fils étant venu voir, regarda dans la marmite et y aperçut son gros orteil qui gisait dans l'eau. Il se mit à pleurer, disant: Père, je me meurs! Le père le rassura, disant: — Sois sans crainte! c'est moi, qui t'ai créé; considère que tout est en moi. Puis il lui dit: — Va au jardin; quand tu reviendras, tu trouveras ici ton frère. Puis, le fils étant allé au jardin, trouva que les arbres avaient fructifié. Après quoi étant retourné

---

[1]) Dies erinnert an die Erzählung von der Arche Noahs.

[2]) Woher diese fremde Frau kommt, ist nicht gesagt. Es ist einfach so, als ob es sich nicht um eine „Genesis" handelte, sondern um ein beliebiges Märchen aus Urväters Zeiten, wo es noch viele „andere" Länder gab, die man nicht kannte, und wo man sich gar nicht zu fragen brauchte, woher diese fremden Menschen kämen und wie sie hießen. Ebenso ist es auch in der Bibel (1. Buch Mose 4, Vers 17): „Und Kain erkannte sein Weib".

[3]) V. Largeau, Encyclop. Pahouine, Paris 1901, S. 215 ff.; Maböge entspricht hier Essamnyamaböge und Nsambe dem Mode-Sama.

chez le Père, il lui dit: — Père, les arbres ont fructifié. Il ajouta: Père, je désire aller demeurer là-bas. Le père répondit: — C'est très bien; je le désire également. Le Père lui dit ensuite: — Ouvre cette maison-là, tu y trouveras soit le bien soit le mal, selon ton jugement. Il observa, disant: — Père, comme je m'en allais par le chemin, j'ai vu mon gros orteil qui était à mon pied. Le père commanda: — Maintenant, ouvre la porte. Ayant ouvert la porte, il aperçut une femme et courut s'embrasser avec elle."

Wir haben hier also eine ähnliche Darstellung wie die biblische von der Erschaffung der Frau aus der Rippe des Mannes — die übrigens nach einer im Archiv für Religionswissenschaft ausgesprochenen Meinung versinnbildlichen soll, daß in der Entwicklung der Lebewesen einer Stufe geschlechtlicher Differenzierung eine ungeschlechtliche Periode vorausgegangen ist, nur mit dem äußerlichen Unterschiede, daß die große Zehe an Stelle der Rippe getreten ist.

Eine kurze Zeit lebten nun Mode und seine Frau glücklich zusammen. Sie „lebten", d. h. sie hatten einen Körper, ein Wesen des Körpers und außerdem noch eine Seele, denn ohne eine solche wären sie keine Menschen. Sie waren also gleich Gott, hatten alles, was sie brauchten, von ihm, infolgedessen keinen Wunsch und waren in völliger Übereinstimmung mit ihm. Beide hatten eine Seele, aber eine Seele ohne Inhalt. Nun tritt der große Riß zwischen Gott und den Menschen ein. Der Mensch handelt gegen das Gebot Gottes, er verkehrt — verführt von der Schlange, die Gott geschickt hatte — mit der Frau, und seine Seele bekommt dadurch eine Eigenart, einen Willen, der sich eben gegen Gott und dessen Gebote richtet, er bekommt ein Wesen. Ich nenne also Seelenwesen des Menschen den gegen Gott gerichteten Willen, der Gottes Gebote nicht befolgt, also Sünde tut. Als Strafe für die Sünde setzt nun Nsambe den Tod. Und diese ungeheure Strafe bringt den Menschen dazu, sich zu entschuldigen und zu sagen: Ich habe nicht die Sünde begangen, für die Gott mich straft, sondern da alles in der Welt von Gott ist, so hat er meiner Seele auch das Wesen, den bösen Willen gegeben, denn er hat die Schlange geschickt, die mich zu der Tat verführt hat. Die Schlange aber ist selbst ein Teil Gottes, denn er hat sie geboren wie alles andere. Auch in der übrigen von Gott geschaffenen Natur sehe ich jetzt tatsächlich Gutes und Böses (Tag und Nacht, Leben und Sterben) [1]). Was Gott uns also als *nsöm*

[1]) Bei den Andamanesen ist nach einer Sage die Nacht und später der Wechsel von Tag und Nacht eine Folge der Sünde des Menschen. P. W. Schmidt sagt darüber in „Die Stellung der Pygmäenvölker in der Entwicklungsgeschichte des Menschen" S. 202: „Nach dieser (d. h. der Mythe, die der Forscher E. H. Man mitteilt, Anmerk. des Verfassers) habe zuerst nur

(Sünde) angerechnet hat, nennen wir Wille Gottes. Wenn wir also Sünde tun, so tun wir den Willen Gottes.

Diese zur Entschuldigung zurechtgemachte Auffassung hält im täglichen Leben nicht stand, denn der Pangwe fühlt sehr wohl, daß Geschlechtsverkehr, heimlicher Mord (= Zauberei) u. a. Sünde gegen Gott ist. Aber da, wo der Mensch ihm in feierlichem Gottesdienst (Kult) gegenübertritt, ihm, von dem die Strafe in Gestalt des Todes gekommen ist und immer wieder kommt, da betont er immer von neuem seine Unschuld und stellt sich als Opfer des Willens Gottes, nicht als Opfer der eigenen Sünde hin.

Das Wort *nsöm* der Pangwe bedeutet im gewöhnlichen Leben „Sünde", d. h. Ungehorsam gegen Gott, in den Kulten Gehorsam gegen Gott.

Die Sagen von der ersten Sünde weichen voneinander ab, die von mir gefundene, die mir die ursprünglichste (ursprünglicher noch als die sonst recht ähnliche Lesart der Bibel) zu sein scheint, ist folgende:

Die Geschichte ist mir von einem Mann aus der Familie Essangbuak erzählt worden; er will sie von seinem Vater haben, der sie wieder von seinem Großvater überliefert bekommen hat. Sie lautet: „Ekoko-Akok (das ist Pilzerde) lebte und gebar Kada (Taschenkrebs), Kada lebte und gebar Mandschib (Wasser), Mandschib lebte und gebar Nko (Hügel), Nko lebte und gebar Nschum-Ngo-Bewine (Name unerklärlich). Dieser lebte und gebar Essamnyamaböge (Gott).

---

beständig die Sonne geschienen. Wegen der Freveltat zweier Frauen ließ Puluga (das ist Gott, Anm. des Verf.) eine Zeitlang die Sonne aufhören zu scheinen, so daß beständig Dunkelheit herrschte. Kolwot, der damalige Häuptling der Menschen, stellte sich so, als mache das für die Menschen gar nichts aus und bringe ihnen keinerlei Schaden, er erfand damals Gesang und Tanz, um sich in der Dunkelheit zu belustigen. Puluga meinte, daß seine Absicht, die Menschen durch den Schaden der Finsternis zu strafen, nicht erfüllt werde; er ließ nun abwechselnd Sonne scheinen und Finsternis herrschen und erschuf später für die letztere auch den Mond", und weiter unten: „E. H. Man fügt seiner Erzählung der oben angeführten ersten Mythe die Bemerkung bei, daß die Andamanesen durch dieselbe die Tatsache erklären, daß das Wort für eine gewisse Raupenart und Nacht das gleiche sei; die Frauen, zu deren Bestrafung Puluga die Nacht schickte, hatten nämlich eine solche Raupe rücksichtslos behandelt." Es ist mir wahrscheinlich, daß unter der „Freveltat" der Frauen, die „eine Raupe rücksichtslos behandelten" (!), der Geschlechtsverkehr zu verstehen ist, denn aus dem Wortspiel zwischen Raupe und Nacht geht schon hervor, daß jene nur als Bild gewählt ist, mit dem man die Freveltat umschreibt. Vielleicht soll es heißen: Die Frauen haben sich mit einer Raupe (d. h. dem männlichen Gliede) abgegeben, also geschlechtlich verkehrt. Die Raupe „gewisser Art" — gewiß eine fußlose Käferlarve oder etwas Ähnliches — entspräche dann der Schlange in den Sagen anderer Völker (vgl. S. 32).

Esamnyamaböge aber hatte vier Söhne, den Mode Sama (Mensch), den Ngi Sama (Gorilla), den Oaa Sama (Schimpanse) und Otöng Sama (Schlange). Eines Tages zog er mit Ngi, Oaa und Otöng und allen seinen Sachen fort und ließ Mode Sama mit einer Frau zurück. Beim Fortgang sagte er zu Mode: ‚Du bleibst hier, ich gehe nicht weit fort und komme wieder. Inzwischen gehab dich wohl, vor allem darfst du aber die eine Frucht nicht essen, die *ebǫ̂n* heißt' (Wortspiel zwischen *ebǫ̂n* = Frucht von **Mimusops djave** (Lan.) Engl. und *ebǫ̂n* = weibliches Organ). Dann zog Sama mit den anderen Söhnen ein ganzes Stück weiter; an seinem neuen Aufenthaltsorte erinnerte er sich, daß er Mode nichts dagelassen hatte, er sagte also Ngi: ‚Nimm diese Feldfrüchte, Mais, Maniok, Erdnüsse und alles andere und vor allem das Feuer und gib es Mode.' Da nahm Ngi die Sachen und ging. Als er in den Busch kam und die Früchte des Kardamoms (Aframomum) sah, legte er die Sachen auf die Erde und begann die Früchte aufzuessen. Schließlich verlosch nun das Feuer und Ngi sagte zu sich: ‚O, was soll ich nun noch nach Mode gehen, ich habe ja längst Essen hier im Busch.' Darauf ist er nicht wiedergekommen. Als Ngi so ausblieb, sagte Sama zu Oaa: ‚Nimm du die Sachen und das Feuer und bringe sie Mode!' Oaa nahm die Sachen auch und versprach alles auszuführen; als er aber an die Stellen im Urwald kam, wo es Früchte gab, machte er es ebenso wie Ngi und kam auch nicht wieder. Da sandte Sama Otöng, die Schlange. Anstatt aber Mode die Sachen zu geben, wie Sama ihr befohlen hatte, sagte sie zu Mode: ‚Du mußt die Frucht essen, die *ebǫ̂n* heißt.' Dann ging die Schlange zurück zu Sama und sagte ihm: ‚Ich habe nun Mode gesagt, er soll die Frucht *ebǫ̂n* essen!' Da rief Sama: ‚Wie, was habe ich dir gesagt?' und stieß die Schlange von sich (*a šogelo* = fortstoßen, wegschubsen), die in den Busch ging, dann machte er sich auf und ging in das Dorf zu Mode. Kaum sahen Mode und das Weib ihn kommen, als sie wegliefen und sich hinter Bananen versteckten, der Mann hier, die Frau auf jener Seite. Da rief Sama: ‚Warum fliehest du vor mir, hast du die Frucht *ebǫ̂n* gegessen, die ich dir verboten hatte?' Da sagte Mode aus dem Versteck heraus: ‚Ich fürchte mich aber zu kommen.' Sama erwiderte: ‚Warum hast du mein Gebot übertreten, ich sagte dir doch, ich selbst würde euch die Zeit geben!' Zum Weibe sagte er aber: ‚Und dir sage ich, du wirst Menschen gebären, aber die eine Hälfte wird sterben und die andere wird leben' (das ist Geburt und Tod). Und zum Mode sagte er: ‚Dir sage ich, damit du allein es wissen sollst, ich bleibe nicht hier, und wenn du mich vergeblich suchst, so wisse: ich bin über das Meer gegangen, und auch dort suche mich nicht, denn ich bin auf zum Himmel gegangen! Deine Kinder aber werden dies nicht wissen.' (Sinn unklar, vielleicht ist gemeint, daß sie Gott nicht kennen werden; *a jèm* = wissen, kennen, lieben.)

Darauf ging Sama fort. Das Weib aber gebar Kinder, und die ersten waren die Esseng (Sippe der Ntum).

Und daher, sagte der Wiedererzähler, ein Esseng, haben wir Schwarzen die Scham!" [1])

Eine zweite Form, die deshalb besonders wichtig ist, weil hier die Vereinigung beider Geschlechter unverblümt beschrieben und dabei ein *nsöm*, eine Sünde, genannt wird, bringt Largeau in der Fortsetzung der Schöpfungsgeschichte:

... Comme la femme créée était dans le village, le serpent boa (mvom) survint et dit à cette femme: — Que fais-tu là! Elle répondit: — J'habite avec mon mari. — Vous restez dans la brousse, pourquoi? la femme répondit: — Le Père de mon mari a ordonné que nous restions ici. — En restant ici que faites-vous? — Je ne sais pas. Il ajouta: — C'est pour cela que tu es malheureuse: tu ne sais pas qu'il vous défend cela, parce que en allant avec lui, dans le même lieu, alors vous connaîtriez toutes choses comme lui.

Le mari, de retour, demande à la femme ce qu'elle avait? Elle répondit: — C'est bon. La nuit étant venue, la femme dit: — Couchons dans le même lit. Se mari répondit: — C'est bien! Au lever du jour l'homme lui demanda: — Tous les jours nous étions ici sans que tu dises: — Couchons dans le même lit; comment se fait-il qu'aujourd'hui cependant nous couchons?

Ensuite, le jour s'étant levé, Nzame se rendit auprès de Mebeghe l'Ordonnateur de toutes choses, et lui dit: — Père, chaque jour ma femme me dit: — Couchons dans le même lit! Le Père lui demanda: — Que réponds-tu? Il dit: je réponds: — C'est bien; c'est pour cela que je suis venu pour te demander ce que je dois faire. Le Père lui dit: — Toute chose, bonne ou mauvaise, est en toi. Le Père continua ainsi: — Si c'est la femme que tu écoutes, alors tu seras éternellement malheureux; si, au contraire, c'est moi que tu écoutes, alors tu seras éternellement heureux. Il lui dit enfin: — Va! as-tu compris? Le

---

[1]) Es ist hier nicht der Platz, eine Ansicht zurückzuweisen, welche verschiedentlich aufgetaucht ist, nämlich die, daß diese Sage erst neueren Ursprungs, etwa von Missionaren eingeführt wäre. Mercker hat in seiner trefflichen und auch für Ethnologen von Fach vorbildlichen Arbeit über die Masai bereits das hohe Alter dieser Sagen bei den Eingeborenen Afrikas nachgewiesen, einen Nachweis, dessen wissenschaftliche Berechtigung ihm auch — wie mir Prof. Dr. K. Th. Preuss liebenswürdigerweise mitteilte — auf dem Religionskongreß in London einstimmig bestätigt ist. Die meisten vergessen immer, daß diese Sagen nicht der ureigene Ausdruck mosaischer Weisheit ist, sondern aus uralten Anschauungen der Menschheit überhaupt hervorgegangen sind.

[2]) V. Largeau, Encyclopédie Pahouine, Paris 1901, S. 174 ff.

fils supplia: — Père, dis-moi une bonne parole. Il répondit: — Je n'ai pas autre chose à te dire.

Ensuite, s'étant acheminé vers l'entrée du village, le fils rencontra la femme qui lui demanda: — Tu viens de chez ton père? Il répondit: — Oui. — Quelles nouvelles de chez ton père? Le mari répondit: — Bonnes.

La nuit étant venue, la femme dit: — Allons nous coucher! Le mari répondit: — C'est bien! Et ils vont se coucher dans le même lit. La femme dit alors: — Approche-toi! Le mari s'approche. Elle dit encore à son mari: — Couchons-nous! Le mari répond: — Mais je vois que nous sommes allongés. La femme réplique: — Ce n'est pas comme ça. Le mari dit: — Alors je ne sais pas. La femme insistant dit: — Lève le pied! Le mari ayant alors levé le pied ... ils commirent le péché ... (ane be nga bo e nsem).

Le jour venu, Nzame ayant regardé son pied, vit que le gros orteil manquait, en outre, tous les animaux étaient partis [1]). Il demanda à la femme: — Où est mon orteil! La femme répondit: — Je ne sais pas. Nzame s'étant rendu chez le Père lui dit: — Père, tous les animaux sont partis; regarde mon pied: le gros orteil manque; je ne sais pas ce qu'il est devenu. Le Père lui répondit: — Je t'avais dit: — C'est moi ou la femme que l'homme écoutera; tu as écouté la femme, alors va! sois errant! ...

Ensuite Nzame s'en retourna vers l'entrée du village. La femme lui demanda: — D'où viens-tu? Comme ils étaient dans leur village, un lézard vint, disant: — Tous les hommes mourront, ils seront malades; et il passa. Deux jours après, un caméléon arriva disant (à son tour): — Tous les hommes seront sauvés; ils seront heureux. Restez ici, travaillez jusqu'à ce que vous retourniez vers Mebeghe (Dieu). Je pars, soyez heureux! ...

Die Geschichte von der Eidechse als Überbringerin der schlechten Nachricht und dem Chamäleon als verspätetem Boten, der die gute Nachricht hatte, hörte ich in noch klarerer Form von einem Manne aus Mabō (Essákunan):

„Nsambe hatte zuerst dem Chamäleon den Auftrag gegeben, den Menschen (d. h. den schwarzen) mitzuteilen, es solle niemand sterben, und es solle keine Armut geben und kein Unglück. Das Chamäleon ging auch mit seiner Botschaft zu den Menschen, aber da es — wie jedermann weiß — so langsam geht, kam die Eidechse ihm zuvor, und diese sagte den Schwarzen: ‚Es sollen Menschen sterben zur Hälfte und zur Hälfte geboren werden (Geburt und Tod) und Armut und Reichtum soll es geben' usw., überhaupt brachte sie nur schlechte Nachrichten. Als dann schließlich das Chamäleon mit seiner guten Botschaft kam, war es schon zu spät. Daher sterben die Schwarzen soviel."

Merkwürdigerweise kann man noch feststellen, daß es sich nicht um irgendeine beliebige Eidechse handelt, sondern um eine besondere Art, die **Lygosoma**

---

[1]) welche zuerst in dem Garten des Vaters friedlich mit den Menschen zusammen hausten.

fernandi Burt. *(ebŏmaküküi)*. Freilich heißt die Eidechse im allgemeinen *nśū,ᵉ III, onsŏ* Bulu, und dieser Name kommt auch in den Erzählungen vor, aber *nśū,ᵉ* ist der Sammelname für Lygosoma-Arten überhaupt und ist dann für die in der Nähe menschlicher Stätten häufige **Lygosoma reichenowi** Ptrs. besonders üblich geworden. Daß aber **L. fernandi**, die bedeutend seltener ist, mit dieser Sage in Verbindung gebracht wird, scheint die wahnsinnige Abscheu, welche die Neger von allen Reptilien nur gegen diese Eidechse und das Chamäleon hegen, zu bestätigen; der Name *ebŏmaküküi* bedeutet das Ding, das mich schaudern, vor Angst erbeben macht *(a bo[ń]* = machen, *ma* = mich, *kukui*, Stamm: *ku* = ein unangenehmes, plötzliches Zusammenschrecken, *a kú-t* = plötzlich erzittern) [1]). Angeblich bedeutet es großes Unglück, z. B. einen Todesfall in der Familie, wenn man eine solche Eidechse (**L. fernandi**) sieht. Auch vor dem Chamäleon fürchten sich die Pangwe sehr. Beide sollen — wie Europäer vielfach berichten — von den Pangwe für giftig gehalten werden [2]). In Wirklichkeit wissen die Pangwe sehr gut, daß diese Tiere an sich dem menschlichen Organismus durchaus ungefährlich sind, sie bringen sie nur mythologisch mit dem Tode in Verbindung.

Es ist kein Zufall, daß diese beiden Tiere heute noch jedem Pangwe die unsympathischsten, ekelerregendsten sind, das Chamäleon, weil es zu langsam ging und so schuld an dem Unglück der Menschen ist, die Eidechse, weil sie die Hiobspost brachte [3]).

Der Hauptpunkt in allen Erzählungen ist der, daß der Geschlechtsverkehr durch den „Willen", den Trieb des Menschen herbeigeführt und deshalb eine Sünde ist, und daß der Tod dafür als Strafe verkündet wird.

Wie wird nun der „Wille", der Trieb des Menschen in diesen Sagen dargestellt?

Alle abstrakten Ausdrücke sind ursprünglich von konkreten abgeleitet und werden durch entsprechende bekannte Bilder ausgedrückt: so stellte der Ägypter die Kraft, Energie, unter dem Bilde der Hand bzw. des Armes dar, denn von

---

[1]) Übrigens steckt auch im Namen *nśūe, onsŏ* der berühmte Stamm *so* für Tod.

[2]) Der Pangwe hat — wie viele Neger — keinen Ausdruck für giftig; man sagt für etwas, was mit dem Tode zusammenhängt, also auch giftige Tiere, *awū* (= Sterben).

[3]) Im einzelnen Falle halten viele, besonders abergläubische Leute einen Haarvogel für den Verkünder des Todes, nämlich die **Alethe castanea** Cass. *(akalat,-ŋiofüo)*. Die merkwürdigen Flötentöne seines Doppelrufes (vgl. Bd. I S. 29) werden gedeutet als *ŋiofüo*, entstanden aus *(a) ŋū ſŋi* = wegsterben. Die Alethe entspricht so unserem Steinkauz (Komm mit! Komm mit!).

ihnen geht ja ursprünglich die sichtbare Kraft aus [1]); so stellt der Pangwe den Verstand dar unter dem Bilde des Schädels, denn im Kopfe ist der Sitz der Klugheit und geistigen Eigenschaften [2]). Und so stellte er die Sünde durch den Körperteil dar, mit dem die erste Sünde — der Geschlechtsverkehr — begangen war, nämlich durch das männliche Glied, das wieder durch eine Schlange ersetzt wurde, denn den richtigen Namen zu nennen verbot die Scham, die bei den Pangwe so ausgeprägt ist (vgl. Abschn. XVIII).

Die Schlange ist einfach die Personifizierung des Penis, was auch aus dem Pangwerätsel erhellt:

ebǔ nkǔk, e mine ʃɛ,r

Verdorbener niedergefallener Baumstamm,

wohinein kriecht (sich schiebt) eine Nashornschlange [3]).

Auflösung: Scheide, in die das männliche Glied eingeführt wird.

Daß Glied und Schlange, Phalluskult und Schlangenkult, ursprünglich dasselbe ist, werden wir nicht nur im Späteren von den Pangwe hören, man hat auch bei anderen Völkern Reste ähnlicher Anschauungen zu verzeichnen [4]).

Wie man darauf kam, zeigt die Ähnlichkeit der Form und Beschaffenheit, namentlich sieht die von der Vorhaut entblößte Glans einem Schlangenkopf auffallend ähnlich, und ich glaube sogar, daß man hier absichtlich durch die Beschneidung einen Dauerzustand geschaffen hat. Doch darauf komme ich bei der Beschneidung zurück.

Gerade wie der männliche Geschlechtsteil durch die Schlange versinnlicht wird, so der weibliche durch die Frucht. Das ist auch ganz natürlich, denn

---

[1]) Daher die Darstellung des Ka der Ägypter durch zwei ausgestreckte Arme. Adolf Erman, Die Ägyptische Religion, Berlin 1909, S. 102; daher die Hand in Nordafrika als Schutzmittel gegen Zauberwesen.

[2]) Vgl. den Schädelkult sowie die Schädel bei den Kultfiguren.

[3]) **Bitis nasicornis** Shaw.

[4]) Um nur zwei Beispiele von ganz verschiedenen Völkern zu bringen: Filippo Salvadore Gilij, Saggio die Storia americana II S. 132 und 133 erzählt von den Stämmen des Orinokogebietes: „Sie glauben auch, daß den Schlangen der jeweilige Zustand der Frau bekannt sei, und um diese, wie sie glauben, von verliebten Angriffen dieser Reptile fernzuhalten, erlauben sie ihnen nicht, zur Zeit der Menstruation im Walde umherzustreifen. Wie ich schon erwähnte, starb zu meiner Zeit die Frau eines gewissen Caucamo an Gelbsucht. Als ich ihm mein Bedauern darüber aussprach, gab er mir zur Antwort: ‚Sie hat ihr Schicksal verdient, da sie, ohne darauf zu achten, daß sie die Reinigung hatte, in den Wald gehen und sich den Liebeswerbungen der Schlangen aussetzen wollte.'" Dr. H. v. Weisocki sagt von den Zigeunern, daß unfruchtbare Frauen nach der Volksmeinung fruchtbar werden, wenn sie auf eine Schlange treten.

erstens schmeckt die Frucht gut, und häufig wird der Gebrauch des Weibes in der gewöhnlichen Rede von den Pangwe mit dem Essen, hauptsächlich mit einer Frucht, verglichen; daher die Redensart:

eli e tele dśi, edso e ne bebumd
Baum, er steht dieser, er ist es, der hat Früchte.
(dieser Baum da, ihm gehören die Früchte),

die als Warnung gebraucht wird, wenn einer des andern Weiber begehrt.

Vergleiche hier ferner das Rätsel:

Aufgabe: *eli da dśi ma a ja*
Baum, ihn essen sie mir hinter dem Hause.
Ein Baum auf dem Platz hinter dem Hause,
dessen Früchte essen sie mir fort.

Lösung: *ngōn ea śok a banduman*
Mädchen es tuschelt mit Liebhabern.
Ein Mädchen, das mit anderen Liebhabern tuschelt.

Zweitens ist aber die Frucht das Zeichen der Fruchtbarkeit, der Vermehrung. Der Zusammenhang zwischen Frucht und Weib wird auch in der von Largeau gebrachten Sage von der Erschaffung des Weibes bestätigt, wo dabei die Bäume plötzlich anfangen, Früchte anzusetzen. Drittens sind auch äußerliche Ähnlichkeiten zwischen manchen durch eine Rinne geteilten Früchten und dem weiblichen Geschlechtsteil vorhanden [1]). In derjenigen Lesart von dem Sündenfall, die der biblischen ähnelt, ist sogar ein Wortspiel zwischen der Frucht von **Mimusops djave** (Lan.) Engl. *(ebōn)* und dem weiblichen Geschlechtsteil *(ebōn)* gebraucht, der deutlich das hohe Alter dieser Sage anzeigt.

---

[1]) Vgl. hier: Anthropophyteia, Jahrbücher für folkloristische Erhebungen und Forschungen zur Entwicklunggeschichte der geschlechtlichen Moral. Herausgegeben von Dr. Friedrich S. Krauß. IX. Bd., 1912, S. 62 Anm. 1: An Vergleichen der vulva (cunnus) mit allerlei Gegenständen ist unsere Vulgärsprache so reich, daß ein vollständiges Verzeichnis derselben hier nicht gegeben werden kann. Jedoch sei bemerkt, daß — wie bei den Tierbezeichnungen dafür die Vogelnamen — hier Benennungen nach gewissen Früchten vorherrschen, so z. B. bes. Pflaume, das (nach Luedecke in Anthrop. V S. 8) auch kundensprachl. sein soll (vgl. dafür ferner Anthrop. II S. 23 u. VI S. 5; mundartl. dafür Plume, Prum, Prune u. ähnl. [s. Anthrop. IV S. 5 u. 13], auch holländ. de pruin [Anthrop. V S. 3]; sachl. übereinstimmend auch im Slovenischen: češbja od. čespa (Anthrop. V S. 10)), weiter auch Feige (Anthrop. IV S. 5: Fig in Solingen), oder Pfirsich (Anthrop. IV S. 5: Peach ebds.); nach Luedecke in Anthrop. V S. 8; Schote (in Berlin = Erbse) u. a. m.

Es ist also:

Trieb des Mannes = Schlange = männliches Glied,
Trieb des Weibes = Frucht = Scheide.

Setzen wir statt der Bilder die dürren Worte, nennen wir das Kind mit dem richtigen Namen, so ist der Sinn der ganzen Sündenfallsgeschichte sofort klar: Die Schlange, die von Gott geschickt ist, hat den Mann dazu verführt, die Frucht zu genießen, das will sagen: Der Naturtrieb des Mannes (männliches Glied), den Gott geschaffen hat, hat den Menschen dazu geführt, mit der Frau geschlechtlich zu verkehren. Die ältere und allein verständliche Lesart ist also die, welche die Pangwesage bringt: „Da sagte sie (die Schlange = Naturtrieb = Glied) zu Mode: ‚Du mußt die Frucht essen, die *ebon* (Frucht von **Mimusops djave** = weiblicher Geschlechtstrieb) heißt.' Fälschlich und unverständlich aber ist die Form, wie sie unsere Bibel enthält, in der die Schlange dem W e i b e und nicht dem Manne den bösen Rat gibt (1. Buch Mose 3, Vers 1): Und die Schlange war listiger, denn alle Tiere auf dem Felde, die Gott der Herr gemacht hatte, und sprach zum Weibe: „Ja, sollte denn Gott gesagt haben: Jhr sollt nicht essen von allerlei Bäumen im Garten" usw.

Derartige Abweichungen, die anfänglich vielleicht unbedeutend, in der Folge sinnentstellend werden, treten bei dem hohen Alter der Schöpfungssagen leicht und überall auf; wie könnte das auch anders sein, wo diese Erzählungen nicht auf dem Papier stehen, sondern von Jahrhundert zu Jahrhundert und über Jahrtausende hinaus von Mund zu Mund, vom Vater auf den Sohn übertragen werden. Hier lag aber außerdem ein tatsächlicher Grund zu dieser „kleinen" Entstellung vor, nämlich der, daß der Mann nach diesem Unglück — wie wir auch späterhin noch sehen werden — nur auf Entschuldigungen und Beschönigungen seiner Schuld sann. Er hat daher auch bei dieser Erzählung die Gelegenheit ergriffen, die Hauptschuld dem Weibe aufzuladen und sie als Verführerin zu bezeichnen. Ein gewisses Recht glaubte er dazu zu haben, weil — wenn das Weib nicht gewesen wäre — die ganze Sache nicht geschehen wäre, weil die Frau diejenige ist, die durch ihre Anwesenheit und vielleicht auch durch ihr nicht ganz ablehnendes Verhalten das Unglück heraufbeschworen hat.

— — — Das war die erste Sünde, für die als Strafe der Tod verkündigt wurde. Gott (Nsambe) aber hat sich mit der Zeit zürnend zurückgezogen und ist nach Meinung der Pangwe weiteren Einwirkungen von der Erde aus unzugänglich. Der letzte ohnmächtige Ausdruck des Wunsches, das verlorene Paradies zu erreichen, lag in dem unbestimmten, unbewußten Drang nach Westen. Aber der führte die Pangwe zu nichts. Sie haben ihren Vater nicht wiedergefunden.

3. Das Seelenwesen.

Wir haben im vorigen Teil die Entstehung des Seelenwesens, das der Pangwe sich — wie oben gesagt — als eine selbständige Persönlichkeit denkt, die der Seele innewohnt, als Folge des bösen Willens, der Sünde der ersten Menschen kennen gelernt. Die erste Sünde, der Geschlechtsverkehr, ist heute indes nicht mehr die einzige, Nsambes Vorschriften — die Naturgesetze — erstrecken sich auf alle Beziehungen des Menschen innerhalb der Familie mit ihrer Erweiterung zur Sippe, zum „Nächsten". Einen fremden Mann niederzuschießen, ist keine Sünde, einen Nächsten zu schädigen, ist Sünde, eine kleinere, wenn es sich um Diebstahl, eine große, wenn es sich um Zauberei (= heimlicher Mord) handelt. Der offene Mord kommt hier nicht in Betracht, weil er ein Verbrechen [1]), keine eigentliche Sünde ist und deshalb auch nicht mit übersinnlichen Mitteln bekämpft wird, wie Zauberei und Diebstahl (solange letzterer nicht erwiesen und gestanden ist).

Das Wesen der Seele (Wille) im lebenden Menschen hat nur seinen Sitz, seinen Ursprung im Kopf bzw. im Gehirn, denn dort hält sich die geistige Kraft, die Willenskraft, auf. In einen Schädel müssen deshalb die Medizinen getan werden, die den Kultfiguren ihre Kraft, ihre Persönlichkeit geben.

Das Wesen der Seele ist nur ein geistiger Begriff, der Pangwe kann es sich aber, ebenso wie die Seele selbst, nur körperlich und mit den Sinnen wahrnehmbar vorstellen, und zwar verkörpert es sich ihm im Schatten des Menschen und in seinem Spiegelbild im Wasser. Das Pangwewort für beide ist *nsisim I*, von *si*, = Erde, weil beide an den Boden (Erde oder Wasserfläche) gebunden sind. Stirbt der Mensch und verschwindet damit der mit ihm verbundene Schatten, so entsteht für den Pangwe die Frage: Wo ist der Schatten geblieben?, um so mehr als er sich in Gedanken mit dem Verstorbenen beschäftigt. Die Antwort kommt ihm aus allem Schattenhaften, was ihn umgibt; im plötzlichen Windstoß, im Rauschen der Blätter, in unerklärlichen Geräuschen und Lauten [2]), im Rascheln, vor allem aber des Nachts in vorüberhuschenden Tieren oder Menschen, kurz allüberall glaubt der Mensch, durch den Todesfall aus dem Gleichgewicht des Alltags gebracht, die Seele dessen zu sehen, der noch eben in menschlicher Gestalt bei ihm weilte. Unbestimmt und flüchtig, wirklich überall und nirgends, ein unbeschreibliches und unheimliches Etwas, irrt

---

[1]) Verbrechen, Vergehen = *a-bö-k* von *a bo-ŋ* = machen, tun (vgl. Abschn. XVI Rechtsanschauungen).

[2]) Besonders Flötentöne deutet der Pangwe in dieser Weise, ob sie nun von Tieren oder vom Menschen ausgehen. Flöten bringt einen Tausendfuß ins Haus. Vgl. Flöten bzw. Pfeifen bei der Eisenverhüttung I S. 231.

das Seelenwesen nach dem Tode des Menschen umher. Vielleicht rühren auch die Schatten der Bäume und Tiere, die ja keine Seelen und Seelenwesen haben, von den vielen menschlichen Seelen her, wer kann das wissen?

Ruhiger und kühler geworden, sah dann der Mensch, daß das, was ihn erschreckt hatte, keine unbestimmten Schatten, sondern wirkliche Dinge waren, z. B. schattengleich vorübereilende Katzen oder sonstige Nachttiere. So sah man denn in diesen die Verkörperung des Seelenwesens. *n-sɨ-ṅ l* = die Ginsterkatze und *n-sɨ-ṅa* = die Katze ist von dem gleichen Stamm wie *n-si-si-m* = Schatten, Spiegelbild abzuleiten, nämlich von *si* = Erde. Vergleiche auch die I. Vorsilbenklasse: Nachttiere. Und zweitens fragte man sich, wenn das Spiegelbild des Menschen im Wasser der Abklatsch der eigenen Seele ist, was muß werden, wenn Körper und Körperwesen stirbt? — Ein Wassertier, ein Fisch, ein Frosch, überhaupt irgendein Amphibium oder ein im Wasser lebendes Reptil. Daher die besondere Stellung dieser Tiere [1]).

Das auf diese Weise von den Pangwe als Schatten- und Spiegelbild verkörperte Seelenwesen ist nicht bei allen Menschen gleich; wohl ist es bei allen böse und so steht der Mensch im Gegensatz zur Natur und zu Gott selbst, aber der Grad dieses Bösen ist nicht bei allen derselbe. Die Erfahrung lehrt, daß es Menschen gibt, die freier von Sünde, von bösem Willen sind als andere. Das heißt in unserem Zusammenhange: ihr Seelenwesen ist nicht so ausgeprägt und sie kommen dem von allem Wesen freien Zustand Nsambes näher, soweit es eben für Menschen möglich ist („Wir sind allzumal Sünder"); zu solchen auserlesenen Menschen gehören Kinder, Geistesgestörte [2]), aber auch noch einzelne Ausnahmenaturen, die bestrebt sind, sich von aller Sünde freizuhalten, und zum mindesten die in der Pflege der Kulte bestehende vermeiden. Solche Menschen heißen *bebɪrn*, von *ebɪrn*, ein Wort, das sich nicht erklären, begrifflich vielleicht am ehesten mit „gute Menschen" wiedergeben läßt. Kinder sind in den ersten Jahren eo ipso „*bebɪrn*", bleiben es aber nicht lange, da sie schon vor der Reife, im Alter von 6—8 Jahren, durch ihre Eltern den Kulten zugeführt werden. Da jedem Pangwe schon als Kind ein ziemlich weitgehendes Selbstbestimmungsrecht zugebilligt wird, so kann dieser oder jener — wenn er will — sich von all dem Teufelskram (die Neger selbst gebrauchen diesen Ausdruck) fernhalten. Von solchen Überzeugungs-*bebɪrn*, die recht dünn gesät sind, hatte ich einen als Diener und Arbeiter in meiner Umgebung, und er ist jedenfalls der Zuverlässigste und — auch menschlich — Beste gewesen, den ich

[1]) Von Fischen führt die Hälfte, nämlich 19, Vorsilben aus den Klassen I und III (Menschenklasse), die andere Hälfte aus den Klassen II und IV—VIII.

[2]) Daher die Ehrfurcht vor den Geistesgestörten, daher die Darstellung der Geistesgestörtheit in den Kulten.

je gehabt habe. Aber damit will ich keinen allgemeingültigen Grundsatz für die Beurteilung aller *bebrn* gegeben haben; der Hinweis möge genügen.

Alle übrigen Menschen heißen *bongụ̈s*, von *ngụ̈s III* — *ngụ̈s* könnte also mit, „Böser, Sünder" übersetzt werden (im Gegensatz zu „Guter") —, sie tun bewußt Unrecht, vor allem begehen sie die gewaltige Sündentat der Kulte, d. h. feierlicher Feste mit geheimnisvollem Zeremoniell, in denen sie sich mit dem großen Lebens- und Todesproblem auseinandersetzen, und die sie direkt als *nsồm*, d. h. gleichsam die Sünde par excellence, bezeichnen. Daher sind weiterhin die *bongụ̈s* nicht bloß allgemein Sünder, sondern im besonderen die Eingeweihten der Kulte, und die *bebrn* nicht bloß im allgemeinen Gute, sondern die den Kulten Fernstehenden, die Uneingeweihten.

Ich führe hier ein Sprichwort als Beweis dafür an, daß man sehr wohl berechtigt ist, die *bebrn* als die „Guten" in einen Gegensatz zu den *bongụ̈s*, den „Bösen", zu bringen, wenn nicht die Bezeichnung *nsồm* = Sünde für alle Kulte, die ja nur von *bongụ̈s* getrieben werden, die Berechtigung schon erwiese. Dies Sprichwort heißt:

ge o ne dʒaňan elɪk e la bebrn, e la bongụ̈s
(Fragewort) du bist Raphia- Wand, zu sehen (die) Guten, zu sehen (die) Bösen.
Bist du die Raphiawand, die zwischen Gut und Böse steht?

Das Sprichwort wendet sich gegen jemanden, der z. B. seinen Bruder mit einer Frau zu verkuppeln sucht. Die Anwendung gerade auf diesen Fall gibt uns einen guten Einblick in die Bedeutung des Verhältnisses zwischen Eingeweihten und Uneingeweihten.

Die Kulte sind eine praktische Folge der Auffassung des Pangwe von dem Seelenwesen als dem bösen Willen des Menschen, der zur Sünde führt und als Strafe für sie den Tod empfängt. In den Kulten will er beweisen, daß alles Wesen sich in der Natur, in erster Linie in Mond und Sonne, verkörpert, er will, mit einem Worte, das Böse und Gute in der Natur darstellen — wie in aller Welt reimt sich denn das mit der Tatsache, daß alles, was nicht Mensch ist, überhaupt kein Seelenwesen hat, da es ja unbeseelt ist?

Wer aufmerksam verfolgt hat, was oben über das Seelenwesen nach dem Tode und vor allem über den Zweck der Verführungsgeschichte durch die Schlange gesagt ist, und dies mit den Lehren, die im 1. Buch Mose enthalten sind, vergleicht, wird nicht in Zweifel sein, wie der scheinbare Widerspruch sich ganz natürlich löst und wer hier die Hand im Spiele hat — die Lüge. Die Lüge, die ja überhaupt die Hüterin des Bösen ist. Wie man schon das ganze Märchen von der Schlange erfunden hat, um nicht zugestehen zu müssen, daß der böse Wille des Menschen selbst die Ursache der Entzweiung mit Gott gewesen ist, so sind die Kulte nur die Fortsetzung dieser Beschönigung und eine

ins Riesengroße übersetzte Lüge, die da vortäuschen will, daß nicht der Wille des Menschen, sondern der Wille Gottes die Ursache des ganzen Unglücks ist, das über die Menschheit gekommen; man stellt das in der Natur vorhandene Böse und Gute dar, legt ihr also ein Seelenwesen unter. Die Kulte sind also eine bewußte große Lüge, da der Mensch weiß, daß die Natur kein Seelenwesen hat. Die Natur aber ist göttlich, denn Gottes Geist hat sie geschaffen oder geboren, und so hat man weiterhin Gott ein Seelenwesen, einen bösen Willen untergeschoben, freilich nur auf dem Umwege über seine Werke, die Natur; damit aber ist gesagt: es ist Gottes Wille gewesen, daß das Böse geschaffen wurde, dasselbe, was beim ersten Sündenfall als Entschuldigung gelten sollte: Gott hat die Schlange geschickt. Und da liegt auch gerade der Kern der Sache: der Person Gottes, Nsambes selbst, hat man nicht gewagt, ein Wesen der Seele beizumessen, wie es die Durchführung dieses Gedankens verlangt hätte. Nsambe ist und bleibt rein, ohne Wesen, wie es später die Seelen der Menschen auch werden. Außerdem ist er schon soweit von den Pangwe entfernt, daß er kaum mehr im Leben für sie in Betracht kommt. An die Stelle, die er einnehmen sollte, treten die in den Kulten dargestellten einzelnen Naturkräfte. Diese Naturkräfte sind anfänglich nur als Versinnbildlichung des eben ausgeführten Gedankens gedacht, daß die Natur und ihr Wesen von Grund aus böse ist. Sie werden deshalb auch nur mimisch, nicht plastisch vorgeführt, dem entspricht es, daß sie nur ganz allein das Böse berücksichtigen. (Der Mond als Anfang aller Kultformen.) Später, je mehr die reine Gestalt Gottes in den Hintergrund tritt, desto mehr werden die Naturkräfte körperlich dargestellt, desto mehr Leben gewinnen sie („Götze"), desto mehr ersetzen und verdrängen sie die Gestalt Gottes, aber desto sichtlicher und besser werden sie auch, denn sie vertreten ja die höchste, sittliche Kraft, Gott (körperhafte Darstellung des reinen Feuers).

Wenn ich eine allgemeine Bemerkung über die Entwicklung der Religion hier anfügen darf, so scheint mir die nächste Stufe religiöser Entwicklung die, daß Gott ganz von den zu Personen gewordenen Naturkräften verdrängt wird (Götter), wenn auch die Erinnerung an ihn in einer Verpersönlichung einer höchsten Naturkraft (meist der Sonne) nie ganz schwindet, und daß jetzt alle Götter mit einem Seelenwesen ausgerüstet werden [1]), dafür aber ihr ursprüngliches geistiges Gepräge (gut und böse) mehr oder weniger verlieren und nun alle als die sittliche Macht für das jedem einzelnen eigentümliche Einflußgebiet gelten (z. B. in Afrika früher ägyptische Religion). Diese Götterwelt kann immer mehr erweitert und dadurch verflacht werden, so daß jeder Beruf seinen eigenen Gott hat, bis zuletzt das ganze Göttergebäude, trotz des äußerlich oft durchaus hohen sittlichen Wertes, vor den Schlägen, die ihm das Christentum

[1]) Daher die öfter wiederkehrende vierfache Darstellung eines Gottes in den ägyptischen Gemälden (vgl. Erman, Die Ägyptische Religion).

versetzt, zusammenstürzt. Und mit dem Christentum in seinem unverfälschten Grundgedanken kehren wir wieder zu der einfachsten und doch höchsten Religion zurück, die allen denen Vergebung verspricht, die ihre eigene Schuld zugeben, ohne sie durch die Lüge zu beschönigen und zu heiligen.

4. Kulte.

Aus der Entwicklungsgeschichte der religiösen Anschauungen, von denen wir hier sprechen, ergibt sich von selbst, daß der Mann die Lüge der Kulte erfunden hat und dauernd vertritt, weil es s e i n e Schuld gewesen ist, die er auf die Natur abwälzen will. Zur Natur rechnet er nun auch das Weib und ihr schiebt er einen Teil der Schuld zu, denn wäre sie nicht dagewesen, so wäre ja die Geschlechtssünde nicht begangen worden. Als Inbegriff des sündhaften Geschlechtsverkehrs ist sie also von den Kulten ausgeschlossen. In einem gewissen Widerspruch damit gelten sie anderseits für besser als die Männer, da sie eben Uneingeweihte, *bebrn*, sind, die zwar als Menschen Sünde tun, ein Seelenwesen haben, aber doch ein besseres, gottähnlicheres als jene, weil sie eben die Lüge, die in den Kulten liegt, nicht mitmachen.

Freilich haben die Weiber ihre eigenen Kulte, aber ich halte sie für einen späteren Abklatsch der männlichen; sie zeigen ebenfalls das Gute und Böse in der Natur und benutzen das ebenfalls als Entschuldigung für ihre Sünde, d. h. den Geschlechtsverkehr, aber die Person wechselt in dem Drama, insofern sich die Frau als den unschuldigen Teil hinstellt, den der „böse" Mann verführt hat.

Dieser religiöse Gegensatz wird später absichtlich benutzt, um gegen das andere Geschlecht ausgespielt zu werden, und man vertieft damit die sozialen Gegensätze, andererseits entstehen letztere innerhalb desselben Geschlechts dadurch, daß die Kulte an Zahl zunehmen und die ursprünglich einheitliche Gemeinschaft der Sippen in viele kleinere Kreise teilen, zwischen denen sich von selbst ein Widerstreit der Interessen herausbildet (Anfänge der Geheimbünde).

Aber soweit ist es bei den Pangwe noch nicht gekommen, es begnügt sich jedes Geschlecht, die Eigenart des andern gehörig zu geißeln und hat damit eine gerade beim Neger äußerst gefährliche Waffe in der Hand. Irgendwelche Vorteile werden aber nicht damit gewonnen, mit Ausnahme dessen, daß die Kulte vom anderen Geschlecht geachtet oder (die Weiberkulte) doch wenigstens geduldet werden.

Von ursprünglich sozialen Zwecken kann man in den Kulten nicht sprechen, vielmehr sind sie aus religiösen Grundanschauungen herausgewachsen.

Als alleinigen Zweck haben die Kulte den Einspruch gegen den Tod (bzw. das Unglück), der eine Strafe für die Sünde ist, und sie werden ursprünglich

(Kult des Bösen) etwa jedes Jahr einmal in der Trockenzeit *(esèb)* gefeiert, sobald eine größere Anzahl von Knaben, die eingeführt werden sollen, vorhanden ist, zuweilen aber auch aus Anlaß eines Todesfalles in der Familie, namentlich bei den Südpangwe, die dabei lebens- oder überlebensgroße Figuren aus Lehm als Verkörperung der Naturkräfte formen und durch Zutat von Medizinen zu selbständig handelnden Personen machen, die sie gegen den Tod durch Zauberei schützen und weiterhin die Vergehen gegen die Sitte rächen und „ihren Kindern", wie der Pangwe sagt, auf deren Bitten sogar Glück und Reichtum verleihen, kurz das Gute schaffen und dem Bösen wehren [1]).

Die Zahl der jedesmaligen Neulinge ist deshalb im Norden größer als im Süden, wo es manchmal nur zwei bis drei sind. Diese Neulinge heißen *bomɛ́ŋ*, von *mɛ́ŋ III* = Neuling, Einzuweihender, und sind meist halbwüchsige Jungen im Alter von 6—10 Jahren; erhebliche Schwankungen kommen aber vor. Es wurde oben gesagt, daß einzelne auf ihren oder ihres Vaters Wunsch *bebɨ́n*, Uneingeweihte, bleiben können, die meisten aber müssen oder pflegen wenigstens e i n e n Kult mitzumachen, sie können auch an mehreren teilnehmen, aber es bedarf dann für jeden einer neuen Einweihung, die freilich wesentlich einfacher ist, und einer Zahlung an den Kultleiter.

Wenn man etwa selbst die „Einweihungsfeier" als Neuling mitzumachen hätte, würde man eher von einer Trauer- und Prüfungszeit sprechen als von einer Feier, wenn auch die Schwere der Lehrzeit sehr verschieden ist. Die Lehre, welche die Neulinge aus den Mysterien ziehen sollen, in die sie eingeweiht werden, ist ja auch keine angenehme und erfreuliche zu nennen. Es ist die Eröffnung der Tatsache, daß die Menschen aus Strafe für ihre Sünde elend und unglücklich sind, und daß sie alle sterben müssen. Zu diesem Zwecke zeigt man den Neulingen Schmerz und Krankheit an ihrem eigenen Leibe (durch Quälereien aller Art) und schließlich müssen sie sogar — im Schauspiel — sterben, denn Nsambe hat den Tod verhängt.

Daher auch der zweite, neben *nsɔ̀m* gebräuchliche Name für alle Kulte: *avɔ́*, von *a vɔ* = sterben, *avɔ* = Tod; von *avɔ́* abgeleitet *wɔ́* = Kultmarke.

---

[1]) Ähnliche Figuren sollen nach M. M e r k e r „die Völker, mit denen die Masai in der Urheimat in Berührung gekommen sind", nach der Überlieferung der Masai gemacht haben. Merker sagt darüber in seinem Werk „Die Masai", Berlin 1904, S. 292, von den 'Lariñai folgendes: „Sie machten sich Gottesbilder aus Lehm, welche die Gestalt einer Giraffe hatten, deren Kopf aber keine Hörner trug", und S. 296: „Die El Merro machten sich aus Erde Figuren in Form von Menschen und Ziegen und bezeichneten sie als Götter," und S. 298 von den El gamassia: „Gott nannten sie Embá und machten sich Standbilder von ihm, welche eine Giraffe darstellten, deren Kopf keine Hörner trug."

Daher auch der Name *m-rú-n* selbst, der also bedeutet: moriturus, der Todgeweihte (siehe unten).

Zweitens werden sie mit der Bedeutung des Geschlechtsverkehrs, als der Sünde, wegen deren Nsambe den Tod verhängt hat, bekannt gemacht, und dieser Geschlechtsverkehr wird ebenfalls im Schauspiel dargestellt, um zu zeigen, daß er ursprünglich von Nsambe kommt. So erwirkt man für sich die Erlaubnis für den Geschlechtsverkehr und die Befreiung vom Tod.

Das Ganze ist also ein riesengroßes Schauspiel, das großartiger ist, als es je auf einer Bühne Europas dargestellt wurde, ein gewaltiges menschliches Ankämpfen gegen Naturgesetze, ein einziger erschütternder Protest gegen das Unglück der Menschheit, ganz naiv gesagt, gegen die Vertreibung aus dem Paradiese. Ich glaube, daß rein soziale Einrichtungen, wie wir sie in den Geheimbünden finden, keinen Vergleich aushalten mit diesem gewaltigen Ringen der Menschheit mit der Natur.

Allen Kulten — mit Ausnahme des Sso der Jaunde — gemeinsam ist die feierliche Herrichtung eines Kultplatzes, der sich dicht am Dorfe befindet, so daß die Frauen sich in ihre Hütten einschließen müssen, um die Feierlichkeiten — durch die Türritzen zu sehen; mitunter werden die Frauen freilich auch in andere Dörfer fortkomplimentiert; ferner meist eine auf dem heiligen Platz errichtete Kultfigur, die stets durch eine Wand aus Raphiablättern oder durch einen zerschlissenen jungen Palmenwedel oder durch beides gegen neugierige Blicke abgeschlossen wird; endlich ein Kultleiter, das ist ein Medizinmann *(ngengan)*, der sich speziell auf die Kultmedizinen versteht und das ganze Zeremoniell angibt und allein angeben darf, ganz wie bei uns der Gottesdienst den dazu Berufenen vorbehalten bleibt. Der Medizinmann bekommt für seine Leistungen ein Honorar, das er klugerweise oft mitten in der Feierlichkeit einfordert.

An bestimmten Tagen vor Beginn der Festlichkeiten werden Trommelsignale abgegeben, die für jeden Kult verschieden sind, ebenso müssen am Tage der Vorfeier die Einwohner der umliegenden Dörfer durch ein eigenes Signal benachrichtigt werden.

Den Kultfeiern geht eine Vorbereitungszeit voraus, in welcher die nötigen Medizinen usw. herbeigeschafft werden, und die meist 3 oder $3 \times 3 = 9$, seltener 7 Tage beträgt. Drei ist auch die Zahl der eigentlichen Festtage, zu denen noch eine Vorfeier am Vorabend des Festes hinzukommt.

Alle Neulinge werden vor oder während der Feier mit einer bei allen Kulten gleichen Narbentätowierung, die aus drei Strichen im Nacken besteht, versehen und durch dieses Zeichen als nunmehr Eingeweihte des betreffenden Kultes gekennzeichnet. Diese Marke heißt *wá III* oder *epíg'ap*, auch *mbá(k) mesôm*; die Ausdrücke werden meist in der Mehrzahl gebraucht, da es ja mehrere Marken sind.

Wir hatten im vorigen Teil gesehen, daß man in den Kulten hervorheben will, wie die Natur an sich schon Böses enthält und nicht erst durch den Menschen bekommen hat. Man verkannte nicht, daß ihr daneben das Gute nicht fehlt, man stellte auch dieses in den Kulten dar, aber erst später. Das erste war, entsprechend der Absicht, die eigene Schlechtigkeit zu entschuldigen, die Darstellung des Bösen. Wo liegt nun dieses Böse in der Natur? Einfach in der natürlichen Gegensätzlichkeit der Nacht zum Tag (Mond zur Sonne), der Erde (Wasser) zum Himmel (Feuer). Erde und Wasser stehen mit dem *nsisim* (d. h. Schatten- und Spiegelbild) in Verbindung (vgl. S. 36) und sind deshalb böse, anderseits ist das blitzgeborene Feuer das Sinnbild der Reinheit und des Guten.

Wir hätten also der Zeitfolge nach: Mond, Sonne, Wasser, Feuer. Diese Grundstoffe werden nun in den Hauptkulten verehrt. Es gibt also einen Mondkult (Kult des Bösen), einen Sonnenkult (Kult des Guten), einen Wasserkult (Kult des Bösen) und einen Feuerkult (Kult des Guten). Die übrigen Kulte sind nur Absplitterungen dieser vier, insonderheit des Mondkultes. Den vier Hauptvertretern der göttlichen Macht sind bestimmte Tiere und Pflanzen zugeordnet, die mit ihnen im Kult verehrt werden.

Die Verbreitung der Kultformen wird noch einmal eine sehr wichtige Handhabe zum Vergleich von afrikanischen Kulturen abgeben, so z. B. hat bei den Pangwe der Kult des Bösen je weiter nach Norden, nach dem Sudan zu, desto uneingeschränktere Verbreitung, und je weiter nach Süden zu, desto mehr gewinnt der Kult des Guten an Bedeutung, genauer gesagt die Mwele und der Hauptteil der Jaunde, die, wie wir wissen, von Norden (Sudan) her beeinflußt sind, kennen nur den Mondkult, während die südlichen Jaunde und teilweise auch die Bene den Kult der Sonne als Anhängsel des Mondkultes und den Feuerkult von den südlichen Pangwe übernommen haben. Nach Süden nimmt überhaupt die Zahl der Kulte zu, die Ntum kennen schon sechs. Bei den Fang hat schließlich das Kultwesen eine Blüte erreicht wie nirgends sonst, wir haben dort nicht weniger als acht bis zehn verschiedene Kultformen.

Nomina sunt odiosa, ganz besonders in heiligen Dingen. Wie man von geschlechtlichen Dingen nur in „Bildern" spricht, so erst recht von heiligen. Aber auch sonst werden wir diesen Zug, alles durch Bilder zu umschreiben, nur nichts mit richtigem Namen zu nennen, überall bei den Pangwe wiedertreffen. So hat man die Grundstoffe: Mond, Sonne, Wasser, Feuer durch eine Umschreibung oder den Namen eines Tieres ersetzt, das in irgendeiner Beziehung zu ihnen steht. Für den Mondkult ist es ein Hörnertier, eine Schopfantilope *(sʊ)*, für das Wasser der Elefant *(ɑ́ɔ́k)*, für das Feuer der Gorilla *(ŋɔ́ɔ)*, aus welchen Gründen, mag später erläutert sein. Wir haben also im Kern des Pangwegebietes folgende Kulte:

böse:	gute:
Sso, Kult des Mondes unter dem Bild der Antilope *sö̃*	Ndong-mba, Kult der Sonne
Bokung, ebenso als Bild die Eule	Elong, ebenso als Bild der Hahn
Schok, Kult des Wassers unter dem Bilde des Elefanten	Ngi, Kult des Feuers unter dem Bilde des Gorillas.

Sso und Ndong-mba werden mitunter, Bokung und Elong meistens zusammengefaßt, um besonders in letzteren den Sieg des Guten über das Schlechte darzustellen. Außer diesen bei weitem häufigsten Kulten haben die Ntum noch den Enikö, worin ein Hund eine Rolle spielen soll, die Fang außerdem noch den Kult Schib (Sumpfbock) und Odschöe (Zwergböckchen), letzterer wahrscheinlich eine Abzweigung des Mondkultes.

Es wurde bereits darauf aufmerksam gemacht, daß *so* der alte Stamm für den Mond ist, was daraus hervorgeht, daß die Flecke auf dem Monde mir einmal als *dši[s]-sö-esämbe*, d. h. Auge des Mondes Gottes, bezeichnet wurden, daß der Ring um den Mond *sön-ekum* und bei den verwandten Bassá der Mond selbst noch *šo,n* heißt; *sö* ist weiter der Stamm für alles Böse, für den Tod, d. h. nur in religiöser Beziehung, soweit an die Anschauungen, die wir dargelegt haben, dabei gedacht wird. *sö* ist schließlich die Bezeichnung für das Hörnertier, das mit dem Monde in erster Linie in Beziehung gebracht wird. Daß die Hörner des wachsenden oder schwindenden Mondes auf die Hörnertiere übertragen wurden, ist ganz erklärlich und eine bekannte Tatsache. Eduard Hahn glaubt, und wohl mit Recht, daß die hörnertragenden Haustiere zuerst aus religiösen Gründen besondere Beachtung gefunden haben und dann gezüchtet sind. Aber das ist hier nicht das wichtigste, sondern daß für den Glauben der Pangwe diejenigen Hörnertiere, welche Nachttiere sind, ganz besonders in Betracht kommen, und da ist neben der Ziege, die, wie sie bei anderen Bantu dem Namen nach mit dem Mond in Verbindung gebracht wird [1]), so bei den Pangwe zu den Kulten des Bösen in Beziehung steht, noch ein Tier zu nennen, das den Namen *sö̃* unverändert trägt. Es ist die Schwarzrücken-Schopfantilope **Cephalophus dorsalis** Gray (im Pangwegebiet subspec. **castaneus** Thomas). Dieses Tier, die einzige rein nächtlich lebende Antilope des tropischen Westafrika, hat überall die Maske für den Mondkult abgeben müssen, dessen Name daher bei den Pangwe *sö̃* ist. Die von *so* abgeleiteten Stämme, die für unsere Betrachtungen wichtig sind, seien hier angeführt: *sö̃* = **Cephalophus dorsalis**, *n-sβ-m* = Sünde, *n-sβ-m* = Ichneumon, Wieselmanguste **Herpestes melanurus** Gray, weil das Ichneumon Hühnereier frißt, wo das

[1]) Baluba, nach C. G. Büttner, n'buishe (mu-ishi = Mond), Suaheli: mbuizi (mu-ezi = Mond).

Huhn ein der Sonne heiliges Tier ist, ebenso die eierfressenden Weibchen des **Sciurus eborivorus** Du Chaillu. *n-sʊ̄-ń* = Grab, *n-sʊ̄-k* = Rindenschachtel, Sarg (vgl. I S. 206 ff.). *n-sʊ̄-ń* = die Spitze, die, wie I S. 202 angeführt, böse ist, *n-sʊ̄-t* = unbeschnittener Penis (ist spitz), *e-sʊ̄,-ń* = **Pennisetum purpureum** Schum. et Thorn., weil dies Gras zum Ssokult benutzt wird, daher auch pleonastisch *e-sʊ̄,-ń sʊ̄*. *o-sʊ̄-n* = die Scham, *e-sʊ̄-n* = **Cremastogaster striatula** Em., Ameise, *sʊ̄,-e*, *sʊ̄,-e* = **Ponera sorghi** Rog., Ameise, *odźige-sʊ̄* = **Sima tessmanni** Stitz, Ameise (vgl. S. 46 usw., Ameise im Kult). *o-n-sʊ̄* Bu. = Eidechse.

Vielleicht älter als *so*, jedenfalls verwandt mit ihm, ist der Stamm *si*. Auch die mit *si* verbundene Gedankenreihe muß hier erwähnt werden, da sie mit dem Mondkult eng zusammenhängt. Bei vielen Bantu ist darum auch *si* der Mond, z. B. (nach C. G. Büttner) im Baluba: *mu-ishi*, im Suaheli: *mu-ezi*, im Herero: *omu-ese*.

Hierbei denke man auch an den Namen Isis (Ese der Ägypter) — ursprünglich war ja diese Göttin die Verpersönlichung der nächtlichen Erde, dann zugleich des Mondes — ferner an Sin, den Mondgott im alten Babylon.

Hier ist *si* die nächtliche Erde, das „Schattenreich" und schließlich die Erde überhaupt:

si, = Erde, *n-sí-sɨ-m* = Schatten, Spiegelbild, weil an den Boden gebunden, *n-sɨ-ń* = Ginsterkatze, **Genetta subryana** Pucheran. *e-sɨ-ńd* = Hauskatze, *sɨ-b* = grünes Eichhörnchen, **Sciurus subviridescens** Leconte, weil es auf der Erde lebt, *sɨ-ge* = Treiberameisen, **Anomma nigricans** Stuck, weil sie auf der Erde kriechen, *i-sɨ* = Haare, vielleicht weil sie auf einem Boden wachsen, *o-sɨ,-s* = Haare vom Nabel zur Scham, *a sɨ,-s* = erschrecken, trans., denn die Schatten schrecken, *í-sɨ,-s* = Issisleute beim Mondkult, die erschrecken sollen, *a-sɨ,-m(an)* = nachdenken, sich an etwas erinnern (Bild vom Schatten genommen), *o-sɨ,-m* = „Erinnerungskraut", **Ocimum basilicum** L.

So gilt der Mond als Hauptvertreter und als Erzeuger alles Bösen in der Natur, die Sonne als Vertreterin des Guten. Der Mond ist außerdem vor allem der Hüter des Geschlechtsverkehrs, der als „Sünde" auch heute noch nur des Nachts und möglichst heimlich ausgeübt werden darf.

I. Der Sso-Kult.

Der wichtigste und, wie mir scheint, älteste aller Kulte ist der Ssokult [1]). Er ist über das ganze Pangwegebiet verbreitet, in den Einzelheiten seines Ver-

[1]) Nach J. Büttikofer, Reisebilder aus Liberia II S. 308 heißen die an den Festen der dortigen Eingeborenen mitwirkenden weiblichen Teufel (!) „soh", die männlichen „soh-ba". Diese Angabe zeigt die weite Verbreitung des Stammes *sʊ̄* = böses Prinzip.

laufs jedoch im Norden und im Süden wesentlich verschieden. Dort, bei den Jaunde, hält er sich gleichsam in der geistigen Sphäre der ursprünglichen Idee, bei den Südpangwe nimmt er gröbere Ausdrucksmittel, wie Masken und plastische Figuren, zu Hilfe. Die beiden Arten sind daher getrennt zu behandeln [1]).

a) Sso der Jaunde.

Zu dem Fest, das meist alle Jahre einmal zu Anfang der großen Trockenzeit, also im Oktober, oft aber auch später, von einem angesehenen Häuptling veranstaltet wird, kommen die Neulinge aus weitem Umkreise zusammen. Mitunter sind es 30 und mehr, die auf ihre Einweihung warten; ihr Alter schwankt zwischen 7 und 25 Jahren. Vier Tage vor Beginn der Festlichkeiten werden alle am Nacken mit einem angelhakenähnlichen Werkzeug, „*nǒb*" (*nǒb* = Angelhaken), gemarkt; diese Marke nennt der Jaunde, ebenso wie die Neulinge selbst, *mrǒn* (J.), d. h. die Todesweihung.

Das Fest beginnt mit einem Phallustanz der Neulinge auf einem Gerüst *(ndǐǒm I)*, das aus zwei Gabelstöcken und einem darüber gelegten dicken Baumstamm [2]) besteht und so aufgestellt ist, daß dieser Stamm an ein Haus, eine Palmblätterwand oder den natürlichen Busch anstößt. Der Stamm ist oft so schwer, daß ihn angeblich mitunter an 100 Mann tragen müssen, und in Form von einem oder mehreren Elefanten, von Schweinen (beides Symbole der geschlechtlichen Unreinheit) oder einer Riesenschlange (= Penis) zugehauen, oft auch mit anderen (menschlichen) Figuren geschmückt. Er stellt einen Penis vor, der vom Hause bzw. der Wand oder dem Busch wie von einem Körper abgeht [3]).

Der Tanz selbst stellt den Geschlechtsakt dar.

Nach zwei Tagen folgt die zweite Nummer des Programms: Quälereien und Standhaftigkeitsproben der Neulinge. Jeder von ihnen bekommt einen Führer zugeteilt, natürlich einen Eingeweihten, der ihn schon in der Nacht vorher darauf vorbereitet hat, daß am nächsten Tage das große Fest vor sich gehen und er dann alle Geheimnisse sehen würde.

---

[1]) Ich bemerke, daß ich außer dem Jaunde-Sso, das mir von Jaundes beschrieben ist, alle Kultfeiern, die hier aufgeführt, von Anfang bis zu Ende selbst mitgemacht habe, einzelne, den Sso- und Ngikult, sogar zweimal.

[2]) Aus der Leguminose *atǐrlim*.

[3]) Merker sagt in „Die Masai" S. 271 Anmerkung: „Als Eigenname der Paradiesschlange wird genannt ol arassument, weil sie im Schilf = or rossua wohnte." Daraus sieht man, daß die „Paradiesschlange" eben der Penis ist, der aus dem Schamhaar herauskommt wie eine Schlange aus dem Schilf. Daher auch die eben beschriebene Anlage der Phallusstange, die bei den Südpangwe (vgl. weiter unten) als Schlange gedacht ist.

Abb. 1. Xylophon der See-Neulinge. Jaunde.

Nachdem alle Weiber und sonstigen Uneingeweihten das Dorf verlassen haben, begibt sich ein Teil der Eingeweihten in den Busch und sucht Nester von stechenden Ameisenarten, besonders der **Plagiolepis carinata** Em. *(kŏ IV)*, und Zweigstücke des Ameisenbaumes **Epitaberna myrmoecia** K. Sch. *(ngúkŏm)*, in denen die schmerzhaft stechenden **Sima spininoda** Andr. *(engúkŏm)* leben. Die Nester werden in großer Zahl (oft 200 Stück) eingesammelt, vorsichtig an langen Stangen ins Dorf getragen und im Beisein der Einzuweihenden und unter anzüglichen Bemerkungen in eine nahe beim Dorfe zu diesem Zweck gebaute niedrige Hütte, die *„esdm"*, gehängt bzw. gestellt, so daß bald darin alles von Ameisen wimmelt. Nicht genug damit, hängt man auch noch die mit gefährlichen Haaren bedeckten Schoten der **Mucuna pruriens** im Hause auf.

Ist das geschehen, so werden die Neulinge auf dem Dorfplatz aufgestellt und allerhand Quälereien und unangenehmen Zumutungen ausgesetzt. Die erste „Prüfung" besteht in der Einnahme einer ekelhaften „Medizin", die der Festveranstalter zu diesem Zwecke hergestellt hat, und die aus einem Gemisch von abscheulich schmeckenden Pflanzen und ekelerregenden Stoffen, z. B. einem Stück seines Auswurfes — „von dem, was zuletzt kommt" — zusammengesetzt ist. Öl und eine tüchtige Portion Pfeffer darf nicht fehlen. Nachdem jeder Junge ein Stück dieser Teufelsspeise zu sich genommen hat, wird er von seinem Führer ergriffen und im Galopp von Versammlungshaus zu Versammlungshaus über den Dorfplatz geschleppt mit dem Rufe: „Ihr sollt sterben!" und ähnlichen Reden. Fällt einer hin, so wird er wieder aufgerissen und mit Hallo weitergezogen. An diesem Tage hat kein Vater das Recht, irgendeinen Eingeweihten dafür verantwortlich zu machen, wenn sein Sohn ein paar Beulen

Abb. 2. Penisraupe der Sso-Neulinge, Jaunde.

abbekommt oder gar, falls er sich wehrt, verprügelt wird. Jetzt dürfen sich die Neulinge ein wenig ausruhen und dem für sie von den Frauen zurückgelassenen Essen zusprechen. Nunmehr kommt die letzte und unangenehmste Prüfung an die Reihe. Die Eingeweihten stellen sich mit Hauern und Messern beim Ameisenhause auf und empfangen die Neulinge, die zu ihnen geführt werden, mit wildem Geheul und den Rufen: „Wir töten euch!", „Nun werdet ihr sterben!" usw. Daß die armen Jungen dabei eine schreckliche Angst ausstehen, braucht kaum erst gesagt zu werden. Sind sie so genügend verängstigt, so müssen sie der Reihe nach durch das Ameisenhaus kriechen, wo sie natürlich fürchterlich zerstochen werden. Inzwischen ist eine Ziege herbeigeschafft, der man eine Medizin eingegeben hatte, damit sie keinen Ton von sich geben kann, und ihr wird durch einen Hieb mit dem Buschmesser der Kopf abgehauen, wobei es als ungünstiges Zeichen gilt, wenn das Tier noch schreit oder röchelt. Während nun die Neulinge unter Geheul durch das Ameisenhaus kriechen, laufen die Führer außen am Hause entlang und jeder von ihnen reißt sich ein Stück von der toten Ziege ab; auch die Füße müssen ausgerissen werden. Wer nicht über die nötigen Kräfte verfügt, muß sich mit einem Fetzen Fleisch begnügen oder bekommt gar nichts. Gegessen wird dies Fleisch nur von ganz alten Leuten, der Festveranstalter bekommt Kopf und Gedärme.

Offenbar soll dieser eigenartige Vorgang das lautlose Sterben des Mondes, von dem ein Stück nach dem andern vergeht, bis er ganz verschwunden ist, vorstellen. Leider bin ich nicht davon unterrichtet, ob für ihn im Jaunde die Bezeichnung *a vüi sŏ* = den Sso töten, in Gebrauch ist, wie für einen ähnlichen bei den Fang.

Die Neulinge haben nun genügend Schmerzen durchgemacht und sind auf den Tod vorbereitet. Bevor sie jedoch „sterben", können sie sich bei einer Henkersmahlzeit von ihrem Schrecken etwas erholen. Der arg verwüstete

Abb. 3. Sso-Neulinge, Jaunde.

Dorfplatz wird am anderen Morgen durch die Eingeweihten von Speiseresten Blättern usw. gereinigt, das nennt man *a bumo ekobe sö*, d. h. das Fell des Sso ausspannen, angeblich um Uneingeweihte glauben zu machen, es handele sich bei dem ganzen Fest nur um die Schopfantilope *(sö)*.

Nach dem Essen werden die Neulinge nun zum Tode abgeführt, d. h. in der Nähe ihrer Heimatdörfer in Buschhütten untergebracht, wo sie völlig nackt einen Monat lang, fern von allen Menschen, sich aufhalten müssen. Man nimmt dort aber nichts besonderes mit ihnen vor, keine Quälereien, keine Unterweisungen, man bringt ihnen reichlich zu essen, ja sie dürfen sogar im Busch herumgehen und müssen nur vermeiden, daß Weiber sie sehen. Um diese warnen zu können, führen sie eine Art Xylophon, das sie bei ihren Spaziergängen andauernd bearbeiten, und dessen Ton weithin hörbar ist. Das Instrument (Abb. 1) — *nkön e mrǖn* genannt — besteht aus einem mit Handgriff versehenen Rahmen aus Raphiamark, das mit Rindenzeug umkleidet ist. Über

Abb. 4. Sao-Neulinge, Jaunde.

den Rahmen werden die zwei Tasten [1]) gelegt, ein unterhalb befestigter halber Kürbis dient als Resonanzboden, eine daran geknüpfte Schnur hält einen Schlägel, der oft in Form eines männlichen Gliedes geschnitzt ist.

Sogar ins Dorf dürfen sie im Notfall, da die Frauen auf den bekannten Zweiklang hin die Türen schließen oder sich die Augen zuhalten; sie müssen darin vorsichtig sein, denn sonst würden sie sehr krank werden, ein Unglücksfall, der freilich durch Schlachten einer Medizinziege oder — wenn die Krankheit leichter ist — eines Huhnes behoben werden kann.

Ist der erste Monat vorüber, so tritt eine Verbesserung der Lage unserer Neulinge insofern ein, als sie schon von Weibern und Uneingeweihten gesehen werden dürfen, auch in die Dörfer zu Spiel und Tanz gehen können. Zugleich erhalten sie eine besondere, freilich dürftige Tracht, die uns ganz eigenartig anmutet. Der ganze Leib wird mit weißer Farbe (Tonerde) bestrichen, auf dem Kreuz wippt ein kleiner weißer Pferdeschwanz, ähnlich wie er von den

[1]) Aus dem Holze der **Albizzia fastigiata** (E. Mey. Oliv.) *(siehe III).*

Frauen der Nordpangwe getragen wird — nur weit zierlicher — und der Penis ist in einen Stulp (Abb. 2) gezwängt, der mit einer Feder (vielfach vom Papagei oder vom Hahn) oder etwas ähnlichem verziert ist. Abb. 3 und 4 zeigt so ein Paar dieser sonderbaren „Todeskandidaten" [1]).

Das schwanzartige Kleidungsstück *(ebal e mrǎn)* besteht nicht aus Raphiabast, wie das entsprechende Kleidungsstück der Frauen, sondern aus den schneeweißen Fasern der Plante, die in verschiedenen Bündeln durch ein dünnes, viereckiges Brett gezogen werden.

Diejenigen *bomrǎn*, welche ihren Anzug nicht selbst anfertigen können, müssen sie für eine Mark von den Älteren beziehen. Die Penisstulpe *(mſónde* J.) sind Rollen aus Blättern des Schraubenbaums, **Pandanus** *(awä'b)*, und an einem Ende mit einem Raphiamarkstück geschlossen. Die Plante ist eine Pflanze des Mondes, weil sie erstens mondförmige Früchte hat und zweitens auf ihren breiten Blättern das Mondlicht widerspiegelt; wir werden ihr später noch oft im Kult des Bösen begegnen. Der Schraubenbaum hat ebenfalls eine heilige Bedeutung, was schon aus dem Namen *a-wä'-b* = Stamm, *vä* = töten, hervorgeht, warum aber, kann ich nicht sagen. Endlich tragen die Neulinge kleine Körbchen aus Schraubenbaumgeflecht *(ebä'da)*.

Der ganze Aufzug ist in seiner Bedeutung klar: weiß ist die Farbe des Todes, denn der Mond, dessen abnehmende Phase eine Art „Sterben" ist, ist weiß, weiß sind auch die Knochen eines Toten, daher der weiße Anstrich und das weiße Hinterkleidchen. Der weiberähnliche Schurz soll die Neulinge zu Weibern stempeln, die ja für den Kult des Bösen *bebi'n*, d. h. Menschen mit guten Seelenwesen sind, und der Penisstulp soll das Geschlecht verdecken, beides also anzeigen, daß man nach dem Tode wieder geschlechtslos, d. h. rein wie vor der Sünde werden möge [2]).

Also Feste dürfen auch die „Toten" einmal mitmachen, aber dann müssen sie wieder in ihr Totenreich zurück, d. h. sie müssen in den Buschhütten schlafen. Ebenso bleiben zwei Bestimmungen bestehen: erstens dürfen die Weiber nicht sehen, wie die Neulinge essen (natürlich, denn die Toten essen nicht) und zweitens dürfen die Neulinge nicht mit Frauen Umgang haben (Tote sind geschlechtslos),

---

[1]) Diese von einem Eingeborenen aufgenommene Photographie verdankt das Museum für Völkerkunde zu Lübeck Herrn Theodor Schultz in Jaunde.

[2]) Vielleicht haben diese Stulpe Dominik dazu geführt, unter die Abbildung eines Tanzes der Jaundeneulinge in seinem Buche „Vom Atlantik zum Tschadsee" die Bezeichnung „Mannbarkeitsfest" zu setzen. Das ganze Sso hat nichts mit Mannbarkeit zu tun, die meisten Jünglinge sind längst beschnitten und mannbar, andere werden es erst später; der innere Sinn betrifft auch ganz andere Fragen als die der Mannbarkeit.

Verbote, die man selbstverständlich vorher allen denen, die es nicht wissen sollten, mitteilt. Wird gegen letzteres Verbot gehandelt, was wohl nur seltener vorkommen mag, so muß die Frau sterben, wobei der einzige Trost der ist, daß auch dieses traurige Schicksal durch eine geeignete Medizin, die in der Hauptsache wieder aus dem „Sündenbock", der Ziege, besteht, abgewendet werden kann.

Nach drei Monaten Aufenthalt in der Buschhütte zählen die Neulinge nur noch halb zu den Toten, was dadurch zum Ausdruck gebracht wird, daß nur Hände und Füße weiß getüncht werden und ein Stück Rindenzeug um die Hüften gelegt wird. In diesem Aufzuge verläßt die Gesellschaft den Busch und zieht in einer Reihe zum Dorf. Alle Verbote sind jetzt aufgehoben, außer dem einen, geschlechtlich zu verkehren, an das sich freilich niemand mehr hält. Im schlimmsten Falle, falls die Frau erkranken sollte, schlachtet man ein Huhn, und die Sache ist in Ordnung. Früher, als die europäische Kultur noch nicht so tief in Jaunde eingedrungen war, mag das möglicherweise anders gewesen sein; als meine Berichterstatter das Sso mitmachten, hatte schon die neue Zeit, namentlich der Einfluß der Mission, stark entartend auf die religiösen Einrichtungen eingewirkt.

Dieser Zustand dauert nun eine bestimmte Zeit und danach sind die Neulinge Eingeweihte *(bongüs)*; sie haben einen ganz anderen Menschen angezogen, auch äußerlich, indem sie sich mit Rotholz (Zeichen der Freude, des Lebens) einreiben und europäische Stoffe tragen, und können im nächsten Jahre schon die Jüngeren quälen.

b) Sso und Ndong-mba der Ntum.

Das Sso der Südpangwe weicht, wie schon erwähnt, von dem der Jaunde vielfach ab, vor allem unterscheidet es sich von ihm durch seine Verbindung mit dem Kult der Sonne, dem Ndong-mba[1]), und durch eine Vorfeier, *ãtã III (alũk)*, am Vorabend des ersten Festtages.

Zu allererst wird ein Gerüst für den Phallustanz errichtet — wie beim Sso der Jaunde —, dessen Stange aber nicht in Form von ganzen Figuren, sondern nur an dem einen Ende zu einem Schlangenkopf ausgeschnitzt ist und während der ganzen Dauer des Ndong-mba mit Plantenblättern verhüllt bleibt.

Am Abend des Alu versammelt sich die männliche Einwohnerschaft des Dorfes zu einem Tanz, während sich die Neulinge — es sind nur einige wenige im Alter von 5—8 Jahren —, ebenso wie die Weiber, in einem verschlossenen Hause befinden. Was draußen vor sich geht, ist die in Tanz übersetzte Nachahmung des Geschlechtsaktes. Kann man bei einigen Tänzen, z. B. dem Dschama, noch in Ungewißheit sein, woraus er entstanden sein mag, so ist man hier jedes Zweifels überhoben, ja, ich glaube den Eingeborenen nicht Unrecht

zu tun, wenn ich annehme, daß dort, wo keine Europäer zugegen sind, der Tanz recht ausgelassen werden kann und an Deutlichkeit nichts zu wünschen übrig läßt. In Bebai, wo ich die Feierlichkeiten mitmachte, ging die Sache aber nicht weiter, als daß von den eingeweihten Knaben und Jünglingen, die sich in zwei Reihen gegenüberstanden, einige mit größerem oder geringerem Geschick gegeneinander oder hintereinander tanzten, indem sie durch Bauchbewegungen den Coitus nachahmten. Hier zeigten die Neger so recht, was sie an Ausdauer leisten können; einzelne waren unermüdlich, und es wurde bis in die späte Nacht getanzt mit einem Eifer, der einer besseren Sache wert gewesen wäre.

An diesen Tanz schloß sich ein Beschimpfen der Weiber, die zum Teil mit einem besonders eintönigen Gegengesang aus dem Hause heraus antworteten. Unter den ausschließlich obszönen Schimpfnamen waren folgende:

mɣŏ, a ne ebŏ̧no, mvŏ̧; buda makə̈n̄;
Scheide, sie ist (in der) Scham, Scheide; großes Gesäß;

epfuɣīn ebọ̄n; mode ebŏn; enum e ne ebŏn;
haarloser Schamberg; große Scham; Geruch, er ist (in der) Scham;

enum e ne elə̈ṅ; madźīm e ne elə̈ṅ; abī e ne elə̈ṅ;
Geruch, er ist (im) After [1]); Wasser, es ist (im) After; Schmutz; er ist (im) After;

ośńte e ne ebŏ̧n; mbō e ne elə̈ṅ, mbōk;
Kleine Schamlippen, sie sind (in der) Scham; Scheide sie ist (im) After, Scheide;

mebé m' 'ebŏ̧n;
äußere Schamlippen der Scham;

la olə̈l ebŏ̧n; la mbọ̄m akiai;
sieh (die) inneren Schamlippen der Scham; sieh (den) Strauß Blätter [2]);

la bŭṅgo bínśia;
sieh (die) reifen Planten [2]);

la olə̈mmadźīm; la okọangŏ̧n;
sieh (das) du — schöpfst — Wasser [2]); sieh (das) du — zerreibst — Ngon [2]);

la ɣerê.
sieh Geschlechtswerkzeug.

Aber auch persönliche Eigentümlichkeiten und Schwächen wurden ans Licht gezogen — ohne daß man Namen nannte, jedoch so, daß die Dorfbewohner schon wußten, wer gemeint war.

Dabei stürmte die Gesellschaft unter höllischem Geschrei den Dorfplatz hinunter, so daß es schien, als ob die wilde Jagd losginge. Dieser Lärm war wohlberechnet, denn er verhinderte, daß die Gegenpartei die einzelnen Stimmen erkannt und sich für besonders gesalzene und treffende Ausdrücke gerächt hätte.

---

[1]) Der After ist hier ein Ekelname für die Scham.
[2]) Spottname für die weibliche Scham.

Abb. 5. Schattendarsteller (Isisleute) beim Sso-Kult in Bébai (Fam. Essengi). Der mittelste mit der Sso-Maske.

Zum Leidwesen einiger Schreier und Hanswürste, die sich in derben Späßen nicht genug tun konnten, nahm diese Sache ziemlich bald ein Ende und die „Hauptattraktion", nämlich die Darstellung des Sso und seines Anhangs, ging vor sich. Zu dem Zwecke vermummten sich mehrere junge Leute mit Lendentüchern, die sie sich von hinten über den Kopf zogen, und huschten so als sonderbare schattenhafte Gestalten über den Dorfplatz, stießen gegen die Vordersten der Zuschauer, rissen sie um und ließen sich dann auf die Erde nieder, wo sie unter ihrem Tuch ganz merkwürdige Bewegungen ausführten, etwa so, als ob sie auf der Erde entlang kriechen wollten und doch keinen Boden fassen könnten. Mit einemmal sprang dann dieser oder jener auf und huschte in seiner sonderbaren Weise wieder über den Dorfplatz. Alsbald erschien die Hauptperson (zuweilen sind es auch mehrere, zwei bis drei), ein Mann mit einer Hörnermaske *(epʊ́ʊ̄)*, setzte sich in der Mitte des Dorfplatzes hin und fing an, ganz wunderlich den Kopf zu bewegen. Die Vermummten bekamen neues Leben, umgaben ihren Herrn und Meister (Abb. 5), krabbelten wie wild, flatterten davon und kehrten wieder zurück.

Alle diese Leute, auch die Maskenträger, heißen *ísɪ,ɛ*, Mz.: *bísɪ,ɛ*, und sollen, wie aus dem Stamm von *ɑ́ sɪ́s* = schrecken hervorgeht, erschrecken. Aber was für Geschöpfe sollen sie vorstellen? Meines Erachtens nur Katzen, dafür spricht die Art der Bewegung und der Stamm *sí*, *n-sɪ́-ʊ̀* = die Katze! Nur ein

Tier noch könnte in Betracht kommen, die Fledermaus. Aber das Kriechen auf der Erde und die Bedeutung des Wortstamms scheinen sie mir auszuschließen.

Nachdem der Maskenträger eine Zeitlang unter betäubendem Trommellärm und Jauchzen der Teilnehmer seine Künste vorgeführt, trugen Erwachsene die Neulinge, die bis dahin im Hause gewartet hatten, einen nach dem andern auf dem Rücken heraus. Jetzt kam neue Bewegung in die Schattenmänner, sie machten verzweifelte Anstrengungen unter ihren Tüchern, stürzten sich auf die entsetzten Jungen und suchten sie in jeder Weise bange zu machen. Dann setzten die Männer ihre Last ab, und die Schatten scheuchten die Jungen gegen den Maskenträger, bei dessen Anblick die Kleinen heftig erschraken und sich gebärdeten wie junge Pferde, die plötzlich irgendeinen fremden Gegenstand am Wege liegen sehen. Ihr Herz schlug heftig von all den Aufregungen, und immer stürmischer wurden sie von den vermummten Gestalten umflattert, während der Maskenmann sich wegschlich und beim Versammlungshause im Dunkel der Nacht verschwand.

Abb. 6, *a* und *b*. Mirlitons für Kulte. Das Mirliton ist ein Stück eines hohlen Stengels, dessen eine Seite mit dem Schutzhäutchen von Spinneneiern überklebt ist. 1/3 nat. Gr.

Die Mitternacht war schon nahe, als damit die Vorstellung abbrach und sich alles in die Hütten begab.

Es braucht wohl kaum hinzugefügt zu werden, daß der Maskenmann den Sso, d. h. den Mond, und die vermummten Gestalten die (bösen) Seelenwesen, die sich nach dem Tode in den (lebenden) Schatten (vergl. S. 36) verkörpern, anzeigen sollen, es handelt sich hier also um eine Vorstellung des Schattenreichs.

Der nächste Tag, der erste eigentliche Festtag, brachte die Feier des Ndongmba, das Sonnenfest, das also hier in das Sso- oder Mondfest eingeschoben ist und aus einer mit großem dramatischem Geschick durchgeführten Darstellung der Sonne besteht. Die Feier zerfällt in zwei Teile, im ersten wird unter Ausschluß der Neulinge die untergehende Sonne unter dem Bilde eines — Verrückten dargestellt, im zweiten den Neulingen — symbolisch — die aufgehende Sonne gezeigt und von ihnen die mimische Vorführung des Ablaufs eines Sonnentages im täglichen Leben und der belebenden Wirkung der Sonne verlangt.

Es wurde oben ausgeführt, daß die Pangwe einen Geisteskranken mit anderen Augen ansehen wie wir; er ist für sie ein von Gott (der Sonne) gewissermaßen Erleuchteter, der den Höchsten oder das Höchste geschaut hat und deshalb auf die irdischen Dinge in besonderer, uns nur nicht verständlicher Weise reagiert; er ist ein von Gott (Sonne) emporgehobener Mensch, der ihm ähnlich, also ohne Seelenwesen ist. Um für den Gesunden etwas Ähnliches

Abb. 7. Ndong-mba in Bébai (Fam. Esseng). Der Kultleiter führt die Neulinge aus dem Hause und zeigt ihnen symbolisch die Sonne; links das beim Seo benutzte Phallusgerät.

im kleinen zu erreichen, setzte man früher die Neulinge solange an die Sonne, bis sie schwindelig wurden und in Krämpfe verfielen. Jetzt hat man diese Sitte wohl wegen ihrer Gefährlichkeit aufgegeben, aber der Glaube besteht noch, Krämpfe kämen davon, daß man zu lange in die Sonne gesehen hat; der Schwindel heißt *ndŏṅ*, von *ndŏṅ* = Sonne, Gestirn.

Die Geisteskrankheit ist also ein der Gottheit geweihter Zustand, dem die Menschen gern nahekommen möchten, anderseits scheint die Sonne selbst, wenn sie als flimmernder roter Ball untergeht, in Schwindel und Krämpfe zu verfallen.

Während nun die Festteilnehmer sich vor dem Versammlungshause in zwei Reihen aufstellten, spielte der Ndong-mba (der Sonnendarsteller heißt ebenfalls Ndong-mba) seine Rolle als Geisteskranker mit einem Geschick, das wirklich für Simulanten als vorbildlich gelten könnte. Das bei allen Kulten unvermeidliche Mirliton *(elŏṅ)* (Abb. 6) im Munde, hielt er einen eindringlichen Vortrag darüber, daß er gar nicht krank sei. Die Kranken nämlich — so wurde mir gesagt — meinen, sie seien ganz gesund und würden nur von den Leuten für einen Narren gehalten. Um zu beweisen, daß ihm „nichts fehle", wies der Ndong-mba auf seine Füße mit Gebärden, die über seinen Geisteszustand keinerlei Zweifel bestehen ließen, zählte alle Zehen und Finger, faßte sich an den Kopf und den Hinteren, redete auf die einzelnen Zuschauer

ein, kurz suchte auf alle mögliche Weise klarzutun, daß er so gesund wie die anderen sei. Plötzlich setzte er sich nieder, bekam Zuckungen an Händen und Füßen und fiel schließlich in Krämpfe. Wieder zur Besinnung gekommen, stand er wie mit einem plötzlichen Entschluß auf, ging stracks ins Versammlungshaus, nahm ein Feuerscheit wie eine wichtige Sache auf die Schulter, legte es auf den Dorfplatz und forderte nun einen Umstehenden auf, das Scheit wieder ins Haus zu tragen. Dann bekam er wieder seine Anfälle oder blies auf seinem Mirliton. Mit einem Worte, er machte seine Sache ganz vorzüglich, und sein schauspielerisches Talent war über jedes Lob erhaben. Dazu sangen die Umstehenden unter Trommelbegleitung. Der Kehrreim lautete:

ungüngödö á ndön, ane ngön abé.

Etwas Halbkugeliges von Gestirn, wie Kern (der) Kolanuß.

Damit ist natürlich die schon zur Hälfte unter den Horizont gesunkene Sonne gemeint, der Kern der Kolanuß (**Cola acuminata** P. B.) ist zum Vergleich herangezogen, da er auch rot (eigentlich rosa) und halbkugelig ist [1]).

Hierauf folgt der Tanz des Ndong-mba, den ich beim Elong besprechen werde.

Nach Beendigung dieses Tanzes führte man die Neulinge aus dem Hause heraus und zeigte ihnen in folgender Weise die aufgehende Sonne.

Einer der älteren Teilnehmer, meistens der Veranstalter des Festes, begibt sich in das Haus, in dem die Jungen eingeschlossen waren, und bringt sie einzeln oder zu mehreren in langsamem Tanzschritt zum Versammlungshaus, indem er unterwegs mehrmals an den Himmel zeigt, und zwar meistens — wenn auch nicht immer — nach Osten (Abb. 7). Scheinbar befanden sich beide Teile, besonders aber die Neulinge, gänzlich darüber im unklaren, was diese Handlung vorstellen sollte. Sie guckten sich denn auch die in der Nähe befindlichen Bäume mit einem Gesicht an, auf dem deutlich zu lesen stand: „Nanu, ich sehe doch nichts!" Alle die ursprünglichen Anschauungen leben bloß noch unbewußt in den Pangwe, und nur durch Überblicken der gesamten Religion und durch zufällige, unbewußte Äußerungen wird man die Zusammenhänge begreifen. So sagte z. B. einer meiner Jungen auf meine Frage, warum der

---

[1]) Vgl. hier das Sprichwort:

ye ma vu ndřime, abé a mfök.

(Fragep.) ich sterbe Verlorensein, Kolanuß in der Umhängetasche.

Soll ich immerfort im Düstern tappen, wenn ich den Lichtspender, d. h. also Feuerzeug, in der Tasche habe.

„Kolanuß" steht hier also direkt für Lichtspender, S o n n e , das Feuerzeug ist ein Lichtspender, eine Sonne im kleinen.

Mann so in die Luft zeigte, wörtlich: „Er macht Spaß, wie wenn Ndong-mba oben (in der Luft) wäre."

Am Schlusse des Vorgangs erschreckte der Ndong-mba die Jungen noch, indem er, von hinten kommend, ihnen plötzlich mit dem Mirliton in die Ohren blies, während der Betreffende, der Richtung des Fingers folgend, das in der Luft schwebende Etwas zu erspähen suchte.

Jetzt gaben die Neulinge, jeder Trupp für sich, nach Angabe und Vorbild des Ndong-mba, eine kleine, ganz allerliebste und von warmem Humor getragene Darstellung des Sonnenaufgangs, d. h. der von der Sonne wachgeküßten Tiere und Menschenkinder und ihres Tagewerkes zum besten. Um dem Jungen zu zeigen, wie er sich zu verhalten habe, machte zuerst ein Erwachsener mit dem Ndong-mba die Sache vor, dann setzte er sich hinter den Jungen und dieser wiederholte mit seiner Unterstützung dasselbe. Ihnen gegenüber saß der Ndong-mba gab auf dem Mirliton an, was zu tun sei, und machte selbst die Bewegungen vor. Zuerst wird hierbei gezeigt, wie der Mensch langsam aufwacht, während er auf seinem Mirliton stöhnende Laute von sich gibt; wie wenn er aus dem Schlafe aufwacht, reckt der Spielleiter sich und streckt sich und zählt nun alle seine Glieder, indem er jede Fußzehe mit der Hand nimmt — sein Gegenüber natürlich ebenso —, zuerst die kleine Zehe, dann alle übrigen und sie hin und her schüttelt, als ob er sehen wollte, ob sie noch festsitzen, erst an dem einen, dann am anderen Fuß. Dann streicht er mit beiden Händen die Unterschenkel aufwärts, um die Glieder geschmeidig zu machen, dann — immer lebhafter werdend — zerdrückt er sich, indem er vom Unterschenkel auf den Oberschenkel vorrückt, gleichsam die Flöhe, die da herumlaufen. Dann reckt er den Oberkörper, zählt die Finger an der Hand, wie die Zehen, streicht sich die Arme von unten nach oben und ist jetzt ganz munter. Am Schlusse legen beide die Hände so auf den Boden, daß sie sich mit den Fingerspitzen berühren, um anzudeuten, daß der Knabe jetzt ein Jünger der Sonne — dargestellt vom Ndong-mba — geworden ist. Jetzt zeigt der Mann, wie die Graupapageien [1]) auf den Wipfeln der Bäume die Morgensonne begrüßen, indem sie sich recken, ihre Flügel ausbreiten, dann immer höher und höher auf die Zweige klettern, um schließlich fortzufliegen. All dies ahmt der Schauspieler trefflich nach, indem er mit den Händen zuerst unten am Boden, dann immer höher herumfuchtelt, bis zuletzt beide Darsteller die Hände zusammenlegen. Jetzt sagt der Spielleiter: „Krieg kommt." Erst langsam, dann immer schneller ahmt der Mann das Verstecken hinter den Planten des Dorfes, das Vorstürmen und Abschießen der Gewehre nach usw. So kommen oft noch allerlei Vorgänge aus dem Leben zur Vorführung, zuletzt meint der Schauspieler: „Jetzt gehen wir auf Honigsuche." Und nun wird in köstlicher Weise

[1]) Die Papageien sind Tiere der Sonne, wir finden daher ihre roten Schwanzfedern als Schmuck bei Kultfiguren sowohl wie bei Menschen.

Abb. 8. Tanz eines Neulings auf dem Phallusgerüst, Seo Kult, in Akonangi (Familie Essonduni).

dargestellt, wie die Leute das Bienennest ausnehmen und fortwährend von den ergrimmten Immen gestochen werden, immer mehr Bienen scheinen über die Räuber herzufallen, während sie selbst nur noch eifriger nach dem Honig suchen. Endlich haben sie die süße Speise, und es geht ans Verteilen. Der Ndong-mba nimmt ein Plantenblatt, reißt davon Stücke ab und deutet mit ihnen die Verteilung der Wabenstücke auf dem Boden an. „Dies zuerst für mich," sagt er und legt ein Stück Blatt vor sich, „dann hier für meine Mutter," wieder ein Blatt für sich, „dies für meinen Vater" usw. Zuletzt: „Hier sind die leeren Waben — für dich," sagt er und legt das Blatt dem Jungen hin. Unter großem Jubel der Umstehenden teilt so der Schauspieler den Honig, indem er für seinen Großvater, seine Bröder, sogar seinen Urgroßvater und alle möglichen Tanten und anderen Verwandten Honig beansprucht, während für den Jungen wenig oder nur der schlechte Rest übrig bleibt.

So schloß dieses mit großem Geschick durchgeführte Lustspiel.

Am zweiten Festtage tanzten die Neulinge den Phallustanz, dem auch Uneingeweihte — selbst Weiber — zuschauen durften.

Die Jungen, auf der einen Hälfte des Körpers mit Rotholz gefärbt, waren von hinten auf das Haus, gegen das das Gerüst lehnte, geklettert und hockten auf dem First. Nun wurde ihnen von einem Vortänzer die Sache gezeigt, dann begann der erste auf das Gerüst zu steigen, mußte bis zum Kopfe der Stange

Abb. 9. Seo-Kultplatz in Bébai (Fam. Essengi, Süd-Kamerun. Links ein gedeckter Gang, der das Grab versinnbildlichen soll, in der Mitte ein Schwein, rechts (vor dem Jungen) eine Schlange.

und wieder zurückgehen und wurde von einem Manne folgendermaßen angesungen:

mon a ne bibai, ikra, mon a ne makomo, ikra

Kind es ist (aus) Bebai: sündenlos! [1]) Kind, es ist (aus) Makomo, sündenlos!

mon a ne ebäangón, ikra, mon a ne bemve, ikra! usw.

Kind, es ist (aus) Ebäangon: sündenlos! Kind, es ist (aus) Bemwe, sündenlos! usw.

ikra, ikra, ikra, ikra, ikra, nga ma mane bol.

sündenlos, nicht wahr, ich beendigte Leute (zu zählen).

Unter hellem *hö* des Chores setzten die Trommeln ein und der Junge begann auf der Stange zu tanzen (Abb. 8), vom Dachrand bis an den Kopf und zurück; der Chor sang dann stets *hè, hè he ngungo (ngungo* = Verzeihung). Dieser Gesang ist ein Reinigungsgesang, der den Fluch des Vaters (Gottes) wegen des Geschlechtsverkehrs aufheben soll [2]). Auch A. L. Bennett sagt in seiner in der Einführung genannten Arbeit: „People are c u r s e d of God on account of their sins." Nachdem der erste Junge geendet, kam der

[1]) D. h. von einer Schuld (bzw. Sünde), die jemand begangen hat, freigesprochen.

[2]) Ähnlich ist der Vorgang beim profanen Fluch, den der Vater seinem Sohne wieder abnimmt (vgl. Abschn. XIX, Teil 2).

zweite dran, und alles wurde genau so wiederholt. Machte ein Neuling seinen Tanz besonders gut, so begannen die anwesenden Weiber, vielleicht zum Teil seine Verwandten, sich wie wahnsinnig zu gebärden, herumzutanzen, schrill zu juchzen und vor Freude außer sich zu sein. In der Begeisterung warfen sie ihm von allen Seiten grüne Planten, halbe Kassaverollen und Ngonkerne zu.

Nach Beendigung des Tanzes wurde jeder Junge von einem Manne auf die Schulter genommen und zuletzt alle Neulinge vor dem Versammlungshause gemarkt.

Der dritte Tag stand ganz im Zeichen des Bösen. Am Morgen begann man den Busch dicht hinter dem Versammlungshause zu roden und einen Kultplatz zu schaffen, der etwas vom Wege ablag (Abb. 9 u. 10). Auf ihm wurden zwei Lehmfiguren, ein Schwein *(a)* und eine Riesenschlange *(b)*, die aus einer Baumwurzel hervorkroch und mit Ruß schwarz bestrichen war, geformt, dann hob man daneben einen Graben aus und überdeckte ihn teilweise mit Baumstämmen *(c)*; davor richtete man einen „Sumpf" *(e)* her, indem man zwischen zwei Paar zusammengeflochtener Kardamomstengel Bananenwasser goß. Zwischen Gang und Sumpf legte man quer einen Baumstamm *(d)* auf die Erde. Auf diesen legte der Medizinmann bei Beginn der Kulthandlung, bei der nie das Trommel- und Mirlitonkonzert fehlen darf, einen Hahn und ließ den Kopf von einem Gehilfen halten. Während die Neulinge im Versammlungshause *(f)* in einem durch Palmblätter abgeschlossenen Raum blieben, begannen die jüngeren der Eingeweihten eine Schweineherde in Szene zu setzen, indem sie unter Grunzen und Schreien durch die Planten liefen und schließlich in einer Linie im Hintergrunde des Kultplatzes zum Vorschein kamen. Die beiden vorderen Leute, Jungen von 8—10 Jahren, krochen eilig durch den Gang, der erste schlug mit einem Haner den Hals des Hahnes durch und lief dann vorn hinaus auf den Dorfplatz, gefolgt von den anderen, die (wohl wegen ihrer Größe) nicht durch den Gang, sondern daran vorbeiliefen.

Abb. 10. Plan eines Seo-Kultplatzes bei Bébal (Fam. Essengi), Nsum.

Auf dem Dorfplatze führte dann die ganze Gesellschaft den Ssotanz auf, den ich — wenn er gut gelingt — für den besten und eindrucksvollsten Tanz der Pangwe halte. Jeder hielt ein Bananenblatt in der Hand, einige hatten außerdem noch ein Blatt vorn in den Gürtel gesteckt, das wie ein erigierter Penis vorstand. Dann stellten sich alle an dem einen Ende des Dorfplatzes in der

Mitte so nebeneinander auf, daß sie mit dem Gesicht gegen die Häuser gerichtet waren, und rückten, sich langsam seitwärts bewegend, unter Gesang mit den Füßen im Dreitakt den Boden stampfend und taktmäßig mit den Händen fuchtelnd, auf das Versammlungshaus zu, wo sich die Zuschauer befanden. Zuerst ertönte Gesang und Füßestampfen nur leise, schwollen dann an und wurden immer stärker, bis zuletzt mit solcher Gewalt getanzt wurde, daß der ganze Boden mitdröhnte und die Fetzen von den Blättern flogen. Nach einem Höhepunkt der allgemeinen Kraftentfaltung nahm die Stärke des Gesangs und Tanzes schnell und stetig ab bis fast zur Unhörbarkeit. Vier- oder fünfmal schwoll so die Welle an und flachte wieder ab, indem die Reihe immer näher ans Versammlungshaus rückte. Jede neue Welle übertraf die vorhergehende an Heftigkeit, und wie die letzte eben am Versammlungshause ankam, war die Höhe der Darstellungskunst und natürlichen Wildheit erreicht. Die ganze Linie tanzte mit solcher Erregtheit, daß sie völlig in Staub gehüllt war und der Boden dröhnte, als ob ein Schlachtheer im Ansturm sei; die letzten Fetzen der Bananenblätter wirbelten den Tänzern um den Kopf und bedeckten, als der Tanz plötzlich abbrach, den verwüsteten Dorfplatz. Diese Fetzen durften nun nicht etwa beiseite geworfen werden, sondern sie wurden sorgsam aufgelesen und sämtlich auf die Bananenstaude, von der sie genommen waren, zurückgelegt, die Früchte dieser Banane aber durften nur von alten Weibern oder Uneingeweihten gegessen werden. — Zumal sich hier kein Trommelton — wie sonst immer — in den Tanz hineinmischt, sucht dieses Schauspiel an wilder Schönheit seinesgleichen [1]).

Nach diesem „Ssotanz", der das Böse, insonderheit die Gewalt des Geschlechtstriebes verbildlichen soll, begaben sich alle Teilnehmer auf den heiligen Platz, auf dem der Baumstamm zwischen Grube und Sumpf weggenommen und Asche gegen jedes Kardamomstämmchen gehäuft wurde. Nun nahm man den Neulingen die Lendentücher ab und führte sie einzeln — wie der Verlauf der Pfeillinie in Abb. 10 zeigt — aus dem rückwärtigen Busch heran; ein Erwachsener nahm jeden unter den Arm, faßte ihn um, wobei er auf die Erde wies, führte ihn im Bogen um den Sumpf und setzte ihn unter dem Gerüst ab, wo ein Gehilfe ihn übernahm und auf dem Bauche durch den Schmutz schleifte. Dabei tauchte er ein Stück Bananenstamm in den Schmutz und strich dem Jungen damit vom Gesäß an über den Rücken bis zur Schulter. Dann mußte der Junge, der nun wie ein „Schwein" aussah, was ja auch beabsichtigt war, aufstehen und sich durch das Tor entfernen, während der nächste an die Reihe kam. Dem letzten wurde von jedem der Umstehenden ein Stück **Pennisetum purpureum** *(256,6)* oder in dessen Ermangelung irgendein Blatt oder ein Zweig, der gerade bei der Hand war, aufs

[1]) Kandt erwähnt in seinem Buche „Caput Nili", nebenbei bemerkt vielleicht eins der besten Bücher, das über Afrika überhaupt geschrieben wurde, von den Warundi S. 254 einen ähnlichen Tanz.

Kreuz gelegt, während er noch in der Pfütze steckte.

Damit war die Feier zu Ende und die jungen Eingeweihten kehrten in ihre Dörfer zurück, während die anderen nach einigen Tagen das Fest durch den sogenannten Palmentanz *(ema)*[5]) beschlossen.

Wenn man diese merkwürdigen Vorgänge des letzten Tages überblickt, so sehen wir hier die Wesenheit des Bösen in neuen Formen zum Ausdruck gebracht. Die Schlange und das Schwein sind Verkörperungen der geschlechtlichen „Sünde". Über die Schlange haben wir bereits des längeren

Abb. 11.
Hörnermaske der Schweinekanner beim Sao-Kult der südspangwe (Fam. Eneboge), Fang.

und breiteren gesprochen, das Schwein hat (wie später der Elefant) wegen seines Aufenthaltes im Sumpf, also wegen seiner Unreinheit, die große Bedeutung im Kult des Bösen bekommen, denn äußere Unreinheit gleicht innerer Unreinheit (Geschlechtsverkehr), und der Sumpf ist — kultlich gesprochen — ein Gemisch der unreinen Elemente Erde und Wasser. Neben dem nächtlichen Hörnertier (hier der Antilope *sö*), das ja den Mond vertritt, ist deshalb das Schwein die wichtigste Verkörperung des Bösen geworden, die Hörnermaske (Abb. 11) trägt schweineartige Züge, z. B. manchmal richtige Schweinsohren und die Warzen des afrikanischen Wildschweins; daher auch die häufige Darstellung von Schweinen in den Kulten, daher das Vorführen einer Schweineherde seitens der Eingeweihten des Sao.

Der Gang in der Erde soll ein Grab versinnbildlichen, ist also hier der einzige, freilich ausdruckvollste Rest des Sterbegedankens, der bei den Jaunde so dramatisch durchgeführt war. Der Anfrug am Anfang der Feier soll nun bedeuten, daß die „sündigen" Menschen (Schweineherde) durch den Tod zu gehen haben (Grab), weil sie dem Guten (dem Hahn, als Tier der Sonne, des Guten) den Garaus gemacht haben. Die Darstellung ist hier etwas unklar, aber das ist häufig bei den Kulten und wir werden es auch sonst wiedertreffen. Bei dieser Vorstellung dürfen die noch uneingeweihten Neulinge als „gute Menschen" nicht zugegen sein, ebensowenig bei dem folgenden Saotanz. Nachher erst werden die Neulinge in den Kult des Bösen eingeführt, indem man ihnen zeigt, daß die Erde sie aufnehmen wird (anderswo werden sie durch das Grab selbst geschickt). Das Schleifen durch den Schmutz bringt die Gedanken-

Verlegt und gedruckt bei Ernst Wasmuth A.-G., Berlin.

Abb. 12. Errichtung einer Soo-Figur über einem gedeckten Gange (das Grab darstellend), Akonangi (Fam. Essendum), Süd-Kamerun.

verbindung zwischen Erde, Schmutz und dem Bösen (Geschlechtsverkehr, Tod) zum Ausdruck: sein Rücken wird mit Schmutz bestrichen zum Zeichen, daß er nunmehr dem Bösen, eben dem Geschlechtsverkehr und dem Tode, geweiht ist.

Sehr eigenartig und beachtenswert ist das Auflegen des Todesgrases, **Pennisetum**, *e-si,-e* (bzw. der Blätter). Vielleicht ist es wegen seiner noch im „Tode" unverwüstlichen Lebenskraft (Fähigkeit der abgeschnittenen und scheinbar trockenen Stengelglieder, auszuschlagen) das Zeichen des Lebens im Tode — wir würden sagen: Auferstehung —, und es wird deshalb dem „toten" Neuling aufs Kreuz gelegt. Hierin ist wohl auch der Anfang der Sitte, den Toten Pflanzen mitzugeben, zu suchen (bei den Ägyptern eine mit Samen bestreute Osirisfigur aus Erde, bei uns Totenkränze).

Ein anderes Soo aus Akonangi zeigt, wie vielgestaltig im einzelnen es bei den Südpangwe ist, und weiter, daß aus der plastisch dargestellten Idee eine mit Kräften ausgerüstete Person geworden ist, aus der sich weiterhin dann ein „Götze" entwickelt. Zu dem Zwecke ist die Lehmfigur (Abb. 12 u. 13 u. Taf. XIX) „geweiht", d. h. mit kraftgebender Medizin ausgestattet und sehr folgerichtig über dem Grab, d. h. dem unterirdischen Gang errichtet, der vor und hinter der Figur freiliegt. Außerdem ist dieser Gang mit Ameisennestern [7]) gefüllt. Die Neulinge müssen durch die hintere Öffnung in den Gang

[7]) Diesmal der Art **Crematogaster striatula** Em. *(1150, 0150 ♂)*.

Abb. 13. Soo-Figur in Akonangi vor der Einweihung. Von der Seite.

unter der Figur entlang kriechen und aus der vorderen Öffnung, sozusagen aus dem Rachen des Soogeistes, d. h. des Bösen, des Todes, wieder herauskommen. Die Figur ist mit zwei Hörnern versehen, die den Mond und damit den altbekannten Gedankengang: Geschlechtsverkehr, Sünde, Tod, Mond (**Cephalophus**) andeuten. Der Pfahl, den unsere Abbildung auf dem Rücken der Figur zeigt, dient nur dazu, einen Schacht freizuhalten, in den bei der Weihe die Kraftmedizin versenkt wird. Diese Medizin besteht aus Teilen von 16 verschiedenen Pflanzen und aus 9 anderen Sachen, nämlich aus Schädelstücken, der Ewu, das ist der Sitz der Zauberei, Gift, einem Stück Messing (Messing gehört wegen des Glanzes zum Zauberglauben), einem Stück vom Regenbogen und vom Himmel, das ist Glimmer (Regenbogen ist von großen Zauberern gemacht), einem Spinnennest (Spinne ist eine Zauberin), einer **Lygosoma fernandi** Burt. (Ursprung des Todes!) und einer **Bufo latifrons** Blgr. (bei der Giftmischerei benutzt). Die Figur wird also zu einem Zauberer gemacht, um den Angriffen fremder Zauberwesen gewachsen zu sein. Doch werde ich auf die Zauberei bei den Kulten noch beim Ngi zurückkommen.

II. Bokung und Elong.

Zeigte das Soo der Jaunde ausschließlich die Wirkung des Bösen, trat beim Soo der Ntum schüchtern und als Anhängsel der Gedanke des Guten in der Natur hinzu, so erscheinen beim Bokung-Elong Böse und Gut als ebenbürtige

Mächte auf dem Plan. Innerlich spielt das Böse nach wie vor die Hauptrolle, aber das Gute tritt in den Kampf mit ihm ein und muß mit ihm noch manchen Vergleich schließen, bleibt jedoch schließlich Sieger.

In sehr hübscher Weise zeigen die Namen Bokung und Elong an, um was es sich handelt. In den Kulten werden die Grundbegriffe Gut und Böse bzw. Sonne und Mond nicht direkt genannt, der Mond war im Ssokult unter dem Bilde der Antilope *(sö)* vorgeführt, hier im Bokung wird sowohl das Gute wie das Böse unter dem Symbol von Tieren dargestellt, unter Hahn und Eule, jenes das Tier der Sonne, des Tages, des Guten, dieses das Tier des Mondes, der Nacht, des Bösen. Bokung kommt vom Stamm *a kǫ̀ǫ̀* = stöhnen, klagen und rufen der Eule; *akǫ̀ǫ̀* = Eule, **Syrnium nuchale** Sharpe), *a lóǫ̀* heißt blasen, flöten, krähen *(nǫ̀m e kub a lóǫ̀* = der Hahn kräht). Besser kann der Gegensatz zwischen dem Tag, dem Guten, und der Nacht, dem Schlechten, nicht verdeutlicht werden, als durch das Verhältnis der Eule, die so schaurig durch die Nacht ihren Klageruf ertönen läßt, zum Hahn, der die erwachende Morgensonne mit Jauchzen begrüßt.

Im übrigen zeigen sich uns viele Ähnlichkeiten und Übereinstimmungen mit dem bisher Erwähnten. Unterschiedlich ist vor allem, daß hier der Phallustanz (auf dem Gerüst) fehlt, also nur zwei Festtage vorhanden sind. Am ersten wurde der Reihe nach vorgeführt das Böse, das Gute, Vergleich der beiden; am zweiten Tage die Überwindung des Bösen, das berühmte *a ɣüe sǫ̀* = das Töten des Sso.

Die Vorfeier begann an Stelle des beim Sso beschriebenen Coitustanzes mit einem Schimpansentanz. Während die Zuschauer sich in zwei gleichlaufenden Reihen vor dem Versammlungshause aufstellten, ahmten drei Leute, darunter der „tonangebende" Medizinmann, auf allen Vieren kriechend, den Gang der Affen nach, um dann in wippender Bewegung in der Kniebeuge eine Art Tanz zu vollführen. Dabei brachte der Medizinmann auf einem Mirliton oder gleich auf zweien jammervoll stöhnende Töne hervor. Nach Beendigung des Tanzes, der ziemlich lange dauerte, traten die Schattenmänner, die Issisleute, in Erscheinung, und daran schloß sich wieder das Beschimpfen der Frauen.

Am *ersten Festtage* folgten weitere Vorführungen innerhalb des Versammlungshauses, in welchem durch einen Blätterverschlag ein kleiner Sonderraum *(elik)* abgetrennt war. In ihm, den später die Neulinge bezieben, saß der Kultleiter mit seinen Gehilfen und ließ Klageweisen auf dem Mirliton ertönen, während ein anderer Medizinmann auf demselben Instrument den Eulenruf ziemlich täuschend nachahmte: *huhú, huhuhuhúhu—uhá.* Dazwischen wurde der Affentanz in erneuter und verbesserter Auflage gebracht. Obgleich anscheinend alle Eingeweihten sich als Schimpansen zeigen konnten, so waren

es doch immer nur drei oder vier, die es in dieser Kunst zu etwas gebracht hatten. Allen zuvor tat es ein ganz alter Mann, der sowieso mit seinem fast kahlen Schädel und seinen vielen Falten im Gesicht wie ein Schimpanse aussah; dieser „Künstler" ahmte sein Vorbild so täuschend und komisch nach, daß es mir nicht mehr möglich blieb, den der Feier angemessenen Ernst zu bewahren. Ohne eine Miene zu verziehen, hockte der Alte auf dem Boden, nahm schweigend — als ob er an etwas ganz anderes dächte — irgendwelche Gegenstände vom Boden auf und ließ sie wieder über den Rücken fallen; plötzlich machte er mit den Händen zitternde Bewegungen, wie sie von den Affen in der Erregung ausgeführt werden, und suchte, wie es die Tiere im Spiel tun, ein Stück Holz oder ein Blatt vom Boden aufzunehmen, um dann dicht davor blitzschnell mit der Hand zurückzufahren, gerade wie der Schimpanse, wenn er eine Schlange oder einen Tausendfuß gesehen hat oder zu sehen glaubt. Dann machte er, immer in der Kniebeuge hockend, mit dem Oberkörper wippende Bewegungen, als ob er Gefahr witterte, schlürfte in dem eigentümlichen Affenschritt davon und setzte sich ohne einen Laut von sich zu geben, auf seinen Platz. Ein anderer Schauspieler hatte mehr die Art heraus, wie die Vierhänder laufen, und leistete in diesem Zweige Unübertreffliches.

Der Medizinmann blieb dagegen — wie es die alten Affenmännchen lieben — ruhig in der Mitte seines Trupps hocken und stöhnte und jammerte auf seinem Mirliton. Dann kam wieder der erste Tenor des Stückes, unser alter Herr. Nachdem er sich die im Versammlungshause stehenden Körbe verständnislos nach Art der Affen von allen Seiten genau angesehen hatte, legte er sich auf die Knie, ballte die Hände vor der — Schnauze, hätte ich bald gesagt, und machte zuletzt eine Art Bauchtanz, kurzum, man fühlte sich in eine vermenschlichte Schimpansenherde versetzt. Dazwischen sang ein Kollege mit Hilfe von zwei an den Mund gelegten Mirlitons, ein zweiter ahmte wieder Eulenrufe nach, wobei ihn oft der Beifall einiger Zuschauer, die jedesmal zu einem begeisterten *jò*— hingerissen wurden, belohnte. Es braucht kaum erwähnt zu werden, daß die Trommeln von Zeit zu Zeit den Eifer der Gesellschaft mit Erfolg auffrischten, da ja kaum eine Negerfestlichkeit ohne Trommelbegleitung (Fell- und Holztrommeln) vor sich geht. Nachdem so vom frühen Morgen bis zum Mittag mit kleinen Pausen geschauspielert war, kam der Ndong-mba- oder hier Elongdarsteller, ein jüngerer Mann aus einem benachbarten Dorfe, an die Reihe. Ihm wurde eine Tanzhaube aus rotglänzenden Turakofedern (**Turacus**-Arten), die vielleicht die Sonnenstrahlen andeuten sollen *(andaɲ*[1]), *ndɛ́ɔ̀k* = Tanzhaube, allgemein: *asɛ́ɔ)* (Abb. 14 u. 15), auf den Kopf gesteckt und eine Fliegenklatsche *(agbwạ)* überreicht. Dann stellte er sich eine für ihn sehr wichtige Medizin zurecht, die die Kehle geschmeidig hält, das Herz beruhigt und ihn

[1]) *a* = Teilklasse, *ndòò* = Gestirn, Kultfeier, d. h. „was zur Sonne gehört bzw. was zur Kultfeier gebraucht wird".

seine Rede nicht vergessen läßt (vgl. Abschnitt XIII), machte sich daran, den großen Sonnentanz vorzuführen und nahm eine Reihe verschiedener Mirlitons, mittels derer er kleine Reden hielt und sang; dazwischen, besonders am Ende des Gesanges, ahmte er den Hahnenschrei und auf einem dumpferen Mirliton das Gegacker der Hühner nach — *gölö, gógölö, gógölö, gölö, gölö.* Bei starker Trommelbegleitung tanzte er nun, indem er die Fliegenklatsche schwang, als wollte er ein in der Luft schwebendes Etwas (den Mond!) bedrohen, setzte sich, unter fortwährendem Mirletongesange herumtanzte. Kurz vor Schluß des Tanzes werden zwei Trommeltakte überschlagen in der Weise, daß in demselben Augenblick, wo der Tänzer zweimal z. B. die Hände in die Luft schlägt oder sonst taktgemäße Bewegungen macht, auch der Trommelschläger zweimal ins Leere schlägt. Nach einigen Trommelschlägen bricht dann die ganze Musik auf ein Zeichen des Tänzers mit einem letzten starken Schlag ab. Oft genug mischen auch Xylophon und

Abb. 14. Tanzhaube aus Turakofedern mit einem Büschel Hahnenfedern.

Abb. 15. Tanzhaube aus Papageienfedern, mit Perlenschnüren verziert.

und -gegacker, auf einen Schemel oder kniete und tanzte in dieser Stellung weiter. Jedenfalls schien der Mann, dessen Kraft gar nicht erlahmen wollte, die größte Befriedigung im Zuschauerkreise hervorzurufen. Öfters nickte er mit dem Kopfe ruckweise nach beiden Seiten, wie die Hähne tun, unter Zuspitzen der Lippen, im übrigen war es mehr Tanz als Mimik. Den größten Beifall erntete der Tänzer aber, wenn er auf den Dorfplatz lief und hier unter wilden Körperbewegungen, die Füße abwechselnd auf den Boden stampfend und mit der Fliegenklatsche den Feind in der Luft bedrohend,

Abb. 16. Schimpansentanz beim Bokúng-Kult in Bébai (Fam. Easeng).

Kastanietten ihre Stimmen in Trommel- und Mirlitonkonzert, so daß sich die Musik zu einem betäubenden Lärm steigern kann und man froh ist, wenn man diesem Ohrenschmaus den Rücken gewandt hat. Unsere Pangwe dagegen können sich an diesem Schauspiel gar nicht satt sehen und nicht genug von der „Musik" bekommen, nur mit Überwindung entschließen sie sich endlich zum nächsten Akt.

Der ganze Tanz ist, wie es sich versteht, eine Darstellung der Sonne, die aus ihrem nächtlichen Lager (dem Versammlungshause) herauskommt und die feindlichen Mächte der Nacht und des Bösen verscheucht (Fliegenklatsche).

Jetzt wurden die Neulinge, die bis dahin in einem Hause eingeschlossen waren, herausgeführt, und man zeigte ihnen — wie beim Ndong-mba der Ntum — symbolisch die aufgehende Sonne, woran sich die oben beschriebene Darstellung des Tagewerkes schloß, die diesmal im Versammlungshause stattfand.

Inzwischen hatten sich die Leute in ein naheliegendes Dorf begeben und sich dort „verkleidet", d. h. sich ein kleines Stück Zeug zwischen den Beinen durchgezogen und den ganzen Körper mit Rotholz bzw. mit weißer Farbe eingerieben. Der eine war rot, der zweite halb rot und halb weiß, der dritte ganz weiß, alle mit Kreisen, Punkten oder Sonnen bemalt, die auf der roten Fläche weiß, auf der weißen rot waren (Abb. 16). Während nun der Ndong-mba noch ein wenig tanzte und sang, anscheinend, um über die Pause hinwegzuhelfen, rückten diese drei, unter denen sich auch der Medizinmann befand,

heran; schon von weitem hörte man ihren Gesang, der näher und näher kam. Nun ergriff der Häuptling des Dorfes ein zugespitztes Stöckchen als Speer und ein Bananenblatt als Schild, sprang und tanzte auf dem Dorfplatz herum und machte wilde Gebärden nach der Seite, von der der Gesang näherkam. Als die drei bemalten Leute — jeder unter dem Schutze eines Bananenblattes — langsam in gebückter Haltung herankamen, stürmte er unter furchtbarem Geheul und Lärm der Musikinstrumente vom Versammlungshause her gegen die unheimlichen Besucher an, bedrohte sie mit dem Speer und führte gleichsam einen Kriegstanz gegen sie auf.

In der Mitte des Dorfplatzes traf er mit den Feinden zusammen, aber anstatt sie zu vernichten, wie man es nach seinem Gebahren erwartet hatte, schien er sich mit den Dreien zu einigen, denn diese ließen das Bananenblatt fallen und kamen à la Schimpanse auf allen Vieren und im Zickzackgange auf das Versammlungshaus zu, wo sich die Teilnehmer, wie am Abend vorher, in zwei Reihen aufgestellt hatten; zwischen den Reihen saßen die Neulinge auf dem Schoße älterer Männer und sahen sich von hier aus das Schauspiel mit an. Nun vollführten die sonderbaren Drei den Schimpansentanz in dritter, vollendetster Auflage, und zuletzt mußte sich jeder Neuling gegen den Rücken des Medizinmannes stellen und wurde nun mit der Kultmarke versehen.

In dieser Vorstellung ist ohne Zweifel der Kampf des Guten (Häuptling) gegen das Böse (Schimpansendarsteller) und der Vergleich beider Mächte zu sehen. Man kann eben dem Guten nicht zum vollständigen Siege verhelfen, sondern muß sich mit den finsteren Mächten gut stellen, sobald sie in der Nähe sind. Wenn auch die Sonne vorübergehend über den Mond siegt, es wird doch immer wieder Nacht; wenn auch der Hahn den Morgen jubelnd verkündet, mit der Dämmerung ist doch seine Zeit zu Ende und die Eule mit ihrem Schreckensruf löst ihn ab; wenn auch der Mensch oft glauben mag, er sei die Krone alles Irdischen, immer wieder wird er daran erinnert, daß noch ein halbes Tier in ihm steckt, immer wieder tritt die Sinnlichkeit, die Lächerlichkeit und das Laster, kurz das Viehische, hervor, gerade so, wie es des Menschen Zerrbild, der Schimpanse, zeigt.

Die Eingeweihten haben den Rest des Tages und die Nacht in dem abgesperrten Teil des Versammlungshauses zu verbringen.

Am letzten Festtage wurde wieder, wie beim Sso, der Kultplatz hergerichtet (Abb. 17). Die Figuren — es sind jetzt zwei vollkommen menschliche Gestalten, der Bokung (Abb. 17 *a*) und Elong (Abb. 17 *b*) — wurden unter Ausschluß der Neulinge auf dem Kultplatz, der eine kurze Strecke vom Versammlungshause entfernt im Busch lag, errichtet. Für die Elongfigur (Abb. 18) wird ein Platz durch zwei doppelt geknickte Kardamomstengel (*a*) umrissen,

die auf die Erde gelegt und mit Haken festgehalten werden. In der Mittellinie werden vier Löcher *(b)* eingegraben, mit den stacheligen Stengelstücken der **Dalbergia tessmannii** Harms *(makɪ,maböm III)* umgeben und mit folgenden Medizinen ausgefüllt:

1. Rindenstücke der **Copaifera tessmannii** Harms *(oɣǒn)*,
2. Rindenstücke der **Epitaberna myrmecoeia** K. Schum. *(mabǒnmadɪiɪǫk)*,
3. halb durchschnittene Früchte der **Solanum duplosinuatum** U. D. *(etüin)*,
4. eine Luftknolle der **Dioscorea preussii** Pax. *(abɔn)*.

Um das an der Stelle des späteren Bauches der Figur befindliche Loch, das größer ist als die anderen drei, kommen außerdem Rindenstücke der **Copaifera** und **Epitaberna**, unter die Stelle des späteren Kopfes und des Bauches endlich Stücke eines Termitennestes *(c)*. Nun legt der Mann auf alle vier Löcher Harz, zündet es an und läßt es einen Augenblick brennen, darauf wird

Abb. 20. Elong-Figur beim Bokung-Kult in Bébai (Fam. Eseng).

ein armdicker Pfahl in das Bauchloch gesteckt und hierauf der Lehm für die Figur aufgeworfen. Bei der Bokungfigur machte man sich die Sache weniger umständlich. Es wurde hier nur e i n Loch an der Stelle des Bauches der späteren Figur gegraben, und dann dieselben vier Medizinen darin versenkt. Nachdem die Figuren fertig modelliert waren, wurden sie mit Wasser begossen und mit Bananenstämmen geschlagen, damit der Lehm zusammenhielt. Zuletzt bemalten die Künstler die Figuren mit bunten Sonnen und Kreisen aus roter oder weißer Farbe, umgaben den Geschlechtsteil der weiblichen Elongfigur mit Haaren und formten den Penis der männlichen aus Lehm[1]). Jetzt zog man den Stock aus dem Bauch und schüttete weitere Medizinen in die Höhlung. Die ganzen Figuren wurden noch mit angespitzten Raphiamarkstreifen, die Speere darstellen sollten, umgeben (Abb. 20).

Es ist bezeichnend, daß der Pangwe keiner seiner heiligen Figuren, nicht einmal dem großen Ngi, von vornherein persönliche Eigenschaften und Fähigkeiten zutraut, sondern solche erst durch die Medizinen überträgt. Sie werden so zu Zauberern, deren Aufgabe es ist, die Angriffe der Zauberwesen zu hintertreiben und zuschanden zu machen. In diesem Kampfe sind sie aber auch selbst gefährdet und müssen daher ihrerseits gegen die Angriffe der Feinde, also gegen Zauberei durch Medizinen geschützt werden. Wie diese Wirkung gedacht wird, erhellt aus folgendem: Der Copalferastamm ist der Sitz der ab-

[1]) Auch werden öfter Holzpenisse geschnitzt.

geschiedenen Seelen, vor denen sogar die Zauberwesen Achtung haben. Der Ameisenbaum, **Epitaberna myrmoecia,** soll den Zauberwesen anzeigen, daß sie ebenso zerfressen werden sollen, wie der Baum von Ameisen, die in den Zweigen wohnen, zerfressen wird. Die Früchte der **Solanum duplosinuatum** sind innen vollkommen „mulschig", während sie äußerlich glatt und gesund erscheinen, beim Zerdrücken der dünnen Schale spritzt das Innere heraus, ebenso soll es den Zauberwesen ergehen. Die Luftknollen der **Dioscorea preussii** haben Flecke wie von einer Krankheit, man wünscht den Zauberwesen gleiches. An den Stacheln der **Dalbergia** und vor allem an den Raphiaspeeren sollen sich die Zauberwesen aufspießen, wenn sie sich auf die Figur stürzen wollen. Das Termitennest ist ein drolliges Memento mori für die Zauberwesen, da die Seelen zuletzt, wenn sie lange, lange im Himmel gelebt haben, auf die Erde fallen und von Termiten verzehrt werden.

Die Einweihung der Figuren verlief in meinem Falle folgendermaßen: Die Neulinge wurden an die Figur geführt, die sie voll grausigen Staunens betrachteten. Dann wurden die unvermeidlichen Trommeln gerührt und die Mirlitons geblasen. Der Medizinmann zerbiß drei Tausendfüße (die großen westafrikanischen!) und spuckte sie in das Loch, wobei sich die Umstehenden vor Entsetzen und Ekel schüttelten. Dann bewaffnete der Ndong-mba oder hier Elongdarsteller den Neuling mit einem richtigen Speer, führte ihn langsam um die Bokungfigur und half ihm den Speer tief in deren Seite stoßen, dann schleifte er ihn von hinten mit dem Bauch über sie hinweg und machte ihm mit Lehm vom Kopfe der Figur (Seelenwesen im Kopf) einen Strich auf die Stirn. Der Medizinmann lief zuletzt noch unter Trommelklang um die Figur und sprang mehrmals hinüber, um sich von den Kräften, die sie enthält, etwas anzueignen [1]).

Unterdessen hatte man neben dem Loche auf dem Bauch der Elongfigur Harz angezündet, zwei Männer ergriffen den Jungen an Händen und Füßen, hielten ihn darüber, so daß der Rauch den Leib und zumal die Geschlechtsteile traf. Nachdem er so eine Weile angeräuchert war, wurde ihm erklärt, die Festlichkeit sei zu Ende, und er dürfe von nun an kein Schildkrötenfleisch mehr essen.

Also auch hier wird der Neuling dem Bösen, dem Tode geweiht, was dadurch zum Ausdruck kommt, daß er mit dem Lehm der Figur beschmiert wird, genau wie vorher beim Schmutzbad im Sso, obwohl er dem Guten dadurch zum Siege zu verhelfen suchte, daß er das Böse mit dem Speer tötete. Es ist eben noch zu mächtig, und man kann nur das Böse äußerlich mit einer guten Tünche versehen, indem der eben dem Bösen Geweihte mit dem heiligen Feuer des Guten beräuchert und dadurch gereinigt wird.

---

[1]) Ebenso steigt man über einen Toten hinweg, der größte Schwur auf den Verstorbenen (Abschn. XVI, 5).

Die Tausendfüße, die der Medizinmann zerkaute, sind eine Medizin gegen Zauberwesen, die ebenso langsam kriechen sollen, wenn sie die heiligen Plätze aufsuchen, wie zerbissene Tausendfüße.

Welche weiteren Aufgaben die Figuren erfüllen sollen, wird später beim Ngi gesagt werden, wo sie aktiver, persönlicher gedacht sind.

Der Medizinmann erhielt eine Bezahlung, die vor der Einweihung auf dem heiligen Platze entrichtet wurde und 10 Speergeld (= Mk. —.70) und mehrere Hühner betrug. 10 Speere muß auch der Zuschauer ausgeben, der nicht Eingeweihter des Bokung ist und sich die Feier anzusehen wünscht.

Nach Beendigung der Feier mußten die Neulinge noch zwei Tage in dem Sonderraum des Versammlungshauses zubringen.

III. Schok.

Das Schok ist einer der merkwürdigsten Kulte der Pangwe und wurde mir an Bedeutung gleich hinter dem Sso genannt, freilich hauptsächlich wohl deshalb, weil bei ihm die Herstellung der Kultfiguren mehr Mühe erfordert als bei den anderen Kulten, mit alleiniger Ausnahme des Odschüe der Fang. Das Schok veranschaulicht unter dem Bilde des Elefanten *(zǫk)* [1]) das Wasser, das, wie schon oben erwähnt, zu den schlechten Grundstoffen gehört, so ist denn auch das Schok eine Abart des Kultes des Bösen, und wir finden allerlei Züge, die dem Sso ähneln.

Der äußere Anstoß zu einer Feier des Schok kann zweierlei Art sein, entweder will man mit seiner Hilfe das oder die Zauberwesen, welche einen soeben Verstorbenen getötet haben, vernichten oder man will ohne eine bestimmte Veranlassung überhaupt mal wieder das Treiben der Zauberwesen einschränken.

Abb. 21. Längsschnitt durch einen Schok, der über einer Leiche errichtet ist.

[1]) Zur Gedankenverbindung des Elefanten mit dem Wasser vergleiche auch Pechuël-Loesche, Volkskunde von Loango, S. 168.

Abb. 22. Plan eines Schok-Kultplatzes in Bedábedan (Fam. Essásum), Span.-Guinea.

Im ersteren Falle wird die Hauptkultfigur, ein Elefant, direkt über dem Toten errichtet. Die Leiche wird einen Tag nach dem Begräbnis wieder ausgegraben, auf den heiligen Platz gebracht und hier mit dem Rücken auf die Erde gelegt. Über ihr wird der Lehm zu der Figur aufgeschüttet, nachdem zum Offenhalten eines Loches in der Figur ein Pfahl in den Bauch der Leiche gestoßen ist (Abb. 21). Nur in diesem Falle findet gleichzeitig auch eine Einweihung von Neulingen statt. Der zweite Fall sei an der Hand einer von mir in Bedábedan (Esseng) mitgemachten Feier beschrieben.

Der Vorabend verlief genau wie beim Sso, am ersten Festtage wurden die heiligen Figuren errichtet, als Hauptsache der Schok, ein riesiger Elefant, neben ihm zwei Schweine und vor ihm eine Riesenschlange und eine Schildkröte (Abb. 22).

Dem Schok gibt man kräfteübertragende Medizinen bei, die in das erwähnte Loch im Bauche der Figur versenkt werden und hauptsächlich aus Stücken Lehm von anderen Kultfiguren, einem Schok, einem Bokung usw., ferner aus Rindenstücken der Leguminose **Detarium macrocarpum** Harms *(enak)*, aus Schädelstücken eines an Framboesie gestorbenen Mannes und vielen anderem mehr bestehen. Abb. 22 zeigt, wie die Figur angelegt, Abb. 23, wie sie modelliert wird. Während und nach der Beendigung der Arbeit sang der Medizinmann auf einem dicken Mirliton, das aus einem Stück Schirmbaumholz bestand (Abb. 24) und dazu dienen sollte, die Stimme der Dickhäuter nachzuahmen, unter Trommel- und Chorbegleitung allerlei altertümliche Lieder, von denen einige auf den geschlechtlichen Hintergrund der Kulte deuten. Neben den Liedern, die als Schoklieder bezeichnet wurden, brachte man noch Bokunglieder, außerdem tanzte ein Mann den Schimpansentanz. Aus den Liedern sei einiges hier angeführt:

Abb. 23. Herstellung einer Schokfigur in Bédabedan (Fam. Eandoum), Span.-Guinea.

mininga a nga kǎn śǫ̀k, ba dśf nie hamoś,
(Die) Frau, sie lebte krank sein (an) Schok, man kohabitierte (mit) ihr tags,

teage dśam oa bó śǫ̀k. Chor: *teage!*
sag an (die) Sache, du machtest (mit) Schok. Chor: Sag an!

Die Frau, welche schokkrank ist, mit der wurde am Tage kohabitiert. (Zur Frau:) Sag an, was hast du in bezug auf den Schok verbrochen (d. h. was hast du verbrochen, daß der Schok dich so bestraft). Dann folgt die Strafe des Schok:

fǔ mabo an' atitel. Chor: *fǔ*
Geschwüre an den Beinen wie Sterne. Chor: Geschwüre

oder: *ndendem a mane bǒl, a ndoŋ-śǫ̀k!*
Medizinmann (?), er macht fertig Leute, o heiliger Schok!

Angeblich, weil der Medizinmann durch seine Medizin die Zauberwesen (das sind Menschen) tötet.

Abb. 24.
Miriton für den Schok-Kult.

Von Bokungliedern hörte ich folgende:

bongu[s] be ɨpk bo za a wok ndoń e ne mbōń,
Eingeweihte des Schok, sie kommen zu hören (einen) Kult, er ist schön,

ɨib e dadań mbgk.
Sumpfbock, er geht über (das) Netz [1]).

Das heißt: Die Eingeweihten des Schok kommen, einen schönen Kult zu hören (wohl den Bokung), der Sumpfbock springt über das Netz. Der in letzterem liegende Vergleich ist mir unverständlich, es wird auch gesagt: *mɛzi* (Fleckenroller, Nandinia) *dadań mbgk*. Ferner:

ndoń-bokań, nkun oa ke kǫlabǫ ané elūń
Heiliger Bokung, Penis, er geht abstehen, wie Elefantenspeereisen
(vgl. hierzu die Zeichnung Bd. I, Abb. 225 Fig. 10).

Dann machten wieder die Issisleute ihre wunderlichen Bewegungen, auch der Medizinmann gab sich die größte Mühe, tanzte, indem er sich an den Pfahl lehnte, welcher in der noch uneingeweihten Figur steckte, machte Koitusbewegungen, löste zuletzt sein Lendentuch und schwang sich an dem Pfahl mit Hilfe des Stockes über den Rücken des Elefanten. Dann turnte er an der Figur herum, z. B. warf er sich über den Hals des Elefanten, fiel wie tot auf der anderen Seite herab, bekam Zuckungen usw., alles unter entsetzlichem Lärm und Geschrei auf dem Mirliton — anders kann man diese Art von Musik bei bestem Willen nicht bezeichnen. Zum Schluß trat der ominöse Tausendfuß wieder auf, der Medizinmann zerbiß das Tier und legte es in einem Blatte auf den Kopf des Elefanten, um ihn zur Einweihung, die am nächsten Tage stattfinden sollte, bei der Hand zu haben.

Zum großen Gaudium einiger meiner Jungen, die als kultivierte Leute nichts mehr von den Kulten wissen wollten, waren aber am nächsten Morgen die „Stücke" Tausendfuß anscheinend weggelaufen; Gläubige behaupteten allerdings mit ehrfurchtsvollen Mienen, der Medizinmann habe sie gegessen. Einerlei, der Tausendfuß war und blieb trotz alles Suchens verschwunden, und einen neuen zu beschaffen, weigerten sich, trotz eindringlicher Vorstellungen des Medizinmannes, die Mitspieler, da sie sich vor dem Tier allzusehr ekelten. So mußte denn die Sache ohne Tausendfuß vor sich gehen. Der Pfahl wurde herausgezogen und eine zweite Medizin in den Bauch des Elefanten versenkt, die aus Splittern der Leguminose **Detarium macrocarpum** Harms *(enāk)*, zerriebenen Knochen eines Mannes und aus Gift *(nśu)* bestand. Außerdem wurde eine Rotholzmedizin neben das Loch gelegt und Harz, das man anzündete; der Medizinmann „aß den Rauch", wie die Neger sagten. Bei der Leichtigkeit

[Facing p. 76]

Verlegt und gedruckt bei Ernst Wasmuth A.-G., Berlin.

dieses Gerichtes war es denn auch kein Wunder, daß der Mann ungeheuer lange und viel „aß". Die Flammen, sagte man mir, sollen den Medizinmann erleuchten, ebenso wie sein Haus, wenn er nachts darin schläft, so daß die nachts umgehenden Zauberwesen lieber umkehren und ihm nichts anzutun wagen. Dann wurde eine Ziege um den Elefanten geführt, auf den Rücken des Tieres gehoben und hier geschlachtet, indem der Medizinmann ihr über dem Loch das Messer in die Kehle stieß (Taf. XX). Am Schluß — in manchen Gegenden geschieht es zu Anfang — der gesamten Festlichkeiten führten die Eingeweihten eine Elefantenherde vor, ähnlich wie beim Sso eine Schweineherde. Durch großen Lärm und Abgabe von Schüssen wurde die Vorstellung, es handele sich um richtige Elefanten, verstärkt.

Der Schok wird durch die Medizinen genau so mit Kräften ausgestattet wie andere Kultfiguren (Sso, Elong, Bokung) und wird dadurch in seiner Fähigkeit, als Verkörperung der göttlichen Macht- und Strafgewalt die Vergehen gegen Nsambe zu bestrafen, gestärkt. Da, wo der Schok über einem Toten errichtet wird, gewinnt er für den Pangwe ein menschlicheres, persönlicheres Leben, indem er Nsambe und den Gedanken seiner Vertretung zurückdrängt und als eine neue eigene Person an seine Stelle tritt, mit derselben Bestimmung, die Sünder zu strafen.

Die Schokfigur nebst zwei seitlichen Schildkröten (Abb. 25) stammt aus dem Gebiete von Manoa (Fam. Obuk), Fang.

Abb. 25. Schok aus Manoa (Fam. Obuk), Fang.

IV. Ngi.

Die bedeutsamste und auch für uns sympathischste aller Kultgestalten ist der Ngi, der, mit Ausnahme der nördlichen Jaunde und Mwele [1]), im ganzen Pangwegebiete verbreitet, aber im Süden bei weitem reiner erhalten ist als im Norden. Vom Süden ist er auch offenbar ausgegangen und hat sich durch die menschlich verständlichere Ausdrucksform seines Kultes ein weites Gebiet erobert [2]), er ist indes bei seinen neuen Anhängern bald verfallen, namentlich werden auch Weiber dort eingeweiht, was immer das Zeichen eines Verfalls der alten Kulteinrichtungen ist.

Das Ngi ist der Kult des reinigenden Feuers [3]) unter dem Bilde des Gorillas. Bei der Aussprache ist zu beachten, daß Gorilla Mitteltiefton — *ngi* —, der Kult Mittelhochton — *ngí* — hat.

Für den, welcher die Menschenaffen nur nach den Schädeln oder ausgestopften Bälgen der Museen kennt, ist es nicht ohne weiteres verständlich, wie der Gorilla zum Sinnbild des Feuers und Guten geworden ist, wo doch sein naher Verwandter, der Schimpanse, im Kult des Bösen eine Rolle spielt. Aber wenn man die Eigenschaften und die Lebensweise der beiden Tiere gegeneinander hält, wird man der Sache näher kommen. Der Schimpanse ist das vollständige, ins Lächerliche gezogene Zerrbild des Menschen, seine Bewegungen, die Art und Weise zu klettern, kurz, sein ganzes Gebaren ist so komisch, daß er zur Karikatur des Menschen wird, die zum Lachen herausfordert, bei den Pangwe nicht anders als bei uns, wenn wir die Tiere in der Gefangenschaft sehen. Nicht so der Gorilla. Sein Benehmen ist ganz anders, tierischer, wilder, eindrucksvoller, vor allem zeichnet ihn aber vor seinem schwächeren Verwandten die ungeheure Kraft aus, die der vernichtenden Kraft des Feuers verglichen wird. Hinzu kommt vielleicht noch die meist rötlichere Färbung [4]) des Gorilla im Gegensatz zu der meist schwärzlichen der Schimpansen. Auch soll schließlich sein Geschlechtstrieb weniger ausgeprägt sein, daher wird das Gerücht

---

[1]) Also der Stämme nördlich des Nyong.

[2]) Sogar Nicht-Pangwe, wie einzelne Küstenvölker und ein Teil der Pygmäen, haben ihn angenommen.

[3]) Daher gelten nach A. L. Bennett für die Anhänger des Ngikultes folgende Verbote:

8. Food refuse must not be destroyed by fire,

9. To spit in the fire is against the law of Ngi (not permitted).

[4]) Es mag hierbei als Parallele erwähnt werden, daß auch dem Donar der alten Germanen „alles geweiht war, was rötliche Farbe — die Farbe des Feuers — aufweist, so Storch (wegen des roten Schnabels und der Beine), Fuchs, Eichhörnchen und Rotkehlchen".

kommen, daß er unter seinen Verfolgern denjenigen am Geruche heraus kennt und zuerst angreift, welcher sich vorher mit einem Weibe abgegeben hat. Die genaueren Einzelheiten entgehen uns natürlich, aber ich glaube, daß die verschiedene Beurteilung der beiden westafrikanischen Menschenaffen seitens der Pangwe berechtigt und ungefähr jenen Eigenschaften entsprungen ist.

Bevor ich mich den Eigenschaften des Ngi zuwende, sei die Feier, wie ich sie in Ebkangon (Essong) mitzumachen Gelegenheit hatte, hier beschrieben. Zuerst wurde ein kundiger Medizinmann, der selbst Ngi genannt wird [1]), herbeigerufen, und zwar neunmal. Neunmal muß der Veranstalter der Feier zum Sprecher des Ngi gehen und ihn an die Abhaltung der Festlichkeit gemahnen. 3 ist die gute, 3 × 3 die heiligste Zahl, drei Tage dauern auch die Festlichkeiten. Am ersten Tage wurde der Kultplatz, den man in schönfärberischer Weise das Ngidorf *(dzo-ngi)* nennt, hergerichtet und durch eine Wand aus Palmenblättern vor neugierigen Blicken geschützt; vor dieser Wand wurde ein offener Platz freigeschlagen, *elik e ngi*, was mit Vorplatz wiedergegeben werden kann [2]): bisher kannten wir *elik* als Bezeichnung für den eigentlichen Kultplatz, auf dem sich die Figur befindet. Auf dem Vorplatz wurden nun die Trommeln aufgestellt, die Teilnehmer ordneten sich in zwei Reihen, zwischen denen der Darsteller des Ngi, also der Medizinmann, seinen Tanz begann, indem er mit gräßlicher Bauchstimme (aber ohne Mirliton) sang und unverständliche Worte redete. Mit einem Messer in der Hand bedrohte er die Umstehenden, fuhr ihnen damit dicht unter die Nase und warf wütende Blicke um sich. Nachdem der Ngi so eine Weile wie ein Verrückter umhergetobt hatte, begab sich alles hinter die Wand, um hier den Grundstein der Ngifigur zu legen. In der Mitte des Platzes war unter dem Bauch der zukünftigen Figur ein kleines Loch in den Boden gegraben und darüber ein wasserhaltiges Holzstück, das aus einem Bach herausgefischt war, gelegt. Über das Loch stellte sich mit gespreizten Beinen ein Knabe, namens Essissa [3]), und bekam vom Medizinmann in die eine Hand einige Rindenstücke, in die andere Hand eine Blattüte mit abgeschabter Rinde (beide Teile von **Detarium macrocarpum** Harms *(ensk)* stammend). Nun mußte der Junge, während ihm von hinten die Augen zugehalten wurden, beides ins Loch stecken und dieses dann zuscharren. Es wurde dabei folgender Gesang, der ihn unter den besonderen Schutz des Ngi stellte, gesungen:

---

[1]) Solange er den Kult leitet.

[2]) Stamm *li* = schlagen, freischlagen (Busch), *eli* = der Baum, *elik* = freigeschlagener Platz, auf dem früher ein Dorf gestanden hatte, das dann aber verlassen wurde.

[3]) Es muß ein reiner Knabe sein, was natürlich cum grano salis zu verstehen ist, wie man mir auch sagte (siehe Abschnitt „Geschlechtsleben").

e mole a vül esisa, mol abuda ngi;
Der Mann, welcher tötet Essissa, der Mann: Opfer des Ngi;
e mole a bus esisa, mol abuda-ngi;
der Mann, welcher verflucht Essissa, (der) Mann: Opfer des Ngi;
nnem a dit esisa, abuda ngi.
(das) Zauberwesen, welches auffißt Essissa: Opfer des Ngi.

Dann legte der Medizinmann das Holzstück wieder über das nunmehr angefüllte Loch. Das Holzstück ist eine Medizin gegen Zauberwesen und soll andeuten, daß die Zauberwesen ebenso „zugrunde" gehen sollen wie das wasserschwangere Holzstück. Von **Detarium macrocarpum** sagt man, daß dicke, grünende Äste scheinbar ohne Veranlassung plötzlich abbrechen, so sollen auch die Zauberwesen vom Lebensbaume herunterfallen. Dem Jungen werden die Augen zugehalten, um anzudeuten, daß die Zauberwesen ebenso blind sein sollen, wenn sie ausgehen, um den Ngi aufzusuchen.

Man sieht, der beim Seo der Jaunde so klar entwickelte Todesgedanke ist schon vollständig verschwunden, wir befinden uns mitten im Kampf gegen die Zauberwesen und Sünder.

Am Schlusse der Kulthandlung gab der Medizinmann dem Festveranstalter, „der ihn gerufen hat", den Auftrag, bis zum nächsten oder übernächsten Tage den Schädel, einen Oberschenkel- und einen Unterschenkelknochen eines im Kriege getöteten oder durch einen Unglücksfall plötzlich ums Leben gekommenen Mannes sowie die übrigen Medizinen, die wir noch kennen lernen werden, zu beschaffen.

Nachdem diese Forderung erfüllt, begann der zweite Festtag. Nach einer Wiederholung des Messertanzes auf dem Vorplatz wurde die Figur selbst errichtet. Wie der Querschnitt (Abb. 26) zeigt, wurde ein Schädeldach *(b)* mit der Höhlung nach oben genau auf das mit Medizinen ausgestattete und wieder zugescharrte Loch *(a)* gelegt, ein unten vierfach gespaltener Stock *(d)* hineingestellt, das erwähnte nasse Holzstück *(c)* daran gelehnt und nun der Lehm darüber angehäufelt. Diesmal tat man auch noch ein übriges, indem man dem Ngi (Abb. 28) eine „Frau" beigab, die indessen nur aus einem Lehmhäufchen bestand, auf dem der Geschlechtsteil und die Oberschenkel-

ansätze angedeutet waren *(b)*. Übrigens habe ich bei anderen Ngifiguren nie ähnliches gesehen. Die Begründung lautete: der Ngi sollte in seinem Herzen lachen, d. h. sich freuen und so in angenehme und seinen „Kindern" geneigtere Stimmung versetzt werden. Jedenfalls ein Zeichen, wie menschlich man sich diesen Ngi denkt. Als Augen wurden Sarcophryniumfrüchte eingesetzt. Um die ganze Figur wurden die bekannten Raphiasperre gesteckt, die aber hier zum größten Teil mit Früchten des Kardamoms besteckt waren. Diese Früchte *(nsun)*, die in einem anderen Falle in der Ngifigur selbst steckten, sollen Flammen bedeuten [7]), „die den Zauberwesen unten alles so rot wie Feuer zeigen" (Abb. 27). Man vergleiche die Abbildung des Aframeomum albo-violaceum K. Sch. (Taf. XXI). Häufiger werden freilich die Früchte des seltenen Aframeomum hasbanyi K. Sch. verwandt, da diese wegen ihrer dünneren und etwas gedrehten Gestalt die Flämmchen noch besser vortäuschen. Andererseits sind diese Früchte aber auch die Hauptnahrung des Gorilla, allerdings auch der Schimpansen, vielleicht mit ein Grund, daß ein Menschenaffe als Symbol in den Feuerkult übernommen wurde.

Nach Fertigstellung der Figur gingen alle, mit Ausnahme des Medizinmannes und einiger Gehilfen, wieder vor die Wand auf den Vorplatz, auf den jetzt die Einzuweihenden geführt wurden.

Die Gehilfen des Medizinmannes schüttelten die Bäumchen, die am Ngidorf standen, um zu zeigen, daß dort der Geist des Ngi herumgingo, dazu ließ

[7]) Daher vielleicht der häufige Name Esum bei den Pangwe; auch Ngi ist als Name sehr oft anzutreffen.

der Medizinmann die Knochen über der Wand tanzen und die Neulinge nach ihnen springen. Der Hauptwitz war, ihnen dabei mit dem Knochen möglichst unauffällig einen tüchtigen Klapps auf die Finger zu geben. Einem Jungen, der die Knochen versehentlich länger anfaßte, wurde sogar mit einer stacheligen Dalibergiaranke ganz eklig über die Hand gefahren. Die kleineren Jungen, fast Kinder waren darunter, nahm ein Verwandter auf den Arm, und dann führte er die Zeremonie für sie aus. Damit war der zweite Festtag beendigt.

Am dritten Tage folgte der Schluß der Einweihung. Nachdem auf dem Vorplatze der Messertanz aufgeführt und den Neulingen eine Zeitlang mit dem Messer dicht vor dem Gesicht herumgefuchtelt war, wurden sie ins Ngidorf geführt. Es war drollig zu beobachten, wie sich das Staunen über den berühmten und gefürchteten Ngi, von dem sie schon so viel wunderbare Taten gehört hatten, deutlich auf ihren Gesichtern abmalte. Man sah, daß einige der Kleineren vor Aufregung und Angst hätten weinen mögen, wenn sie sich es nicht vor dem Kreise der feierlich-vertraut ausschauenden eingeweihten Freunde und Bekannten verbissen hätten. Der Medizinmann suchte sich nun wieder einen anscheinend noch nicht geschlechtsreifen, also im Pangwesinne reinen Knaben aus, der den Stock aus dem Bauche ziehen und die ihm vom Meister überreichten Medizinen ins Loch versenken mußte. Die Einzelteile waren diesmal zwei Schlangenzähne, das Gift *(nǝu)* und ein besonderer Körperteil, der von einem Toten hergenommen war *(eyw)*, und in dem die Zauberkraft beim Menschen sitzt, die hiermit dem Ngi verliehen werden sollte. Damit ist der Ngi eine Persönlichkeit geworden. Darauf vereinigten sich alle Teilnehmer, auch die Neulinge, zu einem Festschmaus, der gleich im Ngidorfe eingenommen wurde und nichts besonderes bot. Sehr hübsch war der folgende symbolische Tanz, der von je einem Neuling und dem Medizinmann vorgeführt wurde und aus drei Teilen bestand. Zuerst stellten die Zwei sich einander gegenüber auf und tanzten aneinander vorbei, indem sie die Hände hinter den Kopf legten, wie es bei der Wehklage geschieht. Es sollte dadurch versinnbildlicht werden, daß die Menschen wegen einer unsittlichen Tat (vor allem Zauberei) vom Ngi mit dem Tode bestraft werden. Beim zweiten Teil des Tanzes, der im übrigen dem ersten glich, hakte jeder die Zeigefinger seiner beiden Hände ineinander, um auszudrücken, daß der Neuling nun auch ein „Kind" des Ngi, wie die Neger sagen, geworden sei und unter seinem Schutze stände; beim dritten Teile kehrten sich beide den Rücken zu, und das sollte heißen, daß die Zauberwesen dem Neuling nicht schaden, sondern sich von ihm — dem Ngigeweihten — abkehren würden.

Hiernach trat ein zweiter Ngimedizinmann — ob zufällig oder ob immer, weiß ich nicht — auf den Plan. Er nahm Rinde der **Eptaberna**, die wir schon

als Medizin gegen Zauberwesen kennengelernt haben, und noch eine andere Rinde *(okbwö)*, legte beide ins Loch und zündete auf einem Rindenstück, das darüber gelegt wurde, das nie fehlende Harz an. In den Rauch hielt ein Gehilfe die Enden der beiden Knochen und noch vier **Dallbergia**ranken, um ihnen die Kraft, als Werkzeug des Ngi zu dienen, zu übertragen.

Den Abschluß der gesamten Ngifeier bildete der Knochentanz, der gleichfalls im Ngidorf ausgeführt wurde. Der Medizinmann tanzte vor den im Halbkreise aufgestellten Teilnehmern und fragte jeden singend:

ondundoń mbań a ne? ototun mbań a ne?
Langer Knochen, er ist (wo)? Kurzer Knochen, er ist (wo)?

Das heißt: Wo ist der Oberschenkelknochen und wo der Unterschenkelknochen?

Darauf antwortete der Gefragte:

ondundoń mbań a majum, ototun mbań a maja!
Langer Knochen in (der) Rechten, kurzer Knochen in (der) Linken!

und gab damit sein Verständnis für das wichtigste Werkzeug des Ngi kund.

Der stets wiederkehrende Gesang des Ngi lautete:

mbań a wū (= a ńū) mbań a wū (= a ńū),
Knochen, er hier (?), Knochen, er hier (?),

ondundoń mbań a majum ototun mbań a maja;
langer Knochen rechts, kurzer Knochen links,

mbań a vüi edu-medśá, mbań a vüi mvŋ̄-bekońo,
Knochen, er tötete Edu-Medscha, Knochen, er tötete Mwo-Bekongo,

mbań ele wū wū.
Knochen, besagter, er hier (?).

Nun wurden die beiden Knochen an die Figur gelegt, meist legt man sie indes auf den Leib und fügt den dazugehörigen Schädel oder ein Stück von ihm hinzu.

Äußerlich sind die Ngifiguren sehr verschieden: Abb. 29 und 30 zeigen einen Ngi vom mittleren Kjegebiet vom Essandundorfe Alén; in Abb. 29, die vor der Einweihung aufgenommen wurde, hatte man den Kopf der Figur durch eine Art Gerüst erhöht gelagert. Dahinter versteckte sich der Medizinmann, so daß, wenn er sang, es für die Zuschauer vorn schien, als ob der Ngi selbst sänge.

Die Feier brachte sonst nichts wesentlich Neues, der Medizinmann benahm sich nur noch bedeutend rabiater als der Messerheld von Ebäangon, er rannte wie toll auf dem Dorfplatze herum und bewarf unter Gröhlen jeden, der sich
